But it is in Lorenzo de' Medici that the influence of Florence on the Renaissance is particularly seen. In forming an opinion of him many people are led away by political preconceptions. Even as a statesman, Lorenzo has a conspicuous place in the history of his time, and in our day it will not be deemed reasonable to expect that in the age of lordships and principalities he alone should stand out from his time, and not feel the influence of the general condition of Italy. With this, however, we have nothing to do. We have to consider Lorenzo de' Medici as a man of letters; and as such he is one about whom tradition and reality best agree. His mind was formed by the ancients: he attended the class of the Greek Argyropoulos, sat at Platonic banquets, took pains to collect codices, sculptures, vases, pictures, gems, and drawings to ornament the gardens of San Marco and to form the library afterwards called by his name. In the saloons of his Florentine palace, in his villas at Careggi, Fiesole, and Ambra, stood the wonderful chests painted by Dello with stories from Ovid, the Hercules of Pollajuolo, the Pallas of Botticelli, the works of Filippino and Verrocchio. Lorenzo de' Medici lived entirely in the classical world; and yet if we read his poems we only see the man of his time, the admirer of Dante and of the old Tuscan poets, who takes inspiration from the popular muse, and who succeeds in giving to his poetry the colours of the most pronounced realism, as well as of the loftiest idealism,—who passes from the Platonic sonnet to the impassioned triplets of the *Amor di Venere*, from the grandiosity of the *Salve to Nencia* and to *Beati*, from the

Canto Carnascialesco to the Lamba. The feeling of nature is strong in him,—at one time sweet and melancholy, at another vigorous and deep, as if an echo of the feelings, the sorrows, the ambitions of that deeply agitated life. He liked to look into his own heart with a severe eye, but he was also able to pour himself out with tumultuous fulness. He described with the art of a sculptor; he satirized, laughed, prayed, sighed, always elegant, always a Florentine, but a Florentine who read Anacreon, Ovid, and Tibullus, who wished to enjoy life, but also to taste of the refinements of art.

Next to Lorenzo comes Poliziano, who also united, and Poliziano, with greater art, the ancient and the modern, the popular and the classical style. In his *Rispetti* and in his *Ballate* the freshness of imagery and the plasticity of form are inimitable. He, a great Greek scholar, wrote Italian verses with dazzling colours; the purest elegance of the Greek sources pervaded his art in all its varieties, in the *Orfeo* as well as the *Stance per la Giostra*.

As a consequence of the intellectual movement towards the Renaissance, there arose in Italy in the 15th century three academies, those of Florence, of Naples, and of Rome. The Florentine academy was founded by Cosmo I. de' Medici. Having heard the praises of Platonic philosophy sung by Gemistus Pletho, who in 1489 was at the council of Florence, he took such a liking for those opinions that he soon made a plan for a literary congress which was especially to discuss them. Marsilius Ficinus has described the occupations and the entertainments of these academicians. Here, he said, the young men learnt, by way of pastime, precepts of conduct and the practice of eloquence; here grown-up men studied the government of the republic and the family; here the aged consoled themselves with the belief in a future world. The academy was divided into three classes:—that of patrons, who were members of the Medici family; that of hearers, among whom sat the most famous men of that age, such as Pico della Mirandola, Angelo Poliziano, Leon Battista Alberti; that of disciples, who were youths anxious to distinguish themselves in philosophical pursuits. It is known that the Platonic academy endeavoured to promote, with regard to art, a second and a more exalted revival of antiquity. The Roman academy was founded by Giulio Pomponio Leto, with the object of promoting the discovery and the investigation of ancient monuments and books. It was a sort of religion of classicism, mixed with learning and philosophy. Platina, the celebrated author of the lives of the first hundred popes, belonged to it. At Naples, the academy known as the Pontaniana was instituted. The founder of it was Antonio Beccadelli, surnamed Il Panormita, and after his death the head was Il Pontano, who gave his name to it, and whose mind animated it.

Romantic poems were the product of the moral scepticism of the artistic taste of the 15th century. Italy never had any true epic poetry in its period of literary birth. Still less could it have any in the Renaissance. It had, however, many poems called *Canzoni*, because they contained stories that were sung to the people; and besides there were romantic poems, such as the *Buovo d'Antona*, the *Regina Anserio*, and others. But the first to introduce elegance and a new life into this style was Luigi Pulci, who grew up in the house of the Medici, and who wrote the *Morgante Maggiore* at the request of Lucrezia Tornabuoni, mother of Lorenzo the Magnificent. The material of the *Morgante* is almost completely taken from an obscure chivalrous poem of the 15th century recently discovered by Professor Pio Rajna. On this foundation Pulci erected a structure of his own, often turning the subject into ridicule, burlesquing the characters, introducing many digressions, now capricious, now scientific, now theological. Pulci's merit consists in having been the first to

Literary dangers of Latinism.

Influence of Florence.

Lorenzo de' Medici.

raise the romantic epic which had been for two centuries in the hands of story-tellers into a work of art, and in having united the serious and the comic, thus happily depicting the manners and feelings of the time. With a more serious intention Matteo Boiardo, count of Scandiano, wrote his *Orlando innamorato*, in which he seems to have aspired to embrace the whole range of Carolingian legends; but he did not complete his task. We find here too a large vein of humour and burlesque. Still the Ferrarese poet is drawn to the world of romance by a profound sympathy for chivalrous manners and feelings,—that is to say, for love, courtesy, valour, and generosity. A third romantic poem of the 15th century was the *Manfricano* by Francesco Ballo (Cicco of Ferrara). He drew from the Carolingian cycle, from the romances of the Round Table, from classical antiquity. He was a poet of no common genius, and of ready imagination. He showed the influence of Boiardo, especially in something of the fantastic which he introduced into his work.

Drama. The development of the drama in the 15th century was very great. This kind of semi-popular literature was born in Florence, and attached itself to certain popular festivities that were usually held in honour of St John the Baptist, patron saint of the city. The *Sacra Rappresentazione* is in substance nothing more than the development of the mediæval *Mistero* ("mystery-play"). Although it belonged to popular poetry, some of its authors were literary men of much renown. It is enough to notice Lorenzo de' Medici, who wrote *Sua Giovanni e Paolo*, and Feo Belcari, author of the *Sua Panunzio*, the *Abramo ed Isaac*, &c. From the 15th century, some element of the comic-profane found its way into the *Sacra Rappresentazione*. From its Biblical and legendary conventionalism Poliziano emancipated himself in his *Ojfe*, which, although in its exterior form belonging to the sacred representations, yet substantially detaches itself from them in its contents and in the artistic element introduced.

Pastoral poetry. From Petrarch onwards the eclogue was a kind of literature that much pleased the Italians. In it, however, the pastoral element is only apparent, for there is nothing really rural in it. Such is the *Arcadia* of Jacopo Sannazzaro of Naples, author of a whimsical Latin poem *De Partu Virginis*, and of some piscatorial eclogues. The *Arcadia* is divided into ten eclogues, in which the festivities, the games, the sacrifices, the manners of a colony of shepherds are described. They are written in elegant verses, but it would be vain to look in them for the remotest feeling of country life. On the other hand, even in this style, Lorenzo de' Medici was superior. His *Nencia da Barberino*, as a modern writer says, is as it were the new and clear reproduction of the popular songs of the environs of Florence, melted into one majestic wave of octave stanzas. Lorenzo threw himself into the spirit of the bare realism of country life. There is a marked contrast between this work and the conventional bucolic of Sannazzaro and other writers. A rival of the Medici in this style, but always inferior to him, was Luigi Pulci in his *Bea da Dicomano*.

Lyric poetry. The lyric love poetry of this century was unimportant. In its stead we see a completely new style arise, the *Canto Carnascialesco*. These were a kind of choral songs, which were accompanied with symbolical masquerades, common in Florence at the carnival. They were written in a metre like that of the ballade; and for the most part they were put into the mouth of a party of workmen and tradesmen, who, with not very chaste allusions, sang the praises of their art. These triumphs and masquerades were directed by Lorenzo himself. At eventide they set out into the city large companies on horseback, playing and singing these songs. There are some by Lorenzo himself, which surpass

all the others in their mastery of art. That entitled *Bacco ed Arianna* is the most famous.

Girolamo Savonarola arose to fight against the literary and social movement of the Renaissance. He was a Ferrarese friar, born in 1452, and he came to Florence in 1489. Some have tried to make out that Savonarola was an apostle of liberty, others that he was a precursor of the Reformation. In truth, however, he was neither the one nor the other. In his struggle with Lorenzo de' Medici, he directed his attack against the promoter of classical studies, the patron of pagan literature, rather than against the political tyrant. Animated by mystic zeal, he took the line of a prophet, preaching against reading voluptuous authors, against the tyranny of the Medici, and calling for popular government. This, however, was not done from a desire for civil liberty, but because Savonarola saw in Lorenzo and his court the greatest obstacle to that return to Catholic doctrine which was his heart's desire; while he thought this return would be easily accomplished if, on the fall of the Medici, the Florentine republic should come into the hands of his supporters. There may be more justice in looking on Savonarola as the forerunner of the Reformation. If he was so, it was more than he intended. The friar of Ferrara never thought of attacking the papal dogma, and always maintained that he wished to remain within the church of Rome. He had none of the great aspirations of Luther. He only repeated the complaints and the exhortations of St Catherine of Siena; he desired a reform of manners, entirely of manners, not of doctrine. He prepared the ground for the German and English religious movement of the 16th century, but unconsciously. In the history of Italian civilization he represents retrogression, that is to say, the cancelling of the great fact of the Renaissance, and return to mediæval ideas. His attempt to put himself in opposition to his time, to arrest the course of events, to bring the people back to the faith of the past, the belief that all the social evils came from a Medici and a Borgia, his not seeing the historical reality as it was, his aspiring to found a republic with Jesus Christ for its king,—all these things show that Savonarola was more of a fanatic than a thinker. Nor has he any great merit as a writer. He wrote Italian sermons, hymns (*laudi*), ascetic and political treatises, but they are roughly executed, and only important as throwing light on the history of his ideas. The religious poems of Girolamo Benivieni are better than his, and are drawn from the same inspirations. In these lyrics, sometimes sweet, always warm with religious feeling, Benivieni and with him Feo Belcari carry us back to the literature of the 14th century.

History had neither many nor very good students in the 15th century. Its revival belonged to the following age. It was mostly written in Latin. Leonardo Bruni of Arezzo wrote the history of Florence, Giovanni Pontano that of Naples, in Latin. Bernardino Corio wrote the history of Milan in Italian, but in a rude way.

Leonardo da Vinci wrote a treatise on painting, Leon Battista Alberti one on sculpture and architecture. But the names of these two men are important, not so much as authors of these treatises, but as being embodiments of another characteristic of the age of the Renaissance,—versatility of genius, power of application along many and varied lines, and of being excellent in all. Leonardo was an architect, a poet, a painter, an hydraulic engineer, and a distinguished mathematician. Alberti was a musician, studied jurisprudence, was an architect and a draughtsman, and had great fame in literature. He had a deep feeling for nature, an almost unique faculty of assimilating all that he saw and heard. Leonardo and Alberti are representatives and almost a compendium in themselves of all that intellectual vigour of the Renaissance age, which in the

16th century took to developing itself in its individual parts, making way for what has by some been called the golden age of Italian literature.

Develop-
ment of
the Re-
naissance.

4. *Development of the Renaissance.*—The fundamental characteristic of the literary epoch following that of the Renaissance is that it perfected itself in every kind of art, in particular uniting the essentially Italian character of its language with classicism of style. This period lasted from about 1494 to about 1560; and, strange to say, this very period of greater fruitfulness and literary greatness began from the year 1494, which with Charles VIII.'s descent into Italy marked the beginning of its political decadence and of foreign domination over it. But this is not hard to explain. All the most famous men of the first half of the 16th had been educated in the preceding century. Pietro Pomponazzo was born in 1462, Marcello Virgilio Adriani in 1464, Castiglione in 1468, Machiavelli in 1469, Bembo in 1470, Michelangelo Buonarroti and Ariosto in 1474, Nardi in 1476, Trissino in 1478, Guicciardini in 1482. Thus it is easy to understand how the literary activity which showed itself from the end of the 15th century to the middle of the following one was the product of the political and social conditions of the age in which these minds were formed, not of that in which their powers were displayed.

History.

Niccolò Machiavelli and Francesco Guicciardini were the chief originators of the science of history. Machiavelli's principal works are the *Istorie Fiorentine*, the *Discorsi sulla prima Deca di Tito Livio*, the *Arte della Guerra*, and the *Principe*. His merit consists in having been the creator of the experimental science of politics,—in having observed facts, studied histories, and drawn consequences from them. His history is sometimes inexact in facts; it is rather a political than an historical work. The peculiarity of Machiavelli's genius lay, as has been said, in his artistic feeling for the treatment and discussion of politics in and for themselves, without regard to an immediate end,—in his power of abstracting himself from the partial appearances of the transitory present, in order more thoroughly to possess himself of the eternal and inborn kingdom, and to bring it into subjection to himself. His *Principe* has been the subject of the severest accusations. But now, especially since Macaulay's essay, it is clear to every one that this book was only the result of the civil and moral conditions of Italy, as it still is the faithful portrait of them.¹

Next to Machiavelli both as an historian and a statesman, comes Francesco Guicciardini. He taught law for many years at Florence; then, having devoted himself to politics, he was always in the service of the Medici. Leo X. made him governor of Modena, Reggio, and Parma. Clement VII. gave him the appointment of president of the Romagna, and afterwards that of lieutenant-general of the army against Charles V., and finally that of governor of Bologna. He worked for the return of the Medici to Florence, defending Duke Alexander from the accusations of the exiles and supporting the election of Cosmo I. Guicciardini was very observant, and endeavoured to reduce his observations to a science. His *Storia d'Italia*, which extends from the death of Lorenzo de' Medici to 1534, is full of political wisdom, is skillfully arranged in its parts, gives a lively picture of the character of the persons it treats of, and is written in a grand style. He shows a profound knowledge of the human heart, and depicts with truth the temperaments, the capabilities, and

the habits of the different European nations. Going back to the causes of events, he looked for the explanation of the divergent interests of princes and of their reciprocal jealousies. The fact of his having witnessed many of the events he related, and having taken part in them, adds authority to his words. The political reflexions are always deep: in the *Pensieri*, as Capponi² says, he seems to aim at extracting through self-examination a quiescence, as it were, of the things observed and done by him,—thus endeavouring to form a political doctrine as adequate as possible in all its parts. Machiavelli and Guicciardini may be considered, not only as distinguished historians, but as originators of the science of history founded on observation.

Inferior to them, but still always worthy of note, were Jacopo Nardi (a just and faithful historian and a virtuous man, who defended the rights of Florence against the Medici before Charles V.), Benedetto Varchi, Giambattista Adriani, Bernardo Segni; and, outside Tuscany, Camillo Forzio, who related the *Congiura de' Baroni* and the history of Italy from 1547 to 1552, Angelo di Costanza, Pietro Bembo, Paolo Paruta, and others.

Ariosto's *Orlando Furioso* was a continuation of Boiardo's *Romantic Immacolato*. His characteristic is that he assimilated the epic romance of chivalry to the style and models of classicism. Ariosto.

Ariosto was an artist only for the love of his art; his sole aim was to make a romance that should please the generation in which he lived. His *Orlando* has no grave and serious purpose; on the contrary it creates a fantastic world, in which the poet rambles, indulging his caprice, and sometimes smiling at his own work. His great desire is to depict everything with the greatest possible perfection, the cultivation of style is what occupies him most. In his hands, the style becomes wonderfully plastic to every conception, whether high or low, serious or sportive. The octave stanza reached in him the highest perfection of grace, variety, and harmony.

Meanwhile, side by side with the romantic, there was an heroic attempt at the historical epic. Gian Giorgio Trissino of Vicenza composed a poem called *Italia liberata dai Goti*. Full of learning and of the rules of the ancients, he formed himself on the latter, in order to sing of the campaigns of Belisarius; he said that he had forced himself to observe all the rules of Aristotle, and that he had imitated Homer. In this again, we see one of the products of the Renaissance; and, although Trissino's work is poor in invention and without any original poetical colouring, yet it helps one to understand better what were the conditions of mind in the 16th century.

Lyric poetry was certainly not of the kinds that Lyre rose to any great height in the 16th century. Originality poetry was entirely wanting, since it seemed in that century as if nothing better could be done than to copy Petrarch. Still, even in this style there were some vigorous poets. Monsignore Giovanni Guidiccioni of Lucca (1500–1541) showed that he had a generous heart. In fine sonnets he gave expression to his grief for the sad state to which his country was reduced. Francesco Molza of Modena (1489–1544), learned in Greek, Latin, and Hebrew, wrote in a graceful style and with spirit. Giovanni della Casa (1503–1556) and Pietro Bembo (1470–1547), although Petrarchists, were elegant. Even Michelangelo Buonarroti was at times a Petrarchist, but his poems bear the stamp of his extraordinary and original genius. And a good many ladies are to be placed near these poets, such as Vittoria Colonna (loved by Michelangelo), Veronica Gambara, Tullia d'Aragona, Giulia Gonzaga, poetesses of great delicacy, and superior in genius to many literary men of their time.

The 16th century had not a few tragedies, but they are Drama.

¹ Hitherto there has been no complete and objective study on Machiavelli, although very much has been written about him. This want, it is hoped, will be supplied when Signor Villari has completed his work, of which only the first volume has as yet appeared, *Niccolò Machiavelli e i suoi tempi illustrati con nuova documenti*, Florence, 1877.

² *Storia della Repubblica di Firenze*, Florence, 1876.

all weak. The cause of this was the moral and religious indifference of the Italians, the lack of strong passions and vigorous characters. The first to occupy the tragic stage was Trissino with his *Sofonisba*, following the rules of the art most scrupulously, but written in sickly verses, and without warmth of feeling. The *Oreste* and the *Rosamunda* of Giovanni Rucellai were no better, nor Luigi Alamanni's *Autigone*. Sperone Speroni in his *Canace* and Giraldo Cintio in his *Orbesche* tried to become innovators in tragic literature, but they only succeeded in making it grotesque. Decidedly superior to these was the *Torricomando* of Torquato Tasso, specially remarkable for the choruses, which sometimes remind one of the choros of the Greek tragedies.

The Italian comedy of the 16th century was almost entirely modelled on the Latin comedy. They were almost always alike in the plot, in the characters of the old man, of the servant, of the waiting-maid; and the argument was often the same. Thus the *Lucili* of Agnolo Firenzuola, and the *Tecchio Amaro* of Donato Giannotti were modelled on comedies by Plautus; as were the *Sporta* by Gelli, the *Marito* by Dolce, and others. There appear to be only three writers who should be distinguished among the many who wrote comedies,—Machiavelli, Ariosto, and Giovan Maria Cecchi. In his *Mandragora* Machiavelli, unlike all the others, composed a comedy of character, creating types which seem living even now, because they were copied from reality seen with a finely observant eye. Ariosto, on the other hand, was distinguished for his picture of the habits of his time, and especially of those of the Ferrarese nobles, rather than for the objective delineation of character. Lastly, Cecchi left in his comedies a treasure of spoken language, which nowadays enables us in a wonderful way to make ourselves acquainted with that age. The notorious Pietro Aretino might also be included in the list of the best writers of comedy.

Burlesque and satire.

The 15th century was not without humorous poetry; Antonio Cammelli, surnamed the Pistoian, is specially deserving of notice, because of his "pungent *benlomia*," as Sainte-Beuve called it. But it was Francesco Berni who carried this kind of literature to perfection in the 16th century. From him the style has been called "bernesque" poetry. In the "Berneschi" we find nearly the same phenomenon that we already noticed with regard to *Orlando Furioso*. It was art for art's sake that inspired and moved Berni to write, as well as Anton Francesco Grazzini called Il Lusa, and other lesser writers. It may be said that there is nothing in their poetry; and it is true that they specially delight in praising low and disgusting things and in jeering at what is noble and serious. Bernesque poetry is the clearest reflexion of that religious and moral scepticism which was one of the characteristics of Italian social life in the 16th century, and which showed itself more or less in all the works of that period, that scepticism which stopped the religious Reformation in Italy, and which in its turn was an effect of historical conditions. The Berneschi, and especially Berni himself, sometimes assumed a satirical tone. But theirs could not be called true satire. Pure satirists, on the other hand, were Antonio Vinciguerra, a Venetian, Lodovico Alamanni, and Ariosto, the last superior to the others for the Attic elegance of his style, and for a certain frankness, passing into malice, which is particularly interesting when the poet talks of himself.

Didactic works.

In the 16th century there were not a few didactic works. In his poem of the *Ape* Giovanni Rucellai approaches to the perfection of Virgil. His style is clear and light, and he adds interest to his book by frequent allusions to the events of the time. But of the didactic works that which surpasses all the others in importance is

Baldassare Castiglione's *Cortigiano*, in which he imagines a discussion in the palace of the dukes of Urbino between knights and ladies as to what are the gifts required in a perfect courtier. This book is valuable as an illustration of the intellectual and moral state of the highest Italian society in the first half of the 16th century.

Of the novelists of the 16th century, the two most important were Anton Francesco Grazzini and Matteo Bandello,—the former as playful and bizarre as the latter is grave and solemn. As part of the history of the times, we must not forget that Bandello was a Dominican friar and a bishop, but that notwithstanding his novels were very loose in subject, and that he often holds up the ecclesiastics of his time to ridicule.

At a time when admiration for qualities of style, the Transalpine desire for classical elegance, was so strong as in the 16th century, much attention was naturally paid to translating Latin and Greek authors. Among the very numerous translations of the time those of the *Æneid* and of the *Pastorals* of Longus the Soplhist by Annibal Caro are still famous; as are also the translations of Ovid's *Metamorphoses* by Giovanni Andrea dell' Anguillera, of Apuleius's *Golden Ass* by Firenzuola, and of Plutarch's *Lives and Morals* by Marcello Adriani.

The historians of Italian literature are even now in doubt Tasso.

whether Tasso should be placed in the period of the highest development of the Renaissance, or whether he should form a period by himself, intermediate between that and the one following. Certainly he was profoundly out of harmony with the century in which he lived. His religious faith, the seriousness of his character, the deep melancholy settled in his heart, his continued aspiration after an ideal perfection, all place him as it were outside the literary epoch represented by Machiavelli, by Ariosto, by Berni. As Carducci has well said, Tasso "is the legitimate heir of Dante Alighieri: he believes, and reasons on his faith by philosophy; he loves, and comments on his love in a learned style; he is an artist, and writes dialogues of scholastic speculation that would have been Platonic." He was only eighteen years old when, in 1552, he tied his hand at epic poetry, and wrote *Rinaldo*, in which he said that he had tried to reconcile the Aristotelian rules with the variety of Ariosto. He afterwards wrote the *Aminta*, a pastoral drama of exquisite grace. But the work to which he had long turned his thoughts was an heroic poem, and that absorbed all his powers. He himself explains what his intention was in the three *Discorsi* written whilst he was composing the *Gerusalemme*: he would choose a great and wonderful subject, not so ancient as to have lost all interest, nor so recent as to prevent the poet from embellishing it with invented circumstances; he meant to treat it rigorously according to the rules of the unity of action observed in Greek and Latin poems, but with a far greater variety and splendour of episodes, so that in this point it should not fall short of the romantic poem; and finally, he would write it in a lofty and ornate style. This is what Tasso has done in the *Gerusalemme Liberata*, the subject of which is the liberation of the sepulchre of Jesus Christ in the 11th century by Godfrey of Bouillon. The poet does not follow faithfully all the historical facts, but sets before us the principal causes of them, bringing in the supernatural agency of God and Satan. The *Gerusalemme* is the best heroic poem that Italy can show. It approaches to classical perfection. Its episodes above all are most beautiful. There is profound feeling in it, and everything reflects the melancholy soul of the poet. As regards the style, however, although Tasso studiously endeavoured to keep close to the classical models, one cannot help noticing that he makes excessive use of metaphor, of antithesis, of far fetched conceits; and it is

specially from this point of view that some historians have placed Tasso in the literary period generally known under the name of "Scenitismo," and that others, more moderate in their criticism, have said that he prepared the way for it.

Period of
decadence.

5. *Period of Decadence.*—From about 1559 began a period of decadence in Italian literature. The Spanish rule oppressed and corrupted the peninsula. The minds of men were day by day gradually losing their force; every high aspiration was quenched. No love of country could any longer be felt when the country was enslaved to a stranger. The suspicious rulers fettered all freedom of thought and word; they tortured Campanella, burned Bruno, made every effort to extinguish all high sentiment, all desire for good. Cesare Balbo says, "if the happiness of the masses consists in peace without industry, if the nobility's consists in titles without power, if princes are satisfied by acquiescence in their rule without real independence, without sovereignty, if literary men and artists are content to write, paint, and build with the approbation of their contemporaries, but to the contempt of posterity, if a whole nation is happy in ease without dignity and the tranquil progress of corruption,—then no period ever was so happy for Italy as the hundred and forty years from the treaty of Cateau Cambresis to the war of the Spanish succession." This period is known in the history of Italian literature as the Scenitismo. Its writers, devoid of sentiment, of passion, of thoughts, resorted to exaggeration; they tried to produce effect with every kind of affectation, with bombast, with the strangest metaphors, in fact, with what in art is called mannerism, "barocheism." The utter poverty of the matter tried to cloak itself under exuberance of forms. It seemed as if the writers vied with one another as to who could best burden his art with useless metaphors, with phrases, with big-sounding words, with affectations, with hyperbole, with oddities, with everything that could fix attention on the outer form and draw it off from the substantial element of thought.

The Scenitismo.

At the head of the school of the "Scenitisti" comes Giovan Battista Marini of Naples, born in 1569, especially known by a poem called *L'Adone*. His aim was to excite wonder by novelties; hence the most extravagant metaphors, the most forced antitheses, the most far-fetched conceits, are to be found in his book. It was especially by antitheses that he thought he could produce the greatest effect. Sometimes he strings them together one after the other, so that they fill up whole stanzas without a break. Achillini of Bologna followed in Marini's steps. He had less genius, however, and hence his peculiarities were more extravagant, becoming indeed absolutely ridiculous. In general, we may say that all the poets of the 17th century were more or less infected with "Marinism." Thus Alessandro Guidi, although he does not attain to the exaggeration of his master, is empty bombastic, inflated, turgid, while Fulvio Testi is artificial and affected. Yet Guidi as well as Testi felt the influence of another poet, Gabriello Chiabrera, born at Savona in 1552. In him the Scenitismo took another character. Enamoured as he said he was of the Greeks, he made new metres, especially in imitation of Pindar, treating of religious, moral, historical, and amatory subjects. It is easy to understand that a Pindric style of poetry in the 17th century in Italy could not but end in being altogether artificial, without anything of those qualities which constitute the greatness of the Greek poet. Chiabrera, though elegant enough in form, proves empty of matter, and, in his vain attempt to hide this vacuity, has recourse to poetical ornaments of every kind. These again, in their turn, become in him a fresh defect. Nevertheless, Chiabrera's school, in the decadence of the 17th century, marks an improvement;

and sometimes he showed that he had lyrical capacities, which in better literary surroundings would have brought forth excellent fruit. When he sings, for example, of the victories of the Tuscan galleys against the Turks and the pirates of the Mediterranean, he rises to grand imagery, and seems quite another poet.

Filicaja the Florentine has a certain lyric *élan*, particularly in the songs about Vienna besieged by the Turks, which seems to raise him more than the others above the vices of the time; but even in him we see clearly the rhetorical artifice and the falseness of the conceits. And in general all the lyric poetry of the 17th century may be said to have had the same defects, but in different degrees,—defects which may be summed up as absence of feeling and exaggeration of form. There was no faith; there was no love; and thus art became an exercise, a pastime, a luxury, for a servile and corrupt people.

The belief then arose that it would be sufficient to change the form in order to restore literature, in forgetfulness that every reform must be the effect of a change in social and moral conditions. Weary of the bombastic style of the 17th century, full of conceits and antithesis, men said—let us follow an entirely different line, let us fight the turgid style with simplicity. In 1690 the "Academy of Arcadia" was instituted. Its founders were Giovan Maria Crescimbeni and Gian Vincenzo Gravina. The Arcadia was so called because its chief aim and intention were to imitate in literature the simplicity of the ancient shepherds, who were fabulously supposed to have lived in Arcadia in the golden age. As the "Scenitisti" erred by an overweening desire for novelty, which made them always go beyond the truth, so the Arcadians proposed to themselves to return to the fields of truth, always singing of subjects of pastoral simplicity. This was obviously nothing else than the substitution of a new artifice for the old one; and they fell from bombast into effeminacy, from the hyperbolic into the petty, from the turgid into the over-refined. The Arcadia was a reaction against Scenitismo, but a reaction which, reversing the movement of that earlier epoch, only succeeded in impoverishing still further and completely withering up the literature. The poems of the "Arcadians" fill many volumes, and are made up of sonnets, madrigals, canzonets, and blank verse. The one who most distinguished himself among the sonneteers was Felice Zappi. Among the authors of songs Paolo Rolli was illustrious. Innocenzo Frugoni was more famous than all the others, a man of fruitful imagination but of shallow intellect, whose wordy verses nobody now reads.

Whilst the political and social conditions in Italy in the 17th century were such as to make it appear that every light of intelligence, all spirit of liberty, was extinguished, there appeared in the peninsula, by that law of reaction which in great part governs human events, some strong and independent thinkers, such as Bernardino Telesio, Giordano Bruno, Tommaso Campanella, Lucilio Vanini, who turned philosophical inquiry into fresh channels, and opened the way for the scientific conquests of Galileo Galilei, the great contemporary of Descartes in France and of Bacon in England. Galileo was not only a great man of science, but also occupied a conspicuous place in the history of letters. A devoted student of Aristotle, he seemed to transmute into his prose the qualities of that great poet,—a clear and frank freedom of expression, a wonderful art of knowing how to say everything with precision and ease, and at the same time with elegance. Galileo's prose is in perfect antithesis to the poetry of his time. Perhaps it is the best prose that Italy has ever had; it is clear, goes straight to the point, is without rhetorical ornaments and without vulgar slips, artistic without appearing to be so.

Another symptom of revival, a sign of rebellion against Satire.

the vileness of Italian social life, is given us in satire and in particular in that of Salvatore Rosa and Alessandro Tassoni. Salvatore Rosa, born in 1615, near Naples, was a painter, a musician, and a poet. As a poet he showed that he felt the sad condition of his country, showed that he mourned over it, and gave vent to his feeling (as another satire-writer, Giuseppe Giusti, said) in *generosi rabbuffi*. His exhortation to Italian poets to turn their thoughts to the miseries of their country as a subject for their song—their country languishing under the tyrant's hands—certain passages where he deplores the effeminacy of Italian habits, a strong apostrophe against Rome, make Salvatore Rosa a precursor of the patriotic literature which inaugurated the revival of the 18th century. Tassoni, a man really quite exceptional in this century, was superior to Rosa. He showed independent judgment in the midst of universal servility, and his *Secchia Rapita* proved that he was an eminent writer. This is an heroic comic poem, which is at the same time an epic and a personal satire. He was bold enough to attack the Spaniards in his *Filippiche*, in which he urged Duke Carlo Emanuele of Savoy to persist in the war against them.

New
political
condi-
tions.

6. *The Revival in the 18th Century.*—Having for the most part freed itself from the Spanish dominion in the 18th century, the political condition of Italy began to improve. Promoters of this improvement, which was shown in many civil reforms, were Joseph II., Leopold I., and Charles I. The work of these princes was copied from the philosophers, who in their turn felt the influence of a general movement of ideas, which was quietly working in many parts of Europe, and which came to a head in the French encyclopedists.

Histori-
cal works.

Giambattista Vico was a token of the awakening of historical consciousness in Italy. In his *Scienza Nuova* he applied himself to the investigation of the laws governing the progress of the human race, and according to which events are developed. From the psychological study of man he endeavoured to infer the "comune natura delle nazioni," i.e., the universal laws of history, or the laws by which civilizations rise, flourish, and fall.

From the same scientific spirit which animated the philosophical investigation of Vico, there was born a different kind of investigation, that of the sources of Italian civil and literary history. Lodovico Antonio Muratori, after having collected in one entire body (*Rerum Italicarum Scriptores*) the chronicles, the biographies, the letters, and the diaries of Italian history from 500 to 1800, after having discussed the most obscure historical questions in the *Antiquitates Italiane Medii Aevi*, wrote the *Annali d'Italia*, minutely narrating facts derived from authentic sources. Muratori's associates in his historical researches were Scipione Maffei of Verona and Apostolo Zeno of Venice. In his *Verona illustrata* the former left, not only a treasure of learning, but an excellent specimen of historical monograph. The latter added much to the erudition of literary history, both in his *Dissertationi Vossiane* and in his notes to the *Biblioteca dell' Eloquenza Italiana* of Monsignore Giusto Fontanini. Girolamo Timboschi and the Count Giovanni Maria Mazzuchelli of Brescia devoted themselves to literary history. The latter meant to give in his *Scrittori d'Italia*, not only the biography of all the writers, but an account of their works. Only six volumes were printed, containing the letters A and B; but the immense materials collected by him are in the Vatican library, and it is to be hoped that some day they may be arranged and published.

Social
sciences.

While the new spirit of the times led men to the investigation of historical sources, it also led them to inquire into the mechanism of economical and social laws. Francesco Galiani wrote on currency; Gaetano Filangieri wrote a

Scienza della Legislazione. Cesare Beccaria, in his treatise *Dei Delitti e delle Pene*, made a contribution to the reform of the penal system and promoted the abolition of torture.

The man in whom above all others the literary revival Satire.

of the 18th century was most conspicuously embodied was Giuseppe Parini. He was born in a Lombard village in 1729, was mostly educated at Milan, and as a youth was known among the Arcadian poets by the name of Darisbo Elidonio. Even as an Arcadian, however, Parini showed signs of departing from the common type. In a collection of poems that he published at twenty-three years of age, under the name of Ripano Eupilino, there are some pastoral sonnets in which the poet shows that he had the faculty of taking his scenes from real life, and also some satirical pieces in which he exhibits a spirit of somewhat rude opposition to his own times. These poems are perhaps based on reminiscences of Berni, but at any rate they indicate a resolute determination to assail boldly all the literary conventionalities that surrounded the author. This, however, was only the beginning of the battle. Parini lived in times of great social prostration. The nobles and the rich, all given up to ease and to silly gallantry, consumed their lives in ridiculous trifles or in shameless self-indulgence, wasting themselves on immoral "Cicisbeismo," and offering the most miserable spectacle of feebleness of mind and character. It was against this social condition that Parini's muse was directed. Already, improving on the poems of his youth, he had proved himself an innovator in his lyrics, rejecting at once Petrarchism, Secentismo, and Arcadia, the three maladies that had weakened Italian art in the centuries preceding his own, and choosing subjects taken from real life, such as might help in the instruction of his contemporaries. In the *Odi* the satirical note is already heard. But it came out more strongly in the poem *Del Giorno*, in which he imagines himself to be teaching a young Milanese patrician all the habits and ways of gallant life; he shows up all its ridiculous frivolities, and with delicate irony unmasks the futilities of aristocratic habits. Dividing the day into four parts, the Mattino, the Mezzogiorno, the Vespere, the Notte, by means of each of these he describes the trifles of which they were made up, and the book thus assumes a social and historical value of the highest importance. Parini, satirizing his time, fell back upon truth, and finally made art serve the purpose of civil morality. As an artist, going straight back to classical forms, aspiring to imitate Virgil and Dante, he opened the way to the fine school that we shall soon see rise, that of Alfieri, Foscolo, and Monti. As a work of art, the *Giorno* is wonderful for the Socratic skill with which that delicate irony is constantly kept up by which he seems to praise what he effectually blames. The verse has new harmonies; sometimes it is a little hard and broken, not by accident, but as a protest against the Arcadian monotony. Generally it flows majestically, but without that Frugonian droning that deafens the ears and leaves the heart cold.

Gasparo Gozzi's satire was less elevated, but directed towards the same end as Parini's. In his *Osservatore*, something like Addison's *Spectator*, in his *Gazzetta Veneta*, in the *Mondo Morale*, by means of allegories and novelities he hit the vices with a delicate touch, and inculcated a practical moral with much good sense. Gozzi's satire has some slight resemblance in style to Lucian's. It is smooth and light, but withal it does not go less straight to its aim, which is to point out the defects of society and to correct them. Gozzi's prose is very graceful and lively. It only errs by its overweening affectation of imitating the writers of the 14th century. Another satirical writer of the first half of the 18th century was Giuseppe Baretti of Turin. In a journal called the *Frusta Letteraria* he took to lashing

without mercy the works which were then being published in Italy. He had learnt much by travelling; and especially his long stay in England had contributed to give an independent character to his mind, and made him judge of men and things with much good sense. It is true that his judgments are not always right, but the *Frusta Letteraria* was the first book of independent criticism, directed particularly against the Arcadians and the pedants.

Dramatic
reform.

Everything tended to improvement, and the character of the reform was to throw off the conventional, the false, the artificial, and to return to truth. The drama felt this influence of the times. Apostolo Zeno and Metastasio (the Arcadian name for Pietro Trapassi, a native of Rome) had endeavoured to make "melodrama and reason compatible." The latter in particular succeeded in giving fresh expression to the affections, a natural turn to the dialogue, and some interest to the plot; and if he had not fallen into constant unnatural over-refinement and unseasonable mawkishness, and into frequent anachronisms, he might have been considered as the first dramatic reformer of the 18th century. That honour belongs to Carlo Goldoni, a Venetian. He found comedy either entirely devoted to classical imitation, or given up to extravagance, to *coups de théâtre*, to the most boisterous succession of unlikely situations, or else treated by comic actors who recited impromptu on a given subject, of which they followed the outline. In this old popular form of comedy, with the masks of pantolon, of the doctor, of harlequin, of Brighella, &c., Goldoni found the strongest obstacles to his reform. But at last he conquered, creating the comedy of character. No doubt Molière's example helped him in this. Goldoni's characters are always true, but often a little superficial. He studied nature, but he did not plunge into psychological depths. In most of his creations, the external rather than the internal part is depicted. In this respect he is much inferior to Molière. But on the other hand he surpasses him in the liveliness of the dialogue, and in the facility with which he finds his dramatic situations. Goldoni wrote much, in fact too much (more than one hundred and fifty comedies), and had no time to correct, to polish, to perfect his works, which are all rough cast. But for a comedy of character we must go straight from Machiavelli's *Mandragora* to him. Goldoni's dramatic aptitude is curiously illustrated by the fact that he took nearly all his types from Venetian society, and yet managed to give them an inexhaustible variety. A good many of his comedies were written in Venetian dialect, and these are perhaps the best.

Patriotic
literature
and re-
turn to clas-
sicism.

The ideas that were making their way in French society in the 18th century, and afterwards brought about the Revolution of 1789, gave a special direction to Italian literature of the second half of the 18th century. Love of ideal liberty, desire for equality, hatred of tyranny, created in Italy a literature which aimed at national objects, seeking to improve the condition of the country by freeing it from the double yoke of political and religious despotism. But all this was associated with another tendency. The Italians who aspired to a political redemption believed that it was inseparable from an intellectual revival, and it seemed to them that this could only be effected by a reunion with ancient classicism,—in other words, by putting themselves in more direct communication with ancient Greek and Latin writers. This was a repetition of what had occurred in the first half of the 15th century. The 17th century might in fact be considered as a new Italian Middle Age without the hardness of that iron time, but corrupted, overrated, overrun by Spaniards and French, an age in which previous civilization was cancelled. A reaction was necessary against that period of history, and a construction on its ruins of a new country and a new

civilization. There had already been forerunners of this movement; at the head of them the revered Parini. Now the work must be completed, and the necessary force must once more be sought for in the ancient literature of the two classic nations. Patriotism and classicism then were the two principles that inspired the literature which began with Alfieri. He worshipped the Greek and Roman idea Alfieri. He took the subjects of his tragedies almost invariably from the history of these nations, made continual apostrophes against the despots, made his ancient characters talk like revolutionists of his time; he did not trouble himself with, nor think about, the truth of the characters; it was enough for him that his hero was Roman in name, that there was a tyrant to be killed, that liberty should triumph in the end. But even this did not satisfy Alfieri. Before his time and all about him there was the Arcadian school, with its foolish verbosity, its empty abundance of epithets, its nauseous pastoralizing on subjects of no civil importance. It was necessary to arm the patriotic muse also against all this. If the Arcadians, not excluding the hated Metastasio, diluted their poetry with languishing tenderness, if they poured themselves out in so many words, if they made such set phrases, it behoved the others to do just the contrary, to be brief, concise, strong, bitter, to aim at the sublime as opposed to the lowly and pastoral. Having said this, we have told the good and evil of Alfieri. He desired a political reform by means of letters; he saved literature from Arcadian vacuities, leading it towards a national end; he armed himself with patriotism and classicism in order to drive the profaners out of the temple of art. But in substance he was rather a patriot than an artist. In any case the results of the new literary movement were copious.

Ugo Foscolo was an eager patriot, who carried into life Foscolo. the heat of the most unbridled passion, and into his art a rather rhetorical manner, but always one inspired by classical models. His life was a most exciting one: he was a soldier with General Massena, a professor of eloquence at the university of Pavia, an exile after 1815. Three strong passions were always united in him—a passion for Italy, for art, and for beautiful women. Foscolo was born at Zante, and took pride in being a Greek. He translated some books of the *Iliad*, and the *Coma Berenice* of Catullus. He studied classical authors widely, and in his original works the reflexion of them is perceptible. The *Lettere di Jacopo Ortis*, inspired by Goethe's *Werther*, are a love story with a mixture of patriotism; they contain a violent protest against the treaty of Campo Formio, and an outburst from Foscolo's own heart about an unhappy love-affair of his. His passions were sudden and violent; they came to an end as abruptly as they began; they were whirlwinds that were over in a quarter of an hour. To one of these passions *Ortis* owed its origin, and it is perhaps the best, the most sincere, of all his writings. Even in it he is sometimes pompous and rhetorical, but much less so than he is, for example, in the lectures *Dell' Origine e dell' Ufficio della Letteratura*. On the whole, Foscolo's prose is turgid and affected, and reflects the character of the man who always tried to pose, even before himself, in dramatic attitudes. This was indeed the defect of the Napoleonic epoch; there was a horror of anything common, simple, natural; everything must be after the model of the hero who made all the world gaze with wonder at him; everything must assume some heroic shape. In Foscolo this tendency was excessive; and it not seldom happened that, in wishing to play the hero, the exceptional man, the little Napoleon of ladies' drawing-rooms, he became false and bad, false in his art, bad in his life. The *Sepolcri*, which is his best poem, was prompted by high

feeling, and the mastery of versification shows wonderful art. Perhaps it is to this mastery more than to anything else that the admiration the *Sepolcri* excites is due. There are most obscure passages in it, as to the meaning of which it would seem as if even the author himself had not formed a clear idea. He left incomplete three hymns to the Graces, in which he sang of beauty as the source of courtesy, of all high qualities, and of happiness. Here again what most excites our admiration is the harmonious and easy versification. Among his prose works a high place belongs to his translation of the *Sentimental Journey* of Sterne, a writer by whom one can easily understand how Foscolo should have been deeply affected. He went as an exile to England, and died there. He wrote for English readers some *Essays* on Petrarch and on the texts of the *Decamerone* and of Dante, which are remarkable for the time at which they were written, and which may be said to have initiated a new kind of literary criticism in Italy. Foscolo is still greatly admired, and not without reason. His writings stimulate the love of fatherland, and the men that made the revolution of 1848 were largely brought up on them. Still, his fame both as a man and as an artist is now on the decline.

Monti. If in Foscolo patriotism and classicism were united, and formed almost one passion, so much cannot be said of Vincenzo Monti, in whom the artist was absolutely predominant. Yet we must be careful: Monti was a patriot too, but in his own way. He had no one deep feeling that ruled him, or rather the mobility of his feelings is his characteristic; but each of these was a new form of patriotism, that took the place of an old one. He saw danger to his country in the French Revolution, and wrote the *Pellegrino Apostolico*, the *Bassviliana*, and the *Fermeade*; Napoleon's victories caused him to write the *Prometeo* and the *Muagonia*; in his *Fancismo* and his *Superstizione* he attacked the papacy; afterwards he sang the praises of the Austrians. Thus every great event made him change his mind, with a readiness which might seem incredible, but is yet most easily explained. Monti was above everything an artist; art was his real, his only passion; everything else in him was liable to change, that alone was persistent. Fancy was his tyrant, and under its rule he had no time to reason and to see the miserable aspect of his political tergiversation. It was an overbearing deity that moved him, and at its dictation he wrote. Pius VI., Napoleon, Francis II., were to him but passing shadows, to which he hardly gives the attention of an hour; that which endures, which is eternal to him, is art alone. It were unjust to accuse Monti of baseness. If we say that nature in giving him one only faculty had made the poet rich and the man poor, we shall speak the truth. But the poet was indeed rich. Knowing little Greek, he succeeded in making a translation of the *Iliad* which is remarkable for its Homeric feeling, and in his *Bassviliana* he is on a level with Dante. In fine, in him classical poetry seemed to revive in all its florid grandeur.

Niccolini. Monti was born in 1754, Foscolo in 1778; four years later still was born another poet of the same school, Giambattista Niccolini. In literature he was a classicist; in politics he was a Ghibelline, a rare exception in Guelph Florence, his birthplace. In translating or, if the expression is preferred, imitating *Æschylus*, as well as in writing the *Discorsi sulla Tragedia Greca*, and on the *Sublime e Michelangelo*, Niccolini displayed his passionate devotion to ancient literature. In his tragedies he set himself free from the excessive rigidity of Alfieri, and partly approached the English and German tragic authors. He nearly always chose political subjects, striving to keep alive in his compatriots the love of liberty. Such are *Nabucco*, *Antonio Foccarini*, *Giovanni da Procida*, *Lodovico il Moro*, &c. He assailed papal Rome in *Arnaldo da Brescia*, a long tragic

piece, not suited for acting, and epic rather than dramatic. Niccolini's tragedies show a rich lyric vein rather than dramatic genius. At any rate he has the merit of having vindicated liberal ideas, and of having opened a new path to Italian tragedy.

The literary period we are dealing with had three writers whose examples of the direction taken by historical study, ^{ans.} It seems strange that, after the learned school begun by Muratori, there should have been a backward movement here, but it is clear that this retrogression was due to the influence of classicism and patriotism, which, if they revived poetry, could not but spoil history. Carlo Botta, born in 1766, was a spectator of French spoliation in Italy and of the overbearing rule of Napoleon. Hence, excited by indignation, he wrote a *History of Italy* from 1789 to 1814; and later on he continued Guicciardini's *History* up to 1789. He wrote after the manner of the Latin authors, trying to imitate Livy, putting together long and sonorous periods in a style that aimed at being like Boccaccio's, caring little about that which constitutes the critical material of history, only intent on declaiming his academic prose for his country's benefit. Botta wanted to be classical in a style that could no longer be so, and hence he failed completely to attain his literary goal. His fame is only that of a man of a noble and patriotic heart. Not so bad as the two histories of Italy is that of the *Guerra dell'Indipendenza Americana*.

Close to Botta comes Pietro Colletta, a Neapolitan born nine years after him. He also in his *Storia del Regno di Napoli dal 1734 al 1825* had the idea of defending the independence and liberty of Italy in a style borrowed from Tacitus; and he succeeded rather better than Botta. He has a rapid, brief, nervous style, which makes his book attractive reading. But it is said that Pietro Giordani and Gino Capponi corrected it for him. Lazzaro Papi of Lucca, author of the *Commentari della Rivoluzione Francese dal 1789 al 1814*, was not altogether unlike Botta and Colletta. He also was an historian in the classical style, and treats his subject with patriotic feeling; but as an artist he perhaps excels the other two.

At first sight it seems unnatural that, whilst the most the burning political passions were raging, and whilst the most brilliant men of genius in the new classical and patriotic school were at the height of their influence, a question should have arisen about "purism" of language. Yet the phenomenon can be easily accounted for. Purism is another form of classicism and patriotism. In the second half of the 18th century the Italian language was especially full of French expressions. There was great indifference about fitness, still more about elegance of style. Prose then was to be restored for the sake of national dignity, and it was believed that this could not be done except by going back to the writers of the 14th century, to the "aurei trecentisti," as they were called, or else to the classics of Italian literature. One of the promoters of the new school was Antonio Cesari of Verona, who republished ancient authors, and brought out a new edition, with additions, of the *Vocabolario della Crusca*. He wrote a dissertation *Sopra lo stato presente della Lingua Italiana*, and endeavoured to establish the supremacy of Tuscan and of the three great writers Dante, Petrarch, Boccaccio. And in accordance with that principle he wrote several books, taking pains to copy the "trecentisti" as closely as possible. But patriotism in Italy has always had something municipal in it; so this Tuscan supremacy, proclaimed and upheld by Cesari, there was opposed a Lombard school, which would know nothing of Tuscan, and with Dante's *De Vulgari Eloquentia* returned to the idea of the "lingua illustre." This was an old question, largely and bitterly argued in the Cinquecento (16th century) by Varchi,

Muzio, Castelvetro, Speroni, and others. Now the question came up again quite fresh, as if no one had ever discussed it before. At the head of the Lombard school were Monti and his son-in-law Count Giulio Perticari. This gave Monti an occasion to write *Proposta di alcune Correzioni ed Aggiunte al Vocabolario della Crusca*, in which he attacked the Tuscanism of the *Crusca*, but in a graceful and easy style, such in fact as to form a prose that is one of the most beautiful in Italian literature. Perticari on the other hand, with a very inferior intellect, narrowed and exasperated the question in two treatises *Degli Scrittori del Trecento* and *Dell' Amor Patrio di Dante*, in which, often disguising or altering the facts, he only makes confusion where there was none. Meantime, however, the impulse was given. The dispute about language took its place beside literary and political disputes, and all Italy took part in it.—Basilio Puoti at Naples, Paolo Costa in the Romagna, Marc' Antonio Parenti at Modena, Salvatore Betti at Rome, Giovanni Gherardini in Lombardy, Luigi Fornaciari at Lucca, Vincenzo Nannucci at Florence.

Giordani. A patriot, a classicist, and a purist all at once was Pietro Giordani, born in 1774; he was almost a compendium of the literary movement of the time. His whole life was a battle fought for liberty. Most learned in Greek and Latin authors, and in the Italian trecentists, he only left a few writings behind him, but they were carefully elaborated in point of style, and his prose was in his time considered wonderful. Now it is looked on as too majestic, too much laboured in phrases and conceits, too far from nature, too artificial. Giordani closes the literary epoch of the classicists.

Contem-
porary
litera-
ture.

7. *Contemporary Period.*—At this point the contemporary period of literature begins. It has been said that the first impulse was given to it by the romantic school, which had as its organ the *Conciliatore* established in 1818 at Milan, and on the staff of which were Silvio Pellico, Lodovico di Breme, Giovanni Scavini, Tommaso Grossi, Giovanni Berchet, Samuele Biava, and lastly Alessandro Manzoni. It need not be denied that all these men were influenced by the ideas that, especially in Germany, at the beginning of the 19th century constituted the movement called Romanticism. Nevertheless in Italy the course of literary reform took another direction. There is no doubt that the real head of the reform, or at least its most distinguished man, was Alessandro Manzoni. He formulated in a letter of his the objects of the new school, saying that it aspired to try and discover and express "il vero storico" and "il vero morale," not only as an end, but as the widest and eternal source of the beautiful. And it is precisely realism in art that characterizes Italian literature from Manzoni onwards. The *Promessi Sposi* is the one of his works that has made him immortal. No doubt the idea of the historical novel came to him from Sir Walter Scott, but he succeeded in something more than an historical novel in the narrow meaning of that word; he created an eminently realistic work of art. The romance disappears; no one cares for the plot, which moreover is of very little consequence. The attention is entirely fixed on the powerful objective creation of the characters. From the greatest to the least they have a wonderful verisimilitude; they are living persons standing before us, not with the qualities of one time more than another, but with the human qualities of all time. Manzoni is able to unfold a character in all particulars, to display it in all its aspects, to follow it through its different phases. He is able also to seize one moment, and from that moment to make us guess all the rest. Don Abbondio and Renzo are as perfect as Azzecagarbugli and Il Sarto. Manzoni dives down into the innermost recesses of the human heart, and draws thence the most subtle psychological reality. In this his

greatness lies, which was recognized first by his companion in genius, Goethe. With the exception of the *Promessi Sposi*, his works are important for the history of the author's mind, not for the history of literature. Some of them are rather in contrast to that masterpiece. It is chiefly the *Inni Sacri* and the two tragedies that explain why Manzoni became the head of the school of Romanticism. It is not to be denied that even as a poet he had gleams of genius, especially where he describes human affections, as in some stanzas of the *Inni* and in the chorus of the *Adelchi*. But it is the *Promessi Sposi* alone that places him at the head of the Italian literature of the 19th century, on account of the artistic realism prevailing in it. But Manzoni shared this glory with another writer, Giacomo Leopardi. It may seem absurd, but still it is the case, that the mystic, the religious Manzoni, has his place side by side with the poet of atheism and despair: they are indissolubly bound together for all time by an artistic intuition, identical although realized by different means. Leopardi was born thirteen years after Manzoni at Recanati, of a patrician family, bigoted and avaricious, and he almost entirely educated himself. His body was deformed, and he was of a sticky habit, so that in the years that bring cheerfulness and laughter to youths and children he shut himself up in his father's library and studied. He became so familiar with Greek authors that he used afterwards to say that the Greek mode of thought was more clear and living to his mind than the Latin or even the Italian. Solitude, sickness, domestic tyranny, prepared him for profound melancholy. From this he passed into complete religious scepticism. He sought rest in art, and first wrote a *Canzone all' Italia* and another for the monument of Dante Alighieri (1818), both full of classical and patriotic feeling. They show that for the time, though only for the time, he was of the school of Alfieri, Foscolo, and the others we have spoken of. His love of classicism always continued, but he changed its subject. He passed on into the poetry of sentiment and nature, describing with an unsurpassable realism what he felt and saw. The *Passero solitario*, the *Quete dopo la Tempesta*, the *Sabato del Villaggio*, are pictures in which objective realism reaches its highest ideality; whilst beside them there are the *Ultimo Canto di Saffo*, the *Ricordanze*, the *Genestra*, and other poems, in which is poured out all the sorrow that weighs on the unhappy man to whom nature has denied every joy and every happiness. Everything is terrible and grand in these poems, which are the most agonizing cry in modern literature, uttered with a solemn quietness that at once elevates and terrifies us. The poetry of despair never had a more powerful or a more sorrowful voice than this. In this Leopardi surpasses even Byron and Shelley. But, besides being the greatest poet of nature and of sorrow, he was also an excellent prose writer. In his *Opere Morali*—dialogues and discourses marked by a cold and bitter smile at human destinies which freezes the reader—the clearness of style, the simplicity of language, and the depth of conception are such that perhaps he is not only the first poet since Dante, but also the most perfect writer of prose that Italian literature has had.

As realism in art gained ground, the positive method in criticism kept pace with it. From the manner of Botta and Colletta history returned to its spirit of learned research, as is shown in such works as the *Archivio Storico Italiano*, established at Florence by Giampietro Vieusseux, the *Storia d'Italia nel Medio Evo* by Carlo Troya, a remarkable treatise by Manzoni himself, *Sopra alcuni Panti della storia Longobardica in Italia*, and the very fine history of the *Feudi Siciliani* by Michele Amari. The same positive method is now being applied to literary history.

But alongside of the great artists Leopardi and Manzoni,

alongside of the learned scholars, there was also in the first half of the 19th century a patriotic literature. To a close observer it will appear that historical learning itself was inspired by the love of Italy. It is well known what Vieusseux's intentions were when he established the *Antologia*, in which work all Italian liberals took part, and which was suppressed by the action of the Russian Government. And it is equally well known that the *Archivio Storico Italiano* was, under a different form, a continuation of the *Antologia*. Florence was in those days the asylum of all the Italian exiles, and these exiles met and shook hands in Vieusseux's rooms, where there was more literary than political talk, but where one thought and one only animated all minds, the thought of Italy.

The literary movement which preceded and was contemporary with the political revolution of 1848 may be said to be represented by four writers,—Giuseppe Giusti, Francesco Domenico Guerrazzi, Vincenzo Gioberti, and Cesare Balbo. Giusti wrote epigrammatic satires in popular language. In incisive phrase he scourged the enemies of Italy; his manner seemed very original, but it really was partly imitated from Beranger. He was a telling political writer, but a mediocre poet,—too much a poet of occasion. Few of his verses will survive as works of art. Guerrazzi had a great reputation and great influence; he was the author of historical novels written with a political object, such as the *Assedio di Firenze*, the *Battaglia di Benevento*, &c. Read with feverish avidity before 1848, these books of his are now almost forgotten. They struck the imagination then by their style, which is partly affected and partly spasmodic. They seemed to be sublime, but were little less than ridiculous. Gioberti had a noble heart and a great mind; his philosophical works are already as good as dead, but the *Prinatio morale e civile degli Italiani* will last as an important document of the times. It is a book false in substance, but inspired by lofty sentiments, and it is written in an easy and eloquent style, although sometimes a little verbose. The *Gesuita moderno* will live as the most tremendous indictment ever written against the Jesuits. Gioberti was a powerful polemical writer; and in polemics he showed his most original and characteristic qualities. Balbo was an earnest student of history, and made history useful for politics. Like Gioberti in his first period, Balbo was zealous for the like papacy, and for a federation of the Italian states presided over by it. His *Sommario della Storia d'Italia* is the best epitome that exists of the intricate history of Italy. In the *Pensieri sulla Storia d'Italia* he touched on important subjects, which still await treatment. He did not do himself justice in the *Meditazioni Storiche*, a work on the philosophy of history, for which he had not the necessary qualifications.

It is not advisable to speak of living authors. We shall only notice the fact that the political revival in Italy seems to have brought forth good fruit also in the fields of literature. It appears that the literary bent of the present day is towards historical research. Of the poets, only one, Giosuè Carducci, has as yet acquired a reputation that seems certain to last.

Literature.—The following are the more important recent works relating to the history of Italian literature.—Emilian Giudici, *Storia della Letteratura Italiana*, 2 vols., Florence, 1855; Francesco de Sanctis, *Storia della Letteratura Italiana*, 2 vols., Naples, 1870; Adolfo Bartoli, *Storia della Letteratura Italiana* (the first three volumes are published), Florence, 1879-80; Giosuè Carducci, *Stati Letterari*, Lughorn, 1874; Alessandro d'Ancona, *Origini del Teatro in Italia*, 2 vols., Florence, 1878; Virgili, *Francesco Berni*, Florence, 1881; Pasquale Villari, *Niccolò Machiavelli e i suoi tempi*, vol. 1, Florence, 1877; Pio Rajna, *La Fonti dell' Orlando Furioso*, Florence, 1876; Attilio Hortis, *Studi sulle Opere latine del Boccaccio*, Trieste, 1879; Francesco de Sanctis, *Staggi Critici*, 3 vols., Naples, 1872; Francesco d'Ovidio, *Saggi Critici*, Naples, 1878. ITHACA (*Ἰθάκη*), vulgarly *Thiaki* (*Θιάκη*), is next to Pasco the smallest of the seven Ionian Islands, with an area of about 44 square miles. It forms an eparchy of the nomos of Cephalonia in the kingdom of Greece, and its population, which was 9873 in 1870, is given by the census of 1879 at 12,232, of whom 6305 were males. The island consists of two mountain masses, connected by a narrow isthmus of hills, and separated by a wide inlet of the sea known as the Gulf of Molo. The northern and greater mass culminates in the heights of Anoi (2066 feet), and the southern in Hagios Stephanos, or Mount Marovugli (2135 feet). Vathy (*Βαθύ*), the chief town and port of the island, lies at the northern foot of Mount Stephanos, its whitewashed houses stretching for about a mile round the deep bay in the Gulf of Molo, to which it owes its name (cf. Dieppe and such Dutch names as Hollands Diep). As there are only one or two small stretches of arable land in Ithaca, the inhabitants are dependent on commerce for their grain supply; and olive oil, wine, and currants are the principal products obtained by the cultivation of the thin stratum of soil that covers the calcareous rocks. Goats are fed in considerable number on the brushwood pasture of the hills; and hares (in spite of Aristotle's supposed assertion of their absence) are exceptionally abundant. The island is divided into four districts:—Vathy, Aeto (or Eagle's Cliff), Anoge (Anoi) or Upland, and Exoge (Exoi) or Outland.

The name Ithaca (*Ἰθάκη*), like Utea, has been explained by ΠΙΝΥ, a "colony," which would point to a Phœnician connexion. It has remained attached to the island from the very earliest times with but little interruption of the tradition, though in Brontë's travels (19th century) and in the old Venetian maps we find it called Pale or Val de Compar, and at a later date it not unfrequently appears as Little Cephalonia. This last name indicates the general character of Ithacan history (if history it can be called) in modern and indeed in ancient times, for the fame of the island is almost solely due to its position in the Homeric story of Ulysses. Ithaca, according to the Homeric epic, was the royal seat and residence of King Ulysses, and within its narrow confines the scene of much of the poem. The island is incidentally described with no small variety of detail, picturesque and topographical, but the very apparent definiteness of the description has rendered the process of identification peculiarly perplexing, and the coincidences between the Ithaca of the *Odyssæy* and the Ithaca of the present day are sometimes as puzzling as the points of disagreement. The phraseology in which the position of the island is indicated is of doubtful interpretation, and the important word *ῥαχμαῖ* would have naturally been rendered "low-lying" if stress of present fact had not forced the commentators to find or fancy such significations as "with low shores" (the shores after all being rather unusually high) or "slanting downwards." The Homeric localities for which counterparts have been sought are Mount Neitos, Mount Neion, the harbour of Phœreys, the town and palace of Ulysses, the fountain of Arethusa, the cave of the Naiads, the stalls of the swineherd Eumæus, the orchard of Laertes, and the Konax or Raven Cliff. The master site may be said to be that of the town; and several of the minor points may be at once dismissed as homeless of all certainty of recognition. Among the "identificationists" there are two schools, one placing the town at Polis on the west coast in the northern half of the island (Leake, Gladstone, &c.), and the other at Aeto on the isthmus. The latter site, which was advocated by Sir William Gell (*Topography and Antiquities of Ithaca*, London, 1807), has received a great accession to its probability as opposed to the rival theory by the excavations of Dr Schliemann carried on in 1878 and 1879 (see Schliemann, *Ithaque, le Péloponnèse, Troie*, Paris, 1869, also published in German; his letter to *The Times*, September 26, 1878; and the story's life prefixed to *Ithaca*, London, 1880). He found that the valley called Polis or city has never been the site of a town, and that the apparent ruins on a neighbouring height supposed to be the acropolis are really a group of castellated rocks. Remains of Cyclopean structures at the spot known as Homer's school (a name of the most modern origin) were the only evidence in favour of the existence of a town in the northern part of the island. On the ridge of Mount Aeto, on the other hand, he found vast Cyclopean walls built of stones even larger than those of Mycenæ and Thyrus; and within the area which they enclose there may have been, he calculates, 2000 houses similar to those which he actually made out to the number of 190. Fragments of pottery of a Trojan type, of tiles with impressed ornaments, and of a curious handmill were the only relics of the former inhabitants. "In the south-eastern extremity of the island are a number of rooms like stables, averaging 85 feet in length and 10 feet in breadth, partly rock-cut, partly

formed by Cyclopean walls of very huge rudely wrought stones, and in their immediate vicinity thousands of very common but most ancient potsherds." Mr Bunbury (*Hist. of Ancient Geography*, vol. i. p. 83) is disposed to consider this evidence conclusive as to the site of the capital.

See, besides the works already referred to, the separate works on Ithaca by Schœnher, Leipzig, 1829; Rühle von Liebenstem, Berlin, 1832; N. Karavitis Gritas (*Geograph. topograph. Ithacæ*, Athens, 1849; Dover, London, 1851); and Gaudier, Paris, 1864; Heichen, in *Hermes*, 1866; Leake's *Northern Greece*, *Notes & Jour. in Greece*, Bussan's *Gloss. von Griechenland*, Gladstone, "The Nominations of Ulysses," in *Macaulay's Magazine*, 1857. A library of the discussions will be found in Buchholz, *Die Homische Realien*, Leipzig, 1871.

ITHACA, the chief town of Tompkins county, New York, U.S., is prettily situated in a township of the same name on the Cayuga Inlet, 1½ miles from the southern end of Lake Cayuga, and 142 miles west by south of Albany. It is at the junction of several railways, has gas and water works, and carries on some commerce, of which the shipping of coal from the Pennsylvania anthracite district forms an important constituent. The manufactures include agricultural implements, paper, glass, leather, and machinery. On an eminence to the north-east rise the handsome buildings of Cornell university, chartered in 1865 and opened in 1868, in which a marked characteristic is the prominence given to the study of agriculture and the mechanical arts. Sage College was presented to the university by the Hon. H. W. Sage, on condition that women should have the same advantages for education as men. The public library of Ithaca was built and stocked at a cost of £13,000 by the same munificent citizen whose endowment of the university is commemorated in its name. The neighbourhood of Ithaca is remarkable for the number of its waterfalls, of which Ithaca Fall, 160 feet high by 150 feet broad, is the chief. The population of the town in 1880 was 9864.

ITINERARIUM. This Latin word, equivalent to road-book, is more particularly employed to designate the descriptions still extant of the ancient Roman roads and routes of traffic, with the stations and distances. It is usual to distinguish two classes, *Itineraria Adnotata* or *Scripta* and *Itineraria Picta*,—the former having the character of a book, and the latter being a graphic indication of the route in the form of a chart. Of the *Itineraria Scripta* the most important are:—(1) *It. Antonini* (see ANTONINI ITINERARIUM and ANTONINUS), which consists of two parts, the one dealing with roads in Europe, Asia, and Africa, and the other with familiar sea-routes,—the distances usually measured from Rome (the better MSS. probably represent a revision dating from the time of Diocletian; edited by Tobler, St Gall, 1863); (2) *It. Hierosolymitanum* or *Burdigalense*, which belongs to the 4th century, and contains the route from Bordeaux to Jerusalem and from Heraclea by Rome to Milan (see Pindar in *Verhandl. of the Berlin Academy*, 1860; A. de Barthélemy in *Revue Archéol.*, 1864; Aurès, *Concordance des voies apollinaires*, &c., Nîmes, 1868); (3) *It. Alexandri*, containing a sketch of the march-route of Alexander the Great, mainly derived from Arrian and prepared for Constantius's expedition in 340–345 A.D. (first ed. by Mai, Milan, 1817, since by C. Müller in Dübner's *Arrianus*, Paris, 1846, and by D. Volkman, Naumb., 1871; see Kluge, *De itin. Alexandri*, Berlin, 1861). A collected edition of the ancient *itineraria* was issued by Fortia d'Urban, Paris, 1845. Of the *Itineraria Picta* only one great example has been preserved. This is the famous *Tabula Peutingeriana*, which, without attending to the shape or relative position of the countries, represents by straight lines and dots of various sizes the roads and towns of the whole Roman world. The best edition is by Desjardins, Paris, 1868.

ITIUS PORTUS, a place of no importance in itself, has a kind of factitious interest as the point whence Julius Cæsar sailed from Gaul to Britain. Although Cæsar does not mention the Portus in speaking of his first expedition

(55 B.C.), his language in describing it as the naval rendezvous before his second invasion (54 B.C.) leaves little doubt that he had sailed from it before. To determine, therefore, the site of the *Portus Itius*, while it would decide one of the most vexed questions of either ancient or modern geography, would go far to fix the spot where the great captain first set foot in England. It is impossible here to describe the controversy, or to detail the arguments which at one time or another have been advanced in favour of every bay between Calais and Boulogne. Modern criticism selects four sites as probable—Boulogne, Wissant, Ambleteuse, and the mouth of the Somme. The first two number most adherents; and in recent criticism Wissant, about $3\frac{1}{2}$ miles north-east of Cape Grisnez (*Itium Promontorium*), has united a majority of voices.

The question turns upon the interpretation of certain passages in Caesar's *De Bello Gallico* (iv. 20 sq., v. 1 sq.), with direct and indirect mentions in other Latin and Greek writers. See also Camden's *Britannia*, 1659; Du Cange, *Dissertationes super la Vie de Saint Louis*, diss. xxviii., "Portus Itius," 1678; D'Anville, "Dissertation sur le portus Itius," in *Mémoires de l'Académie des Inscriptions*, xviii., 1761; Alix, "On the Place of Julius Caesar's Departure from Gaul," in *Archæologia*, 1862; papers by Alix and Guest in the *Athenæum*, 1851, 1856, 1858; by George Long in the *Reader of 1868*; by H. L. Long in *Geographical Magazine*, 1846; and an elaborate article by H. J. Heller in the *Zeitschrift für Allgemeine Erdkunde*, vol. xviii., Berlin, 1865; Thomas Lewin, *The Invasion of Britain by Julius Caesar*, 1862; Cadwell, "Remarks on Julius Caesar's Invasion of Britain," in *Archæologia Cantiana*, vol. iii.; Captain Becher, "Caesar's Invasions of Britain. Nautical Conclusions on the place of his departure from Gaul," in *Nauticus Magazine*, 1862; papers by F. de Sauley and General Creuly in the *Revue Archéologique*, 1860 and 1868; E. de Sauley, "Les Expéditions de César en Grande-Bretagne," in *Campagnes de César*, vol. i., 1862; Abbé Haigron, *Étude sur le portus Itius de Julius César*, 1862; Von Guler, *Cæsar's gallsischer Krieg in den Jahren 53 bis 68 v. Chr.*, 1853; Id., *Cæsar's gallsischer Krieg im Jahre 51 v. Chr.*, 1860; H. Lempereur, "L'ancienne voie romaine d'Éphey," in *L'Institut*, 1864; and A. Wauter's brochure, *Wissant l'ancien Portus Itius*, Brussels, 1879.

ITURBIDE, or YTURBIDE, AUGUSTIN DE (1783-1824), emperor of Mexico from May 1821 to August 1823, was born September 27, 1783, at Valladolid, now Morelia, in Mexico, where his father, an Old Spaniard from Pampeluna, had settled with his creole wife. After enjoying a better education than was then usual in Mexico, Iturbide entered the military service, and in 1810 held the post of lieutenant in the provincial regiment of his native city. In that year the insurrection under Hidalgo broke out, and Iturbide, more from policy, it would seem, than from principle, served in the royal army. Possessed of splendid courage and brilliant military talents, which fitted him especially for guerrilla warfare, the young creole did signal service, and rapidly rose in military rank. In December 1813 Colonel Iturbide, along with General Llano, dealt a crushing blow to the revolt by defeating Morelos, the successor of Hidalgo, in the battle of Valladolid; and the former followed it up by another decisive victory at Puruaran in January 1814. Next year Don Augustin was appointed to the command of the army of the north and to the governorship of the provinces of Valladolid and Guanajuato, but in 1816 grave charges of extortion and violence were brought against him, which led to his recall. Although the general was acquitted, or at least although the inquiry was dropped, he did not resume his commands, but retired into private life for four years, which, we are told, he spent in a rigid course of penance for his former excesses. In 1820 Apodaca, viceroy of Mexico, received instructions from the Spanish cortes to proclaim the constitution promulgated in Spain in 1812, but, although obliged at first to submit to an order by which his power was much curtailed, he secretly cherished the design of reviving the absolute power for Ferdinand VII. in Mexico. Under pretext of putting down the lingering remains of revolt, he

levied troops, and, placing Iturbide at their head, instructed him to proclaim the absolute power of the king. Four years of reflexion, however, had modified the general's views, and now, led both by personal ambition and by patriotic regard for his country, Iturbide resolved to espouse the cause of national independence. His subsequent proceedings—how he issued the *Plan of Iguala*, on February 24, 1821, how by the refusal of the Spanish cortes to ratify the treaty of Cordova, which he had signed with O'Donoghue, he was transformed from a mere champion of monarchy into a candidate for the crown, and how, hailed by the soldiers as emperor Augustin I. on May 18, 1822, he was compelled within ten months by his arrogant neglect of constitutional restraints, to tender his abdication to a congress which he had forcibly dissolved—will be found detailed under Mexico. Although the congress refused to accept his abdication on the ground that to do so would be to recognize the validity of his election, it permitted the ex-emperor to retire to Leghorn in Italy, while in consideration of his services in 1820 a yearly pension of £5000 was conferred upon him. But Iturbide resolved to make one more bid for power; and in 1824, passing from Leghorn to London, he published a *Statement*, and on May 11th set sail for Mexico. The congress immediately issued an act of outlawry against him, forbidding him to set foot on Mexican soil on pain of death. Ignorant of this, the ex-emperor landed in disguise at Soto la Marina on July 14th. He was almost immediately recognized and arrested, and on July 19, 1824, was shot at Padilla, by order of the state of Tamaulipas, without being permitted an appeal to the general congress. Don Augustin de Iturbide is described by his contemporaries as being of handsome figure and ingratiating manner. His brilliant courage and wonderful success made him the idol of his soldiers, though towards his prisoners he displayed the most cold-blooded cruelty, boasting in one of his despatches of having honoured Good Friday by shooting three hundred excommunicated wretches. Though described as amiable in his private life, he seems in his public career to have been ambitious and unscrupulous, and by his haughty Spanish temper, impatient of all resistance or control, to have forfeited the opportunity of founding a secure imperial dynasty. His son Augustin was chosen by the ill-fated emperor Maximilian as his successor.

See *Statement of some of the principal events in the public life of Augustin de Iturbide*, written by himself, English translation, 1824.

ITZEHOE, one of the busiest commercial towns of northern Germany, is situated on the Stör, a navigable tributary of the Elbe, in the circle of Steinburg of the Prussian province of Schleswig-Holstein, 32 miles north-west of Hamburg and 15 miles north of Glückstadt. As chief town of the circle, it is the seat of the usual local courts and of a head custom-house. The church of St Lawrence, dating from the 12th century, and the building in which the Holstein estates formerly met, are noteworthy. The town has a convent founded in 1256, a high school, a hospital, and other benevolent institutions. The sugar-refinery, which employs some 500 hands, is the largest in Germany. Iron-founding, shipbuilding, and wool-spinning are also carried on, and the manufactures include machinery, tobacco, fishing-nets, chicory, soap, cement, beer, and other articles. Fishing employs some of the inhabitants, and the markets for cattle and horses are important. A considerable trade is carried on in agricultural products and wood, chiefly with Hamburg and Altona. Including the garrison, the population in 1875 was 9776.

Itzehoe is the oldest town in Holstein. Its nucleus was a castle built to restrain the Danes in 809 by Egbert, one of Charlemagne's counts. The community which sprang up around it was diversely called *Esseveldoburg*, *Keelsfleth*, and *Ezecho*. In 1201 the town was destroyed, but it was restored in 1224. To the new town the Lübeck

rights were granted by Adolphus IV. in 1238, and to the old town in 1303. During the Thirty Years' War Itzehoe was twice destroyed by the Swedes, in 1644 and 1687, but was rebuilt on each occasion. It passed to Prussia in 1807, with the duchy of Schleswig-Holstein.

IVAN (or JOANN, *i.e.*, JOHN) I., grand-duke of Moscow from 1328 to 1340, was surnamed Kalita in allusion to the "purse" which he always carried at his girdle. Some have imagined that it contained alms for distribution; others with greater probability look upon it as characteristic of the miserly habits of the prince. The great importance of Ivan in Russian history is that he was the consolidator of the power of Moscow, the nucleus out of which the empire was to be formed at a future period. By treachery he procured from Uzbek, the Tatar Khan, the ruin of his rival the prince of Tver, and by craft and bribery made many additions to his territory. He also induced the metropolitan to reside at Moscow, which brought dignity and influence to the city.

IVAN II., grand-duke from 1353 to 1359, son of Ivan I., succeeded on the death of his brother Simon Gordi, or the Proud. He appears to have been a kindly man, but, in so far as his short reign had any effect, it weakened the principality of Moscow.

IVAN III., surnamed the Great, grand-duke from 1462 to 1505, forms one of the most important figures in the annals of Russia, for to him is due the consolidation of the autocracy. His long reign of forty-three years was very beneficial to his country. He was a skillful diplomatist, and often brought about by intrigue what others could only effect by force of arms. Thus he reduced to submission the haughty republic of Novgorod, and united to the principality of Moscow those of Tver, Rostoff, and Yaroslavl; he also took Kazan in 1487, but it was not definitively incorporated with Moscow till the reign of Ivan IV. He reconquered the territory as far as the river Sozh, which had fallen under the dominion of the Lithuanians. In 1472 he married Sophia, niece of Constantine Palæologus. In consequence of this union Ivan considered himself the heir of the Byzantine emperors, and adopted the two-headed eagle for his arms. Embassies were sent to foreign powers. Italian architects were invited into Russia, and many learned Greek monks found refuge there from the yoke of the Turks.

IVAN IV., surnamed the Terrible (*Grozni*), the first czar of Russia, was a mere child at the time of the death of his father Vasilii in 1533. His reign may be divided into three periods:—(1) his minority, under the regency of his stepmother Helen Glinska; (2) from his attaining his majority till the death of his amiable wife Anastasia Romanova, during which time he was a bold and vigorous ruler, and careful of the happiness of his subjects; and (3) from her death till the conclusion of his reign in 1584, the period signalized by those atrocities which have earned for Ivan such an unenviable reputation. He was the first Russian sovereign who took the title of Czar, a Slavonic form of Cæsar. In 1552 he annexed Kazan, and Astrakhan two years later. In many points of his character Ivan resembles Louis XI., especially in his statecraft and superstition; indeed, just as France owed her aggrandizement to some of her most cruel sovereigns, so in Russia the greatest tyrants have been the consolidators of the empire. In the time of Ivan a printing press was set up at Moscow, and the first book published (in 1564) was an *Apostol*—a name given to a collection of the Acts of the Apostles and the apostolic epistles; but persecution was soon directed against the printers, who, from the jealousy of those who gained their livelihood by copying religious books, were compelled to fly from Russia, and were protected by Sigismund II. of Poland. They afterwards printed the whole Bible at Ostrog in Volhynia in 1581.

In the British Museum is a copy of this book, which formerly belonged to the terrible Ivan. Sir Jeremy Horsey, the English ambassador, has written on the fly-leaf, "this Bibell in the Slavonian tongue had out of the emperor's library." Siberia was also annexed in this reign through the enterprise of the Cossack Yermak, and the English first opened up commercial intercourse with the country by means of the expedition of Sir Hugh Willoughby and Richard Chancellor in 1553. The English for a long time enjoyed the monopoly of the Russian trade, and it is to some of them that the Russians are indebted for interesting accounts of their land, especially to Dr Giles Fletcher, uncle of the dramatist, whose *Russæ Commo-wealth* (London, 1591) is a mine of valuable information. The atrocities committed by Ivan at Novgorod in 1569, and at Pskov soon afterwards, are well known. It is from foreigners, such as Horsey, that we get minute accounts of his many cruelties. In the British Museum are preserved some of his letters to Queen Elizabeth, of whom he requested that an English wife should be chosen for him and sent to Russia. A Lady Mary Hastings, daughter of the earl of Huntingdon, was selected and introduced to the Russian ambassador Pisemski, but when the time drew near for her departure she entreated her father with tears not to send her to such a husband. The miserable tyrant expired in 1584, from grief for his son, whom he had killed in a fit of passion three years before. Like Louis XI., he loved to surround himself with quacks and magicians, some of whom, according to Horsey, prophesied the day of his death. The latter has left us the following curious notice of him:—

"Thus much to conclude with this emperor Ivan Vasilivich. He was a goodlie man of person and presence, well favoured, high forehead, shrill voice, a right Sithian, full of readie wisdom, cruell, bloudye, merelous; his own experience managed by direction both his state and commonwealth affaires; was sumptuously intoned in Michell Archangel church, where he though gauded days and night, remains a fearful spectacle to the memory of such as pass by or hear his name spoken of, [who] are contented to cross and bless themselves from his resurrection againe."

IVAN V., czar from 1682 to 1696, was the son of Alexis by his first wife Maria Miloslavskana. He was infirm both in mind and body. The Narshkins, to which family the widow of Alexis (his second wife) belonged, were anxious that Peter, the next brother, should succeed, but Sophia, the ambitious daughter of Alexis by his first wife, wished Ivan to rule, so that she might govern in his name. She was ultimately forced, however, into the Devichi monastery, and Ivan reigned conjointly with his brother; the government being really in the hands of Peter assisted by his mother, the Narshkins, Dolgoroukiss, and Boris Golitzin.

IVAN VI., czar in 1740–41, was son of Anthony Ulrich of Brunswick by his marriage with Anne, granddaughter of Ivan V. The reign of this unfortunate young man lasted but a year, under the regencies of his mother and Biren. Owing to the success of the revolution under Elizabeth, daughter of Peter the Great, he was confined as a prisoner in Schlüsselburg, and Anthony and Anne with their other children were banished to Kholmogori in the government of Archangel. By long detention in the fortress Ivan became, it is said, half-witted. In the year 1764 a certain Lieutenant Mirovich attempted to deliver him from captivity and proclaim him emperor. Ivan, however, was slain in the skirmish that ensued, and Mirovich was afterwards publicly executed. According to some, he had been urged to the act by Catherine, who wanted an excuse for putting Ivan to death.

For the Ivans see Soloviev, *Istoriya Rossii*, 29 vols.; Oustrialov, *Russkaya Istoriya*, 2 vols.; W. R. S. Ralston, *Early Russian History*; Rambaud, *Histoire de la Russie*.

IVANOVO, or IVANOVO-VOZNESENSK, the "Manchester of Russia," a town in the government of Vladimir, 20 miles north-west of Shua, near the river Uvod, and on the road from Shua to Nerakhta. It consists, as the full name implies, of what were originally two villages—Ivanovo, which existed at least as early as the 16th century, and Voznesensk, of much more recent date—united into a town in 1861. Of best note among the public buildings are the cathedral of the Elevation of the Cross, and the church of the Intercession of the Virgin, formerly associated with an important monastery founded in 1579 and abandoned in 1754. One of the colleges of the town contains a public library. The industrial history of Ivanovo begins with the 18th century. Linen-weaving was introduced in 1751, and in 1776 the manufacture of chintzes was brought from Schlüsselburg by some natives of the village. By 1850 the worth of the chintzes amounted to 6,680,875 roubles, and 10,000 workmen were employed in the manufacture of coarse calico. The reports of 1879 show 35 calico-print works, a wool-spinning factory, 6 cotton-weaving factories, 8 bleachworks, 6 iron-works, 3 chemical works, and several minor establishments. The workmen number about 15,000 or 20,000. The cotton factories produce to the annual value of 25,000,000 to 30,000,000 roubles; the iron works manufacture 110,000 poods (1770 tons) of iron, and there is a considerable turn out of boilers and factory machinery. Bast mats are made to the value of 15,000 roubles.

IVORY is essentially equivalent to dentine, that hard substance, not wholly unlike bone, of which most teeth principally consist. By usage, however, its application has become almost restricted to the dentine of those teeth which are large enough to be available for industrial purposes, viz., the tusks of the elephant, the hippopotamus, the walrus, the narwhal, and the sperm whales.

Ivory consists of an organic matrix or basis substance (which by prolonged boiling is converted into gelatin), permeated by an immense number of exceedingly fine canals. The matrix is richly impregnated with calcareous salts, which are probably held in some loose form of chemical combination with it, and is of such consistence that it retains its form after removal of the salts by an acid solvent. The canals start from the axial pulp cavity, and run in a direction generally outwards towards the periphery of the tusk; in the elephant they are of exceptional fineness, being only about $\frac{1}{1000}$ of an inch in diameter, and are placed very closely, being separated by intervals not much greater than their own diameter. To the regularity with which the tubes are disposed, and to their small size and frequent curvature, ivory owes its fineness of grain, and probably also its almost perfect elasticity; whilst to the peculiarities of their curvatures it owes that very characteristic pattern of curved decussating lines, like engine turning, which is seen where the surface is a section transverse to the tusk. For, though it is broadly true that the tubes in elephant ivory run from the axis of the tusk to its periphery, they do not run straight, but make a succession of strong bends at regular intervals, and as the light is differently refracted by the basis substance and by the tubes according to the direction they are pursuing, this peculiarity of their course results in producing that pattern found in the dentine of *Proboscidea* only. Ivory differs from bone in its finer structure and greater elasticity, and in the absence of those larger canals which convey blood-vessels through the substance of bone, and appear upon it as specks or as stripes, according as it is cut transversely or longitudinally. When a transverse section of a tusk cut at a distance from the growing pulp is examined, its middle is seen to be occupied by a darkish spot of obviously different structure; this is the last remains of the pulp,

rudely calcified. The outer border of the section consists of a thick layer of cementum, with which the whole tusk is coated, and the rest is ivory, showing the characteristic engine-turning pattern, and, in addition to this, numerous circular lines, concentric with the central spot. These "contour" lines are due to the occurrence of a large number of minute irregular spaces, found in all dentine, but specially abundant and disposed with a greater regularity in ivory; they are known as interglobular spaces, from the form of their boundaries when seen under a moderate magnifying power. In the areas occupied by these spaces there is a smaller proportion of lime salts and more organic matter; consequently the ivory is here less dense and more liable to decomposition, and fossil tusks, as well as the less perfectly preserved of mammoth tusks, are frequently found to have broken up into a number of superposed cones, and in transverse section to present many concentric detached rings of ivory more or less friable. See Plate VII.

Arguing from the analogy of other dentine, it cannot be doubted that the minute tubes and the interglobular spaces are not empty in living ivory, but that they contain protoplasmic substance, though how far this may have perished or altered in that portion of the tusk which is extruded and far distant from the growing pulp can only be determined by observations at present wanting. According to Von Bibra's analyses, ivory contains as much as from 40 to 43 per cent of organic matter, whereas human dentine contains only about 25 per cent; of fat it contains from .24 to .34 per cent. It differs from other dentines chiefly in its richness in organic constituents, in the fineness of its tubes, in their peculiarly curved course, and in the abundance of interglobular spaces arranged in "contour" lines. The tusks of the elephant are a pair of upper incisor teeth, which may attain to an enormous development. The largest teeth were possessed by the extinct mammoths, of which tusks have been found in Siberia 12 feet and more in length, and weighing 200 lb each. Holzapfel mentions one of very fine quality, that was cut up into piano keys in England, which weighed 186 lb. Among recent elephants the African species possess the largest tusks, these attaining to a length of 9 or 10 feet and a weight of 160 lb each, whilst the tusk of an Indian elephant which measured 8 feet in length and weighed 90 lb has been placed on record as exceptionally large. A pair of African tusks at the London exhibition of 1851 weighed 325 lb, and measured 8 feet 6 inches in length and 22 inches in circumference, but authorities acquainted with the African ivory districts give 20 to 50 lb as the average weight of tusks. In Africa both males and females are furnished with large tusks; but in the Indian species a sexual difference exists, the tusks of the female projecting only a few inches from the gums, while even of the males by no means all are "tuskers." Sanderson says that 10 per cent of Indian male elephants have very small tusks, while in Ceylon only one in three hundred of the males is powerfully armed. The peculiarity is not always transmitted, tuskleless sires ("mucknas") breeding "tuskers," and *vice versa*. The importance of tusks as giving an advantage in combat to their possessors is sufficiently indicated by the dread of a "tusker" shown by other elephants less favoured. Tusks are often broken by fighting, and always show marks of considerable wear, while even captive elephants, with their shortened tusks, make great use of them for a variety of purposes; for example, an elephant will, when set to pull at a rope, take it between his molar teeth and pass it over one of his tusks to get a good purchase. Nothing but an extremely strong and elastic material such as ivory is could withstand the strains to which it is constantly exposed.

Captive elephants have their tusks shortened, and the

ends bound with metal to prevent their splitting; and, as the tusk is continually growing by the conversion of fresh portions of vascular pulp into ivory, the operation has to be repeated. When this is done at intervals of ten years, the segment cut off is valuable, and is sold as ivory; some prefer, however, to cut the tusks much more frequently. In a young elephant the vascular pulp extends beyond the portion of the tusk implanted in the jaw, whilst in the older animal it does not reach so far; its probable extent has to be borne in mind in shortening the tusk, as if it be encroached upon much suffering is entailed on the animal. Yet the vascular formative pulp of an elephant's tooth is singularly tolerant of injury without having its function of ivory formation destroyed, and hence it happens that foreign bodies which have got access into the pulp chamber become solidly enclosed in ivory. The growing end of the tusk is widely open, and its edges are not much thicker than paper; the cavity which contains the pulp is of conical form, tapering to a point, which is situated at a distance down the tusk, varying, as has been before stated, with the age of the animal. The tusk grows by the conversion of successive portions of the surface of the conical mass of pulp into ivory, whilst fresh pulp is added at the flat base or open end of the tusk. The tusks are deeply implanted in curved bony sockets, which run nearly vertically upwards, so that the open growing ends of the tusks are brought up to about the level of the eyes. Hence it is not a rare occurrence for a sportsman's bullet, intended to pierce the elephant's brain, to penetrate the tusk near to its growing end, where the walls of the pulp cavity are quite thin, and to lodge in the "nerve" of its tooth. Indeed sportsmen remark that the forehead shot is less fatal to African than to Asiatic elephants, owing to the size and position of their tusks. The amount of disturbance produced by a bullet in the nerve is variable; sometimes the conversion of pulp into ivory goes on with but little interruption, so that the bullet comes to be imbedded in ivory, which fits closely up against it, instead of in pulp as it was at first. Generally the pulp immediately around it has been so disintegrated by its impact, or by subsequent inflammation, that it is incapable of conversion into normal ivory, and in its place there is a more or less irregular development of nodular secondary dentine. And sometimes there is a failure to produce even this less highly organized tissue in the immediate proximity of the bullet, which then ultimately comes to lie loose in an irregular cavity completely surrounded by secondary dentine. Of a similar nature is the so-called "abscess in ivory"; this was really an abscess in the formative pulp surrounded by a limiting membrane; as the conversion of the pulp into ivory went on, calcification passed all round the abscess and enclosed this, pus, membrane, and all, in solid ivory; and there it is discovered by the ivory cutter as an empty hole lined by a thin dried skin, the old abscess sac.

African natives sometimes spear elephants to death when they have been surrounded by an extemporized barrier of twisted creepers, and for this purpose some of them climb into trees; they also set traps made of a very heavy piece of wood shod with an iron spearhead, arranged to fall upon the elephant as he passes along a track beneath (Du Chailly); elsewhere lances of extreme length are used in the same way. The open base of the tooth, containing the formative pulp, looking directly upwards, a spear from above intended to fall upon the head or to "pith" the animal might easily enter it, and break away, leaving the point in the tooth pulp. In a specimen now in the museum of the Odontological Society, London, such a spear head remained without stopping the further growth of the tusk, and came to be solidly enclosed in ivory and secondary dentine, although it measures no less than $7\frac{1}{2}$ by $1\frac{1}{2}$ inches. Not a trace of

its presence was discernible upon the exterior of the tusk, and it was only discovered when the tooth was sawn up. This specimen is not unique, there being said to be another, which has been turned into a cup with the imbedded spear head as its stem; and there is a specimen of a javelin head firmly built in by ivory in the museum of the Royal College of Surgeons. But that an elephant is not wholly indifferent to a large foreign body in the nerve of his tooth is proved by the fact that a notoriously fierce and dangerous "rogue" elephant in Ceylon was found when killed to have been suffering from inflammation and suppuration consequent upon the presence of a bullet in the pulp of a tooth; the supposed madness of the famed elephant of Exeter Change was also found to have been due to the pain of a diseased tooth. A common result of injury to a growing tusk is the conversion of a portion of the pulp into irregular globular masses of secondary dentine,—sometimes enclosed solidly in the midst of normal ivory, sometimes forming loose masses as big as hen eggs in the pulp cavity, and sometimes stalagmite-like appendages to its walls. Of course such deviations from normal structure seriously injure its value for industrial purposes, and they are specially apt to occur in domesticated animals whose tusks are being repeatedly shortened, the cut not being invariably made at a sufficient distance from the apex of the living pulp. But under no circumstances is the ivory from domesticated elephants so highly esteemed as that from the wild animal.

The large balls of secondary dentine appear on section as a conglomerate of spherical masses bound together by softer and looser-textured materials; they are sometimes beautiful, but cannot be made much use of. Small spots of globular dentine sometimes occur in the midst of normal ivory, for which no cause can be detected. Malformed tusks are far from rare; the College of Surgeons possesses one about 2 feet in length, the base of which is an irregular mass of osteodentine nearly as large as a man's head. Spiral tusks are also met with, and are almost always the result of some disease of one side of the pulp, leading to a slower growth on the one side than on the other. Much of the ivory of such tusks will be faulty; they should not be purchased except as curiosities.

The Board of Trade returns for 1879 give as the total weight of ivory imported into England during the year 9414 cwt., of the value of £406,927;¹ but nearly half this quantity appears again amongst the exports. By far the larger portion of the ivory is entered as coming from African ports, and less than one-fourth from India, while from this fourth a further reduction must be made in estimating the quantity produced by the country, as a considerable weight of African ivory from Zanzibar, &c., is shipped from Bombay. About 1080 cwt. is entered as "from other countries."²

The best ivory is the African, and the first quality of that comes from near the equator; much is brought down by natives by land from the interior, whilst in other districts expeditions are organized by Europeans to go into the interior, and collect the stores gathered by native tribes; 20,000 lb. valued at Khartoum at £4000, would be considered a good result for a season's expedition with one

¹ The imports vary considerably from year to year. In 1875 they amounted to 16,253 cwt., valued at £772,371.

² Westendorp states that Africa exports on an average about 15,550 cwt. a year, which would be worth from £600,000 to £750,000, and that the ivory trade is steadily growing, especially on the West Coast. He estimates that in the west not less than 51,000 elephants are killed annually, and anticipates their becoming less numerous. Although the export from India only reached in 1875-7 from 9000 to 17,000 lb. a year, a considerably larger quantity of ivory is used in India for arm rings, &c., and for decorative and ornamental purposes. China also deals in ivory, exporting most of it after it has been carved.

hundred and fifty men. The price of ivory varies much in different districts, being generally higher on the west than on the east coast; the transaction is generally one of barter, and the price therefore difficult to estimate. The tusks are sold by weight, and stones and iron are sometimes thrust down into the hollow pulp cavity to increase the weight, so that dealers generally feel down the hollow with an iron rod to detect foreign matter. The value of the ivory depends upon the size of the tusks; those below 6 or 7 lb weight are not worth more than half the price per lb of really fine tusks. Something depends on the care bestowed upon the tusks, which are sometimes roughly treated, while others are waxed and carefully wrapped up for protection. The African ivory trade is an ancient one, and in mediæval times Marco Polo speaks of the traffic in ivory at Zanzibar as being astonishing in its amount.

The tusks of the mammoth from northern Siberia are said to furnish almost the whole of the ivory used by Russian ivory workers. They are found in most extraordinary abundance, and it is said that from the time of Dr Breyn's quaint paper "Behemoth" in the *Philosophical Transactions* for 1737 till now there has been no intermission in the supply. They come principally from the neighbourhood of the Lena and other great rivers discharging themselves into the Arctic Ocean, and are abundantly found in the Liakhoff Islands. Mammoth tusks are slenderer, much more curved, and in proportion to the size of the animal much larger than those of recent elephants. In Siberia at different times four mammoths have been found entire, their hair, skin, and even all their soft parts having been preserved without change in the ice for countless years. Just as in some few cases all the most perishable soft parts were preserved, so in a vastly greater number the less perishable ivory was kept without change by the low temperature and exclusion of air; thus when in the summer the ice tears down portions of river banks, or floods break up frozen morasses, the tusks are brought to light. Some are in the most beautiful preservation, like recent ivory; others having been exposed before, in previous summers, their organic constituents have partly perished, and they are inclined to become broken up along the lines of interglobular space into concentric rings, or may have become so disintegrated that a fragment may be used like chalk to write with.

In England this ivory is not very highly esteemed, being considered too dry and brittle for elaborate work, and to be very liable to turn yellow. Most ivory workers strenuously deny ever using them, but, though more rarely than in former years, mammoth tusks are occasionally imported. Within the last few years an exceptionally large tusk in splendid condition was offered for sale to the Oxford University Museum at a price of £100, but was not purchased. In 1872 1630 very fine tusks were brought to England; and in 1873 1140 tusks weighing from 140 to 160 lb each were imported. The best were sold at a very good price, but proved less available, even for such purposes as cutting into knife handles, than was expected, and although smaller importations arrive from time to time they can hardly be considered as a regular article of commerce, and are difficult of sale; some have been very recently sold at a price so low as ten shillings a cwt. Westendarp personally investigated the Siberian ivory trading districts, and returned with no favourable impression. He found that about 14 per cent. of the teeth were good, 17 per cent could be made some use of, 54 were quite bad, and 15 wholly useless. The ivory looks better outside than it really is, and, as only about 30 per cent is usable, it does not pay well for transport. He thought it not worth more than 1s. 6d. a pound.

The finest quality of ivory from equatorial Africa

is closer in the grain, and has less tendency to become yellow by exposure than Indian ivory. When first cut it is semi-transparent and of a warm colour; in this state it is called "green" ivory, and as it dries it becomes much lighter in colour and more opaque. This is supposed to be the result of the drying out of the "oil"; but ivory contains less than one-half per cent. of fatty material, and that which dries out is water, not oil. During this drying process the ivory shrinks considerably, so that it is necessary to season it like wood when such things as box lids, which need to fit, are to be made from it. The tusks shrink much more in their width than in their length, which will be readily understood when the many concentric rings of interglobular spaces, containing soft material, which dries up and leaves them empty, are remembered. It is on account of this peculiarity of structure that billiard balls are turned from tusks not greatly exceeding them in diameter, for by the selection of such tusks the ivory on the opposite sides of the ball will correspond in density and in structure, and the shrinkage will be uniform about its centre. They are usually turned roughly into shape, kept for some time in a warm room to shrink, and then turned true. The thin plates cut for piano keys are dried and shrunk at once by being baked for a time in an oven, but after being dried they are still subject to changes in bulk in a moist atmosphere.

It is not always possible to judge of the quality of ivory before the tusk is cut up. The exterior, or cementum, should be smooth and polished; it is often of a deep coffee colour in the best tusks, and it should not show any large cracks. But the most profound disorganization of the ivory may exist inside an exterior which promises well, or it may be badly cracked from unequal shrinkage in drying without cracks being noticeable on its exterior. About half of the length of an average sized tusk is implanted; this will be hollow, and in a young animal the hollow will extend beyond the implanted portion; the extruded part, recognizable by the deeper colour of its cementum, is solid, and is circular or oval in section. Great care is taken by ivory cutters to cut up the tusk to the greatest advantage, its high price necessitating the strictest economy in its use. Veneers of large size have been cut by a reciprocating saw cutting a spiral shaving round the tusk, one having been thus produced 40 feet in length by 12 inches in width; but they are not of much practical value, save as an example of what is possible. With age ivory turns yellow, and various receipts are given for restoring its whiteness; but they mainly depend upon mere removal of the outer surface, and no satisfactory method of bleaching it is known; it preserves its colour best when exposed to light. Considering the high percentage of organic matter which it contains, it is surprisingly durable. In some of the ivories brought by Mr Lazard from Nineveh, in which the organic constituent had partially perished, leaving them very friable, its place was supplied by boiling them in a solution of gelatin, a process suggested by Professor Owen as the likeliest means of restoring to them something like what they had lost during the lapse of time by exposure. It is possible that by some such treatment the perished ivory of the mammoth may be rendered useful for some purposes. The existence of chryselephantine statues of Phidias, and of flat plaques of ivory larger than could be cut from any known tusk, renders it probable that ancient workers possessed some method of bending it; and receipts have come down from the 12th century for softening it so as to alter its form. But these, which depend upon its partial decalcification, have not been found to yield the excellent results claimed for them, and the larger plaques in question present no appearance of having been submitted to any such process. Moreover, Westendarp states that

from a tusk weighing 200 lb the largest plaques he knows of could have been cut. Ivory can be made flexible by submitting it to the solvent action of phosphoric acid; when washed and dried it becomes hard, and when moistened again it resumes its flexibility; but this is at the sacrifice of many of its properties.

Ivory takes a variety of dyes well, without interfering with the polish of its surface; the actual matrix is stained, and the colour is not merely due to the penetration of pigment into the open dentinal tubes.

The great canine teeth of the hippopotamus furnish an ivory which is harder and whiter than that of the elephant, and less prone to turn yellow; these differences are probably due to its containing a smaller percentage of organic matter. It also lacks the engine-turning pattern of elephant ivory. The tusk of the hippopotamus is a tooth of persistent growth, strongly curved into a segment of a circle, and solid in the greater part of its length. It is thickly coated with enamel on its exterior surface, and is trihedral. On transverse section the remains of the pulp cavity are seen as a line or fissure in the middle, and occasionally there is a nodule of secondary dentine in it. The ivory is not quite homogeneous; for the back of the tooth, which is not covered with enamel and in use wears down the fastest so as to keep a sharp edge to the tusk, is markedly softer than the rest of the tooth. No large piece can be obtained from a hippopotamus tusk, and the incisors and the upper canines yield even smaller pieces than the lower canines. Thirty years ago there was a considerable demand for them for dentists' use, and at that time a fine tusk of 5 lb weight was worth from five to seven guineas, but the price is now much lower, and comparatively few are imported.

Amongst the northern nations the tusks of the walrus have long been used as a source of ivory. The great upper canines consist of a body of dentine invested with cementum; they are oval in section, solid, and their axis is made up of secondary dentine, which is far larger in amount than in the hippopotamus, and makes up a considerable part of the whole tooth. This is very nodular in appearance when cut and polished, but is of dense and tolerably uniform consistence.

The spirally twisted tusk of the narwhal, the teeth of the sperm whales, the ear bones of whales, and the molar teeth of the elephant, are also all made use of as sources of ivory, though they are far less valuable than the larger tusks. For the subject of carvings in ivory, see CARVING, vol. v. p. 167. The earliest piece of ivory work known is a rude incised drawing of a mammoth upon a fragment of mammoth tusk, which must have been executed by a contemporary of the animal. Numerous references to ivory occur in the Old Testament, which show that it was regarded as of great value. It seems to have been used for the decoration of the temple, and it is often mentioned amongst the presents brought to kings, who employed it for purposes of regal state. Some, however, of the references would seem more strictly applicable to wood than to ivory.

The Nineveh ivories in the British Museum are of very great antiquity, a probable date of 900 B.C. having been assigned to them; yet many of them are in good preservation, and others have been tolerably well restored by boiling in gelatin. All exhibit considerable artistic merit and mastery over the material, whilst some reach a very high degree of excellence alike in design and execution. Competent judges declare that, underlying the obviously Egyptian character of the work, there are differences sufficient to lead to the inference that the ivories were not executed in that country. Some of them consist of thin plaques on which figures were delineated by means of incised lines; some were carved in low, and others in high

relief; whilst there are many examples of detached heads, and even entire figures, carved in close imitation of nature (see Plate VII.). Traces of gilding remain on many of them, and they were often further enriched by being inlaid with fragments of lapis lazuli, or of a coloured glass in apparent imitation of this, the eyes of the larger heads were generally rendered conspicuous by this means. In one of the panels figured, the border of the dresses, the thrones on which the figures are seated, the ornaments above the cartouche, and the symbols upon the cartouche itself were thus inlaid with colour. The largest object is a carved staff, perhaps a sceptre; amongst the smaller pieces are heads of animals and entire animals, griffins, human heads, crossed and clasped hands, rings, &c. Like the ivory carvers of later times, these early workers seem to have studied economy of their material; thus a beautiful carving in high relief of two griffins standing upon papyrus flowers has been carved on the interior of a segment of a large tusk, the natural curvature of which it follows. The tendency of ivory to decompose into concentric layers parallel with its exterior has been already noticed, and Mr Layard himself speaks of the trouble he experienced owing to the flaking of the pieces he discovered; it is by the separation along the contour lines that many ancient ivories have been spoiled. Besides those discovered at Nineveh, some other ivories of great antiquity exist; and ivory workers are mentioned as a distinct class of artificers at the commencement of the Christian era. Many writing tablets of ivory, with raised rims inside, where wax was spread over their surface, have come down to us; these were often made to fold together, and the exterior richly ornamented with carvings. It was the custom for newly appointed consuls under the empire to send these plaques to persons of importance, and the covers sometimes have upon them representations of the consul in his robes of office.

One of the most beautiful of ancient ivories is the Roman 3d century plaque purchased by the South Kensington Museum for £400 (see Plate VII.). It forms one half of a diptych, and measures $1\frac{1}{2}$ by $4\frac{1}{4}$ inches. The other half is in the Hôtel Cluny.

From these times down to the present day there has been a constant succession of ivory workers, though in mediæval times artists of higher ability were to be found than any who will now devote themselves to such work. A large proportion of the carvings deal with sacred subjects: one of the most beautiful is a *Pieta*, the virgin holding the dead body of Christ in her lap (see Plate VII.); this was executed about the 14th century. Illustrations of old romances were frequently made use of to decorate mirror cases, boxes, &c., and elaborately carved chessmen of walrus ivory referable to an ancient period have been found in the island of Lewis. Schliemann, in his excavation at the supposed site of Troy, found many useful articles made of ivory,—pins, buckles, &c.,—but no carvings, even of rude character.

Among the chryselephantine statues of ancient Greece executed by Phidias, Praxiteles, and others, one of Minerva in the Parthenon was 40 feet in height, and was constructed of ivory and gold; others are mentioned as made of wood, with face, hands, and feet of ivory. Yet in some cases it is expressly said that the statue was entirely of ivory, special exception being made of a portion of the dress which was not. Among the Nineveh ivories are some which apparently belonged to figures partly wood and partly ivory, but these were of no great size; the wood employed seems to have been ebony.

In former times ivory was frequently used for the manufacture of artificial teeth; but this has become a thing of the past, ivory having been superseded by more durable and more manageable materials. Its use for this purpose

is quite ancient; thus Martial contemptuously speaks of a lady of his own time "emptis ossibus indioque cornu" as having but a poor chance of passing them off as her own teeth. For the use of the dentist elephant ivory was less suitable than that of the hippopotamus or the walrus; of these two the former was generally preferred. The enamel was chipped off with a chisel, or made to fly off by a judicious application of a blowpipe flame, and the task was so cut that the plate might consist as far as possible of the hardest part of the dentine which had formed the front of the tooth. This, carved up to fit the mouth accurately, formed a supporting plate which commonly carried in the front actual human teeth secured by pins, though sometimes the teeth were formed of ivory carved in imitation of teeth, and at the back blocks of hippopotamus or walrus ivory were added for the purposes of mastication. They were called "bone pieces," though there was really no bone used in their construction; their durability was in no case great, though it varied in the mouths of different persons, and a plate had to be ultimately discarded on account of the ivory getting discoloured, softened, and offensive. For dental purposes walrus ivory was more durable than hippopotamus, but its colour was not so suitable, nor was it so hard. Some specimens of native Indian dental work in ivory exist, but these have probably been copied from plates worn by Europeans.

The principal demand for ivory, beyond the purposes already alluded to, arises in connexion with the cutlery trade, very large quantities being used for the handles of pocket and table knives. It is also extensively employed for the handles of walking sticks and umbrellas, for combs, paper knives, and ladies' fans, and for measuring rules and mathematical scales. Further, it is in considerable demand for the manufacture of chess and draughts men, for statuettes, reliquary plaques, caskets, and many minor objects of furniture, decoration, and ornament, and for the purposes of inlaying. Dieppe is now a principal centre of the European ivory manufacture.

But it is in the East, and especially in China, that ivory is now most highly prized and most elaborately worked into decorative forms. No amount of patience and care appears to be considered excessive among the Chinese for the decorative working of ivory, as is obvious in the extremely minute and delicate workmanship in their lacelike carved open-work trays, while their carved nests of concentric ivory balls are still reckoned among the puzzles of industry. By the Japanese ivory is equally held in esteem, and is decoratively treated in their peculiar manner in the form of spill cases, medicine boxes, and the elaborately carved and ornamented nitsuké or large buttons. In India ivory is extensively used in the inlaid work of Bombay, &c., and for furniture decoration generally; and it is also cut into long slender filaments for making the tails of state chowries or fly-flappers, which, both handle and tail, are in many instances made of ivory.

All ivory dust, chips, and pieces unsuited for working are utilized by being converted into gelatin, which they may be made to yield by prolonged boiling, or by being calcined into ivory black. Confectioners are said to make use of ivory dust as a basis for soups, and it forms an excellent colourless size, employed for delicate purposes. When ivory is calcined in a close chamber, in which there is not enough oxygen to burn the carbon into carbonic acid, the organic matrix is burnt into carbon with which remain in the most intimate admixture the lime and magnesium salts which had previously hardened it. Strange to say, the calcined ivory retains its form and texture notwithstanding the destruction of the organic matrix, and specimens sometimes show the engine-turning markings on the cut surface with the utmost distinctness. It is an

animal charcoal of great purity, and owes its delicacy and particular properties to the extremely fine division of the carbon particles. When ground up and mixed with appropriate media, it affords both to the oil and the water-colour painter a most valuable black pigment; it is also used as an ingredient in the fine printing ink used for engravings and etchings.

Attempts have been made to manufacture an artificial ivory, but with no very satisfactory result. Billiard balls and other small objects have been manufactured of celluloid, a combination of gun cotton and camphor with ivory dust, which becomes plastic at a temperature of about 280°, and when cold is again quite hard and somewhat translucent. Plaster copies or reproductions of artistic ivories are prepared, under the name of fétile ivories, by casting in very fine plaster of Paris tinted with yellow ochre, and subsequently treating the surface with a mixture of wax and spermaceti or stearine. But it may fairly be said that for the purposes to which ivory is ordinarily applied no substitute approaches it either in beauty or in those other qualities which render it so agreeable and so satisfactory a material for the workman, whether carver, turner, or miniature painter.

IVORY, VEGETABLE. The plant yielding the vegetable ivory of commerce is known to botanists as *Phytelephas macrocarpa*, Ruiz and Pavon. It is a native of South America, occurring chiefly on the banks of the river Magdalena, Colombia, always found in damp localities, not only, however, on the lower coast region as in Darien, but also at a considerable elevation above the sea. It is mostly found in separate groves, not mixed with other trees or shrubs, and where travellers tell us even herbs are rarely met with, "the ground appearing as if it had been swept." The plant is severally known as the "Tagua" by the Indians on the banks of the Magdalena, as the "Anta" on the coast of Darien, and as the "Pulipunta" and "Homero" in Peru. It is a stemless or caulescent palm-like plant, the top of which is crowned with from twelve to twenty very long pinnatifid leaves. The plants are dioecious, the males forming higher, more erect, and robust trunks than the females. The male inflorescence is in the form of a simple fleshy cylindrical spadix covered with flowers; the female flowers are also in a single spadix, which, however, is shorter than in the male. The fruit consists of a conglomerated head composed of six or seven drupes, each containing from six to nine seeds, and the whole being enclosed in a walled woody covering forming altogether a globular head as large as that of a man. A single plant sometimes bears at the same time from six to eight of these large heads of fruit, each weighing from 20 to 25 lb. In its very young state the seed contains a clear insipid fluid, which travellers take advantage of to allay thirst. As it gets older this fluid becomes milky and of a sweet taste, and it gradually continues to change both in taste and consistence until it becomes so hard as to make it valuable as a substitute for animal ivory. In their young and fresh state the fruits are eaten with avidity by bears, hogs, and other animals. The seeds, or nuts as they are usually called when fully ripe and hard, are used by the American Indians for making small ornamental articles and toys. They are imported into Britain in

considerable quantities, frequently under the name of "Corozo" nuts, a name by which the fruits of some species of *Attalea* are known in Central America,—their uses being chiefly for small articles of turnery. The question of the position of this plant in the vegetable kingdom is one upon which botanists have been much divided. The plant has at different times occupied the attention of such well-known botanical authorities as Ruiz and Pavon, who gave to it its scientific name of *Phytolophus macrocarpa*, and of Martius, Morren, Humboldt, Bonpland, Spruce, and others, by whom it has been considered respectively to be near to the *Palmæ* or the *Pandaneæ*, or to belong to a separate and distinct order, the *Phytelphasiceæ* of Brongniart. This order is now placed by Le Maout and Decaisne between *Palmæ* and *Pandaneæ*, and *Phytelphas* is of course retained in it as the type,—one other genus only, that of *Wettinia*, being included.

IVORY, JAMES (1765–1842), a Scottish mathematician, was born in Dundee in 1765. In 1779 he entered the university of St Andrews, where after four years study he graduated M.A., distinguishing himself especially as an ardent and successful student of mathematics. He then entered on a regular course of theological training; but, after two sessions at St Andrews and one at Edinburgh, he abandoned all idea of the church, and in 1786 settled in his native town as assistant-teacher of mathematics and natural philosophy in a newly established academy. Three years later he became partner in and manager of a flax-spinning company at Douglastown in Forfarshire, still, however, prosecuting in moments of leisure his favourite studies. He was essentially a self-trained mathematician, and was not only deeply versed in the ancient and modern geometry, but had also, what was extremely rare in his country in those days, a full knowledge of the analytical methods and discoveries of the Continental mathematicians. His earliest memoir, dealing with an analytical expression for the rectification of the ellipse, is published in the *Transactions of the Royal Society of Edinburgh* for the year 1796; and this and his later papers on "Cubic Equations" (1799) and "Kepler's Problem" (1802) evince great facility in the handling of algebraic formulae. In 1804 after the dissolution of the flax-spinning company of which he was manager, he obtained one of the mathematical chairs in the Royal Military College at Marlow (afterwards removed to Sandhurst); and till the year 1816, when failing health obliged him to resign, he discharged his professional duties with remarkable success. During this period he published in the *Philosophical Transactions* several important memoirs, which earned for him the Copley medal in 1814, and ensured his election as a Fellow of the Royal Society in 1815. Of special importance in the history of attractions is the first of these earlier memoirs (*Phil. Trans.*, 1809), in which the problem of the attraction of a homogeneous ellipsoid upon an external point is reduced to the simpler case of the attraction of another but related ellipsoid upon a corresponding point interior to it. This beautiful theorem is known as Ivory's theorem. His later papers in the *Philosophical Transactions* treat of astronomical refractions, of planetary perturbations, of equilibrium of fluid masses, &c. For his investigations in the first named of these he received a royal medal in 1826 and again in 1839. In 1831, on the recommendation of Lord Brougham, King William IV. granted him a pension of £300 per annum, and conferred on him the Hanoverian Guelphic order of knighthood. His more purely scientific honours sufficiently prove the high position he held among his contemporaries. Thus, besides being directly connected with the chief scientific societies of his own country, the Royal Society of Edinburgh, the Royal Irish Academy, &c., he was corresponding

member of the Royal Academy of Sciences both of Paris and Berlin, and of the Royal Society of Göttingen. He died September 21, 1842.

IVORY COAST, that part of the West African seaboard which lies between the Grain Coast (now almost all belonging to Liberia) and the Gold Coast, or between Cape Palmas on the west and the Assini river on the east. Slightly different limits are assigned by different writers, and part of the territory which belongs to the traditional Ivory Coast is now officially incorporated in the Gold Coast region, the western limit of which is placed at 5° W. long., a good way to the west of the Assini river. In the older books of travel (both English and foreign) we often find the alternative names Tooth Coast (*Zahn-Küste*) or Quanaa Coast, and less frequently the coast of the five and six stripes (alluding to a kind of cotton fabric in favour with the natives). The trade in ivory has long lost its importance, and at the present day there are very few European trading stations in this part of Guinea. Fort Nemour, Grand Bassam, Pécanyin Bassam, Drewin, and Walloo are the chief points of interest.

IVREA, the ancient *Eporedia*, a town of northern Italy, capital of a district of the same name, is situated at the foot of the Alps on an eminence at the southern extremity of the beautiful and luxurious Val d' Aosta, near the river Dora Baltea, and at the termination of a branch railway line from Chivasso, 29 miles north-north-east of Turin. It is irregularly built, and has an antique and picturesque appearance. The site of the old fortifications is now occupied by promenades. The town possesses an old citadel with three lofty brick towers; a cathedral, supposed to occupy the site of a temple of Apollo; an ecclesiastical seminary, a gymnasium, and several convents and benevolent institutions. The river is crossed by a Roman bridge of one arch. There are important silk manufactures, and a considerable trade in cheese, cattle, and other produce of the Alps. The population of the town in 1871 was 5093.

Ivrea occupied the site of the old Roman *Eporedia*, which originally belonged to the Salassi, and received a Roman colony about 100 B.C., founded in accordance with the directions of the Sibylline books. It afterwards became the seat of the Longobardian dukes, and on the conquest of the Longobards by Charlemagne it was made the capital of a marquisate. In 950 Berenger II. of Ivrea succeeded in mounting the Italian throne, but he held this position for only a short time. His grandson Otto became the founder of the line of the dukes of Burgundy. Arduin, marquis of Ivrea, again aspired to the throne of Italy after the death of Otto III. in 1002, and also disputed the possession of the imperial dignity with Henry II., but was defeated by Henry in 1003, after which Ivrea was incorporated with the empire. In 1248 the town and marquisate were given to the counts of Savoy. The town was occupied by the French in 1554, 1641, and 1704. In 1799 they again made themselves masters of it; and, after losing it for some time, they reacquired it in 1800, and held it till 1814, making it the capital of the department of Doire.

IVRY-SUR-SEINE, a town and commune of France, in the arrondissement of Sceaux and the department of Seine, is situated near the left bank of the river Seine, 4 miles south-east of Paris. It has an interesting old church, but of the castle of the 17th century the fine gardens are the chief memorial. In the Petit Château died the duchess of Orleans, mother of Louis-Philippe. Ivry manufactures cordage, organs, glass, matches, manure, and chemicals. There are numerous handsome villas and fine gardens in the neighbourhood. The population in 1876 was 15,247.

Ivry-sur-Seine is of ancient foundation. In a charter of Louis IV. (D'Outremere), its name appears as *Yvriacum*, and in contemporary documents as *Yvriacum*. The fort of Ivry played an important part in the defence of Paris against the Germans in 1870–71, and in the Communist struggle of the latter year. Ivry-la-Bataille, in the department of Eure, where Henry IV. won his victory over the Leaguers in 1590, is not to be confounded with Ivry-sur-Seine.

IVY (A. S., *Igig*; Germ., *Ephen*; perhaps connected with *apium*, ἀπιον) is the collective designation of certain species

FIG. 1.—European Ivy (*Hedera Helix*). Half nat. size. and varieties of *Hedera*, the important alliances of which are *Aralia* and *Panax*, which, with some twenty other

FIG. 2.—*Hedera Helix*, var. *Deltoidea*. Half nat. size. less-known genera, constitute the natural order *Araliaceae*. There are fifty species of ivy recorded in modern books, but

FIG. 3.—Fruiting Form of *Hedera Helix*. Half nat. size. they may be reduced to three. The European ivy is the *Hedera Helix* of Linnæus (figs. 1-3), a plant subject to in-

finite variety in the forms and colours of its leaves, but the tendency of which is always to a three-lobed form when climbing and a regular ovate form of leaf when producing fruit (fig. 3). The African ivy is *H. canariensis*, Willd. (fig. 4), otherwise known as the Irish ivy, a native of Africa and the adjacent islands. This also varies, but in a less degree than *H. Helix*, from which its leaves differ in their larger size, rich deep green colour, and a prevailing tendency to

FIG. 4.—African Ivy (*Hedera canariensis*). Half nat. size.

a five-lobed outline. When in fruit the leaves are usually three-lobed, but they are sometimes entire and broadly ovate. The Asiatic ivy is *H. colchica*, Koch (fig. 5), otherwise known as *H. regneriana* and *H. ragusina*. This has ovate, obscurely three-lobed leaves of a coriaceous texture and a deep green colour; in the tree or fruiting form the leaves are narrower than in the climbing form, and without any trace of lobes. Distinctive characters are also to be

FIG. 5.—Asiatic Ivy (*Hedera colchica*). One-third nat. size.

found in the appendages of the pedicels and calyx, *H. Helix* having six-rayed stellate hairs, *H. canariensis* fifteen-rayed hairs, and *H. colchica* yellowish two-lobed scales. A revision of the natural order *Hederaceae* by the late Dr B. Seemann will be found in the *Journal of Botany*, 1864-5-6.

It is of the utmost importance to note the difference

of characters of the same species of ivy in its two conditions of climbing and fruiting. The first stage of growth, which we will suppose to be from the seed, is essentially scandent, and the leaves are lobed more or less. This stage is accompanied with a plentiful production of the clasps by means of which the plant becomes attached and obtains support. When it has reached the summit of the tree or tower, the stems being no longer able to maintain a perpendicular attitude fall over and become horizontal or pendent. Coincidentally with this change they cease to produce clasps, and the leaves are strikingly modified in form, being now narrower and less lobed than on the ascending stems. In due time this tree-like growth produces terminal umbels of greenish flowers, which are five-divided, with the styles united into a very short one. These flowers are succeeded by smooth black or yellow berries, containing two to five seeds. The yellow-berried ivy is met with in northern India and in Italy, but in northern Europe it is known only as a curiosity of the garden, where, if sufficiently sheltered and nourished, it becomes an exceedingly beautiful and fruitful tree.

It is stated in books that some forms of sylvestral ivy never flower, but a negative declaration of this kind is valueless. Sylvestral ivies of great age may be found in woods on the western coasts of Britain that have apparently never flowered, but this is probably to be explained by their inability to surmount the trees supporting them, for until the plant can spread its branches horizontally in full daylight, the flowering or tree-like growth is never formed. As regards the clasps, respecting which various views prevail, they are veritable roots, as may be proved by planting an ivy in a damp fern case, when the clasps acquire a new character and penetrate the soil and perform all the functions of roots, suggesting that the hard felt-like form in which they appear on old ivy stems is the consequence simply of an arrest of development. We occasionally see ivies on towers completely isolated from the soil through the destruction of their stems. In these cases the clasps penetrate the structure, and in the capacity of roots obtain the needful sustenance, and the plant lives though no longer deriving nourishment from the earth.

A question of great practical importance arises out of the relation of the plant to its means of support. A moderate growth of ivy is not injurious to trees; still the tendency is from the first inimical to the prosperity of the tree, and at a certain stage it becomes deadly. Therefore the growth of ivy on trees should be kept within reasonable bounds, more especially in the case of trees that are of special value for their beauty, history, or the quality of their timber. In regard to buildings clothed with ivy, there is nothing to be feared so long as the plant does not penetrate the substance of the wall by means of any fissure. Should it thrust its way in, the natural and continuous expansion of its several parts will necessarily hasten the decay of the edifice. But a fair growth of ivy on sound walls that afford no entrance beyond the superficial attachment of the clasps is, without any exception whatever, beneficial. It promotes dryness and warmth, reduces to a minimum the corrosive action of the atmosphere, and is altogether as conservative as it is beautiful.

The economical uses of the ivy are not of great importance. The wood is used by leather cutters to sharpen their knives. From the trunk a resinous substance is obtained called "ivy gum," which is employed for the relief of toothache. The leaves are eaten greedily by horses, deer, cattle, and sheep, and in times of scarcity have proved useful. The flowers afford a good supply of honey to bees; and, as they appear in autumn, they occasionally make amends for the shortcomings of the season. The berries

are eaten by wood pigeons, blackbirds, and thrushes. From all parts of the plant a balsamic bitter may be obtained, and this in the form of *hederic acid* is the only preparation of ivy known to chemists.

In the garden the uses of the ivy are innumerable, and the least known though not the least valuable of them is the cultivation of the plant as a bush or tree, the fruiting growth being selected for this purpose. The variegated tree forms of *H. Helix*, with leaves of creamy white, golden green, or rich deep orange yellow, soon prove handsome miniature trees, that thrive almost as well in smoky town gardens as in the pure air of the country, and that no ordinary winter will injure in the least. The tree-form of the Asiatic ivy (*H. colchica*) is scarcely to be equalled in beauty of leafage by any evergreen shrub known to English gardens, and, although in the course of a few years it will attain to a stature of 5 or 6 feet, it is but rarely we meet with it, or indeed with tree ivies of any kind; but little attention hitherto having been given to this subject. The scandent forms are more generally appreciated, and are now much employed in the formation of marginal lines, screens, and trained pyramids, as well as for clothing walls. A very striking example of the capabilities of the commonest ivies, when treated artistically as garden plants, may be seen in the Zoological Gardens of Amsterdam, where several paddocks are enclosed with wreaths, garlands, and bands of ivy in a most picturesque manner.

The ivies known in gardens number about sixty varieties, the whole of which are figured and described in *The Ivy, a Monograph*, by Shirley Hibberd, 1872. To cultivate these is an extremely simple matter, as they will thrive in a poor soil and endure a considerable depth of shade, so that they may with advantage be planted under trees. The common Irish ivy is often to be seen clothing the ground beneath large yew trees where grass would not live, and it is occasionally planted in graveyards in London to form an imitation of grass turf, for which purpose it is admirably suited.

The ivy, like the holly, is a scarce plant on the American continent. In the northern United States and British America the winters are not more severe than the ivy can endure, but the summers are too hot and dry, and the requirements of the plant have not often obtained attention. In districts where native ferns abound the ivy will be found to thrive, and the varieties of *Hedera Helix* should have the preference. But in the drier districts ivies might often be planted on the north side of buildings, and, if encouraged with water and careful training for three or four years, would then grow rapidly and train themselves. A strong light is detrimental to the growth of ivy, but this enhances its value, for we have no hardy plants that may be compared with it for variety and beauty that will endure shade with equal patience. (S. H.)

IXION, a hero of Thessalian legend, was king of Gyrtion. As a punishment for the murder of his father-in-law, Deioneus, madness came upon him, until Zeus purified him of his crime and received him as a guest in Olympus. Æschylus uses him as the type of a guilt-laden mortal purified and pardoned by divine grace, and the mythical representative of all later penitents (*Eum.*, 441). Ixion abused his pardon by trying to seduce Hera; but the goddess substituted for herself a cloud, by which he became the father of the Centaurs. Zeus bound him on a fiery wheel, which rolls unceasingly through the air. The wheel is one of the commonest symbols of the sun, and Ixion is clearly the sun-god, and a form of Zeus. His wife Die is, as her name shows, the consort of Zeus (*Il.*, xiv. 317), and her son Pirithous is called son of Zeus as well as of Ixion. Nephele, the cloud, occurs also as wife of Zeus-Athamas, as here of Zeus-Ixion.

J

J. THIS letter is a modified I. If we consider its place in the alphabet immediately after I, and the corresponding position of V and W after U, we are naturally led to conclude that the new letter was intentionally formed by some one who wished to have a special symbol to denote the palatal consonant *y*, into which *i* readily passes, just as *w* denotes the labial consonant into which *u* passes. For the symbol is a new one. It is not found in the Latin alphabet, in which I was employed alike for the vowel and consonant—though sometimes the I was doubled for the consonant. So far, however, as we can see, J in its origin was nothing but a fancy of the scribes. In 15th century English MSS. the *i*-symbol was drawn a little below the line to denote J, and by degrees this was curled slightly to the left. Again in writing numbers such as vii, viii, it was usual to write uiij, uiij, &c. This was imitated in early printing, and hence arose *j*, the earliest regularly curled form. At the same time we find only I in capitals, not J—a modern letter made to correspond with little *j*. This at least seems to have been the history of the symbol in England, and possibly the French history is similar.

It follows from this that the value of J ought to have been in all languages, not that which it has with us, nor yet that which it has in France, but that which it has in Germany, *e.g.*, in "Jahr," our "year,"—which is retained by us in the borrowed Hebrew word "Halleljah." But generally in English J denotes the sound which is best represented by *dh*; in this compound *zh* represents the French *j*-sound: the difference between the two may be well seen by comparing the English "John" with French "Jean" (Engl. J = *dh*, Fr. J = *zh*). J, however, is not the only symbol which we employ to represent this sound; we also use G in "gem," "gin," and GE at the end of words such as "edge," "hedge," "wedge," "knowledge," "sings"; while the *zh*-sound (which is the sonant corresponding to the surd *sh* in "shall," "wish," &c.) is never represented with us by J, but by numerous other letters, *e.g.*, in *rouge* (a word borrowed from the French), *pleasure*, *division*, *asure*. See A. J. Ellis, *Early English Pronunciation*, c. vi.

The way in which this *dh*-sound arose seems to have been as follows. In mediæval Latin an inorganic *d*-sound was produced before a *y*-sound,—sometimes medial, as in "ma-d-i-us" for "maius," sometimes initial, as in "diacere" for "iacere." This arose from a careless pronunciation of the palatal *y*. That sound has been liable to obscuration in many languages—notably in Greek, in which a *δ* was developed before it to a very remarkable degree; see Curtius, *Grundzüge*, book iii. D. iii. A simple example may be seen in the particle *δῆ*, which is identical with German "ja" our "yea": the sound of the word was originally *yā*; then in Greek a *d* sprang up before the *y*, producing *dya*; and finally the *y* was expelled altogether, leaving the *d*-sound alone. Sometimes a double sound was produced (denoted by the symbol *z*) as in *ζῦμα* for (*dy*am-ja or *dzum* for *dzum-go*; here the sound may have been *dh*, but was more probably *dz*; be this as it may, the change in Greek, which produced a great effect upon the language, may help us to understand how the *d* sprang up in late Latin, and how the compound sound *dh* was perpetuated in Italian—but there represented by *gi*, as in "giacere," "Giacomo," &c.—and in Old French, in which language it passed at a later time into the modern *sh*-sound described above. But it was introduced into England from France

with its original value in French words. The sound, however, had already existed in England in words of Teutonic origin, the class already mentioned ending in *ge*; "edge" was originally spelt "ecg," and was doubtless sounded as we now sound "egg"; but the final *g*-sound had been palatized, though probably not before the 13th century. These are the two sources of the *dh*-sound in England, and it is noteworthy that the sound when final has never been spelt with *j*, as though a consciousness of the difference of origin in these cases lingered on in the language. A parallel change (but much more common) has taken place in the *k*-sound: this passed into a *ch*-sound in very many words and not merely at the end, but also at the beginning as in "chill," "child," "church," &c., and this *ch*-sound is not the simple palatal *ch*, but *tsh*, which therefore bears exactly the same relation to *k* as *dh* (our *j*) bears to *g*.

It appears then that the symbol J ceased to have its proper signification in English by connexion with that of another compound sound borrowed from the French. Meanwhile another symbol Y was being prepared to do the work of J. G at the beginning of a word was often weakened into the *y*-sound: thus "genew" (comp. German "genug") became "ynow," our "enough." Then the old English form of *g* (that is, *ȝ*) was used to express this *y*-sound, and out of it the symbol *y* was gradually developed, while the French form (*g* or nearly so) was kept for the momentary sound.

In Spanish the symbol J denotes the momentary sound corresponding to *y*,—that is, the palatal denoted by *ch* in German, and heard also in Scotland, *e.g.*, in "loch."

JABALPUR, or **जबलपुर**,¹ a British district in the commissionarship of the Central Provinces, India, between 21° 12' and 23° 56' N. lat., and between 76° 40' and 81° 35' E. long., is bounded on the N. by Panna and Mailhar, on the E. by Rewah, on the S. by the districts of Mandla, Seoni, and Narsinhpur, and on the W. by Damoh district.

Jabalpur consists of a long narrow plain running north-east and south-west, and shut in on all sides by highlands. This plain, which forms an offshoot from the great valley of the Nerbudda, is covered in its western and southern portions by a rich alluvial deposit of black cotton-soil. At Jabalpur town the soil is sandy, and water plentiful near the surface. The north and east belong to the Ganges and Jumna basins, the south and west to the Nerbudda basin. Thus between Jabalpur and Mirzāpur lies the great watershed betwixt the Gulf of Cambay and the Bay of Bengal. The Nerbudda flows through the district for 70 miles from east to west, passing about 9 miles below Jabalpur town through the famous marble rocks, where it throws itself from a rocky ledge with a fall of 30 feet, called *Dhūdan-dhar*, or the "misty shoot."

The population was estimated in 1877 at 555,796; but a more careful census taken in 1872 returned it at 522,859, of whom 270,237 were males and 252,622 females. The ethnic division in 1877 showed—Europeans, 776; Eurasians, 201; aboriginal tribes, 105,349; Hindus, 416,770; Mahometans, 27,282; Buddhists and Jains, 3854. Jabalpur, the capital, which has a population of 55,188, is the only town with more than 5000 inhabitants. Of the total area of 3918 square miles, only 1320 are cultivated, but 1308 more are returned as cultivable. Of the cultivated land 8449 acres are irrigated—entirely by private enterprise. Cereals, rice, cotton, and oil-seeds are the principal crops. The district is rich in garden

¹ The division of Jabalpur or Jabulpore is one of the four which make up the Central Provinces. It comprises the districts of Jabalpur, Sāgar (Saugor), Damoh, Seoni, and Mandla, has an area of 18,564 square miles, and in 1878 had a population of 1,339,100.

produce, raising, besides the ordinary Indian fruits, peaches, pine-apples, strawberries, and potatoes. Both the plains and the high lands are well wooded; the forest produce is of considerable value, consisting of lac and gum, and *teaser* silk. The trade of the district converges at Jabalpur town, which is one of the most important railway centres in India, being at the junction of the Great Indian Peninsula and East Indian systems. One of the chief manufactures is iron. The most productive mines are at Dubwánt, Agaria, and Janti; but the most important are those of the Kumbhí parganá, which supply Panágar, the chief seat of the iron industry in the district. The other manufactures include brass utensils, cotton cloth, and leather articles. Coal is found at several places. The total revenue in 1876-77 was £76,013. The number of Government or aided schools was 125, attended by 7015 pupils. The climate is healthy, and the temperature extremely moderate. As a rule, the hot weather extends only over two months, and, except immediately before the rains, is not oppressive. The rains last from early in June until the latter part of September. The prevailing diseases of the district are fevers and dysentery. Cholera and small-pox are occasional visitants, and influenza at times assumes the character of an epidemic. In 1876 eight charitable dispensaries afforded medical relief to 35,795 indoor and outdoor patients.

The early history of Jabalpur is unknown; but inscriptions record the existence during the 11th and 12th centuries of a local line of princes of that Háthai race which is so closely connected with the history of Gondwána. In the 16th century the Gond rájá of Garhá Mandla extended his power over fifty-two districts, including the present Jabalpur. During the minority of his grandson, Asaf Khán, the viceroy of Kara Mánikpur, conquered the Garhá principality and held it at first as an independent chief. Eventually he resigned his pretensions, and submitted himself to the emperor Akbar. The Delhi power, however, enjoyed little more than a nominal supremacy; and the princes of Garhá Mandla maintained a practical independence until their subjugation by the governors of Sagar (Sangor) in 1781. In 1798 the pesháwa granted the Nerbudda valley to the Bhonslá princes of Nágpur, who continued to hold the district until the British occupied it after an engagement on the 19th December 1817. At first the Sagar and Nerbudda territories were governed by a commissioner in subordination to the resident at Nágpur; but in 1881 Jabalpur was formed into a separate district of the Central Provinces.

JABALPUR, or JUBBULPÖRE, the headquarters of the above district, is situated in 23° 11' N. lat., 79° 59' E. long., in a rocky basin, at an elevation above sea-level of about 1458 feet, 165 miles north-east from Nágpur, and 108 miles south-east from Sagar. The numerous gorges in the neighbouring rocks have been taken advantage of to surround the town with a series of lakes, which, shaded by fine trees, and bordered by fantastic crags and massy boulders, add much beauty to the suburbs. The town itself is modern, and is laid out in wide and regular streets. A streamlet separates the civil station and cantonment from the town; but, though the climate is mild, a swampy hollow beneath renders the site unhealthy for Europeans. Jabalpur contains a school of industry, where tents and carpets are largely manufactured. The opening of the railway system has immensely developed the trade of Jabalpur, which has now become one of the most important centres of commerce in the Central Provinces. In 1875-76 the total imports were valued at £567,000, the chief items being piece-goods, wheat, sugar, metals, salt, rice, country cloth, oil-seeds, spices, *ghí*, oil, inferior grains, lac, and raw cotton. The total exports, principally raw cotton and wheat, were valued at £160,000. The population, almost entirely Hindu, was 55,188 in 1877.

JABIRU, according to Maregrave¹ the Brazilian name of a bird, subsequently called by Linnæus *Mycteria americana*, one of the largest of the Storks, *Ciconiidae*, which occurs from Mexico southwards to the territory of the Argentine Republic. It stands between 4 and 5 feet in height, and is conspicuous for its massive bill, slightly upturned, and its entirely white plumage; but the head and neck are bare and black, except for about the lower third part of the latter, which is bright red in the living

bird. Very nearly allied to *Mycteria*, and also commonly called Jabirus, are the birds of the genera *Xenorhynchus* and *Ephippiorhynchus*—the former containing one or (in the opinion of some) two species, *X. australis* and *X. indicus*, and the latter one only, *E. senegalensis*. These belong to the countries indicated by their names, and differ chiefly by their feathered head and neck, while the last is sometimes termed the Saddle-billed Stork from the very singular shape of its beak. Somewhat more distantly related are the gigantic birds, known to Europeans in India and elsewhere as Adjutants, belonging to the genus *Leptoptilus*, distinguished by their sad-coloured plumage, their black scabrous head, and their enormous tawny pouch, which depends occasionally some 16 inches or more in length from the lower part of the neck, and seems to be

Jabiru.

connected with the respiratory, and not, as commonly believed, with the digestive system. In many parts of India *L. dubius*, the largest of these birds, the *Hargila* as Hindus call it, is a most efficient scavenger, sailing aloft at a vast height and descending on the discovery of offal, though frogs and fishes also form part of its diet. It familiarly enters the large towns, in many of which on account of its services it is strictly protected from injury, and, having satisfied its appetite, seeks the repose it has earned, sitting with its feet extended in front in a most grotesque attitude. A second and smaller species, *L. javanicus*, has a more southern and eastern range; while a third, *L. crumenifer*, of African origin, and often known as the Marabou-Stork, gives its name to the beautifully soft feathers so called, though our markets are mostly supplied with them by the Indian species (in which they form the lower tail-coverts), if not, as some suppose, by Vultures. (A. N.)

JABORANDI, a name popularly applied in a generic manner in Brazil and South America to a number of different plants, all of which possess more or less marked sialogogue and sudorific properties. In the year 1875 a drug was introduced under the above name to the notice of

¹ An apparently accidental transposal of two of the figures given by this author (*Hist. Nat. Brasilie*, vol. 200, 201) misled several of his successors from Piso to Brisson, until noticed by De Buffon (*Hist. Nat. Oiseaux*, vii. pp. 280-286).

medical men in France by Dr Coutinho of Pernambuco, its botanical source being then unknown. When examined by Professor Baillon, the fragments of leaves were found to belong to *Pilocarpus pennatifolius*, Lem., of the natural order *Rutaceae*. About the same time Holmes found that the commercial drug in England consisted also to some extent of *P. Selloanus*, Engl., and his statement was afterwards confirmed by Baillon, and also by Balansa, the latter of whom observed that species to be employed in Asuncion, and collected for exportation to Europe. *P. pennatifolius* is a slightly branched shrub about 10 feet high, growing in the eastern provinces of Brazil. The compound imparipinnate leaves, which are placed alternately on the stem, are often $1\frac{1}{2}$ feet long, and consist of from 2 to 5 pairs of opposite leaflets, the terminal one having a longer pedicel than the others. The leaflets are oval,

Jaborandi—*a*, leaf (reduced); *b*, leaflet (natural size); *c*, flower; *d*, fruit (natural size).

lanceolate, entire, and obtuse, and often slightly emarginate, from 3 to 4 inches long and 1 to $1\frac{1}{2}$ inch broad in the middle. When held up to the light they may be observed to have scattered all over them numerous pellucid dots or receptacles of secretion immersed in the substance of the leaf. The leaves in size and texture bear some resemblance to those of the cherry-laurel (*Prunus Laurocerasus*, L.), but are less polished on the upper surface. The flowers, which are produced in spring and early summer, are borne on a raceme, 6 or 8 inches long, and the fruit consists of 5 carpels, of which not more than two or three usually arrive at maturity. These present the characters of the natural order to which the plant belongs. (See *Pharm. Journ.*, ser. 3, vol. v. p. 582.) *P. Selloanus* differs from the above chiefly in the leaves never being hairy and in the longer and more slender

pedicels of the flowers. The leaves are the part of the plant usually imported, although occasionally the stems and roots are attached to them. The active principle for which the name *pilocarpine*, suggested by Holmes, was ultimately adopted, was discovered almost simultaneously by Hardy in France and Gerrard in England, but was first obtained in a pure state by Petit of Paris. It is an alkaloid, of a soft viscous character, slightly soluble in water, and very soluble in alcohol, ether, and chloroform. It strongly rotates the plane of polarization to the right, and forms crystalline salts of which the nitrate, hydrochlorate, and phosphate are those chiefly used in medicine. The nitrate and phosphate are insoluble in ether, chloroform, and benzol, while the hydrochlorate and hydrobromate dissolve both in these menstrua and in water and alcohol; the sulphate and acetate being deliquescent are not employed medicinally. The formula of the alkaloid is given by Kingzett as $C_{23}H_{21}N_3O_4 + 4H_2O$. The volatile oil contained in the leaves was found by Hardy to be a complex body consisting of *pilocarpene*, which is a dextrogyre hydrocarbon, sp. gr. 0.852, boiling at $178^\circ C$. ($352^\circ 4$ Fahr.), of another hydrocarbon boiling at $250^\circ C$. (492° Fahr.), and a third boiling at a still higher temperature, and forming a colourless transparent solid.

The physiological action of jaborandi is that of an extremely powerful diaphoretic and sialogogue. It acts as a sedative on the heart, probably influencing the circulation through the terminal branches of the vasomotor nerves, and widening the arteries and lessening their tension. The alkaloid does not cause the nausea and vertigo often resulting from the use of the crude drug. Atropine and pilocarpine have been proved to possess antagonistic and mutually antidotal properties. Jaborandi, in the form of liquid extract, tincture, or alkaloid, has been found useful in some forms of chronic pneumonia, in relieving pleuritic effusion in dropsy, in diabetes insipidus, in Bright's disease, as a galactagogue, and more recently in diphtheria. In small doses it restrains the perspiration of phthisis. It has also been proposed as a remedy for hydrophobia. As a mydriatic pilocarpine is said to possess an advantage over eserine, inasmuch as it contracts the pupil of the eye to an equal extent, while it produces less irritation of the conjunctiva, less supraorbital pain, and less spasm of the accommodating apparatus.

According to Peckolt the following are known in some of the Brazilian provinces as jaborandi:—*Serronia Jaborandi*, Guill., *Piper reticulatum*, L., *P. nodulosum*, Link., *Artanthe mollissima*, Miq., *Aubletia trifolia*, Rich., *Xanthoxylum elegans*, Engl. To these may be added *Piper citrifolium*, Lam. Only one of them appears to have undergone chemical examination. In 1875 Parodi isolated from the *Serronia Jaborandi* a crystalline alkaloid $C_{10}H_{13}N_3O_6$, which he named *jaborandine*. It is slightly soluble in ether, has but a weak affinity for acids, and appears to belong to the piperine group; at the same time a volatile oil of an acrid and biting taste was also obtained from the plant.

See *Pharmacography*, 2d ed., p. 113; Stillé and Maisch, *National Dispensatory*, 1879; Bentley and Trimen, *Medicinal Plants*, No. 48; Kingzett, *Journ. Chem. Soc.*, Oct. 1876, p. 367; Hardy, in *Pharmaceutical Journal* (3) vi. p. 565, vii. p. 496; Holmes, *Ibid.* (8) v. pp. 631, 641, 784; and other papers in the same journal and in *British Medical Journal*, 1876, 1876, 1877. (E. M. H.)

JACA, a frontier city of Spain, in the province of Huesca, formerly capital of a partido in the kingdom of Aragon, is situated on the left bank of the Aragon, at an elevation of 2333 feet above the sea-level. It is the seat of a bishop, and the most important of the public buildings is the massive cathedral, the construction of which was begun under King Ramiro in 1040. The industries of the city are unimportant. Its population in 1877 was 4155.

The diligence road from Zaragoza to Pau by the Puerto de Canfranc passes through Jaca.

The origin of the city is unknown. The Jacetani (*Iacetani*) are mentioned as one of the most celebrated of the numerous small tribes inhabiting the basin of the Ebro by Strabo (p. 161), who adds that their territory was the theatre of the wars between Sertorius and Pompey, and afterwards between Pompey's son Sextus and the generals of Caesar. They are probably identical with the Lacetani of Livy (xxi. 60, 61) and Caesar (*B.C.*, i. 60). Jaca at an early period of the invasion fell into the possession of the Moors, by whose writers it is referred to under the name of Dyaka as one of the chief places in the province of Saragosa (Zaragoza). The date of its reconquest is uncertain, but it must have been before the time of Ramiro, who gave it the title of "city," and in 1063 held within its walls a council, which, inasmuch as the people were called in to sanction its decrees, is regarded as having been of great importance in the history of the parliamentary institutions of the peninsula. The original "fuero" of Jaca is one of the oldest extant. In 1705 Jaca was the only city which stood out for King Philip, from whom, in consequence, it received the title of "most noble, may I say venerated." In the war of independence in 1808 it surrendered to the French; it also yielded to General Mina in 1814.

JACAMAR, a word formed by Brisson from *Jacameri*, the Brazilian name of a bird, as given by Marcgrave, and since adopted in most European tongues for the species to which it was first applied and others allied to it, forming the Family *Galbulidae*¹ of ornithologists, the precise position of which is uncertain, since the best authorities differ greatly thereupon. All will agree that the Jacamars belong to the great heterogeneous group called by Nitzsch *Picaria*, but further into detail it is hardly safe to go. The *Galbulidae* have zygodactylous feet, like the *Oculidae*, *Bucconidae*, and *Picidae*, they also resemble both the latter in laying glossy white eggs, but in this respect they bear the same resemblance to the *Monotidae*, *Alcedinidae*, *Meropidae*, and some other groups, to which affinity has been claimed for them. In the opinion of Mr. Sclater² the Jacamars form two groups—one consisting of the single genus and species *Jacamerops aureus* (*J. grandis* of most authors), and the other including all the rest, namely, *Urogalba* with two species, *Galbula* with nine, *Brachygalba* with five, and *Jacamaralcyon* and *Galbalcyphynchus* with one each. They are all rather small birds, the largest known being little over 10 inches in length, with sharply pointed bills, and the plumage in every case more or less resplendent with golden or bronze reflexions, but at the same time comparatively soft. *Jacamaralcyon tridactyla* differs from all the rest in possessing but three toes (as its name indicates) on each foot, the hallux being deficient. With the exception of *Galbula melanogenia*, which is found also in Central America and southern Mexico, all the Jacamars inhabit the tropical portions of South America eastward of the Andes, *Galbula ruficauda*, however, extending its range to the islands of Trinidad and Tobago.³ Very little is known of the habits of any of the species. They are seen sitting motionless on trees, sometimes solitary, at other times in companies, whence they suddenly dart off at any passing insect, catch it on the wing, and return to their perch. Of their nidification almost nothing has been recorded, but the species above-mentioned as occurring in Tobago is said by Mr. Kirk—apparently the only European observer of the mode of propagation in these birds—to make its nest in marl-banks, digging a hole about an inch and a half in diameter and some 18 inches deep. From the accounts

received by other travellers we may possibly infer that more of the Family possess the same habit. (A. N.)

JACANA,⁴ the Brazilian name, according to Marcgrave, of certain birds, since found to have some allies in other parts of the world, which are also very generally called by the same appellation. They have been most frequently classed with the Water-hens or Rails (*Rallidae*), but are now recognized by many systematists as forming a separate Family, *Paridae*,⁵ whose leaning seems to be rather towards the *Limicolae*, as apparently first suggested by Blyth, a view which is supported by the osteological observations of Professor Parker (*Proc. Zool. Society*, 1863, p. 513), though denied by Professor A. Milne-Edwards (*Ois. foss. de la France*, ii. p. 110). The most obvious characteristic of this group of birds is the extraordinary length of their toes and claws (the latter being turned upwards), whereby they are enabled to walk with ease

Jacana.

over water-lilies and other aquatic plants growing in rivers and lakes. It is also remarkable for the carpal spurs with which its members are armed. The Family has been divided into four genera,—of which *Parra*, as now restricted, inhabits South America; *Metopidius*, hardly differing from it, has representatives in Africa, Madagascar, and the Indian Region; *Hydractator*, also very nearly allied to *Parra*, belongs to the northern portion of the Australian Region; and *Hydrophasianus*, the most extravagant form of the whole, is found in India, Ceylon, and China—the draughtsmen of the country last named making it a favourite subject of their pictures, in which its flowing tail and the very peculiar filamentous appendages to the tip of its first and fourth primaries are generally faithfully represented. In habits the Jacanas have much in common with the Water-hens, but that fact is insufficient to warrant the affinity asserted to exist between the two groups; for in their osteological structure, as already implied, there is much difference, and the resemblance seems to be only that of analogy. The *Paridae*, or at least such of them as have been sufficiently observed, lay very peculiar eggs, of a rich olive-brown colour, in most cases closely marked with dark lines, thus presenting an appearance by which they may be readily known from those of any other birds, though an approach to it is occasionally to be noticed in those of certain *Limicolae*, and especially of certain *Charadriidae*. The genus *Palamedia*, consisting of the bird very commonly

¹ *Galbula* was first applied to Marcgrave's bird by Moshring. It is another form of *Galgulus*, and seems to have been one of the many names of the Golden Oriole. See IZBERGUS (vol. xii. p. 696).

² *A Monograph of the Jacamars and Pull-birds*, &c., London (in course of publication).

³ The singular appearance, recorded by Canon Tristram (*Zoologist*, p. 3909), of a bird of this species in Lincolnshire seems to require notice. No instance seems to be known of any Jacamar having been kept in confinement or brought to this country alive. The fact, if such it be, is therefore more difficult of explanation than the occurrence of Dr Plot's Toucan near Oxford.

⁴ In pronunciation the *e* is soft, and the accent placed on the last syllable.

⁵ The classic *Parra* is by some authors thought to have been the Golden Oriole (*of Icterus*), while others suppose it was a Jay or Pie. The word seems to have been imported into Ornithology by Aldrovandus, but the reason which prompted Linnaeus to apply it, as he seems first to have done, to a bird of this group, cannot be satisfactorily stated.

called the Horned Screamer, was at one time thought to be allied to this Family, but is now, by almost common consent, relegated to the neighbourhood of the Geese (*Anatidae*), though forming a separate Family. (A. N.)

JACINTH, a name given to the reddish-brown variety of zircon, known also as *Hyacinth*. The hyacinthus of ancient writers appears to have been our sapphire, or blue corundum, while the jacinth or hyacinth of modern mineralogists may have been the ancient *lyncurium*. The true jacinth is a silicate of zirconium, crystallizing in the dimetric or tetragonal system, and exhibiting strong double refraction. Its hardness is denoted by 7·5; that is to say, it is harder than quartz but not so hard as topaz. The most distinctive feature of the stone, serving to distinguish it from other minerals with which it is likely to be confounded—such as garnet, topaz, and cairngorm—is its high specific gravity; this varies, however, in different varieties of zircon from 4·05 to 4·75. On ignition, most zircons increase in density without loss of weight; but Professor Church has shown that the jacinth of Mudgee, when heated, remains practically unchanged in density, though it loses colour. It is only when the native silicate of zirconium presents a red colour that it is known as jacinth or hyacinth,—those varieties which are of yellow brown and green colours being distinguished, if transparent, by the name of *sargoon*, while the dull-coloured varieties, more or less opaque, are termed simply *zircon*. The lustre of the zircon when polished is of the peculiarly brilliant character designated *adamantine*, and indeed some of the pale jargoons are often sold as inferior diamonds. The Singalese variety, found chiefly at Matura, has been termed "Matura diamond." The true jacinth, or red zircon, is an extremely rare stone. Fine examples, however, have been found of late years as pebbles among the auriferous detritus at Mudgee in New South Wales. Small crystals occur in the river-sands of Expally, Puy-en-Velay, France, but these are too small to be cut as ornamental stones. Most of the gems termed jacinth or hyacinth by jewellers belong to the deep orange-brown variety of garnet known to mineralogists as *essonite* or *cinnamon stone*: the lower specific gravity of the garnet serves to distinguish the false from the true jacinth. It is probable that many of the antique cameo and intagli reputed to be jacinths are merely hyacinthine garnets.

JACKAL (*Canis aureus*), a carnivorous mammal belonging to the dog family (*Canidae*), and believed by many naturalists to be one of the species from which certain of the semi-domesticated dogs of Asia and North Africa have been derived. It is dog-like in external appearance, and there is, according to Geoffroy Saint Hilaire, no constant difference between its structure and that of the small canine races. It resembles them in dentition, in the roundness of its eye pupils, in its period of gestation, and to a large extent also in its habits, while like the dog it is subject to hydrophobia. It grows to a height of 15 inches at the shoulders, and to a length of about 2 feet, exclusive of its bushy fox-like tail. Its fur is of a greyish-yellow colour, darker on the back and lighter coloured beneath. An excrescence consisting of a horny cone, half an inch in length, and concealed by a tuft of hair, is, according to Emerson Tennent, sometimes found on the head of the jackal. The Singalese aver that it is only found on the leader of the pack, and they esteem it as an invaluable talisman. Jackals, of which there are several well-marked varieties, are widely distributed throughout southern Asia and the north of Africa. They are nocturnal animals, concealing themselves until dusk in woody jungles and other natural lurking places, thereafter sallying forth in packs, which sometimes number two hundred individuals, and visiting farmyards, villages, and towns in search of food. This consists for the most part of the smaller mammals

and poultry, although their association in packs enables them also to hunt down antelopes and sheep. When unable to obtain living prey, they feed upon carrion and refuse of all kinds, and are thus useful in removing putrescent matter from the streets of Eastern towns. They are also fond of grapes and other fruits, and are thus the pests of the vineyard as well as the poultry-yard. The cry of the jackal has been described as even more appalling than that of the hyena, a shriek from one member of a pack being the signal for a general chorus of screams, which is kept up during the greater part of the night. In India these animals are occasionally hunted with foxhounds

Jackal.

and greyhounds, and from their extreme cunning and pluck they are said to afford excellent sport. When brought to bay, they frequently turn upon their assailants and inflict severe wounds with their teeth; at other times they have been known to feign death as a means of escape. Jackals are readily tamed; and domesticated individuals are said, when called by their masters, to wag their tails, crouch, and throw themselves on the ground, and otherwise behave in a dog-like fashion. The jackal, like the fox, has a peculiarly offensive odour, due to the secretion of a gland at the base of the tail, but in domesticated specimens this odour is much fainter than in the wild forms.

JACKDAW, or simply DAW (Old Low German, *Daha*; Dutch, *Kaauw*), the prefix being doubtless imitative of the bird's cry, as indeed is probably the substantive name¹—one of the smallest species of the genus *Corvus* (Crov, vol. vi. p. 617), and a very well known inhabitant of Europe, the *C. monedula* of ornithologists. In some of its habits it much resembles its congener the Rook (*q.v.*), with which it constantly associates during a great part of the year; but, while the Rook only exceptionally places its nest elsewhere than on the boughs of trees and open to the sky, the Daw almost invariably chooses holes, whether in rocks, hollow trees, rabbit-burrows, or buildings. Nearly every church-tower and castle, ruined or not, is more or less numerously occupied by Daws, and if they are not

¹ See Professor Skeat's *Etymol. Dictionary*, pp. 153, 304.

also tenants with us of our own dwellings, it is because convenient recesses are therein ordinarily wanting. Yet our chimneys frequently give them the accommodation they desire, much to the annoyance of the householder, who finds the funnel choked by the quantity of sticks brought together by the birds, since their industry in collecting materials for their nests is as marvellous as it often is futile.¹ In some cases the stack of loose sticks piled up by Daws in a belfry or tower has been known to form a structure 10 or 12 feet in height, and hence this species may be accounted one of the greatest nest-builders in the world. The style of architecture practised by the Daw thus brings it more than the Rook into contact with man, and its familiarity is increased by the boldness of its disposition, which, though tempered by discreet cunning, is hardly surpassed among birds. Its small size, in comparison with most of its congeners, alone incapacitates it from inflicting the serious injuries of which some of them are often the authors, yet its pliferrings are not to be denied, though on the whole its services to the agriculturist are great, for in the destruction of injurious insects it is hardly inferior to the Rook, and it has the useful habit of ridding sheep, on whose backs it may be frequently seen perched, of some of their parasites.

The Daw displays the glossy black plumage so characteristic of the true Crows, varied only by the hoary grey of the ear-coverts, and of the nape and sides of the neck, which is the mark of the adult; but examples from the east of Europe and western Asia have these parts much lighter, passing into a silvery white, and hence have been deemed by some authorities to constitute a distinct species (*C. collaris*, Drumm.). Further to the eastward occurs the *C. dauricus* of Pallas, which has not only the collar broader and of a pure white, but much of the lower parts of the body white also. Japan and northern China are inhabited also by a form resembling that of western Europe, but wanting the grey nape of the latter. This is the *C. neglectus* of Professor Schlegel, and is said by Mr Dresser, on the authority of Swinhoe, to interbreed frequently with *C. dauricus*. These are all the birds that seem entitled to be considered Daws, though Mr Sharpe (*Cat. B. Brit. Museum*, vol. iii. p. 24) associates with them (under the little-deserved separate generic distinction *Colarus*) the Fish-Crow of North America, which appears both in structure and in habits to be a true Crow. (A. N.)

JACKSON, chief city of Jackson county, Michigan, U.S., is situated on the Grand river, about 75 miles west of Detroit. The city is paved and lighted with gas, and several of the buildings are very handsome. It is the seat of the large State penitentiary. The commercial interests of the city are fostered by its position on no fewer than six railways; and its manufactures are assisted by the water power, afforded by the river, which flows through the town, and is spanned by an iron bridge. Jackson manufactures fire-clay goods, railway and other carriages, chemicals, agricultural implements, &c., and has foundries, planing-mills, and flour-mills. The presence of bituminous coal in the neighbourhood affords additional stimulus to trade; and the surrounding country is fertile. A business college and a system of graded schools are among the educational resources of the city. Population in 1870, 11,447; in 1880, 16,105.

JACKSON, capital of the State of Mississippi, U.S., and chief city of Hinds county, is pleasantly situated on the right

bank of the Pearl river, about 180 miles north of New Orleans, with which it is connected by rail. The city is fairly well built; the chief buildings are the State capitol, the State penitentiary, and the institutions for the blind and for the deaf and dumb. One mile distant is the lunatic asylum. There are several good schools, and a State library of 15,000 volumes. The chief trade is in cotton, the average export being about 30,000 bales a year. Foundries and a factory for sashes and doors are among the manufactures of the place. Population in 1870, 4234; in 1880, 5205.

JACKSON, chief city of Madison county, Tennessee, U.S., is situated on the Forked Deer river, about 70 miles north-east of Memphis. Its chief trade is in cotton, of which many thousand bales are exported annually. Jackson has flour and planing mills, and manufactures of railway and other carriages, besides smaller industries. Of its several educational institutions the chief is West Tennessee college, founded in 1844, which had in 1874-75 four professors and one hundred students. The South-Western Baptist university was opened in 1875. The population in 1880 numbered 5371.

JACKSON, ANDREW (1767-1845), seventh president of the United States, was born March 15, 1767, at the Waxhaw or Warsaw settlement (whose position in relation to the later boundaries of North and South Carolina is unknown), whither his parents had immigrated from Carrickfergus in Ireland in 1765. Jackson had no regular education. He had some slight share in the war of independence, and was taken prisoner in 1781. He studied law at Salisbury, North Carolina, and was admitted to the bar and began to practise at Nashville in Tennessee. In 1791, on the first incorrect report that Mrs Rachel Robards (*née* Donelson) had succeeded in getting a divorce bill from her husband passed in Virginia, Jackson married her; when, later, it was passed, they were remarried. In 1796 Jackson assisted to frame the constitution of Tennessee, and represented that State in the federal congress, where he distinguished himself as an irreconcilable opponent of Washington. In 1797 he was elected a United States senator; but he resigned the following year. He was judge of the supreme court of Tennessee from 1798 to 1804. In 1804-5 he contracted a friendship with Burr; and at the latter's trial in 1807 Jackson was one of his conspicuous champions. Up to the time of his nomination for the presidency, the biographer of Jackson finds nothing to record but military exploits in which he displayed perseverance, energy, and skill of a very high order, and a succession of personal acts in which he showed himself ignorant, violent, perverse, quarrelsome, and astonishingly indiscreet. In 1806 he killed Charles Dickinson in a duel. In 1813, as major-general of militia, he commanded in the campaign against the Creek Indians in Georgia and Alabama, and there first attracted public notice by his talents. In May 1814 he was commissioned as major-general in the regular army to serve against the English; in November he captured Pensacola, used by the English as a base of operations; and on January 8, 1815, he inflicted a severe defeat on the enemy before New Orleans. During his stay in New Orleans, he declared martial law, and carried out his measures with unrelenting sternness, banishing from the town a judge who attempted resistance. When civil law was restored, Jackson was fined \$1000 for contempt of court; in 1844 congress ordered the fine with interest (\$2700) to be repaid. In 1818 Jackson received the command against the Seminoles. His conduct in following them up into the Spanish territory of Florida gave rise to much hostile comment in the cabinet and in congress; but the negotiations for the purchase of Florida put an end to the diplomatic question. In 1821 Jackson

¹ Some writers, as Jesse (*Scenes and Tales of a Country Life*, p. 57), have ascribed great eagerness to the Daw as a nest-builder, but the statement of this author seems open to a very different interpretation (Yarrell's *Br. Birds*, ed. 4, ii. p. 308, note); and Jardine's remark (*Nat. Library*, x p. 236) that it often exhibits great want of instinct, seems to be quite justified by the known facts.

was appointed military governor of Florida, and there again he came into collision with the civil authority. From this, as from the previous troubles, J. Quincy Adams extricated him.

In August 1822 the house of representatives of Tennessee nominated Jackson for president; and in 1823 he was elected to the senate at Washington. The rival candidates for the office of president were Adams, Crawford, and Clay. Jackson obtained the largest number of votes in the electoral college; but no one had an absolute majority. At the election by the house of representatives (February 9, 1825) Adams was chosen. Jackson, however, was recognized by the ablest politicians as the coming man; Van Buren and others, going into opposition under his banner, waged from the first a relentless and factious war on the administration. Van Buren was the most adroit politician of his time; and Jackson was in the hands of very astute men, who advised and controlled him. He was easy to lead when his mind was in solution; and he gave his confidence freely where he had once placed it. He was not suspicious, but if he withdrew his confidence he was implacable. When his mind crystallized on a notion that had a personal significance to himself, that notion became a hard fact that filled his field of vision. When he was told that he had been cheated in the matter of the presidency, he was sure of it, although those who told him were by no means so.

There was great significance in the election of Jackson in 1828. A new generation was growing up under new economic and social conditions. They felt great confidence in themselves, and great independence. They despised tradition and Old World ways and notions; and they accepted the Jeffersonian dogmas, not only as maxims, but as social forces—the causes of the material prosperity of the country. By this generation, therefore, Jackson was recognized as a man after their own heart. They liked him because he was vigorous, brusque, uncouth, relentless, straightforward, and open. They made him president in 1828, and he fulfilled all their expectations. He had 178 votes in the electoral college against 83 given for Adams. Though the work of redistribution of offices began almost at his inauguration, it is yet an incorrect account of the matter to say that Jackson corrupted the civil service. His administration is rather the date at which a system of democracy, organized by the use of patronage, was introduced into the federal arena by Van Buren. The administration had two parties in it from the first, Van Buren's and Calhoun's, and the president's interference in a purely private matter brought about a rupture. In April 1831 the whole cabinet resigned; Jackson and Calhoun quarrelled; and the former transferred to Van Buren his support for succession in the presidency.

In 1832 Jackson was re-elected by a large majority over Clay, his chief opponent. The battle raged mainly around the re-charter of the Bank of the United States. It is probable that Jackson's advisers in 1828 had told him, though erroneously, that the bank had worked against him, and then were not able to control him. The first message of his first presidency had contained a severe reflexion on the bank; and in the very height of this second campaign (July 1832) he vetoed the re-charter, which had been passed in the session of 1831–32. Jackson interpreted his re-election as an approval by the people of his war on the bank; and after the exciting episode of South Carolina's opposition to the tariff-rates he pushed it with energy. In September 1833 he ordered the public deposits in the bank to be transferred to selected local banks, and entered upon the "experiment" whether these could not act as fiscal agents for the Government, and whether the desire to get the deposits would not induce them to

adopt sound rules of currency. During the next session the senate passed a resolution condemning his conduct. Jackson protested, and after a hard struggle the resolution was ordered to be expunged from the record, January 16, 1837.

Jackson was very successful in collecting old claims against various European nations, for spoliations inflicted under Napoleon's continental system. Aiming at a currency consisting largely of specie, he caused the payment of these claims to be received and imported in specie as far as possible; and in 1836 he ordered land-agents to receive for land nothing but specie. About the same time a law passed congress for distributing among the States some \$35,000,000 balance belonging to the United States, the public debt having all been paid. The eighty banks of deposit in which it was lying had regarded this sum almost as a permanent loan, and had inflated credit on the basis of it. The necessary calling in of their loans in order to meet the drafts in favour of the States, combining with the breach of the overstrained credit between America and Europe and the decline in the price of cotton, brought about a crash which prostrated the whole financial, industrial, and commercial system of the country for six or seven years. The crash came just as Jackson was leaving office; the whole burden fell on his successor, Van Buren.

Jackson is the only president of whom it may be said that he went out of office far more popular than he was when he entered. When he went into office he had no political opinions, only some popular notions. He left his party strong, perfectly organized, and enthusiastic on a platform of low expenditure, payment of the debt, no expenditure for public improvement or for glory and display in any form, and low taxes. His name still remained a spell to conjure with, and the politicians sought to obtain the assistance of his approval for their schemes; but in general his last years were quiet and uneventful. He died near Nashville, June 8, 1845.

Biographies of Jackson have been written by J. H. Eaton, 1824; William Cobbett, 1834; Amos Kendall, 1844; and James Parton, 3 vols., 1860. (W. G. S.)

JACKSON, THOMAS JONATHAN (1824–1893), "Stonewall Jackson," a distinguished Confederate general in the American civil war, was born in Harrison county, Virginia, 21st January 1824, and came of that Scotch-Irish stock to whose hardy virtues the middle States of America are largely indebted for the pure and resolute virtues of their people. His early education was only such as could be furnished by an obscure country school. Thence he passed to West Point military academy, where, though he was at first impeded by his meagre acquirements, his indomitable courage and conscientious diligence eventually raised him to a foremost place. At West Point he exhibited the qualities by which he was distinguished in the splendour of his career,—courage, patience, constancy of purpose, inflexible fidelity to duty, and an artless simplicity of character which engaged instant and universal confidence. Graduating at twenty-two, he was appointed lieutenant of artillery in the army of the United States, and participated, with distinction, in several of the most important battles in Mexico. After the war he resigned his commission, and accepted the professorship of natural philosophy in the Virginia military institute at Lexington, a position which he held until the outbreak of hostilities between the Union and the Confederate States. During his sojourn at Lexington, he entered the Presbyterian communion, and was remarkable ever after for the fervour of his religious devotion. In political discussions or agitations, Major Jackson—such was his title by brevet—had never engaged; but in principle and by profession he was a State-right Democrat of the Virginia school; in other words, he maintained the legitimacy of negro slavery and the

sovereign right of a State to withdraw from the Union, and therefore to the secession movement of 1861 he at once accorded his sympathy. On the organization of the Virginia troops he was commissioned colonel of infantry by Governor Letcher, who, long intimate with him, adequately appreciated his yet undisclosed military genius.

Jackson's first exploit in the war of secession was the capture, on May 3, 1861, of the Federal arsenal at Harper's Ferry. Soon afterwards he received the command of a brigade—the brigade which, by its immovable fortitude at Bull Run, turned the tide of battle in that long doubtful struggle, and, from the admiration of its comrades, extorted for itself and its chief the now historic name of "Stonewall."

Detached from the army at Manassas for separate service in the Shenandoah Valley, Jackson soon signalized his genius for war. Placing himself between the converging columns of Shields, Milroy, and Banks, he struck one after the other; and, with a force inferior to his adversaries separately, he eventually drove them back upon Washington in utter defeat. In this "campaign of the valley" Jackson displayed true military instinct and the highest military art. By vigilance, sagacity, celerity and secrecy of movement, and faultless tactical skill on the field of battle, he achieved the greatest possible results with the smallest possible means. His reputation was now fixed in the estimation alike of friend and foe; and, while the Confederate States were filled with the renown of his achievements, the Federal forces were in constant terror of his prowess. Having stayed the invasion of Virginia along the line of the valley, Jackson repaired to Richmond to concert with Lee the deliverance of the Confederate capital, then closely pressed by McClellan. Appointed, meanwhile, to the command of a corps, he suddenly revealed himself on the right flank of the Federal army at Mechanicsville; and in a series of desperately fought engagements he routed the besieging army, and drove McClellan to shelter at Harrison's Landing. Richmond relieved, Jackson, without pause, hastened to confront Pope, who was menacing the city from the north. In the battle of Cedar Run he inflicted signal defeat upon that general, and compelled him to retrace his steps across the Rappahannock.

Reinforced by McClellan's army and fresh troops from the northern States, Pope made a stand at Manassas; but in the second battle on that field he suffered an overthrow as decisive as that sustained by McDowell in the first fight at Bull Run. As usual Jackson's corps bore the brunt of the battle; and as usual to his skill and courage the Confederate army was mainly indebted for its success. Following up the victory by the invasion of Maryland, Lee detached Jackson for an attack on Harper's Ferry, again in the hands of the Federalists, and garrisoned by 12,000 troops. In a few days the surrender of the place, with all its force and munitions of war, was announced to Lee, who, slowly retiring before McClellan, anxiously expected the arrival of Jackson, that he might turn and crush his pursuer. But before he could effect the desired junction Lee was brought to bay at Antietam, and compelled to accept battle under every disadvantage. Jackson now arrived, however, with two of his divisions, and his presence not only averted an otherwise inevitable disaster, but rescued the Confederate army from the destruction which awaited it if defeated with its rear resting on the river. Henceforth Jackson's operations were under the immediate eye and command of Lee; and, while at Fredericksburg and Chancellorsville his gallantry was as conspicuous as ever, to his illustrious chief belongs the glory of those hard-fought fields.

On the afternoon of May 2, 1863, Jackson fought his last battle. Executing a plan of his own conception, he suddenly struck the flank of the 11th Federal corps, and

drove it pell-mell before him. Night fell with the hostile forces in close proximity; and, while Jackson was making a reconnaissance with a view to pressing the pursuit, he was fired on in the dark by men of his own command, and received wounds of which he died on May 10, 1863. His death smote the Confederates with a pang of unspeakable anguish. The fall of their foremost chieftain was bewailed as the omen of the fall of the party.

In department Jackson was grave and measureful; but he relaxed on approach, and his address was bland and gracious. In conversation he conveyed the impression of a frank, firm character, and of an intellect clear and direct, but in no wise of superior order. No opinion floated languidly in his understanding; he held all his beliefs with an intense earnestness of conviction, and he was prompt and resolute in carrying his convictions into action. He engaged in the war of secession with an unflinching faith in the justice of the cause and an unhesitating persuasion of its triumph. He was the idol of his troops. At his command they would cheerfully endure any sacrifice or confront any peril. On the field of battle he was never known to lose his self-possession, or to be surprised by any fluctuation of fortune; his quick eye would detect the exigent moment, and his unerring judgment direct the decisive manœuvre. (R. A. P. *)

JACKSON, WILLIAM (1730-1803), an English musician of repute, was born at Exeter, in May 1730. His father, a grocer, bestowed a liberal education upon him, but, on account of the lad's strong predilection for music, was induced to place him under the care of John Silvester, the organist of Exeter Cathedral, with whom he remained about two years. In 1748 he went to London, and studied under John Travers, organist of the king's chapel. Returning to Exeter, he settled there as a teacher and composer, and in 1777 was appointed subchanter, organist, lay-vicar, and master of the choristers of the cathedral. In 1755 he published his first work, *Twelve Songs*, which became at once highly popular. His next publication, *Six Sonatas for the Harpsichord*, was a failure. His third work, *Six Elegies for three voices, preceded by an Invocation, with an Accompaniment*, was very successful, and placed him among the first composers of his day. Dr Burney considered these as the best of Jackson's works, and added that "no composer copied less from others than Jackson." His fourth work was another set of *Twelve Songs*, now very scarce; and his fifth work was again a set of *Twelve Songs*, all of which are now forgotten. He next published *Twelve Hymns*, with some good remarks upon that style of composition, although his precepts were better than his practice. A set of *Twelve Songs* followed, containing some good compositions. Next came an *Ode to Fancy*, the words by Dr Warton. *Twelve Canzonets for two voices* formed his ninth work; and one of them—"Time has not thinned my Flowing Hair"—long held a place at public and private concerts. His tenth work was *Eight Sonatas for the Harpsichord*, some of which were novel and pleasing. He composed three dramatic pieces—*Lycidas* (1767), *The Lord of the Manor*, to General Burgoyne's words (1780), and *The Metamorphoses*, a comic opera produced at Drury Lane in 1783, which did not succeed. In the second of these dramatic works, two airs—"Encompassed in an Angel's Form" and "When first this Humble Roof I knew"—were great favourites. Some of his church music, published after his death, did not please the critics. In 1782 he published *Thirty Letters on Various Subjects*, which are well written and interesting. In these he severely attacked canons, and described William Bird's *Non nobis Domine* as containing passages not to be endured. But his anger and contempt were most strongly expressed against catches of all kinds, which he denounced as bar-

barous. In 1791 he put forth a pamphlet, *Observations on the Present State of Music in London*, in which he found fault with everything and everybody. He published in 1798 *The Four Ages, together with Essays on Various Subjects*,—a work which gives a favourable idea of his character and of his literary acquirements. It appears that he cultivated a taste for landscape painting, and imitated, not unsuccessfully, the style of his friend Gainsborough. He died July 12, 1803.

JACKSONVILLE, the chief city in Duval county, Florida, U.S., and the largest in the State, is situated on the west bank of the St John's river, 25 miles from the sea. The city is regularly built. The streets, many of which are pleasantly shaded with trees, are laid out on the common American rectangular system. Jacksonville exports very large quantities of lumber, besides fruit, cotton, sugar, and fish, and carries on a coasting trade with Charleston, Savannah, and St Augustine. The fine salubrious climate attracts numerous visitors and invalids from the northern States. Jacksonville, which owes its name to President Jackson was laid out as a town in 1822. In 1880 its population was 7650.

JACKSONVILLE, the chief city of Morgan county, Illinois, U.S., on Mauvaiseterre Creek, a tributary of the Illinois river, is situated at the intersection of several railways, about 200 miles S.S.W. of Chicago. Its streets are wide and generally well shaded. The public buildings include State institutions for the blind, the feeble-minded, the deaf and dumb, and the insane. Among the educational institutions, which are numerous, are Illinois College, three colleges for women, and a conservatory of music. There is also a free library, with reading-room. The population in 1880 was 10,928.

JACOB (יָעֹב, or יַעֲבֹב, derived according to Gen. xxv. 26, xxvii. 36, from יָעַב, and meaning "one who seizes the heel" or "supplants"), the younger son of Isaac and Rebekah, and the father of the twelve patriarchs. According to the Elohistic (Levitical) narrative in Genesis, he was born in the land of Canaan when his father was sixty years of age. After Esau, his twin brother, at the age of forty years had married two Hittite wives, Isaac at the instigation of Rebekah sent Jacob with his blessing to Padan Aram, there to seek a wife in the family of his maternal uncle Laban. Arrived at his destination, he married Rachel (to whom Bilhah was given as a maidservant); the same narrative implies also his union with Leah (whose maid was Zilpah). Before he left Padan Aram he had become the father of twelve sons, including Benjamin (Gen. xxxv. 23-26). On his return, with the property he had acquired, to his father Isaac in Canaan (xxxi. 18), God met him and blessed him and changed his name from Jacob to Israel; the place where this occurred was called by him Bethel (xxxv. 9-13, xxxv. 15). In the course of a further migration southwards, Rachel died at a point not far from Ephrath (Bethlehem); finally Mamre, near Kirjath Arba (Hebron), where Isaac was living, was reached, and a permanent settlement appears to have been made until the death of Isaac there at the age of one hundred and eighty years. The subsequent migration of Jacob to Egypt with his household of seventy souls is then briefly indicated, and his hospitable reception as an old man of one hundred and thirty by Pharaoh. A residence was assigned to the colony in the best part of the land, the land of Rameses, by Joseph, and here the Israelites prospered much and rapidly increased. Seventeen years after the interview with Pharaoh the patriarch died, after having blessed his sons and particularly Joseph, whose two sons Ephraim and Manasseh he put upon a level with Reuben and Simeon. He was buried by his family, according to his own desire, in the cave of Machpelah, fronting Mamre, in the land of

Canaan. The combined parallel narrative of the Jehovist and the other (elder) Elohist is much fuller, and in some points not easily to be reconciled with the preceding account. Various circumstances connected with the birth of the twins Isaac and Jacob are detailed; the partiality of Isaac for the elder and of Rebekah for the younger is indicated; Jacob's departure from Canaan is represented as a flight necessitated by his fraudulent conduct towards Isaac and Esau with reference to the blessing of the former; a revelation received at Bethel in the course of this flight is described; many minute particulars of his domestic life at Padan Aram and of his relations with Laban his uncle and father-in-law are given; the scene of the change of name is placed at Peniel, where he wrestled with the angel (see Hos. xii. 5); a period of residence at Shechem is mentioned; the death of Rachel at Ephrath is said to have happened in childbed; after having fixed his home successively at Hebron and Beersheba, he is ultimately led by circumstances, which are described with much fullness and vividness, to migrate to Egypt, where he dies. Consideration of the relations of these parallel narratives may be postponed to the article PENTATEUCH. As to the interpretation of the history of Jacob, it is now usual to regard it as having an ethnological at least quite as much as a personal significance; but none of the attempts hitherto made to mythologize it (as by Popper, who sees in the wrestling Jacob the Asiatic Hercules, Melicertes, Palemon) can be regarded as even plausible.

See Ewald, *Gesch. Israels*, i. 412 sqq., 469 sqq.; Wellhausen, *Gesch. Israels*, i. 314, 374; Kuenen in the *Theol. Tijdschr.* for May, 1871.

JACOBÁBÁD, a municipality and the chief town of the frontier district of Upper Sind, India, is situated in 28° 17' N. lat. and 68° 28' 45" E. long. Laid out in 1847 by General John Jacob, on the site of the village of Khangarh, it is now the headquarters of the large military force of the Upper Sind frontier, and also of the local civil administration. It contains therefore a considerable European population, and possesses all the usual public offices and institutions of an important station. In addition to the cantonments, civil and judicial courts, dispensary, jail, post and telegraph offices, &c., it has also a "residency," and lines for the accommodation of trade caravans (*kāfilāns*) from Central Asia. The civil court, which is under the Shikárpur jurisdiction, was established in 1870, the sessions judge of Shikárpur visiting it twice a year. Population, including the military camp, 10,954.

JACOBI, FRIEDRICH HEINRICH (1743-1819), a distinguished writer on philosophy, was born at Düsseldorf on the 25th January 1743. The second son of a wealthy merchant, who owned an extensive sugar factory near Düsseldorf, he was educated for a commercial career, partly in his native place, partly at Frankfurt-on-the-Main. At the age of sixteen he was sent to complete his training at Geneva, where he remained for four years. Of a retiring disposition, and far more inclined to thoughtful meditation than to practical activity, Jacobi mainly associated himself at Geneva with the literary and scientific circle of which the most prominent member was Lesage. He studied closely the works of Bonnet, the Swiss naturalist and metaphysician, and was brought into contact with the new political ideas of Rousseau and Voltaire. In 1763 he was called back to Düsseldorf, and in the following year he married and took his place at the head of the mercantile concern handed over to him by his father. After a short period he gave up his commercial career, and in 1770 became a member of the council for the duchies of Juliers and Berg, in which capacity he distinguished himself by his ability in the management of financial affairs, and his zeal in the direction of social reforms. Like his contem-

porary Hemsterhuis, whom he resembles in many points, Jacobi kept up his interest in literary and philosophic matters by an extensive correspondence, and his mansion at Pempelfort, near Düsseldorf, was the centre of a distinguished literary circle. With Wieland he contributed to start a new literary journal, the *Mercury*, in which some of his earliest writings, mainly on practical or economical subjects, were published. Here too appeared in part the first of his philosophic works, the *Correspondence of Allwill* (*Allwill's Brief-Sammlung*, 1774), a combination of romance with speculation, containing a remarkable delineation of that which we may call the principle of the early romantic school in Germany. This was followed in 1779 by *Woldemar*, a philosophic novel, of very imperfect structure, but full of genial speculation, and giving the most complete picture of Jacobi's method of philosophizing. In 1779 he was invited to Munich as member of the privy council, but after a short stay there differences with his colleagues and with the authorities of Bavaria drove him back to Pempelfort. A few unimportant tracts on questions of theoretical politics were followed in 1785 by the work which first brought Jacobi directly into relation with the contemporary philosophical public. A conversation which he had held with Lessing in 1780, in which Lessing avowed that he knew no philosophy, in the true sense of that word, save Spinozism, led him to a protracted study of Spinoza's works, while his statement of Lessing's confession induced a correspondence with Moses Mendelssohn. The *Letters on Spinoza's Theory* (*Briefe über die Lehre Spinoza's*, 1785; 3d ed., much enlarged and with important *Appendices*, 1789) expressed sharply and clearly Jacobi's strenuous objection to a demonstrative system in philosophy, and drew upon him the vigorous enmity of the Berlin clique, whose philosophic protagonist was Moses Mendelssohn. Jacobi was ridiculed as endeavouring to reintroduce into philosophy the antiquated notion of unreasoning belief, was denounced as an enemy of reason, as a pietist, and as in all probability a Jesuit in disguise, and was especially taken to task for his employment of the ambiguous term "belief" (*Glaube*, which may mean *belief* in the ordinary sense, or *faith* in the specifically theological significance). Mendelssohn's reply showed little more than the writer's very slight acquaintance with the Spinozistic system to which he had so frequently and so earnestly appealed, and his mortification at the public disclosure of the fact that he had remained in entire ignorance that Spinoza's *Opera Posthuma* contained the *Éthics* is said to have hastened his death.

Jacobi's next important work, *David Hume on Belief, or Idealism and Realism*, a dialogue (*David Hume über den Glauben, oder Idealismus und Realismus*, 1785), was an attempt to show not only that the term *Glaube* had been used by the most eminent writers to denote what he had employed it for in the *Letters on Spinoza*, but that the nature of the cognition of facts as opposed to the construction of inferences could not be otherwise expressed. In this writing, and especially in the *Appendix*, Jacobi came into contact with the critical philosophy, and subjected the Kantian view of knowledge to searching examination.

The outbreak of the war with the French republic induced Jacobi in 1793 to leave his home at Düsseldorf, and for nearly ten years he resided in Holstein. While there he became intimately acquainted with Reinhold, in whose *Beiträge*, pt. iii., 1801, his important work *On the Endeavour of the Critical Philosophy to bring Reason to Understanding* was first published, and with Matthias Claudius, the author of the *Wandbecker Bote*. During the same period the excitement caused by the accusation of atheism brought against Fichte at Jena led to the

publication of Jacobi's *Letter to Fichte*, in which he made more precise the relation of his own philosophic principles to theology.

Soon after his return to Germany, Jacobi received a call to Munich in connexion with the new academy of sciences just founded there. The loss of a considerable portion of his fortune induced him to accept this offer; he settled in Munich in 1804, and in 1807 became president of the academy. In 1811 appeared his last philosophic work, directed against Schelling specially, *On Divine Things* (*Von den göttlichen Dingen*), the first part of which, a review of the *Wandbecker Bote*, had been written in 1798. A bitter reply from Schelling was left without answer by Jacobi, but gave rise to an animated controversy in which Fries and Baader took prominent part. In 1812 Jacobi retired from the office of president, and began to prepare a collected edition of his works. He died before this was completed, on 10th March 1819. The edition of his writings was continued by his friend Köppen, and was completed in 1825. The works fill six volumes, of which the fourth is in three parts. To the second is prefixed an introduction by Jacobi, which is at the same time an introduction to his philosophy. The fourth volume has also an important preface.

The philosophy of Jacobi presents itself as in no way a system,—indeed, as, from its principle, essentially unsystematic. A certain fundamental view which underlies all his thinking is brought to bear in succession upon those systematic doctrines which appear to stand most sharply in contradiction to it, and any positive philosophic results are given only occasionally. The leading idea of the whole is that of the complete separation between understanding and apprehension of real fact. For Jacobi understanding, or the logical faculty, is purely formal or elaborative, and its results never transcend the given material supplied to it. From the basis of immediate experience or perception thought proceeds by comparison and abstraction, establishing connexions among facts, but remaining in its nature mediate and finite. The principle of reason and consequent, the necessity of thinking each given fact of perception as conditioned, impels understanding towards an endless series of identical propositions, the records of successive comparisons and abstractions. The province of the understanding is therefore strictly the realm of the condition; to it the world must present itself as a mechanism. If, then, there is objective truth, the existence of real facts must be made known to us otherwise than through the logical faculty of thought; and, as the regress from conclusion to premises must depend upon something not itself capable of logical grounding, mediate thought implies the consciousness of immediate truth. Philosophy therefore must resign the hopeless ideal of a systematic (*i.e.*, intelligible) explanation of things, and must content itself with the examination of the facts of consciousness. It is a mere prejudice of philosophic thinkers, a prejudice which has descended from Aristotle, that mediate or demonstrated cognition is superior in cogency and value to the immediate perception of truths or facts.

The fundamental principle of Jacobi's system, thus sketched, presents a most interesting analogy with that which has become familiar in English philosophy through the writings of Sir W. Hamilton. Upon the historical relations between the two thinkers nothing requires here to be said. No reader of Hamilton can fail to be made aware of the great obligations the Scotch psychologist was under to his German predecessor. But attention to the results of Jacobi's fundamental doctrine, as these were wrought out by comparison of it with the speculative systems of Spinoza, Kant, and Schelling, will throw great light upon Hamilton's writings, and make clear the connexions of the several parts which in his imperfect expositions too frequently remained in obscurity.

As Jacobi starts with the doctrine that thought is partial and limited, applicable only to connect facts, but incapable of explaining their existence, it is evident that for him any demonstrative system of metaphysics which should attempt to subject all existence to the principle of logical ground must be repulsive. Now in modern philosophy the first and greatest demonstrative system of metaphysics is that of Spinoza, and it lay in the nature of things that upon Spinoza's system Jacobi should first direct his criticism. A summary of the results of his examination is thus presented (*Werke*, i. 216-223).—" (1) Spinozism is atheism; (2) the Kabbalistic philosophy, in so far as it is philosophy, is nothing but a more relaxed or confused Spinozism; (3) the philosophy of Leibnitz and Wolff is not less fatalistic than that of Spinoza, and carries a resolute thinker to the very principles of Spinoza; (4) every demonstrative method ends in fatalism; (5) we can demonstrate only similarities

(agreements, truths conditionally necessary), proceeding always in identical propositions, as the very proof presupposes something already proved, the principle of which is immediately given (*Offenbarung*, revelation, is the term here employed by Jacobi, as by many later writers, e.g., Lotze, to denote the peculiar character of an immediate, unproved truth); (6) the keystone (*Element*) of all human knowledge and activity is belief (*Glaube*). Of these propositions only the first and fourth require further notice. Jacobi, according to the law of reason and consequent to the fundamental rôle of demonstrative reasoning, and not the rôle emphatically followed by Synonym, points out that, if we proceed by applying this principle so as to recede from particular and qualified facts to the more general and abstract conditions, we land ourselves, not in the notion of an active, intelligent creator of the system of things, but in the notion of an all-comprehensive, indeterminate *Nature*, devoid of will or intelligence. Our unconditioned is either a pure *abstraction*, or else the impossible notion of a completed system of conditions. In either case the result is atheism, and this result is necessary if the demonstrative method, the method of understanding, is regarded as the only possible means of knowledge. Moreover, the same method inevitably lands in fatalism. For, if the action of the human will is to be made intelligible to understanding, it must be thought as a conditioned phenomenon, having its sufficient ground in preceding circumstances, and, in ultimate abstraction, as the outflow from nature which is the sum of conditions. But thus is the fatalist conception, and any philosophy which accepts the law of reason and consequent as the essence of understanding is fatalistic. Thus for the scientific understanding there can be no God and no liberty. It is impossible that there should be a God, for if so he would of necessity be finite. But a finite God, a God that is *known*, is no God. It is impossible that there should be liberty, for if so the mechanical order of phenomena, by means of which they are comprehensible, would be disturbed, and we should have an unintelligible world, coupled with the requirement that it shall be understood.

Cognition, then, in the strict sense, occupies the middle place between sense perception, which is belief in matters of sense, and reason, which is belief in supersensuous fact. (Jacobi wavered much in his terminology, especially with respect to the word reason; but even at this stage of his thinking the distinctions just named are sufficiently apparent.) Such a view, and especially the fundamental peculiarity that the categories of the understanding are to be regarded as mere forms of the conditioned, from their very nature limited and relative, presented a certain analogy to the critical philosophy, and accordingly, in the second period of Jacobi's speculative development, he is driven to a comparison of his doctrines with those of Kant.

His adverse criticism of the Kantian doctrines was directed on three points mainly, and, though in itself but ill-founded, it deserves the careful consideration of all Kantian students. (1) The categories of the understanding and the forms of intuition supply a blank scheme for the given element of sense. But if the given element be merely sensation, and not actually the external thing, we are still, Jacobi thinks, within the position of subjective idealism. At no point in the whole process do we ever get beyond empty form, bare identity. The synthetical unity of consciousness, if no reality be supplied in regard to which it may operate, is mere repetition of the form of conjunction, mere *possibility* of cognition. Whence do we obtain the reality, the *objectivity*, of knowledge? To Jacobi it seemed that Kant, in the second edition of the *Kritik*, made an effort to demonstrate the external reality of phenomena of experience, and he views the change in Kant's doctrine as the effect of his own critical comments. Nevertheless such demonstration still seems to him unsatisfactory; it yields only the thought-form of externality, not externality in fact. (2) Jacobi agrees with Kant so far as the critical view of the incapacity of understanding to encompass the ideas is concerned, but he thinks Kant in error in supposing that such incapacity results from the subjective limitation of our power of thinking and not from the nature of the categories of understanding in themselves. At the same time he holds that Kant treats the ideas unjustly, and that in his view of reason he tends to make that faculty inferior to understanding. (3) Kant's moral theory is as little satisfactory as his theory of perception. Here, too, in the demand for universally valid law as the law of a will that is its own content, Jacobi can find but the form and not the reality of a universal rule. The universal will is void of content, and the sharp opposition which in the Kantian ethics appears between the ethical motive and all modes of feeling is the natural result of mere formalism. When Jacobi endeavours to supply the place of the Kantian theorems which he rejects, the inherent weakness of his own principle becomes apparent. External things are known to us by immediate perception, a combination of intuition and belief. The principle of inference to realities is that of cause and effect, the significance of which we learn from observing the relation between our will and changes in the objective world, and this principle by a natural necessity we extend to all existence. The infinite progress from consequences to grounds, which is the

form of procedure of understanding, yields no conclusion as regards the being of a God. But when we regard the whole system of real things, we are compelled to infer a real cause, which, from the significance of the causal principle, is seen to be of necessity an active intelligent will, a God who foresees events. This apprehension of God is faith, reason, or feeling, as Jacobi, following Fries, is willing to call it.

Not even in his latest work of importance (*Von den göttlichen Dingen*), which is specifically on religion, does Jacobi manage to make clear the step, which he has himself characterized as the *salto mortale* of the human intellect, from the finite to the infinite, still less the further difficulty as to the possibility of holding that the God who for cognition is the unknown God must be held to possess personality, personality, life. He acknowledges that this is anthropomorphic, bitterly assails Schelling for identifying divine and human reason, but leaves the problem standing. The truth is that what Jacobi called feeling, and regarded as immediate knowledge, is not a simple act of mind, capable of yielding simple results, but the very essence of complex thinking. We cannot separate knowledge of things from apprehension of them in the way he has adopted. Nor can the human reason rest satisfied with a system devoid of inner coherence and harmony.

The best introductions to Jacobi's philosophy are the preface to the second vol. of the *Works*, and Appendix 7 to the *Letters to Spinoza's Theorist*. There are two versions of the latter, one of some extent upon him. — *Kuhn, Jacobi and the Philosophical Zeit*, 1831, and Zarnigke, *F. H. Jacobi's Leben, Dichten, und Denken*, 1897. See also *F. H. Jacobi's Addressen Briefwechsel*, 2d ed., by Roth, 2 vol., 1825-27, and Gulevitch's *Addressen of Hermann's Schriften*, vol. 1.

JACOBI, KARL GUSTAV JACOB (1804–1851), one of the great mathematicians of the present century, was born at Potsdam, of Jewish parentage, December 10, 1804. He studied at Berlin university, where he obtained the degree of doctor of philosophy in 1825, his thesis being an analytical discussion of the theory of fractions. In 1827 he became "extraordinary" and in 1829 "ordinary" professor of mathematics at Königsberg; and this chair he filled till 1842, when he visited Italy for a few months to recruit his health. On his return he removed to Berlin, where he lived as a royal pensioner till his death, February 18, 1851. His investigations in elliptic functions, the theory of which he established upon quite a new basis, and more particularly his development of the Theta-function, as given in his great treatise *Fundamenta Nova Theoriae Functionum Ellipticarum* (Königsberg, 1829), and in later papers in *Crelle's Journal*, constitute his grandest analytical discoveries. Second in importance only to these are his researches in differential equations, notably the theory of the last multiplier, which is fully treated in his *Vorlesungen über Dynamik*, edited by Clebsch (Berlin, 1866). It was in analytical development that Jacobi's peculiar power mainly lay, and he made many important contributions of this kind to other departments of mathematics, as a glance at the long list of papers that were published by him in *Crelle's Journal* from 1826 onwards will sufficiently indicate. Thus he was one of the early founders of the theory of determinants; in particular, he invented the functional determinant formed of the n^2 differential coefficients of n given functions of n independent variables, which now bears his name (Jacobian), and which has played an important part in many analytical investigations. Valuable also are his papers on Abelian transcendents, and his investigations in the theory of numbers, in which latter department he mainly supplements the labours of Gauss, with whom as with the other great Continental mathematicians of the day, Legendre, Bessel, Abel, &c., he was on terms of the closest intimacy. The planetary theory and other particular dynamical problems likewise occupied his attention from time to time. He left a vast store of manuscript, portions of which have been published at intervals in *Crelle's Journal*. See INFINITESIMAL CALCULUS.

JACOBITE CHURCH, an ecclesiastical organization thinly spread over Syria, Mesopotamia, and Babylonia, having for its distinctive doctrinal principle the Monophysite thesis with regard to the person of Christ; it consequently accepts the decrees of the second ("Robber") synod of

Ephesus, and rejects those of the council of Chalcedon. It has some minor peculiarities in points of detail,—for example, as to the preparation of the communion elements, the mode of making the sign of the cross, and the method of electing patriarchs and bishops. Its head is called the patriarch of Antioch, who has his residence, however, for the most part at Diarbekir, second to him is the "maphrian" (i.e., "fertilizer"), who has a kind of primacy over the eastern section of the church. No accurate statistics as to the numerical strength of the Jacobite Church exist; its numbers may probably be safely placed considerably under 250,000. For a considerable time a Roman Catholic patriarch of the Jacobites has resided at Aleppo, and lately the Jacobites of Damascus have accepted Catholicism. The Jacobite Church owes its origin, as its name, to Jacobus, surnamed Baradeus and sometimes Zanzalus, a native of Tella, who became a monk at Constantinople, and afterwards receiving episcopal consecration (541 or 543 A.D.) devoted thenceforward the rest of his life (nearly forty years) to extensive labours throughout Asia Minor, Syria, Egypt, and the Mediterranean islands, on behalf of the Monophysite cause. Such were his energy and zeal that he is said to have consecrated in the course of his travels no fewer than two patriarchs, twenty-seven bishops, and fully 100,000 priests and deacons. The epithet "Jacobite" is sometimes applied with less strict propriety to the Coptic, Abyssinian, and Armenian Churches, which also are Monophysite, and owe much to the influence of Baradeus.

JACOBS, CHRISTIAN FRIEDRICH WILHELM (1764–1847), a German scholar and author, was born at Gotha, October 6, 1764. After studying philology and theology at Jena and Göttingen, he in 1786 became teacher in the gymnasium of his native town, and in 1802 was appointed to an office in the public library. In 1807 he became classical teacher in the lyceum of Munich, but he again returned to Gotha in 1810 to take the charge of the library and the numismatic cabinet. From 1831 to 1842 he was superintendent of the art collections of the town. He died at Gotha, March 30, 1847.

JACOBS, besides editing a large number of the less known Greek and Latin authors, was a voluminous translator and also a successful writer in various departments of general literature. Of his editorial labours the most important is the edition of the *Anthologia Græca*, 13 vols., 1794–1814. He also published translations from the Greek Anthology under the title *Tempo*, 2 vols., 1803. His *Elementarbuch der griechischen Sprache*, 1805, has gone through many editions. His miscellaneous essays on classical subjects were published collectively at various periods under the title *Vermischte Schriften*, and amount in all to 3 volumes. Among his other writings may be mentioned *Schriften für die Jugend*, 3 vols., 1842–44; and *Erzahlungen*, 7 vols., 1842–37.

JACOTOT, JOSEPH (1770–1840), a French educationist, and author of the method of "Émancipation intellectuelle," was born at Dijon, March 4, 1770. He was educated at the university of Dijon, where in his nineteenth year he was chosen professor of Latin, after which he studied law, became advocate, and at the same time devoted a large amount of his attention to mathematics. In 1788 he organized a federation of the youth of Dijon for the defence of the principles of the Revolution; and in 1792, with the rank of captain, he set out to take part in the campaign of Belgium, where he conducted himself with bravery and distinction. After for some time filling the office of secretary of the "commission d'organisation du mouvement des armées," he in 1794 became deputy of the director of the Polytechnic school, and on the institution of the central schools at Dijon he was appointed to the chair of the "method of sciences," where he made his first experiments in that mode of tuition which he afterwards developed more fully. On the central schools being replaced by other educational institutions, Jacotot occupied successively the

chairs of mathematics and of Roman law until the overthrow of the empire. In 1815 he was elected a representative to the chamber of deputies; but after the second restoration he found it necessary to quit his native land, and, having taken up his residence at Brussels, he was in 1818 nominated by the Government teacher of the French language at the university of Louvain, where he perfected into a system the educational principles which he had already practised with success in France. His method was not only adopted in several institutions in Belgium, but also met with some approval in France, England, Germany, and Russia. An account of it will be found in the article EDUCATION, vol. vii. pp. 677–78. After the revolution of 1830 Jacotot returned to France, and he died at Paris, July 30, 1840.

His system was described by him in *Enseignement universel, Langue maternelle*, Louvain and Dijon, 1823—which has passed through several editions—and in various other works, and he also advocated his views in the *Journal de l'Émancipation intellectuelle*. For a complete list of his works and fuller details regarding his career, see *Biographie de J. Jacotot*, by Achille Guillard, Paris, 1860.

JACQUARD, JOSEPH MARIE (1752–1834), inventor of the Jacquard silk-weaving loom, was born of humble parents at Lyons, July 7, 1752. The earlier part of his life is involved in considerable obscurity, though it is said that his mechanical talent was manifest from an early age. Jacquard married in 1777, and at the death of his father fell heir to two looms and a small sum of money. These, however, like Palissy's furniture, were sacrificed to the inventive pursuits of their owner, who was at last forced to become a lime-burner at Bresse, while his wife supported herself at Lyons by plaiting straw. In 1793 Jacquard took part in the unsuccessful defence of Lyons against the troops of the convention; but afterwards served in their ranks on the Rhone and Loire. After seeing some active service, in which his young son was shot down at his side, Jacquard again returned to Lyons, where he succeeded in finding work. He still laboured at his machines, and in 1801 a medal was awarded him for an invention which he exhibited in the industrial exhibition at Paris, whereby one workman per loom was superseded in the weaving of figured silks. Jacquard was summoned to Paris, and after interviews with Napoleon and Carnot was attached to the Conservatoire des Arts et Métiers. A loom of Vaucanson's, deposited there, suggested various improvements in his own, which he gradually perfected to its final state. In 1804 he returned to Lyons, and although his invention was fiercely opposed by the silk weavers, whom it threatened to deprive of a livelihood, its advantages were too great to suffer resistance. Many years before his death, which occurred at Oullins, a village near Lyons, on August 7, 1834, the inventor had the satisfaction of seeing his loom in almost universal use, and, as a consequence, the prosperity of his native city rapidly advancing. Jacquard was rewarded with a pension of £60, a royalty of £2 upon each loom erected, and the cross of the legion of honour. His statue was erected in Lyons in 1840.

See Lamartine's *Jacquard*, and the article WEAVING.

JADE, a name popularly applied to several distinct ornamental stones, but restricted scientifically to a definite mineral species known as *nephrite*. The term nephrite, from *νεφρός*, the kidney, refers to the reputed value of the mineral in renal diseases, whence it was formerly known as *Lapis nephriticus*. Probably the word *jade* is a corruption of the Spanish *hijada*, since this mineral is one of the stones which were known to the Spanish conquerors of Mexico and Peru under the name of *piedra de hijada*, or "stone of the loins"—a name which first appears in the writings of Monardes, in 1565, as *piedra de la yjada*. So numerous have been the names applied to this mineral in

various parts of the world, and at different times, that Professor Fischer has collected nearly one hundred and fifty synonyms of jade.

True jade, or nephrite, is a native silicate of calcium and magnesium, which may be regarded as a compact or crypto-crystalline variety of hornblende, and may be referred either to actinolite or to tremolite, according as its colour tends to green or to white. It never exhibits crystalline form or distinct cleavage; but, according to recent observers who have visited the old quarries in Turkestan, and have seen the mineral *in situ*, traces of cleavage may occasionally be observed; usually, however, the substance breaks with a splintery fracture. The specific gravity of jade varies from 2.91 to 3.06, and offers one of the readiest means of distinguishing between this mineral and others with which it is likely to be confounded. Most specimens of jade are scratched by flint or quartz, their hardness being about 6.5; but, while the hardness is not excessive, the mineral is remarkable for its toughness. It is notable that Hermann von Schlagintweit, who inspected the quarries in the Kara-kash valley, found that the hardness of the stone when freshly broken was considerably less than that assumed by it after a short exposure. The colour of jade is subject to great diversity, —some varieties presenting almost every shade of green, while others are yellowish, grey, or even white.

So far as is at present known, no true jade has ever been detected *in situ* in Europe. A loose block has been found at Schwemml near Leipzig, and the mineral is said to occur in the drift at Potsdam near Berlin. Corsica and Turkey have also been recorded as jade localities, but probably on insufficient grounds.

It is by the Chinese that jade has always been most highly prized, and, notwithstanding its intractability, most elaborately carved. To the Chinese it is known under the name of *yu* or *yu-chi* (yu-stone). Much of the Chinese jade was formerly obtained from quarries in the Kuen-lun mountains, on the sides of the Kara-kash valley, in Turkestan. These ancient workings were visited and described a few years ago by H. v. Schlagintweit, by Dr Stolicka, and by Dr Cayley. The mineral is found in nests and veins running through schistose and gneissose rocks. It is probable that jade occurs throughout the Kuen-lun range, and that a rich site exists to the south of Khotan. The Khotan jade has been known to the Chinese for upwards of two thousand years. In Turkestan the jade is known as *yashm* or *yeshm*, a word which appears in Arabic as *yeshb*, and is said to be cognate with *jaas* or jasper. Indeed, by early mineralogists the jade was often described as *jaspis viridis*. Fine boulders of dark green jade have been found by M. Alibert in the neighbourhood of his graphite mine near Batongol in Siberia. New Zealand is one of the most famous localities for jade, and the stone is highly prized by the natives, who work it, with great labour, into amulets, axe-heads, and various other objects. Among these objects may be mentioned the peculiar club-like implement known as the *mere* or *patoopattoo*, and the hideous breast ornament termed *hei tiki*. By the Maories jade is known as *pumamu* or "green-stone," and the occurrence of this mineral along the western coast of the south island has led to the name *Te wahi pumamu*, or "the place of the green-stone," being applied to this district. Jade also occurs in New Caledonia and in some of the smaller Pacific islands. In consequence of its use by the South Sea Islanders as a material for making axe-heads, it is often known to German mineralogists as *Beilstein* or "axe-stone."

Under the name of "oceanic jade," M. Damour has described a fibrous variety found in New Caledonia and in the Marquesas Islands, having a specific gravity of

3.18, and differing from ordinary nephrite in the proportion of lime and magnesia which it contains. If this oceanic jade be recognized as a distinct variety, the ordinary nephrite may be distinguished as "oriental jade."

Although it was from America that the original jade, or "spleen-stone," was introduced into Europe, it is curious that few, if any, American localities for this mineral are recorded in modern works on mineralogy. Dr Dawson has, however, noted its occurrence in British Columbia. At the time of the Spanish conquest of America, amulets in jade or in some jade-like mineral were highly venerated throughout Mexico, Central America, and Peru. It has been supposed by Mr E. G. Squier that jade was one of the green stones so greatly prized by the ancient Mexicans under the name of *chalchihuitl*. The "Amazon stone," which has sometimes been regarded as jade, is a green variety of microcline-felspar; while the "Bowenite" from Smithfield in Rhode Island, which was at one time supposed to be nephrite, is found to be a variety of serpentine of unusual hardness. Serpentine is also used as a substitute for jade in some of the common objects imported from China.

While true jade has not hitherto been found *in situ* in Europe, it is a very suggestive fact that neolithic celts and scrapers have been found among the relics of several of the ancient pile-dwellings in the lakes of Switzerland. The principal localities have been the stations of Lüscherz and Schaffis on the Lake of Bienné (Biel), Meilen on the Lake of Zurich, and Robenhausen on the Lake of Pfäfers. Yet no jade has been discovered among the rocks of the Swiss Alps; neither have any chippings been found which might lead us to suspect that the stone was worked in Switzerland. As it seems beyond doubt that the jade must be a foreign material, it becomes an interesting question to determine whether such objects were obtained by barter, or had been brought by the ancestors of the old lake-dwellers from their primitive abode in the East, and preserved generation after generation during their migration westwards. It should be mentioned that jade celts have been found by Dr Schliemann among the relics of the oldest of the cities at Hissarlik. A jade celt engraved with a Gnostic formula in Greek characters is preserved in the Christy collection; and among the Assyrian and Babylonian seal-cylinders in the British museum there is said to be one specimen of jade.

It was shown by M. Damour, in 1863, that much of the so-called jade is altogether different from nephrite, and must be separated as a distinct species, for which he suggested the name of "jadeite." Jadeite is a silicate of aluminium and sodium, and therefore differs widely from nephrite in chemical composition. Mineralogically its relations lie rather with epidote than with hornblende. Its colour is generally brighter than that of nephrite, and the paler-tinted kinds often contain veins of a bright-green colour. It is slightly harder than nephrite, but its most distinctive characteristic is its high specific gravity; this ranges from 3.28 to 3.35, while the density of nephrite, even in oceanic jade, never exceeds 3.18.

Much of the Chinese "jade" is really jadeite. According to Pumpelly the jadeite of Yu-nan in south-west China is known as *fei-tsu*. Jadeite also occurs to the north-west of Bhamo in Burmah. Axes of jadeite are not unfrequently found in the remains of the Swiss lake-dwellings, but the mineral is not known to occur in the rocks of Europe. Jadeite forms the substance of many ancient Mexican ornaments, while implements wrought in this same material have been found in Costa Rica. Fischer records an Egyptian scarabæus in jadeite.

The green jade-like stones which are known to the Maories as *kawa-kawa* and *tangiwai* do not appear to be

the place. As early as 1544 the missionaries under Francis Xavier had made converts in this part of Ceylon, and after the conquest the Portuguese maintained their proselytizing zeal. They had a Jesuit college and a Franciscan and a Dominican monastery. The Dutch drove out the Portuguese in 1658. The Church of England Missionary Society began its work in Jaffna in 1818, and the American Missionary Society in 1822.

JAGÁDHRI, a municipal town in Ambálá district, Punjab, India, is situated in $30^{\circ} 10' N.$ lat. and $77^{\circ} 20' 45'' E.$ long., a little west of the river Jumna, 37 miles south-east of Ambálá city, and 3 miles north of the Sind, Punjab, and Delhi Railway. Before the Sikh invasions, Jagádhri was a mere village; but Rái Sinh of Búría, the Sikh conqueror, encouraged the commercial and manufacturing classes to settle on the spot, so that a considerable trade rapidly sprang up. Destroyed by Nádír Sháh during one of his incursions, but rebuilt in 1783 by Rái Sinh, it passed to the British in 1829 together with the territory of which it was the capital. Jagádhri has imports of copper and iron, considerable manufacture of metal work, and exports of vessels and tools. It contains a *tahsíl*, police-office, and rest-house. The population in 1868 was 11,676, comprising 9220 Hindus, 2319 Mahometans, and 137 Sikhs.

JAGUAR (*Felis onca*). This powerful and ferocious animal is the largest of the species of *Felides* found upon the American continent. It ranges from Texas through Central and South America into Patagonia. In the countries which bound its northern limit it is not frequently met with, but in South America it is still quite common, and Azara states that when the Spaniards first settled the district between Monte Video and Santa Fé

Jaguar.

as many as two thousand were killed yearly. The jaguar is usually found singly, or sometimes in pairs, and preys upon such quadrupeds as the horse, tapir, capybara, dogs, or cattle, and its strength is so great that it has been known to swim with a horse it had killed across a wide river, and then to carry its prey into the woods. It rarely slays at a time more than is requisite to satisfy its hunger, and leaves the unconsumed portions for the benefit of any stray prowler who may find them. Its manner of killing its victim is, after springing upon it, to strike it to the earth by a blow of its powerful paw. The jaguar often feeds upon turtles, sometimes following the reptiles into the water to effect a capture; having secured one and turned it over on its back, it inserts a paw between the shells and drags out the body of the turtle by

means of its sharp claws. Occasionally, after having tasted human flesh, the jaguar becomes a confirmed man-eater. The cry of this great cat, which is heard at night, and most frequently during the pairing season, is deep and hoarse in tone, and consists of the sound *pu, pu*, often repeated. The female brings forth from two to four cubs towards the close of the year; they are able to follow their mother in about fifteen days after birth. The colour of the jaguar varies greatly among individuals, ranging from white to black, the rosette markings in the extremes being but faintly visible. The general or typical coloration is a rich tan upon the head, neck, body, outside of legs, and tail near the root. The upper part of the head and sides of the face are thickly marked with small black spots, and the rest of body is covered with rosettes, formed of black spots, with a black spot in the centre, and ranged lengthwise along the body in five to seven rows on each side. These black rings are heaviest along the back. The lips, throat, breast, and belly, the inside of the legs, and the lower sides of tail are pure white, marked with irregular spots of black, those on the breast being long bars, and on the belly and inside of legs large blotches. The tail has large black spots near the root, some with light centres, and from about midway of its length to the tip it is ringed with black. The ears are black behind, with a large buff spot near the tip. The nose and upper lip are light rufous brown. The size varies, the total length of a very large specimen measuring 6 feet 9 inches; the average length, however, is about 4 feet from the nose to root of tail. In form the jaguar is thick-set; it does not stand high upon its legs; and in comparison with the leopard it is heavily built. But its movements are very rapid, and it is fully as agile as its more graceful relative. The skull resembles that of the lion and tiger, but is much broader in proportion to its length. The forehead is concave, and the nasal region broad. The frontal processes of the maxillary are rounded, in contradistinction to the truncated form of the tiger and the pointed one of the lion, and do not extend as far back as the fronto-nasal articulation. On the inner edge of the orbit is a well-developed tubercula. The canines are long and stout, the molar series well developed. The second sillon on the outer side of the crown of the canines is rudimentary, sometimes absent.

JAHANÁBAD, a town in Gayá district, Bengal, situated on the Patná road, $25^{\circ} 13' 10'' N.$ lat., $85^{\circ} 2' 10'' E.$ long. Population (1872) 21,022—namely, 12,413 Hindus and 8609 Mahometans. It was at one period a flourishing trading town, and in 1760 it formed one of the eight branches of the company's central factory at Patná. Since the introduction of Manchester goods, the trade of the town in cotton cloth has almost entirely ceased; but large numbers of the Júláh or weaver caste live in the neighbourhood.

JAHN, JOHANN (1750–1816), a distinguished Orientalist and Biblical critic of the Roman Catholic Church, was born at Tasswitz, Moravia, on June 18, 1750. After completing his school education at Znain he studied philosophy at Olmütz, and in 1772 began his theological studies at the Præmonstratensian convent of Bruck in the neighbourhood of Znain. Having been ordained to the priesthood in 1776, he for a short time held a cure of souls at Mislitz, but was soon recalled to Bruck to become professor of Oriental languages and Biblical hermeneutics there. On the suppression of the convent by Joseph II. in 1784, Jahn was removed to a chair at Olmütz corresponding to that which he had previously held, and in 1789 he was transferred to Vienna as professor of Oriental languages, Biblical archaeology, and dogmatics. In 1792 he published his *Einführung ins Alte Testament* (2 vols.), which almost

immediately began to cause him trouble; a certain Cardinal Migazzi laid a complaint against him before the emperor because in his preface he had confessed himself to have in some points departed from the views of his learned predecessors and adopted opinions of his own, while in the work itself he declared Job, Jonah, Tobit, and Judith to be didactic poems. To these charges was added a third, that in his New Testament lectures he had stated the cases of demoniacal possession there mentioned to be cases of natural disease. On the matter being referred to an ecclesiastical commission, it was reported that the views themselves were not necessarily heretical, but that Jahn had shown undue rashness in giving out, as his own, opinions which teachers of theology ought not to mention otherwise than as foreign; in accordance with this it was decided that he ought to modify his expressions in future editions of his work and in his subsequent lecturing. Although he appears honestly to have accepted this judgment, the hostility of those who were opposed to his teaching did not cease until at last (1806) he was compelled to accept a canonry at Vienna, which involved the resignation of his chair. This step had been preceded by the condemnation of his *Introductio in libros sacros Veteris Testamenti in compendium redacta*, published in 1804, and also of his *Archæologia Biblica in compendium redacta* (1805). The only work of importance, outside the region of mere philology, afterwards published by him, was the *Enchiridion Hermeneuticæ* (1812). He died August 16, 1816. Jahn's place in the history of the modern science of Biblical criticism is undoubtedly an honourable one, and also of some importance, especially when his ecclesiastical environment is taken into account. If he cannot be said to have been either very original or very profound, he has at least the merit of being laborious, candid, and clear-sighted within his range of vision; one of his books, the *Archæologia*, is not even yet entirely superseded.

Besides the works already mentioned, he published *Hebræische Sprachlehre für Anfänger*, 1792; *Aræaische od. Chaldäische u. Syrische Sprachlehre für Anfänger*, 1798; *Aræaische Sprachlehre*, 1798; *Elementarbuch der Hebr. Sprache*, 1799; *Chaldäische Orestomathie*, 1800; *Aræaische Orestomathie*, 1802; *Lexicon Arabico-Leviticum Orestomathie accomodatissimum*, 1802; an edition of the Hebrew Bible, 1806; *Grammatica Lingue Hebræicæ*, 1809; a critical commentary on the Messianic passages of the Old Testament (*Vaticinia prophetarum de Jesu Messia*), 1815. In 1821 a collection of *Nachträge* appeared, containing six dissertations on Biblical subjects. The English translation of the *Archæologia* by Upham has passed through several editions. See A. G. Hoffmann's article in Ersch and Gruber's *Encyclopædie*.

JAHN, OTTO (1813-1869), eminent alike as an archaeologist, philologist, and art critic, was born June 16, 1813, at Kiel, where he began under Nitzsch the philological and archaeological education which he continued at Leipzig under Hermann and at Berlin under Lachmann and Gerhard. After the completion of his university studies he travelled for three years (1836-39) in France and Italy; having "habilitated" in 1839 at Kiel, he in 1842 became professor-extraordinary of archaeology and philology at Greifswald, where in 1845 he was promoted to the rank of ordinarius. In 1847 he accepted the chair of archaeology at Leipzig, but for having taken part in the political movements of 1848-49 he was deprived in 1851. He continued to remain in private life until in 1855 he was appointed ordinary professor of the science of antiquity, and director of the academical art museum at Bonn. In 1867 he was called to succeed Gerhard at Berlin; but after a lingering illness he died at Göttingen, September 9, 1869.

The following list of his works is not to be regarded as exhaustive. 1. *Archæological: Telapnos u. Troilos*, 1841; *Die Geniale des Polymath*, 1841; *Specimen epigraphicum in memoriam Kallermanns*, 1842; *Pantheus u. die Manaden*, 1842; *Pæroris u. Oinone*, 1846; *Die heiligen Kunst*, 1846; *Potho, die Götter der Überwindung*, 1847; *Über einige Darstellungen des Pærs-Urtheils*, 1849; *Die*

Hebræische Cate, 1852; *Beobachtung der Troas-Inschrift des Königs Lythios*, 1851; *Die Tempel der Stadt Athenais u. der Villa Pamphili*, 1857; *Prolegomena ad archæologiam*, 1859; *Darstellung eines griechischen Dichters auf Vasenbildern*, 1861; *Über bemalte Vasen mit Götterschmuck*, 1865; *Über die Kunst der Hebräer u. des Handedschers*, 1868. 2. *Philological* (critical editions of Ptolemy, 1812; Censorinus, 1815; Florus, 1822; the *Drabus*, 1849, and *Orator*, 1851, of Cicero; Juvenal, 1851; the *Periochæ* of Livy, 1853; the *Psychæ et Cypri* of Apuleius, the *Electæ* of Sophocles, 1861; Longinus, 1867. 3. *Biographical and æsthetic: Über Mundschmuck*, 1812; *Biographische Memoiren*, a work of extraordinary labour and loving care, 1826-1830; *Leibniz Urtheil*, 1853; *Gesammelte Aufsätze über Kunst*, 1866; *Biographische Aufsätze*, 1866.

JAINS, the most numerous and influential sect of heretics, or nonconformists to the Brahmanical system of Hinduism, in India, are found in every province of Upper Hindustan, in the cities along the Ganges, and in Calcutta. But they are more numerous to the west—in Mewar, Guzerat, and in the upper part of the Malabar coast—and are also scattered throughout the whole of the southern peninsula. They are mostly traders, and live in the towns; and the wealth of many of their community gives them a social importance greater than would result from their mere numbers. Of what their actual number may be it is unfortunately impossible to form any exact estimate, as in the census returns they are confounded with the Buddhists. Their magnificent series of temples and shrines on Mount Abu, one of the seven wonders of India, is perhaps the most striking outward sign of their wealth and importance.

The Jains are the last direct representatives on the continent of India of those schools of thought which grew out of the active philosophical speculation and earnest spirit of religious inquiry so rife in the valley of the Ganges during the 5th and 6th centuries before the Christian era. For many centuries Jainism was so overshadowed by that stupendous movement, born at the same time and in the same place, which we call Buddhism, that it remained almost unnoticed by the side of its powerful rival. But when Buddhism, whose widely open doors had absorbed the mass of the community, became thereby corrupted from its pristine purity and gradually died away, the smaller school of the Jains, less diametrically opposed to the victorious orthodox creed of the Brahmins, survived, and in some degree took its place.

Jainism purports to be the system of belief promulgated by Vardhamāna, better known by his epithet of Mahāvīra, who was a contemporary of Gautama, the Buddha. But the Jains, like the Buddhists, believe that the same system had previously been proclaimed through countless ages by each one of a succession of earlier teachers. The Jains count twenty-four such prophets, whom they call Jinas, or Tīrthankaras, that is, conquerors or leaders of schools of thought. It is from this word Jina that the modern name Jainas, meaning followers of the Jina, or of the Jinas, is derived. This legend of the twenty-four Jinas contains a germ of truth. Mahāvīra was not an originator; he merely carried on, with but slight changes, a system which existed before his time, and which probably owes its most distinguishing features to a teacher named Pārśwa, who ranks in the succession of Jinas as the predecessor of Mahāvīra. Pārśwa is said, in the Jain chronology, to have lived two hundred years before Mahāvīra (that is, about 700 B.C.); but the only conclusion that it is safe to draw from this statement is that Pārśwa was considerably earlier in point of time than Mahāvīra. Very little reliance can be placed upon the details reported in the Jain books concerning the previous Jinas in the list of the twenty-four Tīrthankaras. The curious will find in them many reminiscences of Hindu and Buddhist legend; and the antiquarian must notice the distinctive symbols assigned to each, in order to recognize

the statues of the different Jinas, otherwise identical, in the different Jain temples.

Very little is at present known of the details of the Jain system of belief. But fresh light is being thrown upon this question year by year, and some of their principal tenets are already beyond dispute. The Jains are divided into two great parties,—the *Digambaras*, or Sky-clad Ones, and the *Svētāmbaras*, or the White-robed Ones. The latter have only as yet been traced, and that doubtfully, as far back as the 6th century after Christ; the former are almost certainly the same as the Niganthas, who are referred to in numerous passages of the Buddhist Pāli Pīṭakas, and must therefore be at least as old as the 4th century B.C. In many of these passages the Niganthas are mentioned as contemporaneous with the Buddha; and details enough are given concerning their leader Nigantha Nāta-putta (that is, the Nigantha of the Jāṭhika clan) to enable us to identify him, without any doubt, as the same person as the Vardhamāna Mātthā-vīra of the Jain books. This remarkable confirmation, from the scriptures of a rival religion, of the Jain tradition seems conclusive as to the date of Mātthā-vīra; and, should any one still doubt the antiquity of the sect, it may be mentioned here that the Niganthas are referred to in one of Asoka's edicts (*Corpus Inscriptionum*, Plate xx.). Unfortunately the account of the teachings of Nigantha Nāta-putta given in the Buddhist scriptures are, like those of the Buddha's teachings given in the Brahmanical literature, not only very meagre, but also very little to be depended upon. And the Jain scriptures themselves, though based on earlier traditions, are not older in their present form than the 6th century of our era. The most distinctively sacred books are called the forty-five Āgamas, consisting of eleven Āṅgas, twelve Upangaṇas, ten Pakiṇṅkas, six Chēdas, four Mūla-sūtras, and two other books. Several of these are in process of translation into English for the series of translations from the sacred books of the East now being published under the auspices of the university of Oxford. It was Devadhi-gaṇin, who occupies among the Jains a position very similar to that occupied among the Buddhists by Buddhaghoṣa, who at the date just mentioned collected the then existing traditions and teachings of the sect into these forty-five Āgamas. It is most probable that, previous to his time, the sacred lore of the Jains was handed down by memory, and not by writing. This mode of transmitting a literature seems very unsafe according to modern European ideas. But when we call to mind the very great value of the historical results drawn from the Vedas and the Buddhist scriptures, both of which were for many centuries preserved for posterity by memory alone, we may confidently look forward to important additions to our knowledge when the Jain Āgamas shall have been made accessible to European scholars. Like the Buddhist scriptures, the earlier Jain books are written in a dialect of their own, the so-called Jaina Prakṛit; and it was not till between 1000 and 1100 A.D. that the Jains adopted Sanskrit as their literary language.

The most distinguishing outward peculiarity of Mātthā-vīra and of his earliest followers was their practice of going quite naked, whence the term *Digambara*. Against this custom Gautama, the Buddha, especially warned his followers; and it is referred to in the well-known Greek phrase *Gymnosophist*, used already by Megasthenes, which applies very aptly to the Niganthas. Even the earliest name Nigantha, which means "free from bonds," may not be without allusions to this curious belief in the sanctity of nakedness, though it was also alluded to freedom from the bonds of sin and of transmigration. The statues of the Jinas in the Jain temples, some of which are of enormous size, are still always quite naked; but the Jains themselves have abandoned the practice, the Digambaras being sky-clad at meal time only, and the Svētāmbaras being always completely clothed. And even among the Digambaras it is only the recluses or *Yatis*, men devoted to a religious life, who carry out this practice. The Jain laity—the *Śrāvakas*, or disciples—do not adopt it.

The supreme aim of the Jains as of the Buddhists is called *Nirvāṇa*; but the word conveys different ideas in the two religions. The Jains appear to believe in the existence of a soul inside the human body, and in the transmigration of souls; and their Nirvāṇa seems to consist in the delivery of the soul from this transmigration. It differs from the *moksha* of the Hindus in that the Jains, not teaching the existence of a supreme being, do not hope for an absorption of the soul into the deity. This Nivāṇa will follow on the belief in certain metaphysical theories, the nature of which still remains unknown to scholars. But it is to be accompanied by the practice of the four virtues—liberality, gentleness, piety, and remorse for failings—by goodness in thought, word, and deed, and by kindness to the mute creation and even to the forms of vegetable life. This last item in their belief, though common to the Jains and the Buddhists, has been carried out by the Jains to a more extreme result, and seems to be based on the wide extension of the doctrine of the soul. They regard all animals and plants as endowed with souls, and they consider it an act of piety to put up and to maintain hospitals for sick animals. They believe also in the existence of numerous angels or demons, good and bad, among whom they include most of the deities of the Hindu pantheon, and the later Jains do not scruple to render a kind of worship to these spirits. This practice is, however, not in accordance with the earlier and stricter Jainism; and it is the negative side of their creed, their denial of the power of the gods, of the authority of the Vedas, and of the sacredness of caste, which has been the most important part of their teaching. Practically, no doubt, many of their laity adhere to some of the social caste distinctions of the Hindus; and their authors quote the Vedas with respect when passages from the Vedas can be used in support of their own views; but no distinction of caste excludes from their religious orders, or prevents the attainment of their Nirvāṇa, and the Vedas, even when quoted, are not regarded as conclusively authoritative. Professor Jacobi, who is the best authority on the history of this sect, thus sums up the distinction between the Mātthā-vīra and the Buddha: "Mātthā-vīra was rather of the ordinary class of religious men in India. . . . He may be allowed a talent for religious matters, but he possessed not the genius which Buddha undoubtedly had. . . . The Buddha's philosophy forms a system based on a few fundamental ideas, whilst that of Mātthā-vīra scarcely forms a system, but is merely a sum of opinions (*pannatti*) on various subjects, no fundamental ideas being there to uphold the mass of metaphysical matter. Besides this. . . . it is the ethical element that gives to the Buddhist writings their superiority over those of the Jains. Mātthā-vīra treated ethics as corollary and subordinate to his metaphysics, with which he was chiefly concerned."

Authorities.—Bhadraśūkh's *Kaṭpa Sūtra*, the recognized and popular manual of the Svētāmbara Jains, edited with English introduction by Professor Manual, Leipzig, 1879; Hemacandra's "Yoga Sūtram," edited by Winternitz, in the *Zeitschrift der deutschen morgenl. Ges.* for 1874; "Zwei Jaina Sūtras," edited in the *Indische Studien*, vol. xv.; *Āra Prāgñāna der Bhagavata*, by Professor Weber, *Abhandlungen der Königl. Preuss. Akademie der Wissenschaften*, Berlin, 1866; *Nirvāṇa Sūtra*, edited by Dr. Winternitz, with Dutch introduction, Amsterdam, 1879; *Ōst- und west-indische Religionen der Jains*, by Dr. Winternitz (his doctor-dissertation, Zwettl, 1875); *Reise zur Geschichte der Jaina-Religion*, by Dr. Edward Müller, Berlin, 1876; *Cave Temples in India*, vol. ii. Mr. Burgess has an exhaustive account of the Jain Cave Temples (some older than the 7th century) in Ferguson and Burgess's *Cave Temples in India*, London, 1889.

(T. W. R. D.)

JĀINTIA HILLS. For administrative purposes the Jaintia Hills are regarded as a subdivision of the Khāsi and Jaintia Hills district, in the province of Assam. They cover an area of about 2000 square miles, and are bounded N. by the district of Nowgong, E. by Cachar, S. by Sylhet, and W. by the Khāsi Hills.

The Jaintia Hills are divided into twenty-five fiscal divisions, of which three are inhabited by Kukl or Lushai immigrants, and one by Mikirs. The remainder of the inhabitants are Syntengs, a race akin to the Khāsis, but with distinct ethnic characteristics and language. The chief crop is rice, grown on the nomadic system of agriculture known as *jām*. The most valuable natural product is limestone, which is quarried on the river banks, and despatched by water into Bengal from the Sylhet markets. Coal of excellent quality has been found in situations mostly inaccessible to water traffic. The Syntengs are keen traders, and retain in their own hands the valuable commerce of their hills. They frequent the markets held in the chain of villages at the foot of the hills on the Sylhet side. In 1876-77 the total value of exports from the subdivision was £19,000, and of the imports (chiefly cotton, woollen, and silk cloth, rice, dried fish, salt, and tobacco) £34,560. The gross revenue in the same year was £1271.

This tract was annexed in 1835, its rājā having been deposed for complicity in carrying away British subjects, and in their immolation as human sacrifices in a shrine of the goddess Kālī. At first no change was made in the indigenous revenue system, which consisted simply in the payment of a he-goat once a year by each village. In 1869, when a new taxation was introduced, the hillmen objected, and in January 1882 they rose in open rebellion. The police station at Jowā was burned to the ground, the garrison of sepoy was closely besieged, and all show of British authority was swept away throughout the hills. The hillmen fought bravely for their independence. At first they were successful in cutting off several detachments of sepoy and police, but the ringleaders were captured, and order finally restored in March 1883.

JĀIPUR. See **JETPORE.**

JĀISALMIR, a native state in Rājputān, under the political superintendence of that agency and the Government of India, lying between 26° 5' and 28° 24' N. lat. and between 69° 30' and 72° 50' E. long., with an area of 16,447 square miles, is bounded on the N. by Bahāwalpur, on the E. by Bikaner and Jodhpur, on the S. by Jodhpur and Sind, and on the W. by Kharipur state and Sind.

Jāisalmir is almost entirely a sandy waste, forming a part of "the Great Indian Desert." The general aspect of the country is that of an interminable sea of sandhills, of all shapes and sizes, some rising to a height of 150 feet. Those in the west are covered with *phoy* bushes, those in the east with tufts of long grass. Water is scarce, and generally brackish; the average depth of the wells is said to be about 250 feet. There are no perennial streams, and only one small river, the Kākni, which, after flowing a distance of 23 miles, spreads over a large surface of flat ground, and forms a lake or *jāl* called the Bhuj-Jhīl. The climate is essentially dry and healthy. The temperature is highest in May and June; the coldest months are from the middle of December to the middle of February. Throughout Jāisalmir, only rain-crops, such as *bājra*, *soar*, *moh*, *tūl*, &c., are grown; spring crops of wheat, barley, &c., are very rare. Owing to the scanty rainfall, irrigation is almost unknown.

The main part of the population lead a wandering life, grazing their flocks and herds. Large herds of camels, horned cattle, sheep, and goats are kept. The principal trade is in wool, *ghat*, camels, cattle, and sheep. The chief imports are grain, sugar, foreign cloth, piece-goods, &c. There is only one civil court. Education is at a very low ebb. Jain priests are the chief schoolmasters, and their teaching is very elementary. The income of the state for 1873-74 was £11,854, the expenditure £16,911. The mahārājā has a force of 651 infantry and 155 cavalry, who have no drill or discipline, but are very efficient as police. It has been estimated that the total number of inhabitants do not exceed 72,000; 43,500 are said to be Hindus, 28,000 Mahomedans, and 2500 Jains.

The majority of the inhabitants are Yadu Bhatti Rājputs, who take their name from an ancestor named Bhatti, renowned as a warrior, when the tribe were located in the Punjab. Shortly after this the clan was driven southwards, and found a refuge in the Indian desert, which was thenceforth their home. Deorāj, a famous prince of the Bhatti family, is esteemed the real founder of the present Jāisalmir dynasty, and with him the title of *rājā* commenced. In 1156 Jāisāl, the sixth in succession from Deorāj, founded the fort and city of Jāisalmir, and made it his capital. Jāisāl was succeeded by several valiant princes, who were constantly engaged in battles and raids. In 1294 the Bhattis so enraged the emperor Alā-ud-dīn that his army captured and sacked the fort and city of Jāisalmir, so that for some time it was quite deserted. After this there is nothing to record till the time of Rājā Sabal Singh, whose reign marks an epoch in Bhatti history in that he acknowledged the supremacy of the Delhi emperor Shāh Jahān, and was the first of the Jāisalmir princes who held his dominions as a vāṭ of the Delhi empire. The Jāisalmir princes had now arrived at the height of their power, but from this time till the accession of Rājā Mubāj in 1762 the fortunes of the state rapidly declined, and most of its outlying provinces were lost. In 1818 Mubāj entered into political relations with the British. Since his death in 1820, no stirring events have occurred. The present chief is Mahārājā Bairi Sal, who was born in 1848, and is a Yadu Bhatti Rājput. The ruler of Jāisalmir is styled *mahārājā*, and holds that position as head of the clan of Bhattis. The constitution may be described as tribal suzerainty in process of conversion to the feudal stage. Many of the tribal chiefs are to a great extent independent, inasmuch that they hold their estates rent free.

JĀJPUR, or **JAJPORE**, a municipal town in Cuttack district, Bengal, is situated on the right bank of the Baitarāni river, in 20° 50' 45" N. lat., 86° 22' 56" E. long. It contains the usual subdivisional and public buildings, a charitable dispensary, a Government-aided school, &c. It was the capital of the province of Orissa under the Kesari dynasty until the 11th century, when it was superseded by Cuttack, the modern metropolis. Jajpur is celebrated as a settlement of Brāhman Śivaite priests, and as the headquarters of one of the four regions of pilgrimage into which Orissa is divided, viz., that sacred to Parvati, the wife of the All-Destroyer. In Jajpur are numerous ruins of Śivaite temples, sculptures, &c. In the 16th century this town was the scene of the struggle between Muslimān and Hindu powers, from which it emerged in ruins. It, however, still ranks as the fourth town of Orissa, and derives much wealth from its yearly fair in honour of Barun, "Queen of the Waters," at which numbers of pilgrims assemble to bathe in the holy Baitarāni, the Styx of Hindu mythology. The population in 1872 numbered 10,763.

JAKOB, LUDWIG HEINRICH VON (1750-1827), a German writer on political economy, was born at Wettin, 26th February 1759. After receiving preparatory instruction at Merseburg and at the gymnasium of Halle, he in 1777 entered the university of the latter city, at first devoting his attention specially to philological studies. In 1780 he was appointed teacher at the gymnasium, and, now occupying his leisure chiefly with the study of philosophy, he in 1785 obtained the degree of doctor of philosophy, and in 1791 was appointed professor of philosophy at the university. The suppression of the university of Halle having been decreed by Napoleon, Jakob took himself to Russia, where in 1807 he was appointed professor of political economy at Kharkoff, and in 1809 a member of the Government commission to inquire into the finances of the empire. In the following year he became president of the commission for the revision of criminal law, and he at the same time obtained an important office in the finance department, with the rank of counsellor of state; but in 1816 he returned to Halle to occupy the chair of political economy. He died at Lauchstadt, July 22, 1827.

Shortly after his first appointment to a professorship in Halle, Jakob had begun to turn his attention rather to the practical than the speculative side of philosophy, and in 1806 he published at Halle *Lehrbuch der Nationalökonomie*, in which he was the first to advocate in Germany the necessity of a distinct science dealing specially with the subject of national wealth. His principal other works are *Grundriss der allgemeinen Logik*, Halle, 1788; *Grundriss der Politischen Ökonomie und Polizeiwissenschaften*, Leipzig, 1809; *Einführung in das Studium der Staatswissenschaften*, Halle, 1819; *Entwurf eines Organisationsplans für das Russische Reich*, Halle, 1818; and *Staatsfinanzwissenschaft*, 2 vols., Halle, 1821.

JALALABAD. See **AFGHANISTAN.**

JALANDHAR, or **JULIUSBURG**, a British district in the lieutenant-governorship of the Punjab, India, lies between 30° 56' 30" and 31° 37' N. lat., and between 75° 6' 30" and 77° 49' 15" E. long., forming the southernmost district in the division¹ of the same name. It is bounded on the N.E. by the district of Hushīārpur, on the N.W. by the native state of Kapurthāla and the river Bías, and on the S. by the Sutlej. The blunt triangular tongue of land enclosed by the confluent streams of the Sutlej and the Bías bears the general name of the Jalandhar Doāb. Its submontane portion belongs to Hushīārpur; the remainder is divided between Kapurthāla state and the district of

¹ Jalandhar, a division under a commissioner in the Punjab, comprises the three districts of Jalandhar, Hushīārpur, and Kangra, between 30° 56' 30" and 32° 59' N. lat., and 75° 6' 30" and 77° 49' 15" E. long., with an area of 12,181 square miles, of which 2738 are cultivated, and a population (1868) of 2,477,536, of whom 1,334,653 are males and 1,142,883 females.

Jalandhar. Below the hills, the whole Doab consists of one unbroken alluvial expanse, whose fertility extends from river to river. A well-defined bank marks the bed of the Sutlej on the Jalandhar side. In winter the river contains about 15 feet of water in its deepest parts, and is navigable at all seasons for large flat-bottomed country boats. The main channel shifts from year to year through the wide bed, often forming new islands by slight changes in its course. The Bías touches upon the district for a few miles only. The torrents from the Siwálk hills in Hushíárpur district unite in two main streams, the White and the Black Ben, the former of which runs through the whole of Jalandhar. The White Ben receives numerous affluents, which meet it at right angles; and, following a serpentine path in a deep channel, it finally falls into the Sutlej 4 miles above its junction with the Bías. Several marshy lakes (*jáils*) collect a considerable quantity of water in the rains, which they retain throughout the dry season.

The chief staples are wheat, barley, gram, rice, sugar-cane, Indian corn, *jowar*, cotton, &c., except the low alluvial tract of the Sutlej, irrigation is carried on by means of wells, worked with Persian wheels. Water lies everywhere near the surface, and is absolutely necessary for the higher cereals and sugar-cane, so that well irrigation prevails very generally. The traffic of the district consists mainly in its agricultural produce. Sugar-cane forms the chief commercial crop, and sugar and molasses are largely manufactured. English piece-goods and draught cattle are the principal imports. Cotton cloth, silver wire, and gold and silver lace are manufactured at Jalandhar town. The Sind, Punjab, and Delhi Railway passes through the district, with stations at several of the principal towns. Education was carried on in 1875-76 by means of 1615 aided schools, with a total roll of 7876 pupils. The proximity of the hills renders the climate of Jalandhar comparatively moist, and the annual rainfall for the seven years ending 1872-78 amounted to 28·6 inches. Malaria fever in an endemic form proves the chief cause of mortality, but small-pox often appears as an epidemic, and dysenteric complaints are frequent. There are five Government charitable dispensaries, which afforded relief in 1872 to 34,808 persons.

Jalandhar ranks first in the density of its population amongst all the Punjab districts, and is only exceeded by those of Benares, Jaunpur, and Gházipur in the North-Western Provinces. The enumeration of 1868, taken over an area of 1332 square miles, disclosed a total population of 794,764 persons, of whom 436,690 were males and 358,076 females. As regards religion, Hindus numbered 818,401; Mahometans, 453,427; Sikhs, 117,147; and others, 769. The district contained eleven municipal towns in 1875-76, whose names and populations were as follows:—Jalandhar, 48,933; Kartárpur, 10,953; Aláwalpur, 4873; Adampur, 3269; Banga, 4508; Nawashahr, 4946; Rahon, 14,384; Phillaur, 7535; Nirmahál, 7866; Mahatpur, 6374; and Nakodar, 8800. The following towns had populations exceeding 5000 in 1868:—Basti Shaikh, 8000; Búga, 5441; Jandála, 6499; Maláim, 6288; and Kurkha Kalan, 6791. The district contains a total cultivated area of 657,094 acres, of which 200,097 are artificially irrigated.

The Jalandhar Doab in early times formed a separate Hindu kingdom, ruled by a family of Rájputs, whose descendants still exist in the petty princes of the Kángra hills. Under Mahometan rule the Doab was generally attached to the province of Lahore, in which it is included as a *sarkár* or governorship in the great revenue survey of Akbar's reign. Its governors seem to have held a partially independent position, subject to the payment of a fixed tribute into the imperial treasury. The Sikh reaction extended to Jalandhar at an early period, and a number of petty chieftains established themselves by force as independent princes throughout the Doab. In 1768 the town of Jalandhar fell into the hands of the Sikh confederacy of Faiz-ulá-pur, then presided over by Khushál Síah. His son and successor built a masonry fort in the city, while several other leaders similarly fortified themselves in the suburbs. Meanwhile, Ramjit Síah was consolidating his power in the south, and in 1811 he annexed the Faiz-ulá-pur dominions in the Doab. By the autumn of the same year the maharája's authority was successfully established. Thenceforth Jalandhar became the capital of the Lahore possessions in the surrounding Doab up to the date of the British annexation, which took place at the close of the first Sikh war.

JALANDHAR, a municipal town and cantonment in the above district, is situated in 31° 19' 50" N. lat. and 75° 37' 20" E. long. It lays claim to considerable antiquity, having been the original capital of the Rájput kingdom of Kátach, which dates back to the period

before Alexander's invasion. Hwan Tsang, the Chinese Buddhist pilgrim of the 7th century, describes the town as 2 miles in circuit, the metropolis of a considerable state. Ibráhim Sháh of Ghazni reduced the town to the Mahometan yoke, and it appears as a place of considerable strength during the early Musalmán times. The modern city consists of a cluster of wards, originally distinct, and each enclosed by a wall of its own. Some of them still remain detached, but the majority have now united. The cantonment is 4 miles from the town, and was established in 1846. It has an area of 7½ square miles, and a population (1868) of 11,634 persons. Numerous suburbs, known as *bastis*, surround the city. The trade, though considerable, presents little special interest. The staples of local traffic are English piece-goods and country produce. In 1871-72 the imports were valued at £105,248, and the exports at £96,020. The population in 1868 was 50,067, of whom 15,921 were Hindus, 33,601 Mahometans, 468 Sikhs, and 77 Christians.

JALAP, a cathartic drug consisting of the tuberous roots of *Esogonium Purga*, Benth, a convolvulaceous plant growing on the eastern declivities of the Mexican Andes at

Jalap (*Esogonium Purga*).

an elevation of 5000 to 8000 feet above the level of the sea, more especially about the neighbourhood of Chiconcuaco, and near San Salvador on the eastern slope of the Cofre de Perote. In these localities, where the temperature varies during the day from 60° to 75° Fahr. (15° to 24° C.), and rain falls almost every day, it flourishes in the deep rich soil of shady woods. Jalap has been known in Europe

since the beginning of the 17th century, and derives its name from the city of Jalapa in Mexico, near which it grows, but its botanical source was not accurately determined until the year 1829, when Dr Coxo of Philadelphia published a description and coloured figure taken from living plants sent him two years previously from Mexico. The Jalap plant has slender herbaceous twining stems, with alternately-placed cordate acuminate leaves sharply pointed at the basal angles, and salver-shaped deep purplish-pink flowers. The underground stems are slender and creeping; their vertical roots enlarge and form turnip-shaped tubers, which, as they do not bear leaf organs on their surface, are sometimes called tubercules. The roots are dug up in Mexico throughout the year, and are suspended to dry in a net over the hearth of the Indians' huts, and hence acquire a smoky odour. The large tubers are often gashed to cause them to dry more quickly. In appearance they vary from spindle-shaped to ovoid or globular, and in size from a pigeon's egg to a man's fist. Externally they are brown, and marked with small transverse paler scars, and internally they present a dirty white resinous or starchy fracture. The ordinary drug is distinguished in commerce as Vera Cruz jalap, from the name of the port whence it is shipped. The average annual imports into Great Britain have been estimated at 180,000 lb.

Jalap has been cultivated for ten years past in India, at Ootacamund, and grows there as easily as a yam, often producing clusters of tubers weighing over 9 lb; but these, as they differ in appearance from the commercial article, have not as yet obtained a place in the English market. They are found, however, to be rich in resin, containing 18 per cent. In Jamaica also the plant has been grown, at first amongst the cinchona trees but more recently in new ground, as it was found to exhaust the soil. The 1880 crop of jalap in Jamaica amounted to 14,294 lb, and sold in the fresh state for £82, 3s. 8d. Some of it was exported to the London market.

Jalap owes its properties to *jalapin*, a resin which is present in it to the extent of 12 to 18 per cent. According to Mayer¹ its composition is $C_{31}H_{40}O_{10}$. Jalapin is soluble in alcohol, but insoluble in ether and bisulphide of carbon. Jalap also contains in small quantity *convolvulin*, a resin soluble in ether, homologous with jalapin, and of the composition $C_{34}H_{46}O_{10}$. It yields also about 19 per cent. of sugar according to Gaubour, and starch, gum, uncrystallizable sugar, and colouring matter.

Besides Mexican or Vera Cruz jalap, a drug called Tampico jalap has been imported during the last few years in considerable quantity. It has a much more shrivelled appearance and paler colour than ordinary jalap, and lacks the small transverse scars present in the true drug. It differs also in containing in the place of jalapin a resin identical with the convolvulin above mentioned, and with the para-rhodoretin of Kayser, which exists in it to the extent of 11 per cent. This kind of jalap, the Purga de Sierra Gorda of the Mexicans, was traced by Hanbury to *Ipomoea simulans*, Hanbury. It grows in Mexico along the mountain range of the Sierra Gorda in the neighbourhood of San Luis de la Paz, from which district it is carried down to Tampico, whence it is exported. A third variety of jalap known as woody jalap, male jalap, or Orizaba root, or by the Mexicans as Purga macho, is derived from *Ipomoea orizabensis*, Ledanois, a plant of Orizaba. The root occurs in fibrous pieces, which are usually rectangular blocks of irregular shape, 2 inches or more in diameter, and are evidently portions of a large root. It is only

occasionally met with in commerce. The resin contained in it is identical with that found in Tampico jalap.

According to Dr W. Rutherford, jalap acts as a powerful hepatic and intestinal stimulant. It is used as a hydragogue cathartic in combination with cream of tartar in dropsy, and in all cases where it is desirable to cause a copious watery evacuation, also as a vermifuge. Buchheim asserts that jalap is only purgative when combined with bile, in which the resin is soluble.

JALAPA, or XALAPA, the Aztec Xalapan, a town of Mexico, in the state of Vera Cruz, and about 70 miles inland from the city and port of that name, with which it communicates by a railway opened since 1870. There are few towns in Mexico which are so happily situated: at a height of 4500 feet above the sea, on the edge of the plateau behind which towers the summit of Macultepec, it looks out over the rich lowlands of the *tierra caliente*, enjoying their beauty and escaping their baneful vapours. The immediate vicinity is abundantly fertile, and yields a harvest of rare variety for the botanist. The town lost much of its importance as a commercial entrepôt by the opening of the railway from Vera Cruz *via* Orizaba to Mexico, but the line above mentioned may help to restore its prosperity. Of chief note among the public buildings are the principal church and the old Franciscan monastery, built in 1555. The population is stated at 10,000.

JALAUN, a British district in the lieutenant-governorship of the North-Western Provinces of India, lies between 25° 46' and 26° 26' N. lat., and between 78° 59' and 79° 55' E. long., with an area of 1553 square miles, and forms the northern district of the Jhansi division. It is bounded on the N.E. and N. by the river Jumna, on the W. by the Gwalior and Datia states, on the S. by the Samthar state and the river Betwa, and on the E. by Baoni state. The district lies entirely within the level plain of Bundelkhand, north of the hill country, and is almost surrounded by the Jumna and its tributaries the Betwa and Pahli. The central region thus enclosed is a dead level of cultivated land, almost destitute of trees, and sparsely dotted with villages. The southern portion especially presents one unbroken sheet of cultivation. The boundary rivers form the only interesting feature in Jalaun. The little river Noh flows through the centre of the district, which it drains by innumerable small ravines instead of watering. Jalaun has little picturesqueness or beauty, but possesses great fertility and abundant agricultural resources.

The census of 1872 gives a population of 404,384, of whom 216,007 were males and 187,777 females. The principal tribes are the Bráhmans, the Kúrmis, the Gújars, the Kachhwaras, the Longars, the Kayaths, and the Musalmáns. There were four towns in 1872 with a population exceeding 5000—Kálpí, 15,570; Kúmh, 14,448; Jalaun, 10,197; and Uráí, 6308. The staple crops are the cereals, gram, and cotton. Oil-seeds, dyo-stuffs, and sugar-cane are also raised, but in no large quantities. Irrigation was employed in 1872 over 19,157 acres. Jalaun has suffered much from the noxious *káru* grass, owing to the spread of which many villages have been abandoned and their lands thrown out of cultivation. Drought is the great danger in Jalaun. The last important drought was that of 1868-69; no actual famine resulted, but great distress prevailed. Jalaun is almost entirely an agricultural district, and its trade accordingly depends mainly upon its raw materials and food-stuffs. Kálpí is the great mart of the district; Kúmh is also a considerable trading town. The river traffic by Kálpí is chiefly for thorough goods; and the Jumna is little used as a highway. A good commercial road connects Uráí and Jalaun with Páshpárd, the railway station on the East Indian line. There is also a great military road from Kálpí to Jhansi. The administration is on the non-regulation system, which unites civil, criminal, and fiscal functions in the same officer. In 1860 there were 1484 children under instruction; in 1871, 2708. The climate, though hot and dry, is not considered unhealthy. The mean temperature is 81°·9 Fahr. The prevailing diseases are fevers, and dysentery and other bowel complaints.

Jalaun seems to have been subject to the Nága dynasty, which

¹ By Mayer, Gmelin, and others, jalapin is called convolvulin. It is identical with the rhodoretin of Kayser.

lasted from the 1st to the 3d century of our era. In course of time the eastern portion fell under the power of the Chamela, while the western districts, including that of Jalán, were ruled by the Kachhwahas, a Rajput clan. These seem to have held most of the district until the invasion of the Bundelas in the 14th century. But the town of Kálpi on the Jumna was conquered for the princes of Ghor as early as 1196. Early in the 14th century the Bundelas occupied the greater part of Jálán, and even succeeded in holding the fortified post of Kálpi. That important possession was soon recovered by the Musalmans, and passed under the sway of the Moghal emperors. Akbar's governors at Kálpi maintained a nominal authority over the surrounding district; and the native princes were in a state of chronic revolt, which culminated in the war of independence under Chhatar Sái. On the outbreak of his rebellion in 1671 he occupied a large province to the south of the Jumna. Setting out from this base, and assisted by the Marhattas, he reduced the whole of Bundelkhand. On his death he bequeathed one-third of his dominions to his Marhattá allies, who displayed their usual alacrity in occupying their new territory, and before long succeeded in quietly annexing the whole of Bundelkhand. Under Marhattá rule the country was a prey to constant anarchy and intestine strife. To this period must be traced the origin of all the poverty and desolation which are still conspicuous throughout the district. In 1806 Kálpi was made over to the British, and in 1840, on the death of Náná Golind Rá, his possessions lapsed to them also. Various interchanges of territory took place, and in 1866 the present boundaries were substantially settled. During the whole period of British rule before the mutiny, Jálán only recovered its prosperity by very slow degrees. When the news of the rising at Cawnpur reached Kálpi, the men of the 68d native infantry deserted their officers, and in June the Jánási mutineers reached the district, and began their murder of Europeans. The natives everywhere revelled in the licence of plunder and murder which the mutiny had spread through all Bundelkhand, and it was not till September 1858 that the rebels were finally defeated. Since the mutiny the condition of Jálán seems to have been steadily but slowly improving.

JALÁN, a decayed town in the above district, and the former capital of a native state, is situated in 26° 8' 32" N. lat., 79° 22' 24" E. long. It occupies a large area, and contains a considerable number of good houses, and a ruined fort. The position is low, and swamps surrounding the town engender cholera and malarious fever, for which reason the headquarters of the district have been fixed at Uná. The population in 1872 was 10,197,—8824 Hindus and 1373 Mahometans.

JÁLNA, or JALNA, a town in Hyderabad state, southern India, 19° 50' 30" N. lat., and 78° 56' E. long., 240 miles north-west of Sikandarábád (Secunderabad), 38 east of Aurangábád, and 210 miles north-east of Bombay. It has a British cantonment, situated on a gentle declivity, at an elevation of 1652 feet above the sea, in an arid tract of country; the lines were built in 1827. Two miles south-west of Jálma is the old town of the same name, once the seat of a flourishing trade, but now rapidly decaying.

JÁLPAIGURI, or JALPIGOREE, a British district of India, forming the north-eastern part of the Rájsháhi Kuch Behar division, under the lieutenant-governor of Bengal, and lying between 26° 0' 35" and 26° 59' 30" N. lat., and between 88° 22' 40" and 89° 55' 20" E. long. It consists of an irregularly shaped tract south of Bhután and north of the state of Kuch Behar and Rangpur district, with an area (1875) of 290,464 square miles. The district divides into a "regulation" tract, lying towards the south-west, and a strip of country, about 23 miles in width, running along the foot of the Himsálayas, and known as the Western Dwárs. The former is a continuous expanse of level paddy fields, only broken by groves of bamboos, palms, and fruit-trees. The Western Dwárs are, for the most part, overgrown with grassy jungle, the secure home of large game, and are everywhere traversed by hill torrents, which, on the higher slopes, lose themselves beneath the sandy soil. The frontier towards Bhután is formed by the Sinchúli mountain range, some peaks of which attain an elevation of 6000 feet. It is thickly wooded from base to summit. The principal rivers, proceeding from west to east, are the Maháanandá, Karatóyá,

Tistá, Jálhdhaká, Duduyá, Mujnai, Torshá, Káljáni, Ráidhak, and Sankos. The most important is the Tistá, which forms a valuable means of water communication. The Government forest reserves in the Western Dwárs cover a total area of 34234 square miles. Lime is quarried in the lower Bhután hills. During the last few years tea-planting has been introduced, with every prospect of success.

The parliamentary abstract of 1878 gives a population of 418,665. The returns from the Dwárs were not drawn up in the form adopted for Bengal generally. The remaining part has a population of 327,985 (169,238 males and 158,667 females), comprising 25 Europeans, 7 Eurasians, 8 Chínese, 144 Nepáls, 553 aborigines, 148,043 semi-Hinduized aborigines, 32,156 Hindus according to caste, 2070 Hindus not recognizing caste, and 144,980 Mahometans. The great bulk of the population belongs to the semi-Hinduized tribe known as Koch or Ráylens, which numbers 137,136, and is ascertained to form as much as two-thirds of the total inhabitants in the Western Dwárs. Rice is the staple crop in all parts of the district. Mustard seed is extensively grown; cotton is the staple of the Dwárs, jute and tobacco of the regulation tract. Irrigation is common in the Western Dwárs. There is still some spare land uncultivated in the regulation tract; and in the Western Dwárs it has been estimated that about three-fourths of the land now is sown to a staple of cultivation. Of late years trade has been stimulated by the demand for agricultural produce from the south, and by the institutions of fairs on the Bhután frontier. The chief exports are jute, tobacco, timber, and rice; the chief imports are piece-goods, salt, and betel-nuts.

Education encounters great difficulties in Jálpaiguri, because the people are not gathered into villages, each family living in its own sequestered homestead. In 1876 the number of schools was 153, with 3268 pupils. The climate in the vicinity of Jálpaiguri town does not materially differ from that common to northern Bengal, except that the rainfall is heavier, and during the cold months fogs and mists are of daily occurrence. The average annual rainfall is over 100 inches; the average temperature is 76° Fahr. The climate of the Western Dwárs is markedly different; the hot weather disappears altogether, and the rains last continuously from April to October. The average annual rainfall at Baxá is 280 inches; the temperature averages 74° Fahr. The principal diseases are malarious fevers, splenic enlargement of the liver, dysentery, and gonorr. Of late years some very fatal outbreaks of cholera have occurred.

The district of Jálpaiguri first came into existence in 1860, when the Titalyá subdivision of Rangpur was incorporated with the Western Dwárs, and erected into an independent revenue unit. The permanently settled portion of Jálpaiguri has no history of its own, apart from the parent district of Rangpur. The Western Dwárs became British territory as the result of the war with Bhután in 1844-45. The newly acquired territory was immediately formed into the two districts of the Eastern and Western Dwárs, the former of which has since been incorporated with the Assam district of Goldpirá. The remainder, with the exception of a subdivision, was formed into the new district of Jálpaiguri with the addition of a portion taken from the unwieldy jurisdiction of Rangpur. Cultivation is now rapidly extending throughout the Dwárs; and it is believed that the population has been doubled during the ten years that have elapsed since British annexation. From motives of precaution, a regiment of native infantry is stationed in permanent cantonments at the hill pass of Baxá.

JÁLPAIGURI, the administrative head-quarters of the above district, is situated on the west bank of the Tistá, in 26° 32' 20" N. lat., 88° 45' 38" E. long. This town has only risen into importance since the creation of the district in 1869, since which date its population has doubled. The population is estimated at between 4000 and 5000, including the regiment of native infantry in the cantonments, which lie south of the civil station.

JAM. See JAMS AND JELLIES, p. 564.

JAMAICA, an island lying between the Caribbean Plate Sea and the Gulf of Mexico, and about 80 miles to the VII southward of the eastern extremity of the island of Cuba, within 17° 40' and 18° 30' N. lat., and 76° 10' to 78° 30' W. long. It is the largest island of the British West Indies, being 135 (or, as sometimes stated, 144) miles in length and 21½ to 49 miles in breadth. Its area is about 4200 square miles, or, as stated in the Report of the Geological Survey, 3250 square miles. Within its government are comprised the three small islands called the Caymanas,

—Grand Cayman, the principal of these, lying off the centre of the Yucatan passage; British Honduras has a lieutenant-governor under the general government of Jamaica, although distant 660 miles, on the mainland of Central America; and Turks and Caicos islands, lying between 21° and 22° N. lat. and 71° and 72° 37' W. long., were annexed to Jamaica in 1874.

The surface of Jamaica is usually hilly or mountainous, and there is a great variety of climate, according to situation and elevation. The largest extent of level land is to the westward, where the low lands are near the sea. The form of the coasts presents the outline of a turtle, the mountain ridges representing the back. The highest elevations are situated to the east, the inclined slope rising from the west. Vestiges of intermittent volcanic action occur. From the sea-level on all sides a series of ridges gradually ascend towards the central range, dividing the large rivers, and rising occasionally into peaks of 6000 feet. The Blue Mountains, running centrally from east to west, rise at some points to above 7000 feet. The vapours ascending from the rivers and surrounding ocean produce in the upper regions clouds saturated with moisture, which induce vegetation belonging to a colder climate. During the rainy season there is such an accumulation of vapour as to cause a general coolness over the island, and of course occasioning very sudden and heavy showers, and sometimes destructive floods. Upwards of one hundred and fourteen rivers or streams find their way from the interior to the sea, besides the numerous tributaries which issue from every ravine in the mountains. These streams for the most part are not navigable; in times of flood they become devastating torrents. In the parish of Portland, the Rio Grande receives all the smaller tributaries from the west; there is scarcely a mile width between any of these streams, and the land rises about 1000 feet to the nile. In St Thomas in the east, the drainage of the main ridge is performed by the Plantain Garden river, the tributaries of which form deep ravines and narrow gorges in the mountains, which unite and descend, the valley of the Plantain Garden expanding out into a most picturesque and fertile plain. Black River flows through a level country, and is accessible to small craft for about 30 miles. Salt River and the Cabarita, both also on the south side, are navigable by barges. The others on the south are the Rio Cobre (where irrigation works have been constructed for the sugar estates and provision and fruit growing in the district), Yallahs, and Rio Munho; on the north Martha Brae, the White River at Buff Bay, the Great Spanish River, and Rio Grande. There are several medicinal springs. Jamaica has sixteen harbours, the chief of which are Port Morant, Kingston, Old Harbour, Green Island, Montego Bay, Falmouth, Port Maria, St Ann's Bay, Lucoa, and Port Antonio, besides numerous bays, roadsteads, and shipping stations affording tolerable anchorage. The surface of the valleys and level lands consists of alluvial deposits composed of sediment derived from the disintegration of the higher land. The White Limestone formation seems to originate two descriptions of alluvia, one white and the other red, the colour being due to oxide of iron combined with the argillaceous residue of the pre-existing limestone. The red soil is particularly favourable for coffee growing. The area occupied by the Coast Limestone and White Limestone represents about five-eighths of the island. The substructure of Jamaica consists of igneous rocks. In economic geology Jamaica produces a great variety of marbles, porphyrites, granite, and ochres. Traces of gold have been found associated with some of the oxidized copper ores (blue and green carbonates) of the Clarendon mines. Copper ores are very widely diffused, though the working of the veins has been found too expensive. Cobalt and

lead have been worked, but hitherto unprofitably. Manganese occurs, also iron ores and a form of arsenic. There is a great variety (and at the same time great equality) of climate. In the lowlands the temperature rises from 75° at night to 85° in the day, and is tempered by the sea and land breezes. At Up-Park Camp, 325 feet above the sea-level, the mean temperature of the hottest month (July) was 81°·71, and of the coldest month (January) 75°·65. At Newcastle, 3800 feet, the hottest month was 67°·75, and the coldest 61°. The temperature therefore is very equable. In the higher levels the temperature may be 40° to 50°. In the plains there is much humidity. At Kingston the temperature ranges from 70° to 80° throughout the year. Parts of the island are extremely favourable for sufferers from tubercular disease. The island is generally healthy, though sometimes subject to yellow fever, like most tropical countries. Hurricanes, when they occur, come between July and October. The periodical rains, which generally last for six weeks, constitute the May and October seasons.

The vegetable productions are very numerous. There are forest trees fit for every purpose; among these are the ballata, rosewood, satinwood, mahogany, lignum vite, lancewood, and ebony. The logwood and fustic are exported for dyeing. There are also the Jamaica cedar, and the silk cotton tree (*Ceiba Bombax*). Pimento (peculiar to Jamaica) is indigenous, and furnishes the allspice. The bamboo, coffee, and cocoa are well known. Several species of palm abound,—the macaw, the fan palm, screw palm, and palmetto royal. There are plantations of cocoa-nut palm. The Government are raising cocoa-nuts with profit on a barren spit of sand by the sea. Cinchona plantations have recently been successfully established in the mountains, the produce selling well in the London market. The other noticeable trees and plants are the mango, the breadfruit tree, the papaw, the lacebark tree, and the guava. The *Palma Christi*, from which castor oil is made, is a very abundant annual. English vegetables grow in the hills, and the plains produce plantains, cocoa, yams, cassava, ochra, beans, peas, ginger, and arrowroot. Maize and guinea corn are cultivated, and the guinea grass, accidentally introduced in 1750, is very valuable for horses and cattle,—so much so that pen-keeping or cattle farming is a highly profitable occupation. Among the principal fruits are the orange, shaddock, lime, grape or cluster fruit, pine-apple, mango, banana, grapes, melons, avocado pear, breadfruit, and tamarind. There are public gardens at Kingston, at Castleton, about 20 miles from Kingston, and at Bath, and an experimental plantation of different varieties of cane at Hope plantation. The sugar cane was cultivated at an early period, for in 1671 there were a number of sugar works. There are many beautiful flowers, such as the aloe, the yucca, the datura, the mountain pride, the *Victoria regia*; the cactus tribe is well represented. Innumerable varieties of ferns grow in the mountains, and orchids in the woods. The sensitive plant grows in pastures.

There are fourteen sorts of *Lampyridæ* or fireflies, besides the *Blateridæ* or lantern beetles. There are no venomous serpents, but plenty of harmless snakes and lizards. The large lizard, the iguana, is eaten, as are also the land crab and tortoise. The scorpion and centipede are poisonous, but not very dangerous. Anse, mosquitoes, and sandflies swarm in the lowlands. Gosse enumerates twenty different song birds in Jamaica. Parrots, pigeons, guinea fowl, and a great variety of water birds are found. The sea and rivers swarm with fish, and turtles abound. The seal and manatee are sometimes found, and the crocodile. The domestic animals are those of the ordinary English kind. Jamaica beef and pork are very good. Poultry succeeds well.

The population was returned in the census of 1814 as 380,000, of whom 16,000 were white, 68,000 coloured, and the rest black. In 1861 it was returned as 441,000, of whom 14,000 were white, 80,000 coloured, and 347,000 black. In 1871 the numbers were 13,000 white, 100,000 coloured, 333,000 black; total 506,000. The census of 1881 will probably show a total of 600,000—a large increase in the black and coloured population, and a stationary if not reduced number of white people.

The total value of imports was £1,492,722 (including £757,077 from the United Kingdom) in 1876, and £1,947,942 in 1879—amounts considerably below the values for the preceding six years, in four of which it was above £1,700,000. The imports consist principally of provisions for consumption, a considerable proportion coming from the United States. The total value of exports in 1878 was £1,310,705 (£954,684 to the United Kingdom), consisting of 9,573,714 lb of coffee (an extending industry), 908,603 lb of ginger, 6,195,109 lb of pineapples, 18,115 puncheons of rum, 26,066 hhds of sugar, and 35,157 tons of logwood. The total value is below that of the six preceding years. The sugar exported was below the average of preceding years, but in 1879 sugar exports rose again to 29,000 hhds. The value of the fruit exported (principally to United States) had risen from £9387 in 1875 to £39,451 in 1878. The total exports for 1879 were £1,307,571 value. The area under crops in 1878 was 121,457 acres, in guinea grass 120,264, in pasture 818,549, in wood and ranate 1,217,596, leaving 942,184 acres of the total extent to be accounted for as unpatented primeval forest or rocky land of no value. One of the newest industries, besides cinchona, is the growth of excellent tobacco; Jamaica cigars are now becoming well known in England. The public revenue for 1878 was £438,564, and the appropriated revenues from roads, poor rates, &c., £71,900, making a grand total of £510,464, or about 18s 6d per head of the population. The estimates for 1880 showed a public revenue of £460,875 and appropriated £72,580, total £533,455. £245,000, or more than half the public revenue, is raised from import duties, and £94,000 from rum duties; the railway receipts (Government having purchased the line) by loan with a view to extension for 1880 were estimated at £23,000. The remainder comes from licenses, postal revenues, and other sources. The public expenditure for 1879 was £480,154, the appropriated £73,050, total £553,204, and the estimated expenditure for 1880—public £485,655, appropriated £72,580, total £558,235. The main items of expenditure are—debt charges and sinking funds and redemption, £73,000; administrative departments, £38,000; revenue departments, £38,000; judicial, £38,000; ecclesiastical, £20,000 (the church has been disestablished, and the expenditure will be gradually less as vested interests disappear); medical, £55,000; constabulary, £50,000; penitentiary and prisons, £25,000; education, £25,000; railway managing, &c., £14,000; public works and irrigation, £58,000.

In 1878, 617 schools underwent inspection by the Government; 51,438 children were on the books, the average attendance being 29,679. Of these schools, 64 passed first class, 178 second class, and 343 third class. The average Government grant to each school aided during the year was £29, and the total education grant, exclusive of departmental salaries, was £18,572. Elementary education has made progress during the eleven years the present system has been in operation. The collegiate school in Kingston offers higher education. Among ecclesiastical institutions, the Church of England high school, the Calabar institution or Jamaica Baptist College, and Wolmer's free school, founded in 1729 by John Wolmer for the free education of poor children, as well as the Alice school, require mention. The ecclesiastical establishment is regulated by Law No. 30 of 1870, which provided for gradual disendowment. Thus Law created a synd, to consist of clergymen and lay representatives, and it continued to each existing rector, island curate, and stipendiary curate the payments from the state so long as they fulfilled their functions. Under this law the estimates for 1880 show as still on the establishment five rectors, twenty island curates, and three stipendiary curates, the total amount for the Church of England being £9749; this, with £267 to the Church of Scotland, and £100 to the Church of Rome, makes up the ecclesiastical establishment. Besides the state clergyman, there are about forty clergyman paid out of the Diocesan Church Fund. Besides these American church missionaries at Kingston, there are about twenty Presbyterian ministers, thirty Wesleyan, eight of the London Missionary Society, fifty Baptist, one Independent, six United Methodist Free Church. The Moravians have fourteen stations and seventeen missionaries. There are two synagogues.

Kingston, the capital, is on the south coast. It was founded in 1693, and is built on a plain which rises from the shore with a gradual ascent to the foot of the Liguanea mountains. This plain is covered with country residences

and sugar estates. The town population in 1871 was 4393 whites, 13,291 coloured, and 16,630 blacks. It is now estimated at over 40,000. The seat of government was recently transferred from Spanish Town to Kingston, and the principal civil and judicial business is transacted there. The chief retail business street is Harbour Street. Port Royal Street is the chief thoroughfare of the wholesale merchants, who keep wharves which line the seaboard of the town. The public buildings possess little architectural interest. The Victoria Market (opened in 1872) and public landing place at the foot of King Street (where Rodney's statue was brought from Spanish Town), form a very fine market-place. The court house in Harbour Street is a handsome building. The public hospital (with 170 beds), the law library, the chancery registrar's office (with its piece of tapestry of the royal and island arms, which used to be carried before the governor on state occasions), the court of vice-admiralty, the public library and museum in East Street, are also worthy of mention. The parish church in King Street is one of the oldest churches in the island, dating probably from 1692. It contains the tombs of William Hall (1699) and Admiral Benbow (1702). The only bank is a branch of the Colonial Bank, besides the Government Savings Bank. Up-Park Camp, to the north-east of the city, is the headquarters of a West India regiment.

Jamaica was discovered by Columbus and possession taken in the name of the king of Spain on the 3d of May 1494. He called it St. Jago, but it is known by its Indian name Jamaiqua, "the isle of springs." It is sometimes written Xamayca. The inhabitants belonged to the gentler Indian tribes, not to the fierce Caribs. In June 1508 Columbus was driven by a tempest into a bay on the north side, now St. Ann's Bay. After his departure the island remained unvisited until 1509, when his son Diego, having established his right in the council of the Indies to the governorship of Hispaniola, sent Don Juan d'Esquivel to take possession of the island, in opposition to Alonso d'Ojeda, who claimed it under a royal grant. Thereafterward, under the rule of the Spaniards, the Indian population diminished, until in 1655, when the island fell into the possession of the English, the race was practically extinct. The controversy respecting the rights of the descendants of Columbus continued for a long time. About the year 1523 Diego Columbus founded St. Jago de la Vega, St. James of the Plain, which was the official capital, under the name of Spanish Town, until Kingston was recently selected. Attention had been gradually given to agriculture, the cotton plant, sugar cane, and various kinds of corn and grass having been introduced. In 1596, during the alliance of Queen Elizabeth with the Low Countries, and the consequent war with Spain, Sir A. Shirley, a British admiral, invaded Jamaica, but made no attempt at occupation. In the reign of Charles I. Colonel Jackson defeated the inhabitants at Passage Fort. Shortly afterwards the island was divided into eight districts in the nominal possession of eight noble families, and the total population became extremely small. The next important event was the expedition sent by Cromwell, under Admirals Penn and Venables; failing against Hispaniola, they took possession of Jamaica on the 3d May 1655, the island having been in the possession of the Spaniards one hundred and sixty-one years. Under Cromwell emigrants were sent from Scotland and Ireland and other places. But the Spaniards and their negroes harassed the new comers, who died in considerable numbers. On the 8th May 1658 an attack from Hispaniola was defeated, and soon after the remaining Spaniards were driven from the island. The slaves called Maroons, however, who had fled to the mountains, continued formidable. Down to the end of the 18th century the disaffection of these Maroons caused much trouble. In 1661 a regular civil government was established, Colonel D'Oyley being appointed governor-general with an elective council. Next year he was succeeded by Lord Windsor, who was instructed to summon a popular assembly to pass laws. Jamaica became the resort of the buccanniers, who carried on a profitable piracy on these seas during the war with Spain. In 1670 peace was made with Spain, and the English ships were recognized by the treaty of Madrid. The buccanniers were suppressed. In 1672 the Fourth or Royal African Company was formed to carry on a monopoly of the slave trade. From 1700 to 1786 the number of slaves imported was estimated at 610,000, of whom about one-fifth were re-exported. In 1773 the governor sent home the first pot of sugar to the secretary of state; at this time there were 7768 whites and 9604 negroes on the island. In 1778, while the earl of Carlisle was governor, an attempt was made to saddle the island with a yearly tribute to the crown, and to restrict the free legis-

lative power of the assembly. The privileges of the assembly, however, were restored under Sir Thomas Lynch in 1682; it was not until 1728 that £8000 (currency) a year was settled on the crown, and the laws and statutes of England were made equally applicable to Jamaica. This amount was afterwards commuted for £8000, usually by the governor for salaries, allowances, and contingencies. In 1854 this fund was merged in the ordinary civil list. The other principal event in the general history of Jamaica was the threatened invasion in 1783 by the combined fleets of France and Spain under De Grasse. It was saved by the victory of Rodney and Hood, off Dominica, in commemoration of which event a statue of Rodney, by Bacon, was erected in Spanish Town.

A great earthquake occurred in 1792, when the chief part of the town of Port Royal, built on a shelving bank of sand, slipped into the sea. In 1712 and 1722 there were dreadful hurricanes, the last causing the seat of commerce to be transferred from Port Royal to Kingston. Since then there have been a number of hurricanes, the most recent being in August 1880, when considerable damage was done to crops, provision grounds, churches, chapels, and school-houses in the eastern part of the island.

Since 1800 the history of Jamaica has been, with some exceptions (such as the defeat by Admiral Duckworth in 1806 of the French squadron intended to invade Jamaica), confined to its domestic concerns and its relations with the mother country. In 1807, when the slave trade was abolished, there were 238,627 slaves in the island. The island was very prosperous—sugar, coffee, cotton, cotton, pimento, ginger, and indigo being produced, and it was also the depot of a very lucrative transit trade between Europe and the Spanish main. The anti-slavery agitation in England, growing stronger every year, caused great excitement in the island, and there was much violence and misrepresentation on both sides of the question. The negroes revolted in 1832, under the belief that emancipation had been granted; many hundreds of lives were sacrificed, a large amount of property destroyed, and various atrocities were committed. This stimulated the agitation in England, and in 1833 the Emancipation Act was passed, the period of apprenticeship being ultimately reduced to four years. Of the £20,000,000 compensation, £6,161,927 was awarded to Jamaica, being about £19 a head on a slave population of 309,338. The wisdom of the manner in which the emancipation policy was carried out by England has been often questioned. During Sir Lloyd Smith's administration, on the 1st of August 1838, the apprenticeship was ended, and the negroes were emancipated by an Act of the assembly. Difficulties arising between the British Government and the assembly as to the Prison Act, a bill was introduced by Mr Labouchere (Lord Taunton) into the House of Commons to suspend the constitution of Jamaica, the rejection of which measure occasioned the resignation of Lord Melbourne's ministry. The dispute was afterwards compromised, and under the government of Sir Charles Metcalfe an improved state of things was brought about. Education and religious instruction and better administration of justice were subjects of attention, together with schemes of agriculture to develop the varied resources of the island. The want of cheap and continuous labour was, however, a great obstacle. The introduction of labourers from Africa was objected to in England as a renewal of the slave trade. Coolie immigration was feared about with such expensive restrictions by the home Government that no large or comprehensive scheme was possible. The earl of Elgin continued Sir C. Metcalfe's policy, and a railway was opened, 12 miles long, between Kingston and Spanish Town, but the prospects of the colony became exceedingly gloomy under the effects of the legislation in 1845 regarding the duties on sugar and slave sugar. The advantages of slave labour in Cuba were so great that the utmost economy and skill of practical resident planters in Jamaica failed of success. Differences between the assembly, the council, and the home Government on the means of retrenching the public expenditure, created much bitterness of feeling, and most disastrous results were brought about, affecting seriously the credit of the island, by the assembly refusing to perform its functions and renew duties necessary for revenue. An outbreak of cholera added to the confusion and gloom. The result of this convulsion was that the home Government offered an imperial guarantee for a loan of £500,000 and other financial assistance, conditionally on permanent provision being made for official salaries, on the initiation of all money grants by the crown, and on certain members of the legislature being held responsible for the expenditure of the public money. Sir Henry Barkley had the task of carrying out these arrangements. In 1854 the Incumbered Estates Act was passed, under which in recent years considerable sales of property in Jamaica have taken place. During the next decade the island was tranquil, but very much depressed. Many white people, of a superior class, had left. Public business suffered by the recommitments in the assembly, and by want of economy and good management (causing annual deficits) of the public finances. But in 1866 an event occurred which opened a perfectly new chapter in Jamaica history. On October 20 Governor Eyre reported to the secretary of state (the present Lord Cardwell) a "serious and alarming insurrection of the negro popula-

tion." In this despatch the letter written by Dr Underhill, the secretary to the Baptist Society, was referred to as causing public meetings to be held, and giving rise to excitement. Dr Underhill subsequently asserted that it was through Governor Eyre his letter became public. The letter referred to the distress among the population, to alleged unjust taxation, to the alleged refusal of just demands, to the denial of political rights to the emancipated negroes. The despatches of Governor Eyre caused much discussion and excitement in England, and under date of 30th December 1866 a royal commission was issued to inquire into the disturbances. The commissioners—Sir Henry Storks (sent out as governor), Mr Russell Gurney, and Mr J. B. Maule—began their work on January 22, 1868, and sat for fifty-one days. They reported on the 9th April that the disturbances in St Thomas in the east had their immediate origin in a planned resistance to lawful authority, arising from the desire to obtain rid of rent, want of confidence in tribunals, feelings of hostility towards political and personal opponents, while not a few contemplated the death or expulsion of the white inhabitants. Had more than a momentary success been obtained, the ultimate overthrow of the insurgents would have been attended with a still more fearful loss of life and property. The commissioners attributed the speedy termination of the outbreak to the skill, promptitude, and vigour of Governor Eyre in the early stages, they viewed the military and naval operations as prompt and judicious; they thought that martial law was continued too long, and that the punishments inflicted were excessive. The commissioners expressed an opinion that the conduct of Gordon, a member of the assembly, whose trial by court martial and execution caused great controversy in England, had been such as to convince both friends and enemies of his being a party to the rising, yet they could not see any sufficient proof either of his complicity in the outbreak at Morant Bay, or of his having been a party to a general conspiracy. The case was warmly taken up in England by the Jamaica committee under the leadership of Mr J. S. Mill. A charge was made against Mr Eyre, resulting in an elaborate exposition of martial law by Chief Justice Cockburn, and the stoppage of the prosecution by the grand jury ignoring the bill. On the 26th December 1866 the assembly passed an Act rendering it lawful for the Queen to create and constitute a Government for the island; the same was passed by the council on the 22d, and on the 23d it received the governor's consent.

Thus the constitution which had existed for two hundred years was swept away. It was composed at the time of a governor, a privy council, a legislative council, an assembly of forty-seven elected members, and a paid body called the executive committee, who were practically responsible ministers of the crown, holding office at the governor's pleasure. The present constitution is that of an ordinary crown colony. It was established by an imperial Act, and an order in council, dated 9th April 1868, and subsequent orders. There is only one chamber, called a legislative council. In 1880 this consisted of the governor as president, eight officials, (viz., colonial secretary, senior military officer, attorney general, director of roads, collector general, auditor general, colonial secretary, and crown solicitor), and eight non-officials, nominated by the crown. All councillors holding office at the royal will and pleasure. No proposal is admitted or debate allowed on any matter affecting revenue, unless introduced by the governor or by his direction. Sir J. P. Grant was governor from 1866 to 1874, and reforms and changes were vigorously effected. The revenue was better collected. Irrigation and other public works were begun. But the sugar industry has continued in a state of great depression, though Sir A. Musgrave, who was appointed governor in 1877, reported in 1880 that the public debt had been reduced from £718,000 to £445,000 (excluding loans for special purposes), that there had been no increase of taxation since 1867, that savings banks deposits had increased from £58,913 in 1868 to £207,000 in 1879 (the Government paying interest at 4 per cent.), and that the industrious negroes, especially those with small holdings, growing provisions, coffee, cocoa, or possessing small sugar mills, were fairly prosperous. These results are attributed by officials to the change from representative to non-representative government, although the latter has been much criticised as too arbitrary, and tending to a narrow officialism. The number of parishes for purposes of local government has been reduced from twenty-two to fourteen. Each parish has its own hospitals, almshouses, &c., managed by its municipal body, the chairman of whom is the custos, nominated by the governor. The members are appointed by the custos, subject to the governor's approval. Each parish also has a road board. The judicial establishment consists of the chancellor (the governor), a vice-chancellor and chief justice, two puisne judges of the supreme court, attorney general, crown solicitor, &c.; there are seven district courts, somewhat on the model of county courts in England, the judges being barristers sent out from England. There are also four stipendiary magistrates, and a police magistrate for Kingston. The constabulary was placed on its present footing in 1867, and is modelled on the system of the Irish (semi-military) constabulary. Parochial medical officers paid by Government attend the parochial institutions, constabulary, and immigrants. These officers are

allowed private practice in addition. The island is in telegraphic communication with England, and indeed with the world, and has also an inland telegraphic service. The Government have purchased the 25 miles of railway from Kingston to Old Harbour, and are about to construct 47 miles more. Steam communication is very frequent between England, United States, and the colony.

JAMES (Ἰάκωβος). This name, the Hebrew *Yakob* or Jacob, belongs to several persons mentioned in the New Testament, of whom the first that appears in the Gospels is

1. *James the son of Zebedee*. He was among the first who were called to be Christ's immediate followers and afterwards chosen to be his apostles, and is one—the others being Peter, Andrew, and John (the brother of James)—of the always first-mentioned and, as the narrative shows, most remarkable group of the apostolic band. In all the enumerations of the twelve (Matt. x. 2; Mark iii. 17, Luke vi. 14; Acts i. 13), his name appears early in the list, twice occupying the second place after Peter's. The call of James and John (the fullest account of which is given in Luke v. 1–11; comp. Mark i. 20) took place on the same occasion when Peter and Andrew, the other pair of brothers, were taken from their humble fisher's trade to be fishers of men. After this we next find James noticed as one of the persons present (Mark i. 29) when Jesus restored Simon Peter's wife's mother, who was sick of a fever.

His brother and he were surnamed by our Lord (Mark xii. 17) "Boanerges," a name derived from two Aramaic words signifying "Sons of thunder," as it is interpreted by the evangelist. The name has been explained as having reference to the powers of their eloquence in preaching, or even from their being present when the voice like thunder spake to Jesus from the cloud (John xii. 29). It is more probable, especially as one meaning of the word translated "thunder" is "rage, anger," that the name was given to them by the Lord because he perceived the fiery impetuosity of their nature. Two instances (Luke ix. 54; Mark x. 32–41) are recorded in the Gospels from which we can discern somewhat of this character of the sons of Zebedee.

James is included among those who after the ascension waited at Jerusalem (Acts i. 13) for the descent of the Holy Ghost on the day of Pentecost. This is one of the passages in which the name of James is placed before those of John and Andrew, and we may judge from the title that we are told of him subsequently that he was a most zealous and prominent member of the Christian community. For when a victim is to be chosen from among the apostles who should be sacrificed to the animosity of the Jews, it is on James that the blow falls first. The brief notice is given Acts xii. 1, 2: "Now about that time Herod [Agrippa I.] the king put forth his hands to afflict certain of the church. And he killed James the brother of John with the sword."

Eusebius (*H. E.*, ii. 9) has preserved for us from Clement of Alexandria the circumstance that the accuser of the apostle, "beholding his confession and moved thereby, confessed that he too was a Christian. So they were both led away to execution together, and on the road the accuser asked James for forgiveness. Gazing on him for a little while, he said, 'Peace be with thee,' and kissed him. And then both were beheaded together." Other legends which tell of the apostle's preaching in Spain, and of the translation of his body to Compostella,

are to be found in the *Acta Sanctorum*, July 25 (vol. vi. pp. 1–124).

2. *James the son of Alphaeus*. He also was one of the apostles, and is mentioned in all the four lists (Matt. x. 3; Mark iii. 18; Luke vi. 15; Acts i. 13) by this name, but in no other place. It is, however, thought by some that he is the same with

3. *James the Lord's brother*. In Matt. xiii. 55 and Mark vi. 3 the brethren of the Lord are named James, Joseph, Judas, and Simon. It is also to be remarked that they are in both places spoken of as the children of the carpenter, that is, of Joseph the husband of the Virgin Mary. But it has been urged that they were called sons of Joseph and Mary because the children of two families,—of Mary the Virgin and Mary the wife of Clopas, her half sister,—were brought up together. Those who in this way make James the Lord's brother to be a son of Alphaeus require to establish (a) that Clopas is the same name as Alphaeus, (b) that Mary the wife of Clopas (John xix. 25) was the sister of the Virgin Mary, and (c) that this Mary, wife of Clopas, is the same who is called (Matt. xxvi. 56; Mark xv. 40) Mary the mother of James and Joseph, and (Mark. xvi. 1; Luke xxiv. 10) simply the mother of James, in which four passages the same person is evidently intended. But the identity of the names Alphaeus and Clopas is by no means certain. Those who maintain it take Clopas as the Aramaic Chalpai, and Alphaeus to be a Græcized form thereof. But when we turn to what might be supposed the best source of evidence on this point, viz., the Peshito version of the New Testament, instead of finding the two names treated as the same word, we find in all cases Chalpai where the Greek has Alphaeus, and where Clopas or Cleopas occurs, it is simply transliterated Kleopas. The same is the case with the Jerusalem Syriac. The identity of these names is thus far from being established. Then in John xix. 25 the versions and those authorities are in favour of making four persons of those there mentioned: "his mother, and his mother's sister, and Mary the wife of Clopas, and Mary Magdalene." This is the Peshito rendering, and, even if the conjunction were not there, it is not uncommon in Scriptural enumeration to find names given in pairs without any conjunction, while to make Mary the wife of Clopas the Virgin's sister would be to assume two Murics in the same family of sisters, which is not very probable. Whether Mary wife of Clopas was the mother of a James (called in one place "the little") and of Joseph can neither be asserted nor denied from the evidence in the Gospels; but, when the other two assumptions have so little foundation to rest on, it seems impossible to consider the son of Alphaeus the same person with the "brother of the Lord."

Further, James the Lord's brother was bishop of Jerusalem (comp. Gal. i. 19 with Gal. ii. 9–12), and was president of the church in its earliest days (Acts xii. 17, xv. 13, xxi. 18). Such a position required him to be a resident in Jerusalem, while had he been an apostle (as the son of Alphaeus was) we should have expected him to take his share of the missionary labour of publishing the gospel in distant lands. But this bishop of Jerusalem was the author of the epistle of St James. He simply styles himself in the introduction thereto "a servant of God and of the Lord Jesus Christ." He who could thus write with the certainty of being identified must have been the most famous person of his name in the church, must have been what St Paul, in a passage (Gal. ii. 9) where he places James before both Peter and John, calls him, "a pillar" of the Christian society. And again Jude, when commencing his epistle, calls himself the brother of James, with no other mark of distinction. Here too the same

James must be intended, and when we read St Jude's epistle (17, 18) we find him distinguishing himself from the apostles, and as it were disclaiming the apostolic dignity. This is as it would be if James and Jude were both brethren of the Lord and were not apostles, but we should certainly expect one or other would have left some indication in their letters had they been of the number of the twelve, and most surely neither of them would have been likely to give us reason for believing that he was not an apostle.

The two passages (1 Cor. xv. 7; Gal. i. 19) from which it might be argued that James the brother of the Lord was an apostle cannot be relied on, for we find the same title given to Barnabas, and it is certain that the name "apostle" began to be more widely applied after the ascension than it is in the Gospels.

Once more, the brethren of the Lord are expressly said (John vii. 5) not to have believed on Jesus at a period much later in his ministry than the appointment of the twelve; while in the mention of them in Acts i. 14 there is given first a list of the eleven, who are said all to have "continued in prayer with the women and Mary the mother of Jesus and with his brethren." Such a studied severance of the brethren of the Lord from the number of the apostles is very significant, while the position which they hold in the list may well be due to the fact that it was only at a late period that they had become disciples of Jesus. The change in their opinions has been thought by many to be sufficiently accounted for by the statement of St Paul (1 Cor. xv. 7) that after his resurrection Jesus "was seen of James." Such a demonstration of the truth of what others had long believed and Jesus himself had taught could not fail to work conviction on a mind which, if we may accept the tradition of the "Gospel according to the Hebrews" (which also testifies to this appearance of Christ to James), was somewhat inclined to believe, even before the crucifixion.

It seems right therefore to conclude that James the son of Alphaeus, one of the apostles, was a different person from James the Lord's brother and bishop of Jerusalem. Of the history of the former we are told nothing except that he was an apostle. The latter is spoken of by St Peter (Acts xii. 17) as if he were at that time the recognized head of the Christian community in Jerusalem. Again (Acts xv. 13), after the debate at Jerusalem about the circumcision of the Gentiles, it is he who sums up the arguments and declares the sentence of the council, as if he were the chief person among them. In Acts xxi. 18, on St Paul's last visit to Jerusalem, he holds the same position, and receives the visit of St Paul in the presence of all the presbyters. In Gal. i. 19, ii. 9 he is placed foremost among "the pillars" of the church of Jerusalem.

From the New Testament we learn no more of the history of James the Lord's brother, but Eusebius (*H. E.*, ii. 23) has preserved for us from Hegesippus the earliest ecclesiastical traditions concerning him. By that authority he is described as having been a Nazarite, and on account of his eminent righteousness called "Just" and "Oblias." So great was his influence with the people that he was appealed to by the scribes and Pharisees for a true and (as they hoped) unfavourable judgment about the Messiahship of Christ. Placed, to give the greater publicity to his words, on a pinnacle of the temple, he, when solemnly appealed to, made confession of his faith, and was at once thrown down and murdered. This happened immediately before the siege. Josephus (*Antiq.*, xx. 9, 1) tells that it was by order of Ananus the high priest, in the interval between the death of Festus and the arrival of his successor Albinus, that James was put to death; and his narrative gives the idea

of some sort of judicial examination, for he says that along with some others James was brought before an assembly of judges, by whom they were condemned and delivered to be stoned.¹

Other less important bearers of this name are (4) James, of whom all we know is that he was the "son of Mary" (Matt. xxviii. 56; Mark xv. 40, xvi. 1; Luke xxiv. 10) and the brother of a certain Josès (comp. Mark xv. 40 with xvi. 1), and that he is called "the little," *ὁ μικρὸς* (A. V. "the less," wrongly); and (5) James, who was either the father or brother of Judas, one of the apostles. The Greek gives (Luke vi. 16; Acts i. 13) "Judas of James." The ellipsis may, as has been shown by Winer, be supplied either by the word "father" or "brother." The A. V. supplies "brother." But, as in both these lists within a line of the name of this Judas a similar form "James of Alphaeus" occurs, which is in both places rendered James the "son" of Alphaeus, as it is also in both the other lists of the apostles in St Matthew and St Mark, it seems natural to suppose that the evangelists intended the same noun to be supplied in both cases. If this be so, the James here mentioned would be a person otherwise unknown, but the father of the apostle Judas, who is distinguished as Lebbaeus and Thaddæus, and also by St John (xiv. 22) as "Judas not Iscariot."

JAMES, THE GENERAL EPISTLE OF. Of the author of this epistle enough has been said in the previous article (3); it only remains to add in connexion with the introductory words thereof that probably the same reason actuated both St James and St Jude to leave out any mention that they were "brethren of the Lord." We need not enter into the question of what relationship is intended by those words, though, from the mention of Joseph on each occasion where the "brethren" are spoken of, it is probable that they were really his children by a former marriage. Thus Jesus would be younger than those who are called "his brethren," and their behaviour in rejecting his teaching for so long a time may have been partly a result of their growing up with him and regarding him as a younger member of the same family, and from familiarity becoming less willing than strangers would be to acknowledge anything which looked like an assertion of superiority. But, whatever the reason for their former unbelief, it is easy to see that, when they had at length come to own Jesus as their Lord, humility would check the mention of the relationship in which they might claim to stand to Jesus, as would also a desire not to appear to place themselves in a position of close connexion with Christ, to which none others could lay claim.

The epistle is addressed "to the twelve tribes which are of the dispersion." The word "dispersion" (*διασπορά*) was employed in the New Testament times to signify the Jewish population in every part of the then known world. Jews were to be found in Persia, Egypt, Asia Minor, and indeed in all the lands surrounding the Mediterranean Sea. When the writer addresses them as "the twelve tribes" he gives us the key to the character of his epistle. It was written to Christians who had been converts from Judaism, but to whom their ancient faith was still of the very highest importance, indeed, of somewhat more importance than it ought to have been. We can see therefore why the language of this epistle partakes so largely of the character of the preaching of John the Baptist (comp. Jas. i. 22, 27 with Matt. iii. 8; Jas. ii. 16, 16 with Luke iii. 11;

¹ For a discussion of these traditions, and on the question whether the text of Josephus is interpolated, consult Credner, *Einleitung*, p. 581; Hilgenfeld, *Ev. l.*, p. 523 seq.; Wieseler in *Jahrb. f. d. Theol.*, 1878, p. 99 seq. Compare also Jerome's account of James in his book *De vir. ill.*, 2, where further traditions from the Gospel according to the Hebrews are given.

Jas. ii. 19, 20 with Matt. iii. 9; and Jas. v. 1-6 with Matt. iii. 10-12) and of that of our Lord's earliest teaching in the Sermon on the Mount (cf. especially Jas. i. 2, 4, 5, 9, 20; ii. 13, 14; iii. 17-18; iv. 4, 10, 11; v. 2, 10, 13, 15), and why it is so largely illustrated by the language of books like Ecclesiasticus and the Book of Wisdom, which were specially esteemed by the Jews of Alexandria and other Hellenistic centres of Judaism (see Jas. i. 1, 5, 8, 11, 12, 17, 19, 20, 23, 25; ii. 21; iii. 5, 6; iv. 14). We should judge from this that the bishop of Jerusalem, in the earlier days of the Christian church, availed himself of his central position to circulate among the scattered Judæo-Christian populations, of whom representatives would constantly be within his reach, such a letter as was suited to stimulate the new converts to more truly Christian life, and to check errors into which, from their attachment to the older faith, they were prone to fall. The epistle contains many exhortations to accept a higher standard for the conduct of life, though a considerable section (i. 22-ii. 26) applies more specifically to the dangers that beset Jewish converts of trusting to a faith which produced no results in the form of Christian love.

But it was not only for those who were scattered into distant parts of the world that the epistle was written. It bears marks of its relation to a time of special trial and hardship, and has much to say of how trials and sufferings are to be borne. "Count it all joy when ye fall into divers temptations" is the opening language; and the writer returns to the same theme at the close of his letter: "Be ye also patient," "Stablish your hearts," "Behold, we count them happy which endure." Such words agree best with the dispersion of the first Christian brotherhood after the death of Stephen, and with that persecution by Herod Agrippa I. in which James the brother of John was put to death. It is an additional indication that the epistle was written about those times that in it there is no word of that contention which soon agitated the whole Christian church about the circumcision of the Gentiles, and about which James pronounced the sentence of the council of Jerusalem in 51 A.D. The persecution which ensued on the martyrdom of Stephen (33 A.D.) is too early a date after the ascension for us to think it probable that Christianity could have had enough representatives among the dispersion to make such an epistle as the present necessary. It seems better therefore to refer it to that larger persecution in which the one James suffered death, and after which the other James comes into special prominence in Christian church history. This would lead to the conclusion that the epistle, primarily addressed to the Jewish Christians throughout Palestine, but intended also for others who lived beyond the limits of the Holy Land, was written at Jerusalem, from which James the Just seems never to have departed, and that it should be dated some time after 44 A.D., the date of Herod's persecution, and antecedent probably by several years (for the agitation which led to the council must have existed for some time) to the council at Jerusalem (51 A.D.).

The epistle contains nothing to indicate where it was written, but at the same time there is nothing in the imagery and illustrations employed by the writer which would be out of character with one writing in Palestine. It is therefore probable that, since tradition represents James as constantly resident in Jerusalem, the epistle was written there. He uses the Jewish name "synagogue" (ii. 2) for the place of assembly for worship, which would perhaps be longer preserved among the Christians in Jerusalem than elsewhere; but on the other hand he speaks (v. 14) of the "elders of the church" (*ἐκκλησία*) just as we find St Luke doing in the Acts of the Apostles. He mentions the "burning wind" (*καύσων*) spoken of in the

Gospels (Matt. xx. 12; Luke xii. 55), and his language (iii. 4) about ships and the storms by which they are driven is such as would be natural in one who knew by experience of the tempests that sometimes sweep suddenly over the Sea of Galilee, with which this James must have been familiar as well as the son of Zebedee.

The epistle appears to have been written with a view, in the first place, to comfort some who were undergoing severe trials. This is clear from the opening sentence, "Count it all joy when ye fall into divers trials." But the words also seem to show that there was a spirit prevailing among those for whom the letter was first intended which did not tend to that perfect patience under sufferings that should characterize the faithful Christian. And so the writer passes on to notice a want of perfect trust in God, and a too great regard for temporal things, concerning which they are exhorted to foster such a mind as shall make changes in worldly affairs, when they are for the worse, yet still no cause for sorrow. For the only perfect gifts are of God's own sending, and in His gifts as in Himself there is no change. The epistle next dwells on that which was the great danger with Jewish converts, the profession of a belief in God and Christ without a corresponding Christian life; they are further exhorted to avoid sins of the tongue and sins of presumption, while those to whom wealth had become the chief object in life are severely condemned. But before the close the writer turns once more to his first theme, the commendation of patience under sufferings, which he enforces by the examples of the prophets and of Job. Then with certain cautions about the use of oaths, some precepts for conduct under sorrow, joy, sickness, or the consciousness of sin, the epistle is brought to a close, and has not the apostolic benediction, a feature which also marks the letter as one of the earliest of the Christian writings. The time of trial alluded to suits well with the date which has been suggested, when Herod's persecutions made it necessary for the Christians in Jerusalem to meet in secluded rooms, and to exercise the utmost precaution about all whom they admitted to their meetings. We know too, from the statements of Josephus, that it was from the wealthy Sadducees that the Christians in Jerusalem experienced most persecution, and that they especially were adverse to Christianity because of the preaching of the resurrection of Jesus. The followers of Jesus were, as we know, at this time just beginning to be called Christians, and this name soon became (if it was not at first given as) a name of reproach. These circumstances seem to be specially noticed in this epistle (ii. 6, 7). To the necessities of those days then the letter appears to be first directed, though it contains precepts eminently profitable for those who, having held firm to the belief in the unity of God (ii. 19), were disposed, even after the acceptance of the teaching of the gospel, to think that an intellectual assent to what was set forth was enough, without any effort to build up on the groundwork of faith the superstructure of Christ-like virtues.

In the time of Eusebius (325 A.D.) the epistle of St James was reckoned among the books not fully accepted by the church. He says (*ii. E.*, iii. 25) "among the controverted books, which are yet well known and recognized by most is the epistle circulated under the name of James." But among the apostolic fathers we have quotations from it in the writings of Clement of Rome (*i. Ep. ad Cor.*, cc. 10, 12) and perhaps of Hermas (*Pastor.*, mand. xii. 5). Further, in the Syriac version of Melito's apology there are some passages which bear a striking resemblance to the words of St James, and may have been quotations (see Cureton's *Spicil. Syr.*, pp. 42, 48); and the Peshito Syriac version contains the epistle. Origen in his commentary on John (*Works*, xix. 6) speaks of the epistle as

in "circulation under the name of James," and he quotes from it in another place (*Works*, xii. 129) as that of James, without any comment. Dionysius of Alexandria, who was at the head of the catechetical school there (245), quotes from the epistle. These are all the notices of the epistle on which dependence can be placed before the council of Laodicea (363), when it was included among the canonical books. But there seems no doubt that the words "well known and recognized by most," used by Eusebius indicate that the epistle was by him regarded as a part of Scripture, for in other portions of his works he alludes to it as if he so esteemed it, and evidence of its recognition in the Syrian Church speaks strongly in favour of its authenticity. For that church was most likely to have the best knowledge concerning the origin and early circulation of the epistle. We can account for the slight extent to which it was known from the fact that it was addressed, by a bishop who never moved from his home, to one section only of the Christian church, and was not likely to gain such wide acceptance at first as the epistles of St Paul, whose missionary labours made his name and his writings well known in different countries. Moreover, the tone of the epistle is practical and not doctrinal, and for this reason also it would be less likely to be noticed in the writings of the Christian fathers. Indeed, this feature of the epistle led Luther, who thought there was in it some contradiction to St Paul's teaching on the doctrine of justification by faith, to call it *eine rechte strohorne Epistel* (ed. of German N. T., 1522), "a veritable epistle of straw." But language like this is due to the distorted way in which the great Reformer looked at the subject. His day called for prominence to be given to the Pauline view of justification. St James's day had different needs. The character of those for whom this epistle was intended and their special dangers are sufficient to account for the way in which St James emphasizes what St Paul would as stoutly have maintained in a like case, that "faith without works is dead."

The view given above, which dates the epistle before the rise of the Pauline controversy, has been ably maintained by many recent theologians, especially in Germany, in opposition to the Tübingen school. See Schneckenburger's *Annotatio*, 1832; Luther's *Commentar*, 1858, 3d ed. 1870; Neander, *Planenung*, 4th ed. 1847, p. 594 seq.; Ritschl, *Altkath. Kirche*, 2d ed. 1857, p. 109 seq.; and Reiche, *und Vernehm*, 1874, ii. 277 seq.; Weiss, *Bib. Theol. des N. T.*, 1st ed. 1868, 2d ed. 1873; Boysen, *in Stud. und Krit.*, 1874, i.; Hofmann, *Heilige Schrift*, vii. 8, 3876. Other scholars, while denying the genuineness of the epistle, recognize in it distinct allusions to the Pauline theology, and so prefer a later date. So, for example, Ewald (*Geschichte*, vi. 591 seq.; *Sendesh an d. Hebr. u. Jakobus Runden*, 1870), who takes the epistle as directed against mistaken inferences from Paul's teaching. The Tübingen school, on the other hand, regards the epistle as directly anti-Pauline, and at the same time denies that it is genuine. So Baur, *Paulus*, 2d ed. 1867, Anh. 2; Schweigler, *Nachap. Zeit*, 1846, i. 413 seq.; Hilgenfeld, *Evnl.*, 1875, and in *Z. f. w. T.*, 1877, p. 87 seq.; Blass, *Die Briefe von Jakobus*, Dort, 1869, and in *Theol. Tijdsch.*, 1872, p. 211 seq. See also Holtzmann in Schenkel's *Bibl. Zeitsch.*, s.v. "Jakobusbrief." The argument turns mainly on the interpretation of the doctrine of faith and works in chap. ii. 24, which formally at least is in direct opposition to Rom. iii. 28. In other words, Luther's difficulty is still its chief turning-point of the argument. Now it is certain that the antithesis between Paul and James is not really so sharp as it appears in the verses just cited, because the two do not attach the same meaning to the word "faith." In fact, James's faith without works is not Paul's justifying faith, but the useless faith without love spoken of in 1 Cor. xiii. We have to deal with two types of doctrine using the same terms in different senses, so that it is not inconceivable that the two may really be capable of such reconciliation in the practical Christian life as to make their divergences unimportant. But, say Baur and his school, there is no proof and great internal improbability that any type of doctrine existed before Paul, maintaining justification by faith alone, precisely in Pauline terms, and using the very illustrations of Abraham and Rahab which occur in the Pauline theology and the kindred epistle to the Hebrews. Starting with this difficulty, and indicating in detail the proofs of the author's familiarity with the peculiar terminology of the great Pauline epistles, the Tübingen school urge also that James ii. 5, i. 12 presuppose acquaintance with Rev. ii.

9, 10, and even that the allusion to Rahab (ii. 25) proves the author to have read Heb. xi. 31. Further, it is contended that the supposed marks of an early date, in the condition of the churches addressed, are capable of another interpretation, and that the persecution alluded to may be best understood of the time of Domitian. Finally, the language of the epistle is regarded as a proof that the date is not very early, and the author different from the thoroughly Hebrew figure of James as described by Hegesippus. The weight of these arguments is plainly very unequal, and the ultimate solution of the controversy must mainly be in the region of Biblical theology, where one side has often been tempted to minimise the difference between James and Paul, while the other has not done justice to the positive value of the teaching of our epistle, often speaking of it as a mere ineffective polemic against Paul by one who did not understand him. JAMES I. (1394-1457), king of Scotland, third son of Robert III. and of Annabella Drummond of Stobhill, was born at Dunfermline in 1394. A second son, John, did not survive infancy. David, duke of Rothesay, the eldest son, had died under suspicious circumstances while committed to the care of the king's brother the duke of Albany, to whom had also been delegated the virtual government of the kingdom; and the king, in order to secure the safety of the surviving son, resolved in 1405 to place him under the protection of the king of France. The prince, however, on his way thither fell into the hands of the English, and Henry IV. determined not to admit him to ransom. On the death of his father, April 13, 1406, James became nominal sovereign, but, as he was still retained in captivity in England, the duke of Albany continued regent, and was succeeded, on his death in 1419, by his son Murdoch. At first James was confined in the Tower of London, but in 1407 he was removed to the castle of Nottingham, where he enjoyed as much liberty as was compatible with detention, and was treated in all respects by his governor, Sir John Pellham, as a member of the household. The physical and intellectual training begun at St Andrews under Bishop Wardlaw was completed by the most accomplished tutors, so that he not only attained to high proficiency in all kinds of manly sports, but reached perhaps a more varied and thorough culture than any of his contemporaries. His figure was not much if at all above the middle height, and, though thickset, was finely proportioned. His agility was no less remarkable than his strength; he not only excelled in throwing the hammer and putting the stone, but in all kinds of athletic feats demanding suppleness of limb and quickness of eye. As regards his intellectual attainments he is reputed to have been well acquainted with philosophy, and it is evident from his subsequent procedure as a sovereign that he had made a special study of jurisprudence; while, besides being a proficient in instrumental and vocal music, he cultivated the art of poetry with a success not surpassed by any previous English writers with the exception of his models Gower and Chaucer. Henry V., on succeeding his father in 1413, removed James to close confinement in the Tower, but shortly afterwards took him to Windsor, and in 1417, with the view of detaching the Scotch auxiliaries from the French standard, invited him to accompany him in his expedition against France. From this time, and especially after the death of the duke of Albany in 1419, James was treated with much consideration; and, having given a pledge of his friendly intentions towards England by his marriage with Lady Jane Beaufort, February 2, 1424, he finally obtained his release in the end of March of the same year, the Scottish nation agreeing to pay a ransom of £40,000, in name of expenses for his maintenance while in captivity.

With the reign of James I., whose coronation took place at Scone on the 21st May, may almost be said to begin the substitution in Scotland of constitutional sovereignty, regulated by definite principles and laws and modified by a regard to the opinions and interests of the subjects, for the indefinite authority of the king and the arbitrary rule of the nobles. It is true that after his death the lawless contests of the nobles broke out as fiercely as ever, but by his energetic repression of their violence during his lifetime, and more especially by the virtual creation of statute law modelled on that of England, and the additional importance assigned to parliament, the leaven was partly prepared which was to work towards the destruction of their unlicensed influence. During a session of the parliament held at Perth on the 12th March 1425, James suddenly arrested a large number of the nobles, including the duke of Albany and his two sons, whom along with the earl of Lennox he caused to be executed. With similar strategy he at a parliament held at Inverness in 1427 arrested Donald of the Isles and fifty of his chiefs. Donald, however, on making all due submission, received his liberty; but when, in violation of his oath he made an abortive attempt to assert his independence, the king, on his making unconditional surrender, confined him to Tantallon castle. As was natural, the energetic rule of the king, and especially his stringent coercion of the nobles, aroused a secret purpose of revenge; and, acting on the inspiration of the earl of Athole, uncle of the king, Sir Robert Graham and other accomplices, with a band of three hundred Highlanders, suddenly, on the evening of the 20th or morning of the 21st February 1437, entered the apartment of the king in the priory of the Dominicans at Perth, and stabbed him to death with their daggers.

Although the constitutional reforms introduced by James I., and the general tenor of his reign, showed that in him were united in a rare degree decision in action with far-sighted sagacity, his merits as a statesman have been cast in the shade by his achievements in literature. It is also worthy of mention that it was owing chiefly to his representations when in captivity that the pope was induced to grant a bull for the erection of a university at St Andrews. The *Poetical Remains* of James I. were first published in 1783, edited by William Tytler. The principal poems of which he is the reputed author are *The King's Quair*, *Christie Kirk on the Grene*, and *Pellis to the Play*, and he also wrote several minor pieces. A manuscript of the *King's Quair* formerly belonging to Selden is preserved in the Bodleian library at Oxford. The poem, which is divided into seven cantos, and is written in the seven-lined stanzas of Chaucer, was composed during his captivity in England, to celebrate his love for the lady whom he afterwards married. It is allegorical in form and somewhat tedious in its minute description of details, but always preserves a smooth and harmonious versification, while it contains many finely imaginative passages inspired by true and tender feeling, and characterized by a charming simplicity and grace akin to those of his master Chaucer. One reason why many have doubted that James could be the author of *Christie Kirk on the Grene* is its entire dissimilarity in manner and style to the *King's Quair*. Pope's line, "A Scot will fight for Christ's Kirk o' the Green" is sarcastic, but undoubtedly chronicles a fact. The poem is a humorous delineation of a phase of Scotch rustic life, and its spirit and graphic vigour are not unworthy of Burns, who indeed has received from it more than one suggestive hint, and in *The Holy Fair* and *The Ordination* has imitated its refrain. The oldest evidence for assigning it to James I. is that of the Bannatyne MS. collection made by George Bannatyne in 1568; and, if this evidence is not conclusive for James I., it is so against James V., the only other probable

author. There is no printed edition earlier than 1663. Since then several separate editions have appeared, and it has also been printed along with *The Gubertunise Man* as the work of James V. That James I. was the author of the poem receives a certain amount of corroboration from its resemblance in subject and style to *Pellis to the Play*, the first words of which are quoted by John Major in describing a ballad which he attributes to James.

The contemporary authorities on the reign of James I. are principally Wyntoun's *Cronykil*, and Bower's continuation of Fordun's *Scotichronicon*. To the succeeding century belong the histories of John Major, Hector Boece, and Bishop Lesley. The modern histories of Finkerton, Tytler, and Burton are of course well known. In regard to questions connected with his character as an author, see Sibbald's *Chronicles of Scottish Poetry*; Walpole's *Royal and Noble Authors*; Chalmers's *Historic Remains of Scottish Kings*; Tytler's *Scottish Worthies*; Pinkerton's *Ancient Scottish Poems*; Ritson's *Historical Essay on Scottish Song*; Washington Irving's *Sketch Book*; Prescott's *Miscellanies*; and David Irving's *History of Scottish Poetry*. An account of the murder of James I., professedly translated from the Latin of John Shilley in 1440, has been published in an Appendix to Pinkerton's *History*, in vol. ii. of *Miscellaneous Stories*, Glasgow, 1818; and in Galt's novel, *The Spacelyfe*.

JAMES II. (1430-1460), twin son of James I., was born in 1430, and Alexander his elder brother having died in infancy, was shortly after the assassination of his father crowned king at Holyrood. During his minority the house of Douglas used every endeavour to extend their influence,—William, who succeeded to the earldom in 1443, ultimately making no pretension to conceal his claims to independent sovereignty, and at the festivities in 1449, in honour of the king's marriage to Mary of Gueldres, with ostentatious bravado bringing in his train as many as 5000 followers. Shortly after the king attained his majority he in 1452 invited Douglas to become his guest in Stirling castle, and, on his refusing to break the "bands" he had made with the other nobles, in sudden passion stabbed him with a dagger, after which Sir Patrick Grey completed the assassination with a poleaxe. It was not till 1454 that the struggle following this act of violence, which involved all Scotland in a series of intermittent contests, was brought to a close by the flight of the Douglas and the forfeiture of his estates to the crown. His own kingdom being freed from distraction, James resolved to take advantage of the protracted intestine conflict in England, known as the Wars of the Roses, to wrest from the English the possessions they held in the south of Scotland; but while conducting the siege of Roxburgh castle he was killed by the bursting of a cannon, 3d August 1460.

JAMES III. (1452-1488), king of Scotland, son of James II., was born 1st June 1452, and shortly after the death of his father was crowned king at Kelso. The custody of the young prince was entrusted to Bishop Kennedy of St Andrews, but in 1466 he was seized at Lanlithgow by Lord Boyd, who in this way succeeded in obtaining the governorship of the royal fortresses, and also won the apparent friendship of the king. James was, however, as fickle and faithless as he was weak and pliant, and while Lord Boyd's eldest son, who had been created earl of Arran, and had married the king's sister, was absent in the summer of 1469 on an embassy to bring home the king's bride, Margaret of Denmark, the enemies of the Boyds set agencies in motion for having them tried for their seizure of the king. The earl of Arran, obtaining news of their machinations before landing, returned to Denmark; Lord Boyd fled to England; but Sir Alexander, brother of Lord Boyd, suffered execution, and the estates of the family were forfeited. James, whether the fault was his own or not, was sadly unfortunate in his connexion with his near relations. While his brother-in-law was a fugitive from his vengeance, his two brothers were also, whether justly or not, the objects of his animosity and dread. The earl of Mar, the younger brother, died at

Craigmillar castle in circumstances so suspicious that he was generally believed to have been murdered; and the duke of Albany the elder, making his escape from Edinburgh castle to France, afterwards in 1482 came to an agreement with Edward IV. to hold the kingdom as his vassal. The rivalry of Albany was the more formidable because James by the preference which he showed for artists and musicians and by his retired and reserved manners had alienated the majority of the nobility. While James in the summer of this year was leading an army against England, the nobles, headed by Douglas, suddenly at Lauder seized Cochrane and several of the king's other favourites, and, having hanged them before his eyes, returned with their royal captive to Edinburgh castle. On this Albany suddenly made his appearance, and, having demanded and received the king's liberty, assumed with apparently no objection on the part of James the sovereignty of the kingdom, until an accusation for treasonable connexions with England compelled him to flee thither. For some years after this Scotland enjoyed both outward and inward tranquillity, but the jealousy of the nobles against the king's favourites induced them in 1488, along with the young prince, afterwards James IV., to raise the standard of rebellion. The two armies met at the stream of Sauchieburn, near Stirling, but hardly had they come to blows when the king fled in panic from the field. In his flight he was thrown from his horse, and being received into the cottage of a miller near Bannockburn, was there (June 11) stabbed to death by a person unknown, undoubtedly a straggler from the hostile army.

JAMES IV. (1472-1513), king of Scotland, son of James III., was born March 17, 1472, and on the death of his father in 1488 was crowned king at Scone, probably on June 26th. As he not only adopted an entirely opposite policy with the nobles from his father, but also showed great affability towards the lower classes of his subjects, among whom he delighted to wander incognito, few kings of Scotland won such general popularity or passed a reign so untroubled by intestine broils. His liberalism was overlooked on account of his open and friendly bearing, and was to some extent atoned for by his hardness and courage and his just and temperate rule. So slight were the attempts at insurrection on his accession to the throne that they scarcely required repression; and, although in 1491 Lord Bothwell and others entered into an agreement with Henry VII. to seize his person, the circumstances were always such as either not to require or not to favour the carrying out of the project. Indeed, Henry seems throughout to have greatly preferred the friendship of the Scotch monarch either to his active hostility or his enforced submission; and accordingly, although James had welcomed "Perkin Warbeck," the pretender to the English throne, and made a futile invasion of England in support of his claims, Henry after Warbeck left Scotland in 1497 was willing to forget all old causes of enmity. In September of that year a truce of seven years was negotiated between the two monarchs, and in August 1503 the alliance was confirmed by the marriage of James with the princess Margaret of England,—a union which led eventually in default of the Tudors to the accession of the Stuart dynasty to the English throne. Of the peace with England James took advantage to establish order in the Highlands, where he introduced a more complete legal jurisdiction. After the accession of Henry VIII. it became apparent that the friendly relations with England were no longer possible; and, James, having several private grounds of quarrel, was induced by the king of France to venture in 1513 on an invasion of England. His methods of warfare seem, however, to have been formed chiefly according to notions borrowed from the knightly tournaments, the organization of which had made him famous throughout Europe; and on the threshold of his enterprise

he was slain on the 9th September at Flodden Field, his death and the disastrous rout of his army being due to his rash and quixotic bravery.

JAMES V. (1512-1542), king of Scotland, son of James IV., was born at Linlithgow 10th April 1512, and crowned king at Scone in October 1513. At first the regency was vested in his mother, but after her marriage with the earl of Angus in 1514 the office was transferred by the estates to the duke of Albany. The English forebore to follow up their victory at Flodden, but the close connexion of Albany with France now aroused the jealousy of Henry VIII., and Scotland was continually exposed to more or less serious attacks from the English until Albany, to whose arrogant bearing and French manners and habits not even the enmity against him of Henry could reconcile the estates, finally in 1524 took his departure to the country of his choice. Upon this James, through the scheming of Henry, was "erected" king in the Tolbooth of Edinburgh, ruling the kingdom by the advice of his mother and the lords in council. In 1526 James was persuaded to choose as his governor the earl of Angus, who kept him in close confinement until May 1528, when he made his escape from Falkland, and put such vigorous measures in execution against Angus as compelled him to flee to England. In 1532 Angus, taking advantage of the discontent in the south of Scotland caused by the king's conduct towards the Armstrongs, and of the distracted condition of the Highlands, aided an English raid on the borders; but shortly afterwards negotiations for peace were begun, and a treaty was finally signed in 1534. In January 1537 James was married to Madeleine of France, but, she dying in July of the same year, he in June 1538 espoused Mary of Lorraine. Henry VIII. was by no means satisfied with the influence he exercised in Scotch affairs, or the amount of deference he received from his nephew; and, his jealousy receiving special provocation from the interest taken by James in foreign politics, he in 1542 despatched an expedition against Scotland, which failed from want of a commissariat. James determined to make reprisals, but owing to the indecision of the nobles, who had no love of the enterprise, his army was scattered at the rout of Solway Moss on the 25th November. On the 14th December following James died at Falkland. His successor was his daughter Mary, born seven days before his death. Though possessing a weak constitution which was further impaired by his irregular manner of life, James manifested great vigour and independence as a sovereign, both in withstanding the machinations of his uncle and opposing the influence of the nobles. The persecutions to which the Protestants were exposed during his reign were, however, due to the excessive influence exercised by the ecclesiastics, especially David Beaton, archbishop of St Andrews. The king's habit of mingling with the peasantry secured him a large amount of popularity, and has led many to ascribe to him the authorship of three poems descriptive of scenes in lower class life—*Christis Kirk on the Grene*, *The Galloway Man*, and *The Jolly Beggar*. There is no proof that he was the author of any of these poems, but from expressions in the poems of Sir David Lindsay, who was on terms of special intimacy with him, it would appear that he occasionally wrote verses.

JAMES I. (1566-1625), king of England. This sovereign, James VI. of Scotland, in whom the crowns of Scotland and England were united, was the son of Mary Queen of Scots and of Henry, Lord Darnley, and was born in the castle of Edinburgh 19th June 1566. His mother while in captivity having been forced to abdicate the sovereignty, James was crowned king at Stirling July 29, 1567. The regency was vested in the earl of Murray, who by his masterly political skill and force of character held

the various factions in complete restraint until his assassination at Linlithgow in February 1570. The absence of his authoritative will at once allowed free scope to the various elements of disorder latent in the kingdom, and during the regency of Lennox, who was mortally wounded in a fray at Stirling with the adherents of Mary, September 1571, and of the earl of Mar his successor, who died in October 1572, strife and confusion held almost rampant sway. The earl of Morton, the next regent, being possessed, however, of some of the high qualities of his predecessor Murray, succeeded with assistance from Elizabeth of England in quelling the last embers of insurrection, and afterwards held in check the interested ambition of the nobles, until in 1578 they succeeded in discrediting his influence by the scheme of placing the government nominally in the hands of the boy monarch. In June 1581 Morton suffered death for his connexion with the murder of Darnley. James, to whom were thus early entrusted the functions of sovereignty, had spent his infancy under the care of the earl of Mar, on whose death he was taken charge of by the earl's brother, Alexander Erskine. For his principal tutor he had George Buchanan, who inspired him with a genuine interest in learning and a strong ambition to excel in poetical composition; he was also so far influenced by the Reformed type of religion as to have imbibed a love for theological argument, although he always cherished a strong distaste towards both Calvinistic doctrine and the Presbyterian form of government. His character was indeed formed amidst moral and intellectual surroundings strangely mingled and inharmonious, in addition to which the nature he inherited was rather a medley of isolated capacities than a definite and distinct idiosyncrasy. From the first compelled to adopt an attitude hostile to his mother, and, at the same time that he could not but resent her imprisonment by Elizabeth, unable to trust in her intentions towards himself, he seems to have regarded her death both as a relief and as a calamity and disgrace. As he knew that each party in the state, the Catholics, the nobles, the Presbyterians, wished to make him their tool, he resolved to act towards them as suited his convenience; but, although he possessed a certain sharp shrewdness and foresight as well as no small knowledge of character, his inability to take a comprehensive view of affairs, or to form a truly courageous resolution, made his policy often rash and reckless in regard to matters seemingly small, and always shifting and irresolute in regard to affairs of the highest moment. The moral courage he possessed was not inconsistent with physical cowardice; indeed the chief element in it was an overweening self-conceit, to which the consciousness of superior intellectual attainments gave the consummating touch; and thus it was that the very difficulties of his position gradually nourished within him the conviction of the divine right inherent in his office, and caused all his conduct, wavering and uncertain as it was, to be inspired by the one purpose of building up his kingly prerogative.

Taking advantage of the weakness of the royal authority during the king's minority, the General Assembly of the Scottish Church resolved in 1581 to substitute Presbyterianism for Episcopacy, and James, being shortly afterwards seized by the nobles at the raid of Rathven, was unable to put his veto on their procedure, until after the overthrow of those implicated in the conspiracy, when in 1584 the estates passed an act denouncing their assumption of legislative power. In 1585 James was, however, besieged in Stirling by the exiled lords, and compelled to pardon them and dismiss his favourite, Arran. As their influence was moreover backed by Elizabeth, and as the hopes of James were even then early directed towards succeeding her on the English throne, he discovered it to be advan-

tageous to disguise his sentiments towards the Presbyterians. The destruction in 1588 that overtook the Armada of the Catholic Philip of Spain deprived James of all anxiety regarding the effects of his mother's testamentary disposal of her crown to that monarch, but it naturally inclined him for a time to a more close alliance with the Protestants, the result of which was seen, not only in his marriage in 1589 to the Protestant princess Anne of Denmark, but in an Act of the estates in 1592, which sanctioned the formal abolition of Episcopacy. In 1594 he also found it necessary to reduce the Catholic lords of the north of Scotland, but in 1597 he deemed it prudent to balance the influence of the Presbyterians, and also to flatter the hopes of the Catholics of England by securing the revocation of the forfeiture of the estates of the banished nobles, and permitting them to return. Previous to this his action against the preacher of a sermon in which Elizabeth was attacked as an atheist led to a "No Popery" riot in Edinburgh. The breach between him and the Presbyterians was still further widened by the statute of 1599, appointing a certain number of ministers to a seat in parliament with the title of bishop, and by his publication in the same year of his *Basilicon Dorn*, in which he promulgated his views in regard to the divine right of kings. With the exception, however, of his peculiar experiences in connexion with the mysterious Gowrie conspiracy at Perth (August 5, 1600), the remainder of his reign in Scotland until his succession to the English throne in 1603 was quiet and uneventful; and the only fact of notable importance connected with his subsequent government of that kingdom is his suspension of the meetings of the General Assembly, until by the banishment and imprisonment of Melville and its principal leaders he was able in 1610 to convene an Assembly which agreed to the organization of a modified Episcopacy. The peculiar union of talents and defects which constituted the character of James made him perhaps the most unfit successor of Elizabeth that could have been chosen. His strutting pomposity was rendered strangely ludicrous by a personal appearance the several defects of which were heightened by their contrast with each other, and it was also constantly interfered with by his want of a proper sense of decorum. If he displayed great cleverness in avoiding immediate political difficulties and in gaining for the moment his own ends, he was incapable of adapting himself mentally to his new position as sovereign of England, and his fussy self-importance made it almost inevitable that he should mortally offend the political temperament then in England so peculiarly sensitive. Indeed, the traditional policy which the circumstances of Scotland had rendered almost a second nature to the Stuarts was repugnant to the susceptibilities of England, and utterly alien to her political constitution, and in the case of James all the worst defects of this policy were exaggerated. Thus his seeming shrewdness in small matters, and his witty and terse political axioms, only secured him the reputation of being the "wisest fool in Christendom;" and, while his absurd personality cast ridicule on his kingly pretensions, the general character of his political procedure estranged from him every party in the state, and called into action influences which in the subsequent reign wrought the overthrow of the monarchy whose prestige he had almost hopelessly tarnished. Having narrowly escaped a plot of the Catholics to seize his person shortly after his arrival in London, James resolved to flatter their hopes by granting them toleration, but his proclamation in February 1604 against the Jesuits revealed the hollowiness of his professions and led to the futile gunpowder conspiracy of November 1605. Its discovery dissipated for the time the alienation already begun between him and the Commons on account of his imprudent assertion of

his prerogative against the Puritans at the Hampton Court conference, and the subsequent disagreements in regard to ecclesiastical reform and a union with Scotland. Against the goodwill of the Commons, which showed itself in the readiness with which a subsidy was granted for his debts, he, however, trespassed almost immediately by abusing the royal custom of placing impositions on merchandise. All attempts at a compromise on the subject having failed, James in February 1611 dissolved the parliament, and a second parliament which he summoned in 1614 proving equally recalcitrant was also dissolved, the fact that it was not allowed the opportunity of transacting business earning for it from the courtiers the name of the "addled parliament." To help in filling the vacuum in his treasury, James had recourse with small success to the odious practice of demanding benevolences, and, in addition to various other misuses of his prerogative, to the excessive increase of monopolies, and to the virtual sale of peerages and other high offices. The administration of the affairs of the kingdom was at the same time gradually withdrawn from the council, and the whole executive authority entrusted to favourites. As the breach between him and his subjects gradually widened he became more anxious—both in order to supply himself with money, and to obtain the support of an influential external authority—for an alliance with Spain, and in 1617 negotiations were entered into for a marriage between the young prince Charles and the Spanish infanta. But on the part of Spain those proposals were never seriously entertained. Their only result was to impart such irresolution to the policy of James in reference to the Bohemian insurrection as to afford Spain the opportunity of seizing the Palatinate; and by continuing to dangle the possibility of the marriage before the eyes of James the emperor succeeded in delaying his interference till the Palatinate was lost. Still intent on his purpose of the Spanish marriage, to which he had ruthlessly sacrificed the life of Sir Walter Raleigh, James despatched his favourite Buckingham along with Charles to Madrid, and the return of the baffled and disappointed wooer in 1624 dissipated the last lingering sentiment of respect which the English nation may have cherished towards the king. Buckingham and Charles now virtually overrode the royal prerogative, and at their instance not only was war declared against Spain, but on the condition of granting toleration to the Catholics of England, a treaty of marriage between Charles and Henrietta Maria of France was signed at the close of 1624. James died on March 25, 1625.

James inaugurated his literary career in 1584 by the publication of the *Essays of a Prentice in the Divine Art of Poetry*, and in 1591 he published *Poetical Exercises at Vacant Hours*. His other compositions in verse include a paraphrase of the Revelation of St John and a version of the Psalms. As he deemed it necessary to give to the world his opinion on almost every subject of importance which then occupied public attention, his prose disquisitions are legion, but the best known are *Demonologie*, 1597; *Basiliens Doron*, 1599; and *Counterblow to Tobacco*, 1615. A collected edition of his prose writings was published in 1616, edited by the bishop of Winchester. Some of his poetical translations are not without merit, but both his prose and poetry, though displaying occasional wit and cleverness and some facility of composition, are studded with absurdities, and but for the fact that their author was a monarch would scarcely deserve a reference.

The original authorities for the reign of James I. are the state-papers published in the series of the Master of the Rolls; the *Register of the Privy Council of Scotland* (vol. ii. 1569-78, by Burton, 1878; vol. iii. 1578-86, by Masson, 1880); the *Letters and State-Papers during the reign of James the Sixth*, published by the Abbotford Club; the *Letters of the children and other relations of James*, published by the Maitland Club, in facsimile form, from the originals in the Advocates' Library, Edinburgh; the letters published under the title of the *Court and Times of James I.*, 1846; his correspondence with Cecil, published by the Camden Society; the correspondence in the *Cubala*; Camden's *Annals*; Goodman's *Court of James I.*, edited by J. S. Brewer, 1889; Calderwood's

History of the Church of Scotland; Melville's *Diary*; *Historie and Life of James the Sixth*, 1566-96, with a short continuation to 1617, published by the Bannatyne Club, Edinburgh, 1826; the secret histories by Osborne, Weldon, Heylin, and Peston, edited by Sir Walter Scott; Arthur Wilson's *Life and Times of James I.*, London, 1653. See also, in addition to the histories of Burton, Tyler, Gardner, Ranke, and others, Harris's *Historical and Critical Account of the Writings of James I.*, 1573; Irving's *History of Scottish Poetry*; and Disraeli's *Literary and Political Character of James I.*

JAMES II. (1633-1701), king of England, and as king of Scotland James VII., second surviving son of Charles I. and Henrietta Maria, was born at the palace of St James's, October 15, 1633, and was created duke of York in January 1643. During the civil war he was taken prisoner by Fairfax at Oxford in 1646, but in 1648 he made his escape to Holland. After the second failure of the Stuart cause he served for some time in the French army under Turenne, but at the command of his brother he in 1656 accepted a military commission from Spain. At the Restoration in 1660 he was appointed lord high admiral and lord warden of the Cinque Ports. For the management of the civil administration of the navy he had the qualification of industry and careful regard to details; and if his victory over the Dutch in 1665 was principally a happy stroke of good luck, and his drawn battle with De Ruyter in 1672 was more to his antagonist's credit than to his, still the fact that his career as an admiral was free from disaster shows that his seamanship must have been at least respectable. Outside, however, the sphere of practical routine, James was blind and insensate, and his whole political conduct—while it indicated that he could stoop to compromise and deception when he deemed these necessary—was marked by a headlessness and perverse obstinacy possible only to a rigid and contracted understanding preoccupied with a single purpose. He possessed the vices of his race without its virtues and redeeming points, and in him the propensity to despotism developed itself in a form unmitigated by any mildness or amiable weakness of temper, unenlightened by any gift of foresight or practical wisdom, and unadorned by any personal accomplishment. Although at the Restoration his sympathies were so little Catholic that he supported the policy of Clarendon, whose daughter Anne he secretly married in September 1660, publicly acknowledging the union in the December following, he soon thereafter became a convert to Romanism, and in 1672, in opposition to the expostulations of his brother, openly avowed his change of faith. Anne Hyde having died in 1671, he also persuaded his brother to defy the wishes of both Houses of Parliament by permitting him in 1673 to marry the Catholic princess Mary of Modena. On account of the Test Act, passed in this year, he had been compelled to resign his office of admiral, and, although the marriage in 1677 of his daughter Mary to William, prince of Orange, somewhat allayed the distrust with which he was regarded, it was deemed advisable on the discovery of the Popish plot in 1679 that he should retire for a time to Brussels. Afterwards he was appointed lord high commissioner to Scotland, where his arbitrary bigotry found congenial employment in the persecution of the Covenanters; but in 1684 Charles ventured to dispense in his case with the Test Act, and restored him to his office of admiral.

The influence of the loyal enthusiasm which surrounded the last days of Charles in 1685 was felt in the calm acquiescence with which the nation witnessed James's succession to the throne on February 6, and his coronation on April 23, 1686. The trust awakened by his promise to preserve the Government both in church and state as by law established was indeed almost immediately rudely shaken by his public celebration of mass, by his prohibition of preaching against Catholicism, and by his appointment of Catholic officers to the army; but that the goodwill at

least of the Commons was still strong was manifested by the grant of a revenue of two millions, and by the enactment of severer measures against treason. If the loyalty of the nation had begun to waver, it was also for the time strengthened by the premature and headstrong attempts at rebellion by Argyll in Scotland, and Monmouth in England. The renewal of the Covenanting persecutions had, however, branded the name of James with the hatred of the Scottish people, and the butchery of the Bloody Assizes, which in England followed the discomfiture of Monmouth, left behind it a widespread horror, the repression of which only wrought effects on the mind of the nation the deeper and more ineffaceable. But James was too intent on his one aim—the establishment of irresponsible despotism—to scrutinize or consider the indirect consequences of his acts. In that aim was necessarily involved the restoration of Popery, because James was a Papist, but happily the accidental prominence given to this secondary and subordinate aim made the other impossible of success. In his imprudent zeal to accomplish his purpose, James outran the wishes even of Rome, but that was because the purpose which to the one was secondary was to the other primary. James required both a large standing army and freedom from the control of parliament; but for these ends a foreign source of money supply was at first necessary, and this he could only obtain by an arrangement which, while it was unpalatable to himself and loathsome to the nation, was far from acceptable to the pope—namely, by becoming the temporary vassal of Louis of France, whose ambitious designs, notwithstanding his intense and virulent Catholicism, had awakened the jealousy of Rome. Besides, many of the individual acts of James were prompted by the Jesuits, with whom the pope was then at feud. The progress of James's ill-starred design was marked by clear and well-defined steps. While all England was shocked by the cruelties following the revocation by Louis of the edict of Nantes, James resolved to demand the repeal of the Test Act, and when this was refused by parliament he fabricated by means of corrupted judges a semblance of legal sanction for his disregard of its provisions, and not only encamped an army on Hounslow Heath, chiefly officered by Catholics, but manifested his determination that henceforth to be a Catholic should be a recommendation and not a bar to the highest offices of state, by creating Father Petre and five Catholic peers privy councillors. An appearance of liberality was indeed given to his policy by a declaration of indulgence to Protestant dissenters, but this only quickened suspicion as to his ultimate purpose. Moreover, while a commission was illegally appointed to restrain the discussion of political subjects by the clergy, the publication of Romanist sentiments was freely permitted, monasteries and Catholic schools were being rapidly augmented, and an attempt was made to swamp the Protestantism of the universities by conferring the principal dignities as they became vacant on Catholics. This final step, and a second declaration of indulgence of April 1688, which contained a provision for the prosecution of those clergymen who might refuse to read the declaration in their pulpits, dissipated the last atoms of veneration in the minds of the Tories for the divine right of the king; and after the birth of a son to James in May of the same year nearly every party in the state was prepared to support the invitation to William of Orange to aid in the restitution of the liberties of the country. The discussion of the motives which induced William to accept this invitation, and the results which followed his landing in England, belong properly to the article on WILLIAM III. James, finding the bulwarks of despotism crumbling around him, after refusing the advice of a council of lay and temporal peers to open negotiations

with William, made a pretence of yielding only to gain time to escape, and by his cowardly flight, which he persevered in even after being intercepted and brought back to London, rendered the coronation of Mary and William indispensable. All hope in England was for the time lost, and as by his action on the Test Act he had alienated the sycophantic estates of Scotland, the rising in the Highlands afforded no permanent benefit to his cause; but in Ireland it might be possible for him still to enjoy, though in diminished lustre, the glories of sovereignty until he should be restored to his wider dignities. If his policy towards Ireland had been dictated by the position in which he was now placed, it failed of its purpose, for even before the arrival of William he discovered that he had to fight his way to dominion, and finally, notwithstanding the aid of French troops, his craven irresolution in the face of danger lost him the battle of the Boyne, July 1, 1690, after which he made a hurried escape to France. An expedition to England in his favour was projected by Louis in 1692, but was frustrated by the defeat of the French fleet off Cape La Hogue on May 17, and another invasion planned to follow on the success of an assassination plot on February 10, 1696, was foiled by the discovery of the treachery. James died at St Germain, September 1701.

The principal contemporary authorities for the reign of James are the *Diaries* of Evelyn, Pepys, and Luttrell; Burnet's *History of His Own Times*; Sir William Temple's *Memoirs*; *Life of James II.*, London, 1705; Bishop Kennet's *History of England*, *The Ellis Correspondence*, London, 1829; and the *Life of James II., collected out of Memoirs written by his own hand*, by J. C. Clarke, 1816. See also the *Life* by C. J. Fox; C. T. Wilson, *James II. and the Duke of Berwick*, 1876; and the histories of Macaulay, Lingard, and Ranke.

JAMES, or, in full, JAMES FREDERICK EDWARD STUART (1688–1766), prince of Wales, called by his adherents James III. of England, but better known as the Pretender, was the son of James II. and Mary of Modena, and was born in St James's Palace, London, June 10th 1688. The general opinion prevailing at the time of his birth that he was a supposititious child seemed to be confirmed by a variety of circumstances, but it has been completely overthrown by undoubted facts. Shortly before the flight of the king to Sheerness, the infant prince along with his mother was sent to France, and afterwards he continued to reside with his father at the court of St Germain. On the death of his father he was immediately proclaimed king by Louis XIV. of France, but a fantastic attempt to perform a similar ceremony in London so roused the anger of the populace that the mock pursuivants barely escaped with their lives. A bill of attainder against him received the royal assent a few days before the death of William III. in 1702, and the Princess Anne, half-sister of the Pretender, succeeded William on the throne. An influential party still, however, continued to adhere to the Jacobite cause; and an expedition planned in favour of James failed of success chiefly in all probability because his falling ill of measles, on the eve of its departure, enabled the English to assemble so powerful a fleet as rendered disembarkation inadvisable. A rebellion in the Highlands of Scotland was inaugurated in September 1715 by the raising of the standard "on the braes of Mar," and the solemn proclamation of James Stuart, "the Chevalier of St George," in the midst of the assembled clans, but its progress was arrested in November by the indecisive battle of Sheriffmuir, and it was practically extinguished a few weeks afterwards by the surrender at Preston. Unaware of the gloomy nature of his prospects, the Chevalier landed in December at Peterhead, and advanced as far south as Scoon, accompanied by a small force under the earl of Mar; but, on learning of the approach of the duke of Argyll, he retreated to Montrose, where the Highlanders dispersed to the

mountains, and he embarked again for France. A Spanish expedition sent out in his behalf in 1718 under the direction of Alberoni was scattered by a tempest, only two frigates reaching the appointed rendezvous in the island of Lewis. In 1719 James was married at Avignon to the Princess Clementina of Poland, by whom he had two sons, Charles Edward, and Henry, afterwards Cardinal York. His licentious habits soon led to a separation from his wife, and his indolence and irresolution having completely unfitted him for the rôle of aspirant to the English throne, the hopes and affections of his adherents were gradually transferred to his son Charles Edward, of whose career an account is given in vol. v. p. 426-7. James spent the remainder of his years at Rome, where he was regarded with very little esteem both by the pope and the populace. The papal soldiers mounted guard at the Palazzo Muti, where he resided, and the pope issued an order that he should be styled king of England, but the Italians were in the habit of naming him the king here in contradistinction to the king *there*, that is, in England. Latterly his regular income was 12,000 scudi from the pope, which only was supplemented by the donations, probably not very large, of the adherents of the cause in England. Horace Walpole, writing in 1752, thus describes him, "He is tall, meagre, and melancholy of aspect. Enthusiasm and disappointment have stamped a solemnity on his person which rather awakens pity than respect. He seems the phantom which good nature divested of reflexion conjures up when we think of the misfortunes without the demerits of Charles the First. Without the particular features of any Stuart, the Chevalier has the strong lines and fatality of air peculiar to them all." For several of the last years of his life the Chevalier was so infirm in health that he was unable to leave his bed-chamber. He died at Rome, January 12, 1766, and was interred in the church of St Peter's.

The Jacobite cause in Scotland has given rise to some of the finest specimens of national ballad literature. Two volumes of *Jacobite Relics* were published in 1810-1821, but the collection is very miscellaneous. An edition of Jacobite songs appeared at Glasgow in 1820, and a more complete collection was published in 1861, edited by Charles Mackay. See *History of the Jacobite Club*, London, 1712; *Secret Memoirs of Bur-le-dur*, 1716; Macpherson's *Original Papers*; *The Decline of the Last Stuarts*, printed for the Roxburgh Club, 1843; Chambers's *History of the Rebellion*, 1824; Jesse, *The Pretenders and their Adherents*, 1858; Thackeray, *Henry Bonaparte*; Deloress, *L'Histoire d'un Cent Ans*, 1836; Lacroix de Marles, *Histoire du Chevalier de Saint-Georges et du Prince Charles Edward*, 1808 and 1876; Doran, *Mann and Manners at the Court of Florence*, 1875; *Id.*, London in the *Jacobite Times*, 1877.

JAMES, GEORGE PAYNE RAINSFORD (1801-1860), English novelist, was born in George Street, Hanover Square, London, in 1801, and was educated at Greenwich and afterwards in France. He began to write early, and had, according to his own account, composed the stories afterwards published as *A String of Pearls* before he was seventeen. Contributing plentifully to newspapers and magazines, he came under the notice of Washington Irving, who is said to have encouraged him to produce (in 1822) his *Life of Edward the Black Prince*. His next attempt was *Richelieu*, which was finished in 1823, and was well thought of by Sir Walter Scott (who apparently saw it in manuscript), but was not brought out till 1829. Perhaps Irving and Scott, from their natural amiability and invariable habit of encouraging literary aspirants, were rather dangerous advisers for a writer so well inclined by nature to abundant production as James. But he took up the ball of historical romance writing at a lucky moment. Scott had firmly established the popularity of the style, and James in England, like Dumas in France, reaped the reward of their masters' labours as well as of their own. For thirty years the author of *Richelieu*

continued to pour out novels of the same kind though of varying merit. The full list of his works in prose fiction, verse narrative, and history of an easy kind includes between seventy and eighty items, most of them being three-volume novels of the usual length. The best examples of his style are perhaps *Richelieu*, 1829; *Philip Augustus*, 1831; *Henry Masterlon* (probably the best of all), 1832; *Mary of Burgundy*, 1833; *Darnley*, 1839; *Corse de Léon*, 1841; *The Smuggler*, 1845. His poetry does not require special mention, nor does his history, though for a short time in the reign of William IV. he held the office of historiographer royal. After writing vigorously in all these styles for about twenty years, James in 1850 went to America with his family. He was appointed consul at Richmond, Virginia, and held that post from 1852 to 1858. In September of the latter year he was appointed to a similar post at Venice, where he died May 9, 1860.

James has been compared to Dumas, and the comparison holds good in respect of kind, though by no means in respect of degree of merit. Both had a certain gift of separating from the picturesque parts of history what could without much difficulty be worked up into picturesque fiction, and both were possessed of a ready pen. Here, however, the likeness ends. Of purely literary talent James had little. His plots are poor, his descriptions weak, his dialogue often below even a fair average, and he was deplorably prone to repeat himself. His "two cavaliers" who in one form or another open most of his books have passed into a proverb, and Thackeray's good-natured but fatal parody of *Barbaze* is likely to outlast *Richelieu* and *Darnley* by many a year. Nevertheless, though James cannot be allowed any very high rank even among the second class of novelists, the generation that read him, and those chiefly youthful persons who read him now and will read him for some time to come so long as he is attainable on the bookstalls, are not wholly without excuse. He had a considerable portion of the narrative gift, and, though his very best books fall far below *Les trois Mousquetaires* and *La Reine Margot*, there is a certain even level of interest, such as it is, to be found in all of them. James never resorted to illegitimate methods to attract readers, and deserves such credit as may be due to a purveyor of amusement to the public who never caters for the less creditable tastes of his guests.

JAMES, JOHN ANGELL (1785-1859), preacher and author, was born at Blandford, Dorsetshire, June 6, 1785. After obtaining at school a knowledge of reading, writing, ciphering, and a little Latin, he was at the age of thirteen bound to a seven years' apprenticeship with a hindsman at Poole, with the view of assisting his father in his business at Blandford; but about the close of his term of apprenticeship he began to form the resolution of becoming a preacher, and in 1802 he went to prosecute his studies at the theological college of Gosport. After remaining there for a year and a half, he happened to pay a visit to Birmingham, where his preaching was so highly esteemed by the congregation of Carr's Lane Independent chapel that they invited him to "exercise his ministry amongst them," and accordingly, after finishing his short theological course, he was settled there in the beginning of September 1805, and ordained on the 8th May of the following year. For seven years his success as a preacher was comparatively small, but about 1814 his eloquence almost suddenly acquired for him a popularity which attracted large crowds wherever he officiated in England, and never faded during the long term of his subsequent ministry. At the same time his numerous religious writings, the best known of which are *The Anxious Inquirer* and *An Earnest Ministry*, acquired a wide circulation both in England and in America. He died at Birmingham

October 2, 1859. The degree of D.D. was conferred on James by the college of Princeton, New Jersey, and also by the university of Glasgow.

A collected edition of James's works appeared in 1860-64. See *A Review of the Life and Character of J. Angell James*, by J. Campbell, 1860, *True Greatness, a brief Memoir of J. A. James*, 1860, and *Life and Letters of J. A. James*, edited by R. W. Dale.

JAMESON, ANNA (1794-1860), was born in Dublin in 1794. Her father, Mr Brownell Murphy, who was a miniature and enamel painter of some celebrity, took part in his early days in the political commotions which then agitated Ireland. His removal to England in 1798 confined his attention fortunately to his more peaceful calling, in which he attained considerable skill, but his daughter's mind seems to have been influenced in the highest sense by the circumstances that surrounded her birth; she was distinguished from her tenderest years by that ardour and courage and keenness to supply the needs and redress the injuries of others which marked her career through life.

At sixteen years of age she undertook the office of governess in the family of the marquis of Winchester, and later in that of Mr Littleton, afterwards Lord Hatfield. Between these two engagements she accompanied a young pupil, one of a party of travellers, to Italy, a tour which gave rise to a narrative of what she saw and did, written in an imaginary character. This, her first literary production, the merits of which she little appreciated, did not make its appearance until after her marriage with Mr Robert Jameson, a barrister, in 1825, when it was advertised by a friend under the title of a *Lady's Diary*, and ultimately published by Mr Colburn as *The Diary of an Ennuyée*. Mrs Jameson's marriage was not a happy one; but, if not more unfortunate than many of her sex in this form of trial, she set the example of a rare discretion under it. Her marriage troubles were made no excuse for appealing against the laws of the land or the usages of society. *The Diary of an Ennuyée* attracted much attention. Italy was no such beaten ground then, nor a traveller with ardent feelings for art and nature so common, as both have become since. The authoress has been blamed for assuming the disguise of an invalid, who dies on her way back; but such a tinge of romance made no difference in the truth of her descriptions, while it procured them more readers.

In 1829 Mr Jameson was appointed puisne judge in the island of Dominica. It was decided to be impracticable for her to accompany him, and meanwhile Mrs Jameson visited the Continent again with her father. Traces of this journey appear in *Visits and Sketches at Home and Abroad*. Hitherto the subjects she had treated had been limited to impressions of outer scenes and passing things, or to abridgements of history, as in her good schoolbook *Female Sovereigns*. The first work in which her powers of original thought became embodied were her *Characteristics of Shakespeare's Women*, which appeared in 1832. These analyses of the great poet's heroines are unsurpassed for delicacy of critical insight and fineness of literary touch. They are the result of a penetrating but essentially feminine mind, applied to the study of individuals of its own sex, detecting characteristics and defining differences not perceived by the ordinary critic, and entirely overlooked by the general reader.

In 1833 Mrs Jameson paid her first visit to Germany, the literature and art of which country may be said to have then first roused the curiosity of English minds. Dresden and Tieck and Rotsch, Frankfort and Dannecker, Weimar and, if not Goethe, who had died the year before, yet his homagie whom more than restored him to life, successively occupied her. Nor was she proof to the spell of the modern German art which the late King Louis of Bavaria had evoked in his capital. Those conglomerations of hard

lines, cold colours, and pedantic subjects which decorated Munich were new to the world, and Mrs Jameson's enthusiasm first gave them the reputation which has long since faded away.

It was in 1836 that Mrs Jameson was summoned by her husband to join him in Canada. She started with many a regret for the life she was leaving, and was not long left in doubt as to the fruitlessness of the step. He failed to meet her, even by a letter, at New York, and she was left to make her way alone at the worst of seasons to Toronto. After six months' experiment she felt it useless to prolong a life far from all ties of family happiness and opportunities of usefulness. Before leaving, she undertook a journey to the depths of the Indian settlements in Canada; she explored Lake Huron, and saw much of emigrant and aboriginal life unknown to travellers, which she afterwards embodied in her *Winter Studies and Summer Rambles*. She returned to England in 1838. It was at this period that Mrs Jameson first devoted her attention to the subject of art. She began by making careful notes of the chief private collections in and near London which had hitherto received no systematic description. This *Companion to the Private Galleries* was soon followed by the *Handbook to the Public Galleries*. These works were useful compilations, and had a certain circulation; but the authoress laid claim to no powers of real discrimination, and many of her verdicts, in which she only followed those that went before her, have been since superseded by exacter knowledge. These works, however, led on to those by which her literary career has been specially distinguished,—her series of *Sacred and Legendary Art*. The time was ripe for such contributions to the traveller's library. *The Acts Scriptorum* and the *Book of the Golden Legend* had had their readers, but no one had ever pointed out the connexion between these tales and the works of Christian art. The painters employed by convent or church had introduced the local or family saints according to contract, and the faithful had retained the tradition of their names; but for the modern Protestant traveller the whole was a *terra incognita*. The way to these studies had been pointed out in the preface to Kugler's *Handbook of Italian Painting* by Sir Charles Eastlake, who had intended pursuing the subject himself. Eventually he made over to Mrs Jameson the materials and references he had collected. They could not have been placed in better hands. She recognized the extent of the ground before her as a mingled sphere of poetry, history, devotion, and art. She directed the taste of her readers with judgment and even enthusiasm; and, with the same penetration that had guided her in her literary tasks, she threw many a light on a master's intentions which had escaped both artists and critics.

Another service Mrs Jameson rendered to the English public, and that the most valuable of all, has still to be noticed. She began her literary career by analysing books, she proceeded to analyse works of art, and she ended by analysing society. It was a natural supplement to a course of varied personal experience and no little struggle that her attention should be directed to the great moral questions of the day, and especially to those affecting the education, occupations, and maintenance of her own sex. Her early essay on *The Relative Social Position of Mothers and Governesses* is a masterpiece. She knew both sides; and in no respect does she more clearly prove the falseness of the position she describes than in the certainty with which she predicts its eventual reform.

To Mrs Jameson we owe the first popular enunciation of the principle of male and female cooperation in works of mercy and education. Her mind was peculiarly to be trusted with the advocacy of such tenets—it had become as clear and judicious by experience as it was ardent and

vigorous by nature. In her later years she took up a succession of subjects all bearing on the same principles of active benevolence, and the best ways of carrying them into practice. Sisters of charity, hospitals, penitentiaries, prisons, and workhouses all claimed her interest—all more or less included under those definitions of "the communion of love and communion of labour" which are inseparably connected with her memory. To the clear and temperate forms in which she brought the results of her convictions before her friends in the shape of private lectures, subsequently printed, may be traced the source whence living reformers and philanthropists took counsel and courage.

Mrs Jameson died in March 1860. She left the last of her *Sacred and Legendary Art* series in preparation. It was completed, under the title of *The History of our Lord in Art*, by Lady Eastlake. (R. E.)

JAMESON, or JAMESONE, GEORGE (c. 1587–1644), a Scotch portrait painter, was born, probably in 1587, at Aberdeen, where his father was architect and a member of the guild. After studying painting under Rubens at Antwerp, with Vandyck as a fellow pupil, he returned in 1620 to Aberdeen, where he was married in 1624 and remained at least until 1630, after which he took up his residence in Edinburgh. The department of painting which he chiefly practised was portraiture in oil, but he also painted a few historical subjects and landscapes. His portraits are generally less than life size. According to Walpole they are characterized by "delicacy and softness, with a clear and beautiful colouring"; but, although undoubtedly the instructions of Rubens had left their influence on his style, he has no claim to the title of the Vandyck of Scotland by which he is often known, and perhaps owed even his exceptional fame in Scotland as much to chance as to his own merits. Having been employed by the magistrates of Edinburgh to copy several portraits of the Scottish kings for presentation to Charles I. on his first visit to Scotland in 1633, the king rewarded him with a diamond ring from his own finger. This circumstance appears to have at once established his fame, and he soon found constant though not very remunerative employment in painting the portraits of the nobility and gentry of his native land. He also painted a portrait of Charles, which he declined to sell to the magistrates of Aberdeen for the price they offered. The largest collection of the works of Jameson is said to be that in Taymouth castle, and; besides those in the houses of several of the gentry of Scotland, there are a few in the colleges of Aberdeen. He died at Edinburgh in 1644.

JAMESON, ROBERT (1774–1854), regius professor of natural history in the university of Edinburgh, was born at Leith July 11, 1774. After an education at Leith grammar school and Edinburgh university, he became assistant to a surgeon in his native town; but, having studied natural history under Dr Walker in 1792 and 1793, he felt that his true province lay in that science, for which indeed he had had a predilection from boyhood. The course of his studies during the next few years is to be traced in his scientific papers and books. He went in 1800 to Freiberg to study for nearly two years under the learned Werner, and spent other two in Continental travel. On his return to Edinburgh in 1804, when he succeeded Dr Walker in the chair of natural history, he became, in lectures, writings, and controversy, perhaps the first great exponent in England of the Wernerian geological system; and it is to his credit that, when he found that theory untenable, he frankly and honestly announced his conversion to the views of Hutton. As a teacher, Professor Jameson was no less remarkable than Werner for his power of imparting his own enthusiasm to his students,

and from his classroom there radiated an influence which gave a marked impetus to the study of geology in Britain. It was his energy also that, by means of Government aid, private donation, and personal outlay, amassed the greater part of the splendid collection which now occupies the natural history department of the Edinburgh Museum of Science and Art. In 1808 Jameson founded the Wernerian Natural History Society, and in 1819, along with Sir David Brewster, he originated the *Edinburgh Philosophical Journal*, which after the tenth volume remained under his sole conduct till his death, which took place April 19, 1854. His bust, presented by the Wernerian Society to the museum some years before his death, now stands in the university library hall.

Professor Jameson was the author of *Mineralogy of Ayr and the Shetland Islands*, 1798, incorporated with *Mineralogy of the Scottish Isles*, 3 vols. 4to, 1800; *Mineralogical Description of Scotland*, vol. i. pt. 1, "Dumfriesshire," 1804 (this was to have been the first of a series embracing all Scotland); *System of Mineralogy*, 1804; *Characters of Minerals*, 1804; *Elements of Geology*, 1808; and *Manual of Minerals and Mountain Rocks*, 1821; besides a number of occasional papers, of which a list will be found in the *Edinburgh New Philosophical Journal* for April 1854, along with a biographical sketch of the author.

JAMESTOWN, a village in Chautauqua county, New York, is situated on the Chautauqua Outlet at the southern end of Chautauqua Lake, about 55 miles south-south-west of Buffalo. It may be conveniently reached by rail, or by steamer from Mayville at the north end of the lake, and its vicinity is steadily rising into favour as a summer resort. The manufactures include alpaca, woollens, pianos and furniture, sashes and blinds, edge-tools and iron. The population, which in 1870 was 5536, was 7264 in 1880.

JAMI. Nûrûddîn 'Abdurrahmân ibn Aîmed (1414–1493), called el Jâmî from his birthplace Jâm in Khôrâsân, was the last great poet and mystic of Persia. See PERSIA.

JAMIESON, JOHN (1759–1838), author of the *Scottish Dictionary*, was born in Glasgow, where his father was a Dissenting clergyman, March 3, 1759. He was educated at Glasgow university, and subsequently attended classes in Edinburgh. After six years' theological study, Jamieson was licensed to preach in 1779. From 1780 till 1797 he was pastor of the Secession (Antiburgher) congregation of Forfar; and from 1797 till his death on July 12, 1838, he occupied the pulpit of the Antiburgher church in Nicolson Street, Edinburgh.

Jamieson's name stands at the head of a tolerably long list of works in the *Bibliotheca Britannica*; but by far his most important book is the laborious and erudite compilation, best described by its own title-page—*An Etymological Dictionary of the Scottish Language; illustrating the words in their different significations by examples from Ancient and Modern Writers; shewing their Affinity to those of other Languages, and especially the Northern; explaining many terms which though now obsolete in England were formerly common to both countries; and elucidating National Rites, Customs, and Institutions in their Analogy to those of other nations; to which is prefixed a Dissertation on the Origin of the Scottish Language*. This appeared in 2 vols. 4to, at Edinburgh in 1808, followed in 1825 by a *Supplement*, in 2 vols. 4to, in which he was assisted by scholars in all parts of the country. Both appeared together in later editions; in 1879 the first volume of an edition, in which the *Supplement* is incorporated in the body of the work, was published. Abridgments of the Dictionary have been issued in 1818, and in many subsequent years. Among Jamieson's other works may be mentioned *The Use of Sacred History*, 2 vols., 1802; *Hermes Sythicus, or the Radical Affinities of the Greek and Latin Languages to the Gothic*, 1814; and various essays, sermons, and poems. For his *Vindication of the Doctrine of Scripture and of the Primitive Faith concerning the Deity of Christ*, 1795, a reply to Dr Priestley, Jamieson received the degree of D.D. from the college of New Jersey.

JAMNIA (Ἰαμνία or Ἰάμνεια), the Greek form of the Hebrew name Jabneh (Josh. xv. 11) or Jabneh (2 Chron. xxvi. 6), the modern Arabic Feḥa, a city of Palestine, on the border between Dan and Judah, situated 13 miles south of Jaffa, and 4 miles east of the sea-shore. The

modern village stands on an isolated sandy hillock, surrounded by gardens, with olives to the north, and sand-dunes to the west. It contains a small Gothic church, now a mosque. The place belonged to the Philistines in Biblical times, was taken by Judas Maccabeus (2 Mac. xii. 8, 9), and is mentioned by Strabo (xvi. 2) as a very populous village. The population was mainly Jewish (Philo, *Leg. ad Caium*, § 30), and the town is principally famous as having been the seat of the Sanhedrin from 70 to 135 A.D. In 1144 a crusading fortress was built on the hill; it is often mentioned under the name Ibelin. There was also a Jabneel in Lower Galilee (Josh. xix. 33), called later Caphar Yama, the present village *Yemma*, 12 English miles south of Tiberias; and another fortress in Upper Galilee was named Jamnia (Joseph, *Vita*, 37).

JAMRUD, a ruined fort in Peshawar district, Punjab, India, situated in 34° N. lat. and 71° 24' E. long., at the mouth of the Khyber Pass, 1670 feet above sea-level. It was occupied by Hari Singh, Ranjit Singh's commander, in 1836; but in April 1837 Dost Muhammad sent a body of Afghans to attack it. A battle ensued, in which the Sikhs gained a doubtful victory, with the loss of their general, Hari Singh. During the military operations of 1878-79 Jamrud became a place of considerable importance as the frontier outpost on British territory towards Afghanistan.

JAMS AND JELLIES are conserves of the pulp and juice of succulent and juicy fruits prepared by boiling with sugar. They differ from each other only in the fact that jam is a thick pulpy opaque preparation, sometimes of the entire fruit—rind, pulp, and kernel—and sometimes of fruits only partly broken, as in the case of black currant jam, while jellies are pure transparent gelatinous preparations of juices alone. The preparation of these preserves was formerly a purely domestic art; but of recent years manufacturers of very large dimensions have sprung up for the preservation of many of the commoner fruits, as an example of which the marmalade trade may be cited, marmalade being simply a form of jam. The principal fruits commonly used for jam-making are varieties of plums, apricots, cherries, black currants, gooseberries, strawberries, raspberries, mulberries, cranberries, oranges, and quinces; rhubarb stalks are also employed. Jellies have a wider signification than is comprehended in the above definition, which embraces fruit jellies alone, as many jellies have for their basis isinglass and other gelatin-yielding bodies of animal origin, and starches also form with boiling water a kind of jelly. Fruit jellies owe their property of gelatinizing to the presence or development of a gummy principle in their composition, called pectin. Except in its gelatinizing effect pectin is in no way related to gelatin, being indeed a non-nitrogenous body closely allied to cellulose. Pectin is only found in very ripe fruits, but an allied body, pectose, which is abundant in growing and partially ripened fruits, is easily transformed into pectin by the action of heat, and such a transformation takes place in the boiling of the juices of acid unripe fruits. In the preparation of jellies it is essential to obtain the juices as free from all pulp and cloudiness as possible, therefore the less the fruits are squeezed the more transparent will be the resulting jelly. To get the juice to flow freely from hard fruits it is necessary in most cases to heat and in some instances to boil them. The quantity of sugar required for the preservation of jams and jellies varies from two-thirds to equal weight of the fruit or juice, and the boiling should be conducted at a gentle heat as short a time as possible after the addition of the sugar, which by long or violent boiling tends to become syrupy, thus destroying the gelatinizing property. Jellies are principally prepared from red, white, and black currants, gooseberries, grapes, apples,

raspberries, cherries, bilberries, pomegranates, quinces, and various other juicy fruits. Jams and jellies for preservation are poured into earthenware jars; the surface of the preserves is then covered with a disk of paper dipped in brandy, and the jar tightly tied over with membrane or gummed paper, and stored in a cool dry situation. They must be prepared from clean dry fruit, and it is essential that cane and not beet sugar should be used for their preservation. Wet or otherwise damaged fruit, and all fruits preserved with beet sugar, are peculiarly subject to mouldiness, an evil against which some amount of precaution is necessary at all times. The domestic uses of these preparations, and the esteem in which they are held, are known universally. They have a refrigerating and gently laxative influence, and the citrate, malate, or tartrate salts they contain give them a positive value as anti-scorbutics, in addition to the pleasant and refreshing taste and flavour they possess. While these preserves have the same anti-scorbutic efficacy as the respective fresh fruits from which they are prepared, they are free from the tendency to induce choleric disorders which frequently attends the consumption of uncooked fruits, and the sugar with which they are prepared possesses its own proper nutritive value as an article of food.

JAMU, or JUMMOO, a town in Kashmir state, Punjab, India, headquarters of Jamu province, in 32° 43' 52" N. lat. and 74° 54' 14" E. long. on the Tawi, a tributary of the Chenab, among the mountains of the outer Himalayan range. The town and palace stand upon the right bank of the river; the fort overhangs the left shore at an elevation of 150 feet above the stream. The lofty whitened walls of the palace and citadel present a striking appearance from the surrounding country. An adjacent height commands the fortress, rendering it untenable against modern artillery. Extensive and handsome pleasure grounds and ruins of great size in the suburbs attest the former prosperity of the city when it was the seat of a Rajput dynasty of independent rajas, whose dominions extended into the plains and included the modern district of Sialkot. It was afterwards conquered by the Sikhs, and formed part of Ranjit Singh's dominions. For its subsequent acquisition by Ghulab Singh, see KASHMIR. The population is estimated at about 8000.

JANESVILLE, chief town of Rock county, Wisconsin, U.S., was founded in 1836, and received its city charter in 1853. It contains numerous churches and schools, including the State Institute for the blind. Rock river, flowing through the city, supplies water-power for five flour-mills, two woollen factories, and a cotton factory; and the manufactures comprise boots and shoes, carriages and farm machinery, and beer. The population in 1870 was 8789; in 1880, 9018.

JANGIPUR, or JAHANGIRPUR, the chief town of the subdivision of the same name, in Murshidabad district, Bengal, situated on the left bank of the Bhāgirathi, in 24° 28' N. lat. and 88° 6' 45" E. long. The town is said to have derived its name from having been founded by the Mughal emperor Jahāngir. During the early years of British rule it was an important centre of the silk trade, and the site of one of the Company's commercial residences. Jangipur is best known as the toll station for registering all the traffic on the Bhāgirathi. The number of boats registered there annually is about 10,000; the amount of toll is £8000, or about one-third of the total gross revenue derived from the Nadia river. The population in 1872 was 11,361.

JANIN, JULES GABRIEL (1804-1874), a remarkable instance of a certain kind of critic, was born at St Étienne, the great manufacturing town of the department of the Loire, on December 24, 1804, and died at his house near

Paris in June 1874. His father was a lawyer, and he was well educated, first at St Étienne, and then at the famous Collège Louis-le-Grand at Paris. He betook himself to journalism very early, and worked on different papers, the *Figaro*, the *Quotidienne*, &c., until in 1836 he fixed himself as dramatic critic of the *Débats*. Long before this, however, he had made a considerable literary reputation, for which indeed his strange novel *L'Âne Mort et la Femme Guillaumée* (1829) would have sufficed. *La Confession*, which followed, was less remarkable in substance but even more so in style; and *Barnave*, in 1831, sustained the literary reputation of the author, though the violent attacks it contained on the Orleans family did not, when they were taken with his subsequent conduct, increase his reputation for consistency. From the day, however, when Janin became the theatrical critic of the *Débats*, though he continued to write books indefatigably, he was to most Frenchmen a dramatic critic and nothing more. His system was odd enough. He called himself "prince of critics," a self-presented testimonial in which the mixture of irony and vanity (in all senses of the word) which marked all his work may be detected. He was outrageously inconsistent, and judged things from no general point of view whatsoever, though at least latterly his judgment was usually good-natured. But few journalists have ever been masters of a more attractive fashion of saying the first thing that came into their heads, and if he had called himself a prince of journalists he would not have been far wrong. After many years of *feuilleton* writing he collected some of his articles in the work called *Histoire de la littérature dramatique*, which, as may be gathered from what has been said, by no means deserves the title. In 1865 he made his first attempt upon the Academy, but was not successful till five years later. Meanwhile he had not been content with his *feuilletons*, written persistently about all manner of things. No one was more in request with the Paris publishers for prefaces, letterpress to illustrated books, and all the other hackwork which usually engages in France men of letters of a somewhat higher class than those who generally devote themselves to it in England. He travelled (picking up in one of his journeys a curious windfall, a country house at Lucea, which fell to him in a lottery), and wrote accounts of his travels; he wrote numerous tales and novels, for the titles of which we have no space here, and composed many other works, of which by far the best is the oddly entitled *Fin d'un Monde et du Neveu de Rameau*, in which, under the guise of a sequel to Diderot's masterpiece, he showed to considerable advantage his great familiarity with the late 18th century. He married in 1841; his wife had money, and he was always in easy circumstances. In the early part of his career he had many quarrels, notably one with Felix Pyat, but latterly, partly owing to his critical authority and partly to his good temper and hospitality, he was a very popular man with his craft, and at his death his library was said to contain the greatest number of gift and dedication copies of contemporary works that had ever been brought to the hammer. Even in the few years since his death, however, his reputation has rapidly faded, and except with those who know how to look at literature in the largest and most tolerant way, it is not likely to revive. His *Âne Mort* is really a most remarkable book. Written half in parody, half in deliberate pursuance of the romantic ideas, it anticipated by fifty years in point of time and far excelled in point of literary value the recent performances of the naturalist school. Those who wish to know what Janin might have been should read this, *Barnave*, and the *Fin d'un Monde*. But for the most part his work is mere improvisation, and has no elements of vitality in it except a light and vivid style.

JANINA, JANNINA, JOANNINA, or, as the name is frequently written according to its actual Albanian pronunciation, YANINA, a town of European Turkey in southern Albania, or—to retain the ancient designation—Epirus. The position of Janina is strikingly picturesque. At the foot of the grey limestone mass of Mount Mitzekeli (1500 ft.), which forms part of the fine range of hills running north from the Gulf of Arta, there lies the valley (the Hallopiis of antiquity) partly occupied by a lake; and on the slopes of a slight eminence, stretching down to the western shore, stands this town of St John. It has greatly declined from the state of barbaric prosperity which it enjoyed in the beginning of this century, when it was the seat of Ali Pasha, estimated to have from 30,000 to 50,000 inhabitants. The fortress—Demir-Kula or Iron Castle, which like the principal seraglio was built on a promontory jutting down into the lake—is now in ruins. But the town still possesses fourteen mosques, each embosomed by a cluster of trees, and there are also seven churches, two synagogues, a Greek college, a library, and a hospital. As the centre of a vilayet it contains a governor's residence (rebuilt in 1870). Sayades (opposite Corfu) and Arta are the places through which it receives its imports. A considerable activity in trade and industry is maintained by the Greek population, the rich gold and silver embroidery for which the town has long been famous being still one of the notable articles in its bazaar. According to M. Moreau, the French consul (*Bull. de la Soc. de Géogr.*, Paris, 1876), Janina contained 16,230 inhabitants in 1875, of whom 4136 were Mahomets, 8989 Christians, and 3105 Jews. Synvet (*Les Grecs de l'Empire Ottoman*, Constantinople, 1878) reckons the Greeks alone at 14,362 (the island on the lake being included). The vilayet of Janina, previous to the cessions made to Greece in 1881, comprised the sandjaks of Janina, Argyrocastro, Berat (Avlona), Preveza, and Thessaly, and the sandjak contains the districts of Janina (town and country), Aidwat, Prevena, Cognizta, Metzovo, and Philates. The lake (perhaps to be identified with the Pambotus of antiquity) is 6 miles long, and has an extreme breadth of 3 miles. In time of flood it is united with the smaller lake of Labchistas, which lies to the north. According to Guido Cora's investigations in 1878, the greatest depth does not exceed 32 feet. There are no affluents of any considerable size, and the only outlets are underground passages or *katavothra* extending for many miles through the calcareous rocks.

The theory supported by Leake (*Northern Greece*) that the citadel of Janina is to be identified with Dodona, is now generally surrendered in favour of the claims of a more southern site. As Anna Comnena, in describing the capture of the town (*ἡ Ἰωάννινα*) by Bohemond in 1082, speaks of the walls as being dilapidated, it may be supposed that the place existed before the 11th century. It is mentioned from time to time in the Byzantine annals, and on the establishment of the lordship of Epirus by Michael Angelus Comnenus Duca, it became his capital. During the 14th century it was frequently attacked by the Albanians; but it was still in possession of the successors of Michael when the forces of Sultan Amurath appeared before it in 1430 (*cf.* Hahn, *Alban. Studien*, pp. 319–322). Since 1431 it has continued under Turkish rule. In modern times it became famous as the seat of the tyrant Ali (1788–1822). See ALI PASHA, vol. i. p. 573.

Descriptions of Janina will be found in Holland's *Travels*, 1815; Hughes, *Travels in Greece*, &c., 1830; Tozer, *The Highlands of Turkey*, 1869. See also Major K. Stewart, "On the Phys. Geogr. of Epirus," in *Journ. Roy. Geogr. Soc.*, 1869.

JANIZARIES, or JANISSARIES (Turkish, *Yeni*, new, and *askari*, soldier). See ARMY, vol. ii. p. 617.

JANSEN [JANSENUS], CORNELIUS (1585–1638), bishop of Ypres, and the author of the celebrated *Augustinus*, was born, of humble Catholic parentage, at Acquoy or Ackooi, a small village near Leerdam, and 7 miles to the north-east of Gorcum, Holland, on 28th October 1585. After completing his preliminary studies at Leerdam and

Utrecht, he in 1602 proceeded to Louvain, where he studied for a short time at the Jesuit college; but afterwards, becoming dissatisfied with the doctrines there taught on the hotly discussed questions of free will and grace, he transferred himself to the college of Adrian VI, where he came under the influence of a pious and learned teacher, Jacobus Jansonijs by name, who is described as having been an ardent disciple of Augustine and a follower of Michael Bajus (see BAJUS), whose doctrinal views had been condemned by Pius V. and Gregory XIII. At the same time he formed an acquaintance, which grew into intimate friendship, with the like-minded Vergerius (see DU VERGIER DE HAURANNE), who afterwards became abbé of St Cyran. Having graduated in philosophy at Louvain in 1604, Jansen went to Paris for the benefit of his health, which had suffered from the arduous with which he had pursued his studies in theology with a view to a doctor's degree. Here he remained for some time, supporting himself by teaching; afterwards he accompanied Vergerius to Bayonne, the native place of the latter, where they spent several years together, Du Vergier ultimately becoming canon of the cathedral, and Jansen head of the episcopal college. Every available moment of their time was devoted to the study of the fathers and especially of Augustine. In 1617 Jansen returned to Louvain, whither he had been urgently summoned by Jansonijs, who greatly desired to have there a man of real learning and energy who should be able to counteract the growing influence of the Jesuits. On his arrival he undertook the principal charge of the newly founded college of St Pulcheria, but this appointment he did not long retain, feeling, it is said, a growing aversion to philosophical pursuits, and desiring to possess the utmost possible leisure that he might devote himself wholly to theology. In 1619 he became doctor in that faculty. The reputation which he even then enjoyed as a theologian is well indicated by the fact that he was formally requested by the papal nuncio to undertake a reply to the recently published *De Republica Ecclesiastica* of Marco Antonio de Dominis, archbishop of Spalato, while the direction in which his sympathies so strongly ran was at the same time not obscurely indicated by the fact that he excused himself from complying with the invitation. In 1624, and again in 1626, he undertook a journey to Spain, on behalf of the university, with reference to certain encroachments of the Jesuits on its exclusive privileges; in the second of these missions he was successful, the members of the Society of Jesus in the Low Countries being ordered to continue to observe the restrictions which had been laid upon them in 1612. In 1630 Jansen was made regius professor of Biblical exegesis; and in the same year, in connexion with the recent introduction of the Reformed religion into Bois-le-Duc, he entered upon a controversy about Protestantism with the learned Voetius, the issue of which conclusively showed that he had grievously underestimated his adversary's strength. In 1635 he published a pseudonymous work entitled *Alexandri Patrii Armacani, Theologi, Mors Gallicæ, seu de justitia armorum et fœderum Regis Gallia libri duo*, embodying an argument and remonstrance against the policy of France in its recent alliance with the Protestant Gustavus Adolphus. For this supposed service to Spain he was rewarded in 1636 with the bishopric of Ypres. He was preparing for the press his great work upon St Augustine, which had occupied him for twenty-two years, when he was cut off by sudden illness on May 6, 1638. By his last will the MSS. of this work were bequeathed to his chaplain Lamæus, and his friends Fromondus and Calenus, to be published "quam fidelissime"; at the same time he declared his obedience to the Roman See should any alterations be desired.

The title of the first work of Jansen against Voetius was *Alexipharmacum*; it called forth *Notæ in Alexipharmacum*, to which he replied in his *Spongia*, 1630. On the publication of Voet's *Desperata Causa Papatus* in 1635, Jansen handed over the further management of the controversy to Fromond, whose *Orisels* (1636) was met with Schook's *Desperatissima Causa Papatus*. Among other works of Jansen are mentioned *Tetractichus sive Commentarius in IV. Evangelia* and *Pentactichus sive Commentarius in IV. libros Moysis*. See Leydecker, *Notæ in Jansenium* (Utrecht, 1695).

JANSENISM. The *Augustinus*, seu doctrina S. Augustini de humana naturæ sanitate, agnitione, et medicina, adversus Pelagianos et Massilianos of Jansen, published in 1640, is a work in three folio volumes. The first of these is devoted to an historical exposition of the Pelagian and Massilian (semi-Pelagian) heresies; the second sets forth the Augustinian doctrine as to the state of innocence and the fallen state; while the third treats, in ten books, of the grace of Christ the Saviour. The sting of the work is to be found mainly in the epilogue, which draws a parallel, in various particulars, between the errors of the Massilians and those "recentiorum quorundam," the Jesuits being referred to. Its bearing upon previous controversy had become well known long before its publication; and while it was still in the press at Louvain strenuous efforts were made by the Jesuit party there, through the papal interuincio, to induce the university to prohibit its appearance, on the ground that various popes had forbidden that anything should be written on the delicate subject of the grace of God without express papal permission. These efforts not only failed to attain their immediate object, but had the effect of greatly stimulating public interest in the *Augustinus* when it appeared; and as soon as it arrived in Paris it was forthwith reprinted with the written approval of six of the most eminent doctors of the faculty of theology there. In 1641 the reading of the book, thus flung into the arena of theological controversy and ecclesiastical intrigue, was prohibited by the Inquisition; no opinion, however, was pronounced as to its doctrine, and the counter-agitation of the Jesuits in relation to it was condemned as inconsistent with the spirit of the papal injunctions already referred to. But the dispute did not admit of being thus quietly repressed, and accordingly, in 1643, the bull *In eminenti* of Urban VIII. was published, renewing and confirming the constitutions of Pius V. and Gregory XIII., as well as the decrees of Paul V. and of himself, and forbidding the reading of the *Augustinus*, not only on the ground that its appearance had not been sanctioned, but also because it contained various errors. This bull encountered a very general resistance in the Netherlands, on the part both of the university of Louvain and of the clergy at large; but ultimately, through the intervention of the Spanish Government, it was accepted (1651), subscription to it, however, not being insisted on. At the Sorbonne also it was badly received, and the dissatisfaction it had caused in France found expression in the *Apology for Jansen* by Arnauld in 1644, which was followed by a second in 1645. The strength of these *Apologies* lying largely in the fact that no particular doctrines of Jansonijs had been condemned as heretical in the papal bull, the Jesuits, inflexible in their determination to secure the effectual condemnation of a book which told so powerfully against their distinctive theology, immediately set about obviating this weakness in their attack, and various attempts were accordingly made to formulate, in the shape of definite propositions, the heresy which they believed to exist. In 1646 eight such propositions were stated by Habort, "theologal" of Notre Dame, to be submitted to the judgment of the pope; subsequent successive adjustments reduced them in 1650 to five, which in the name of eighty-five French prelates were forwarded for condemnation to Rome. They were as follows:—(1) There are some com-

mandments of God which just men, although willing and anxious to obey them, are unable with the strength they have to fulfil, and the grace by which they might fulfil them is also wanting to them; (2) in the state of fallen nature inward grace is never resisted; (3) in the fallen state merit and demerit do not depend on a liberty which excludes necessity, but on a liberty which excludes constraint; (4) the semi-Pelagians admitted the necessity of an inward preventent grace for the performance of each particular act, and also for the first act of faith, and yet were heretical inasmuch as they maintained that this grace was of such a nature that the will of man was able either to resist or obey it; (5) it is semi-Pelagian to say that Christ died or shed His blood for all men without exception. The pope long resisted the pressure with which he was urged to pronounce upon these theses in an adverse sense; it is easy to understand why he should steadily have inclined to the old and simple expedient of enjoining silence upon disputants on either side of the controversy; for, if the Jansenist propositions had a Calvinistic ring about them, there was no denying that they also admitted of an Augustinian and therefore presumably of an orthodox interpretation. At length, however (May 1653), Innocent X. in the bull entitled *Cum occasione impressionis libri* pronounced the first four points heretical, while the fifth was declared to be false, with the addition that, if it was intended to convey the meaning that Christ died only for the elect, it was impious and blasphemous as well as heretical. This bull was accepted and promulgated in France and the Netherlands with the royal consent, and the victory of the Jesuits was quite decisive. The Jansenists still seemed indeed to have one line of defence left to them; they expressed themselves willing to condemn the five propositions in their heretical sense, but not as propositions of Jansen. This position, however, ceased to be tenable when, in September 1654, the pope declared that the propositions were found in the *Augustinus* of Jansen, and that their condemnation, as doctrines of Jansen, was imperative. Arnauld nevertheless, with whom were the other Port Royalists (see Port Royal), refused to yield. In the second of his "Letters" to a person of quality (the Duc de Luynes), he argued that, while the Holy See had authority to decide with respect to doctrine, and every good Catholic owed submission not only "de respect" but also "de croyance" to such determinations, yet it might be mistaken on the question of "fact" whether a given book contained certain statements or not. The commotion which ensued called forth in January 1656 the first and second of the *Provincial Letters* of Pascal, but these brilliant controversial efforts did not suffice to avert the expulsion of Arnauld from the Sorbonne (31st January 1656). In the following year the theological faculty of Paris drew up a formula avowing full acceptance of the bull of Alexander VII., in which it had been specifically declared that the five propositions contained *de facto* Jansenist error. This document, sanctioned by the king in 1661, the clergy and all inmates of conventual establishments were called upon to sign, all who refused being treated as heretics. The leading Jansenists were compelled to go into hiding, and the nuns of Port Royal were subjected to imprisonment and other harsh treatment. Many of the clergy, with whom were four bishops, persisted in their refusal to sign, until at last, in September 1668, the compromise called the "peace of Clement IX." was arranged, in virtue of which, by the omission of a single word ("purement"), assent was no longer required to the proposition that Jansen had actually taught the five propositions in a "purely" heretical sense. The respite from controversy and persecution thus secured was not of long duration. The Jesuits were quite unable to make a moderate use of the power of

which they were now so fully ascertained. Arnauld was driven into Holland, where he found congenial society and apt disciples in Catholic circles, and particularly at Delft. In 1705 a bull was obtained from Clement XI. in which the heretical character of Jansen's teaching, in Jansen's sense, was authoritatively asserted, and thus the peace of Clement IX. was destroyed. This measure ultimately led, in 1710, not only to the breaking up of the establishment at Port Royal, but also to the destruction of the very buildings. Louis XIV. was further induced to approach the pope for a decision upon the doctrine contained in Quesnel's *Réflexions morales sur le Nouveau Testament*, a work of practical edification, which, published in 1693-94, had attained great popularity in France, and been recommended by many bishops, including the cardinal-archbishop of Paris, De Noailles, but was suspected of latent Jansenism. In this way the bull *Unigenitus* (1713) was obtained, in which no fewer than one hundred and one propositions taken from Quesnel were condemned as erroneous and heretical. The result was to divide the French Church into two parties, the acceptants or constitutionists, and the appellants or anti-constitutionists; but again the Jesuit influence was able to secure the ultimate defeat (1728) of Noailles and his party, and in 1730 the bull was formally registered as the law of the kingdom. Oppressed Jansenism now changed its method of defence. Reports of miracles wrought in the cemetery of St Medard, Paris, at the grave of François de Paris, a young Jansenist deacon who had died in 1727, began to be circulated; and the spot became a pilgrimage centre daily visited by thousands of fanatics. It was in vain that the place was walled up (giving occasion to the witty epigram "De par le Roi, défense à Dieu De faire miracle en ce lieu"); portions of earth which had been taken from the grave were equally efficacious, and the number of convulsory prophets of coming ruin to the state and church continued to increase. Repression by imprisonment and other violent means was vainly attempted; but as the novelty of the movement wore off the excitement gradually died down; and after the middle of the 18th century, the appellants or Jansenists of France ceased to make any figure in the public view. Their cause may be said to have been buried in the grave of François de Paris. In Holland the history of the disciples of Jansen followed a different course. The Catholics there, though steadfastly refusing to be called Jansenists, became deeply imbued with his views; at their head was the archbishop of Utrecht, who on this account was deprived by the pope in 1704. In 1723 the chapter there secured the consecration of a successor (which the pope had steadily refused) by an appellant bishop; in similar circumstances bishops were consecrated at Haarlem and Deventer also, and the separatist church thus constituted still subsists, though its members in 1869 were under 6000. Its adherents claim to be disciples of St Augustine and members of the Catholic Church, of which they recognize the pope as the visible head, although they deny his infallibility.

For the earlier stages of the history of Jansenism, see Leydecker, *Historia Jansenismi*, 1695, and the anonymous work of Gerberon, *Histoire Générale du Jansenisme*, 1700. Modern authorities are Sainte-Beuve, *Port-Royal*, 1840-48, 3d ed. 1887; Reuchlin, *Geschichte v. Port-Royal*, 1899-44; and Bouvier, *Etude critique sur le jansenisme*, 1864.

JANSEN, or JANSEN (sometimes JOHNSON), CORNELIUS (1590-1665), painter, was born at Amsterdam about 1590. About 1618 he went to England, where he was patronized by James I. and the court. Under Charles I. he continued to paint the numerous portraits which adorn very many of the mansions and collections of England; but in 1648, after the outbreak of civil war, he retired to Holland, where his brush was busy till his death in 1665. Jansen's pictures, chiefly portraits, are distinguished by clear

colouring, delicate touch, good taste, and careful finish. He generally painted upon panel, and often worked on a small scale, sometimes producing replicas of his larger works. A characteristic of his style is the very dark background, which throws the carnations of his portraits into rounded relief.

JANSENS, or JANSENS, VAN NUYSSEN, ABRAHAM (1567-1632), painter, was born at Antwerp in 1567. He studied under Jan Snellinck, was a "master" in 1602, and in 1607 was dean of the master-painters. Till the appearance of Rubens he was considered perhaps the best historical painter of his time. The styles of the two artists are not unlike. In correctness of drawing Janssens excelled his great contemporary; in bold composition and in treatment of the nude he equalled him; but in faculty of colour and in general freedom of disposition and touch he fell far short. A master of chiaroscuro, he gratified his taste for strong contrasts of light and shade in his torch-lights and similar effects. Good examples of this master are to be seen in the Antwerp museum and the Vienna gallery. The stories of his jealousy of Rubens and of his dissolute life are quite unfounded. He died at Antwerp in 1632.

JANSENS, or JANSENS, VICTOR HONORIUS (1664-1739), painter, was born at Brussels in 1664. After seven years in the studio of an obscure painter named Volders, he spent four years in the household of the duke of Holstein. The next eleven years Janssens passed in Rome, where he took eager advantage of all the aids to artistic study, and formed an intimacy with Tempesta, in whose landscapes he frequently inserted figures. Rising into popularity, he painted a large number of cabinet historical scenes; but, on his return to Brussels, the claims of his increasing family restricted him almost entirely to the larger and more lucrative size of picture, of which very many of the churches and palaces of the Netherlands contain examples. In 1718 Janssens was invited to Vienna, where he stayed three years, and was made painter to the emperor. The statement that he visited England is based only upon the fact that certain fashionable interiors of the time in that country have been attributed to him. Janssens's colouring was good, his touch delicate, and his taste refined. He died in 1739.

JANUARIUS, ST., or SAN GENARO, the patron saint of Naples, according to the Roman Breviary, was bishop of Benevento, and flourished towards the close of the 3d century after Christ. On the outbreak of the persecution by Diocletian and Maximian, he was taken to Nola and brought before Timotheus the governor of Campania on account of his profession of the Christian religion. After he had withstood various assaults upon his constancy, he was at last sentenced to be cast into the fiery furnace, through which he passed wholly unharmed. On the following day, along with a number of fellow martyrs, he was exposed to the fury of wild beasts, which, however, contrary to their nature, laid themselves down in tame submission at his feet. Timotheus, again pronouncing sentence of death, was struck with blindness, but immediately healed by the powerful intercession of the saint, a miracle which converted nearly five thousand men on the spot. The ungrateful judge, only roused to further fury by these occurrences, caused the execution of Januarius by the sword to be forthwith carried out. The body was ultimately removed by the inhabitants of Naples to that city, where the relic became very famous for its miracles, especially in counteracting the more dangerous eruptions of Vesuvius. His clotted blood, preserved in a glass phial, even to this day is wont to liquefy and bubble up as if but recently shed whenever it is placed within sight of the martyr's head. So far the Breviary. This liquefaction of the blood, which is brought about at least twice a year, on

May 1 and on September 19, the day assigned to this saint in the Roman calendar, is a miracle the recurrence of which is observed by believing Neapolitans on each occasion with various festivities extending over a whole week. The Januarius of Cordoba, to whom along with Saints Faustus and Martialis, a special local office is assigned in the Spanish Breviary, has a story which bears a general resemblance to the preceding; he also is stated to have suffered under Diocletian and Maximian, but the scene of his martyrdom was Cordoba. His day is October 13, and the invention of his remains is commemorated on November 26. The number of minor saints of this name is very considerable; the cognomen appears to have been somewhat common.

JANUARY, the first month in our present calendar, consists of thirty-one days. It was, however, not the first month of the year in the British Isles till the reformation of the calendar was made in 1752, when the legislature, by an Act passed in the preceding year, altered the mode of reckoning time from the Julian to the Gregorian style. At this period it was directed that the legal year which had commenced in some parts of the country on March 25, and in others with January, should thenceforward be appointed to begin always on the 1st of January. January derives its name from the god Janus, who had two faces looking in opposite directions, and Macrobius states that it was dedicated to him because, from its situation, it might be considered to be retrospective to the past and prospective to the opening year. The consecration of the month took place by an offering of meal, salt, frankincense, and wine, each of which was new. On the first of this month all enmities were suspended, presents were exchanged, consuls installed, &c. The principal festivals now observed in this month are the following:—Jan. 1, New Year's Day, Feast of the Circumcision; Jan. 6, Epiphany, Twelfth-Day; and Jan. 25, Conversion of St Paul. See CALENDAR.

JANUS, a Roman god, after whom the month of January was named. His temple was open in war and closed during peace, and the ceremony of closing it for the third time in Roman history was performed by Augustus, 29 B.C., when he had established his authority over the whole empire. This temple, which was in reality only an arch or gateway, facing east and west, stood near the Forum. When most of the Roman gods were merged in Greek divinities, Janus retained his native character. Amid the obscurity that hangs over the genuine Roman religion, it is difficult to determine the nature and origin of Janus. It is probable that he was the chief deity of one of the races which were united in the Roman people, and that his worship was maintained beside, but overshadowed by, that of Jupiter, the chief deity of another of these races. The hill of Janus, Janiculum, lay on the north or Etruscan side of the Tiber, and was doubtless the seat of his original worshippers. An Etruscan origin is thus suggested, and most authorities accept this hypothesis. The Romans themselves thought that Janus and the feminine Jana, i.e., Diana, were sun and moon; and the names are commonly assimilated to the Greek *Ζην*, i.e., *Δία*. If, however, Janus was an Etruscan god, belonging to the Etruscan element in Rome, he must then be identified with the Etruscan deity *Ani*, the form of the name being prompted by the word *janua*, as Janus is the god of opening and beginning. The god is represented with two faces looking in opposite directions, a design found on the coins of the Etruscan Volaterra, but possibly due to the influence of Greek art.

See Preller, *Röm. Myth.*; Gerhard, *Griech. Myth.*, ii.; Hartung, *Relig. der Römer*; Schweigger, *Röm. Geschichte*, &c.; Doeck, *Templum von Piacenza*. Mommsen in his history proposes a different view.

Plate
IX

THE empire of Japan consists of a long chain of islands separated from the eastern coast of Asia by the Sea of Japan and Okhotsk, and extending from 24° to 50° 40' N. lat., and from 124° to 156° 38' E. long. It commences with the Kurile Islands and descends in a south-westerly direction to the Loochoo group, to which the Japanese Government reasserted their claim in 1875. The southern portion of the island of Saghalien was ceded to Russia in exchange for the Kuriles. The whole empire is called by the natives *Dai Nippon*, or "Great Japan"; but *Nippon* or *Nihon* is often employed alone. *Nippon* means literally "sun's origin," i.e., the land over which the sun first rises, and thus denotes the position the empire occupies in the extreme East. The principal islands may be enumerated as follows:—

1. The main island, which does not bear any special name. In many of the older geographical works it is stated that *Nippon* is the distinctive appellation of this one island, but by the Japanese themselves the name is applied only to the whole country.
2. *Kinsiu* (lit., "the nine provinces").
3. *Shikoku* (lit., "the four provinces").
4. *Yezo*.
5. *Sado*.
6. *Tsushima*.
7. *Hirado* (often wrongly written *Firado*).
8. *Awaji*.
9. *Oshima* ("Vries Island") and the chain adjacent to it, terminating with *Hachijō* (misspelt on charts *Fatisio*).
10. *Iki*, with several smaller isles.
11. The *Ōki* group.
12. The *Ōgō* group.
13. The *Bonin* group.
14. The *Riukiu* (Loochoo) group.
15. The *Kurile* group (*Chijima*; lit., "the thousand islands").

Owing to the lack of reliable surveys, it is exceedingly difficult to form a correct estimate of the area of the Japanese empire. A few years ago the Government instituted surveying operations under the direction of skilled foreign engineers, and an ordnance map of the city of *Tōkiō* has already been prepared and published; but any correct calculation of the size of the whole country can hardly be obtained for some years to come. In a work on general geography published a few years ago by the Education Department at *Tōkiō*, the area of Japan is stated to be 24,780 square *ri*, which measurement, taking the linear *ri* as equal to 2·45 English miles, gives a total of about 148,742 miles, or nearly one-fourth more than the area of the United Kingdom. This estimate, however, is founded on maps which are far from correct.¹

The old division of Japan into provinces was made by the emperor *Seimu* (181–190 A.D.), in whose time the jurisdiction of the sovereign did not extend further north than to a boundary line running from the Bay of *Sendai*, on the east coast of the main island, to near the present treaty port of *Niigata* on the west coast. The northern

portion beyond this line was then occupied by barbarous tribes, of whom the *Ainos* (still to be found in *Yezo*) are probably the remaining descendants. The whole country was then divided into thirty-two provinces. In the 3d century the empress *Jingō*, on her return from her victorious expedition against *Corea*, portioned out the empire into five home provinces and seven circuits, in imitation of the *Corean* system. By the emperor *Mommu* (696–707) some of the provinces were subdivided so as to increase the whole number to sixty-six, and the boundaries then fixed by him were resurveyed in the reign of the emperor *Shōmu* (733–756). The old division is as follows:—

1. The *Go-kinaid*, or "five home provinces," i.e., those lying immediately around *Kiōto*, the capital, viz.—

<i>Yamashiro</i> ² also called <i>Jōshiu</i> .	<i>Idzumi</i> , also called <i>Senshū</i> .
<i>Yamato</i> , "Washin."	<i>Setsu</i> , "Sesshiu."
<i>Kawachi</i> , "Kashiu."	

II. The seven circuits, as follows:—

1. The *Tōkaidō*, or "eastern-sea circuit," which comprises fifteen provinces, viz.—

<i>Iga</i>	<i>Ishiu</i> .	<i>Kai</i>	or <i>Kōshū</i> .
<i>Isa</i>	" <i>Senshū</i> ."	<i>Sagami</i>	" <i>Shōshū</i> ."
<i>Shima</i>	" <i>Shūshū</i> ."	<i>Musashi</i>	" <i>Bushū</i> ."
<i>Ōwari</i>	" <i>Bishū</i> ."	<i>Awa</i>	" <i>Bhōshū</i> ."
<i>Mikawa</i>	" <i>Sanshū</i> ."	<i>Kadzuwa</i>	" <i>Sōshū</i> ."
<i>Tōtōmi</i>	" <i>Enshū</i> ."	<i>Shinden</i>	" <i>Sōshū</i> ."
<i>Suruga</i>	" <i>Sunshū</i> ."	<i>Htachi</i>	" <i>Jōshū</i> ."
<i>Idzu</i>	" <i>Danshū</i> ."		

2. The *Tōsandō*, or "eastern-mountain circuit," which comprises eight provinces, viz.—

<i>Ōmi</i>	or <i>Ōshū</i> .	<i>Kōdzuké</i>	or <i>Jōshū</i> .
<i>Mino</i>	" <i>Nōshū</i> ."	<i>Shimotsuké</i>	" <i>Yashū</i> ."
<i>Hida</i>	" <i>Hishū</i> ."	<i>Mutsu</i>	" <i>Ōshū</i> ."
<i>Shinano</i>	" <i>Shūshū</i> ."	<i>Dewa</i>	" <i>Ushū</i> ."

3. The *Hokurikudō*, or "northern-lake circuit," which comprises seven provinces, viz.—

<i>Wakasa</i>	or <i>Jakushū</i> .	<i>Echū</i>	or <i>Eshū</i> .
<i>Echizen</i>	" <i>Eshū</i> ."	<i>Echigo</i>	" <i>Eshū</i> ."
<i>Kaga</i>	" <i>Kashū</i> ."	<i>Sado</i> (island),	" <i>Sashū</i> ."
<i>Noto</i>	" <i>Nōshū</i> ."		

4. The *Sansūdō*, or "mountain-back circuit," which comprises eight provinces, viz.—

<i>Tambei</i>	or <i>Tanshū</i> .	<i>Fukū</i>	or <i>Hakushū</i> .
<i>Tango</i>	" <i>Tanshū</i> ."	<i>Izumo</i>	" <i>Ushū</i> ."
<i>Tajima</i>	" <i>Tanshū</i> ."	<i>Iwami</i>	" <i>Sekishū</i> ."
<i>Iwaba</i>	" <i>Ushū</i> ."	<i>Ōki</i> (group of islands).	

5. The *Sansūdō*, or "mountain-front circuit," which comprises eight provinces, viz.—

<i>Harima</i>	or <i>Danshū</i> .	<i>Bingo</i>	or <i>Bishū</i> .
<i>Mimasaka</i>	" <i>Sakushū</i> ."	<i>Aki</i>	" <i>Geishū</i> ."
<i>Bizen</i>	" <i>Bishū</i> ."	<i>Suō</i>	" <i>Bōshū</i> ."
<i>Bitchū</i>	" <i>Bishū</i> ."	<i>Negato</i>	" <i>Chōshū</i> ."

6. The *Nankaidō*, or "southern-sea circuit," which comprises six provinces, viz.—

<i>Kii</i>	or <i>Kishū</i> .	<i>Sauki</i>	or <i>Sanshū</i> .
<i>Awaji</i> (island),	" <i>Tanshū</i> ."	<i>Iyo</i>	" <i>Yoshū</i> ."
<i>Awa</i>	" <i>Ashū</i> ."	<i>Tosa</i>	" <i>Toshū</i> ."

7. The *Saikūdō*, or "western-sea circuit," which comprises nine provinces, viz.—

<i>Chikuzen</i>	or <i>Chikushū</i> .	<i>Higo</i>	or <i>Hishū</i> .
<i>Chikugo</i>	" <i>Chikushū</i> ."	<i>Hyūga</i>	" <i>Nishū</i> ."
<i>Bizen</i>	" <i>Hōshū</i> ."	<i>Ōsumi</i>	" <i>Gishū</i> ."
<i>Bungo</i>	" <i>Hishū</i> ."	<i>Setsuma</i>	" <i>Sasshū</i> ."
<i>Hizen</i>	" <i>Hishū</i> ."		

III. The two islands, viz.—

1. *Tsushima* or *Toshū*.
2. *Iki*, "Ishū."

Upon comparing the above list with a map of Japan it

¹ The names given in italics are those more commonly used. Those in the first column are generally of pure native derivation; those in the second column are composed of the Chinese word *shū*, a "province," added to the Chinese pronunciation of one of the characters of which the native name is written. In a few cases both names are used.

will be seen that the main island contains the *Go-kinaï*, *Tokaidô*, *Tôsandô*, *Hokurikudô*, *Sanindô*, *Sanyôdô*, and one province (*Kishin*) of the *Nankaidô*. Omitting also the island of Awaji, the remaining provinces of the *Nankaidô* give the name *Shikoku* ("the four provinces") to the island in which they lie; while the *Saikaidô* coincides exactly with the large island of *Kiusiu* ("the nine provinces"). This name *Kiusiu* must not be confounded with that of the one province of *Kishin* on the main island.

In 1868, when the rebellious nobles of Ôshin and Dôwa, in the *Tôsandô*, had submitted to the *mekado* (the emperor), those two provinces were subdivided, Dôwa into Uzen and Ugo, and Ôshin into Iwaki, Iwashiro, Rikuzen, Rikuchiu and Michinoku (sometimes also called Mutsu). This increased the old number of provinces from sixty-six to seventy-one. At the same time there was created a new circuit, called the *Hokkaidô*, or "northern-sea circuit," which comprised the eleven provinces into which the large island of Yezo was then divided (viz., Oshima, Shiribeshi, Ishikari, Teshimo, Kitami, Iur, Hitaka, Tokachi, Kushiro, and Nemuro) and the Kurile Islands (*Chijima*).

Another division of the old sixty-six provinces was made by taking as a central point the ancient barrier of Osaka on the frontier of Ômi and Yamashiro,—the region lying on the east, which consisted of thirty-three provinces, being called the *Kwantô*, or "east of the barrier," the remaining thirty-three provinces on the west being styled *Kuansai*, or "west of the barrier." At the present time, however, the term *Kwantô* is only applied to the eight provinces of Musashi, Sagami, Kôdzuké, Shimotsuké, Kadzusa, Shimôsa, Awa, and Hitachi,—all lying immediately to the east of the old barrier of Hakoné, in Sagami.

Chiû-goku, or "central provinces," is a name in common use for the *Sanindô* and *Sanyôdô* taken together. *Saikoku*, or "western provinces," is another name for *Kiusiu*, which in books again is frequently called *Chinsei*.

Each province (*ken*) is divided into what may be termed departments (*kôri*). The latter vary in number according to the size of the province. In the old system there were altogether six hundred and twenty-nine departments, but the addition of the *Hokkaidô* has raised the number to considerably over seven hundred.

For purposes of administration the whole of the empire except the *Hokkaidô* was again divided in 1872 into three cities (*fu*) and seventy-two prefectures (*ken*). The three cities are Yedo, Ôzaka, and Kiôto. In 1869 Yedo also received the name of Tôkiô, or "eastern capital," as opposed to Saikô (the new name for Kiôto), or "western capital." This was in consequence of the removal of the emperor's court from his old capital to Yedo. It may, however, be here remarked that, whilst the Japanese invariably speak of Tôkiô *Fu*, "the city of Tôkiô," they use the name *Kiôto Fu*, "the city of Kiôto," and not, as might have been supposed, *Saikô Fu*. The limits of the prefectures (*ken*) were irrespective of the boundaries of the provinces. There were originally seventy-two, but a gradual process of amalgamation has considerably reduced the list; and in August 1876 a Government notification fixed the prefectures at only thirty-five, the names of which are given in the following table:—

The Home Provinces (14)—Sakai, Hiôgo (part)—apart from the two cities of Osaka and Kiôto.
Tôkaidô (8)—Ibaraki, Chiba, Satsuma, Kanagawa, Yamanshi, Shidzuoce, Aichi, Miyé—apart from the city of Tôkô.
Tôzendô (11)—Awomori, Iwaki, Miyagi, Fukushima, Akita, Yamagata, Tohigi, Gunma, Nagano, Gifu, Shiga.
Hokurikudô (2)—Nigata, Ishikawa.
Saundô (1)—Shimane.
Sanyôdô (34)—Hiôgo (part), Okayama, Hiroshima, Yamaguchi.
Nankaidô (3)—Wakayama, Ehime, Kochi.
Saikaidô (8)—Ôita, Fukuoka, Kumamoto, Nagasaki, Kagoshima.

From the above list it may be noted that in many instances a single *ken* now contains several provinces or portions of different provinces. In 1878-9 a separate prefecture (called the Okinawa *ken*) was created, including the Riukiu (Loochoo) group. Until that time Riukiu was governed by a king of its own, but being in fear of its powerful neighbours, China and Japan, it had for many years sent tribute to both. A question of double allegiance thus arose, which was solved by Japan asserting its sovereignty; the king received the title of noble of Japan, and the Okinawa *ken* was established. Whether this action on the part of the Japanese Government may not embroil them with China is a point not yet definitely settled.

The total number of islands in the Japanese group, smaller exclusive of the four main ones, is stated to be over three islands thousand. Many of these are mere barren rocks, uninhabited and uncultivated. Others, again, are of considerable size and exceedingly fertile, particularly the countless islets in the *Suwo Nada*, commonly known to Europeans under the name of the "Inland Sea," lying between the main island on the north and the islands of Shikoku and Kiushiu on the south. The whole coast-line, too, is dotted with islands and rocks of all sizes. Ôshima, also called Vries Island, at the mouth of the Bay of Yedo, is one of considerable importance. It has many inhabitants, and its volcanic soil is fairly productive. It is the most northerly of a chain which extends as far south as the 27th degree of north latitude. The Bonin group, termed by the Japanese the Ogasawara Islands, lies far out at sea, to the south of the entrance of Yedo Bay; it consists of two large islands, separated from each other by 50 miles of sea, and a host of islets. The Japanese Government reasserted their sovereignty over the Bonins in 1878. The Kurile Islands are merely a chain of barren rocks, and the few inhabitants are chiefly occupied in the fisheries and in hunting the sea-otter. Due south from the province of Satsuma lie several minor groups, terminating with the Rinkin Islands. The Gotô group (lit. "the five islands") extends in a westerly direction from the province of Hizen, in Kiushiu, to which it belongs.

Coast-line.—The bays along the coast are often of considerable size. The Japanese, strange to say, have no names for either their bays or their straits, the appellations found on maps and charts having been given by European navigators. Yedo Bay is perhaps the best known to foreigners, but Sendai Bay (on the east coast) and that running up to the north of the island of Awaji, and commonly called Ôzaka Bay, are also famous. Owari Bay, in the province of that name, is of considerable size. The Bay of Kagoshima, in the province of Satsuma, is long and narrow; it is well known to foreigners as having been the scene in 1863 of an attack on Kagoshima (the castle-town of the lord of Satsuma) by a British squadron. The entire coast-line teems with smaller bays and harbours, in many of which good anchorage can be found. An English man-of-war, the "Sylvia," has for several years been employed as a surveying vessel to obtain soundings of the principal inlets and draw up charts of the coast.

The straits best known to foreigners are the Straits Straits of Tsuguru (often misalled Sangur in maps), which separate Yezo from the northern portion of the main island; the Straits of Akashi and of Idzumi, near the island of Awaji, at the eastern entrance of the "Inland Sea"; and the Straits of Shimonoski, at the extreme western end of that sea, separating the main island from Kiushiu. The attack on Shimonoski in 1864 by an allied squadron of English, French, Dutch, and American vessels, in retaliation for injuries inflicted upon foreign shipping passing

through the straits by the batteries erected by the lord of Chōshū (in which province Shimonoseki is situated) is a matter of historical note. The current in these straits is so swift that vessels have difficulty in stemming it unless under steam.

Capes.

It will suffice to name a few of the almost countless promontories and capes along the coast. On the extreme north of the main island we have Rihū-zaki and Fujishizaki in the Tsugaru Straits. Innobō no saki lies on the east coast just below the mouth of the Tōnōgawa. Su-saki in Awa and Miura no misaki (called by foreigners Cape Sagami) mark the entrance to the Bay of Yedo. Cape Idzu is in the province of that name, and at the southern extremity of the province of Kishū are Idzumo-zaki and Shiwo no misaki. Muroto-zaki and Ashizuri no misaki are the chief promontories on the south coast of the island of Shikoku, both being situated in the province of Tosa. Tsutsui-zaki in Hūga, and Sata no misaki (better known to Europeans as Cape Chichakoff) in Ōsumi are the extreme southern points of the island of Kiushū. In the island of Yezo there are several noticeable promontories.

Harbours.

The number of harbours and trading-ports called by the natives *ō-minato* ("large harbours") is stated to be fifty-six, but many of these would no doubt be inaccessible to foreign vessels of heavy tonnage. They are, however, admirably adapted for the accommodation of coasting junks and fishing craft, and these vessels have no lack of places of refuge in heavy weather. In many instances the entrances are blocked by one or more small islands or rocks, which render the anchorage within even more secure. In Yezo the port of Matsumae is the one best known. The Bay of Yedo abounds with harbours, some being situated within the mouths of the rivers. In Idzu, Shimoda is one that deserves special mention; the water is there very deep, and it is a common occurrence for vessels beating up towards the entrance of Yedo Bay to seek shelter in it. Shimida in Suruga is also a well-known place; a long sandy promontory covered with fir trees defends the port from the sea on the south. In the province of Shima are Toba and Matoya, both magnificent harbours. The "Inland Sea" is, of course, especially rich in this respect, the harbour of Misaki, between two islands near the province of Aki, being a favourite place of call. In Shikoku, Takamatsu in Sanuki is the best known. Kiushū is abundantly supplied, Kagoshima in Satsuma being one of the largest and best. The harbours on the north-west coast of the main island are also numerous, and each of the islands Tsushima, Iki, and Sado possesses one. The ports thrown open to foreign trade since the year 1859 are Yokohama, Hiogo (Kōbē), and Niigata on the main island, Nagasaki in Kiushū, and Hakodate in Yezo.

Mountains.

Mountains.—Japan, as might reasonably be expected in a country where volcanoes are so numerous, is very hilly; and in some districts there are many mountains of considerable height. The most extensive plains are those of the Kwantō and Echigo, and the north of Ōshū. The provinces of Mikawa, Mino, and Owari are also very flat. Half-way between Tōkiō (Yedo) and Kiōto lies the great watershed of the east of Japan, the table-land of Shinano, elevated some 2500 feet above the level of the sea. The ridges around or forming part of it are very lofty, particularly those of the province of Mīda. The plain of Yedo lies to the east of this table-land, about 1800 feet below, while to the north the hills gradually slope away to the province of Echigo. Another range of considerable height runs due north from Aizu to Tsugaru, thus dividing the old provinces of Ōshū and Dewa. The province of Kai is almost entirely surrounded by mountains, and the hill scenery in Kiushū and near Kiōto is exceedingly fine. Shikoku

possesses some large ridges, and the south of Kiushū, especially in the provinces of Higo and Hūga, is also by no means deficient. Even in the wide rice-plains throughout the country there may often be seen minor elevations or hills, rising abruptly, in some cases to a considerable height. The mountain best known to foreigners is Fuji-san, commonly, but most erroneously, termed Fusi-yama or Fusi-no-yama in geographical works. It rises more than 12,000 feet above high-water level, and is in shape like a cone; the crater is 500 feet deep. It stands on the boundary line of the three provinces of Kai, Suruga, and Sagami, and is visible at a considerable distance seaward. It is regarded by the natives as a sacred mountain, and large numbers of pilgrims make the ascent to the summit at the commencement of summer. The apex is shaped somewhat like an eight-petaled lotus flower, and offers from three to five peaks to the view from different directions; it is visible from no less than thirteen different provinces. Though now apparently extinct, it was in former times an active volcano, and Japanese histories mention several very disastrous eruptions. The last of these occurred in 1707, when the whole summit burst forth into flames, the rocks were shattered and split by the heat, and ashes fell even in Yedo (about 60 miles distant in a direct line) to a depth of several inches.¹ After Fuji-san may be mentioned Gassen in the province of Uzen, Mitaké in Shūano, the Nikkō range in Shimotsuké, Ōminé in Yamato, Hakusan in Kaga, Tatéyama in Echū, Kirishima-yama in Hūga, Asosan in Higo, Tsukuba-san in Hitachi, Onsen-ga-také in Hizen, Asama-yama in Shinano, Chōkaizan in Ugo, and Iwaki in Mīchinoku. There are several active volcanoes in the country, that best known to foreigners being Asama-yama. This mountain is 8500 feet in height. The earliest eruption of which records now exist seems to have taken place in 1650; after that the volcano was only feebly active for one hundred and thirty-three years, when there occurred a very severe eruption in 1783. Even so lately as 1870 there was a considerable emission of volcanic matter, at which time, also, violent shocks of earthquake were felt at the treaty port of Yokohama. The crater is very deep, with irregular rocky walls of a sulphury character, from apertures in which sulphurous fumes are constantly sent forth. At present very little is known in regard to the heights of the mountains, but the subject is one that has attracted the attention of foreign residents in Japan for several years past. The following is an approximate estimate:—

¹ According to Japanese tradition, it was upheaved in a single night from the bottom of the sea, about twenty-one and a half centuries ago, and its history has been carefully recorded. From July to September the wants of the pilgrims are supplied by temporary restaurants distributed along the principal routes of ascent, one of which is from the east by Subashiri, another from the north by Yoshida, and a third from the south by Maruyama. The white vestments usually worn by the pilgrims are stamped by the priests at the top with various seals and images. Sir Rutherford Alcock and a party of Englishmen ascended the mountain in 1860, and since then it has frequently been visited by Europeans. The height as then estimated by Lieutenant Robinson was 14,177 feet; but a more accurate subsequent measurements gives only 12,500. In the great crater there are neither sulphuric exhalations nor steam. According to Dr von Drasche this is a circular bowl about 700 or 800 feet deep. The lavas are mainly dolomitic; those forming the walls of the crater are composed of anæsthesite, in which here and there grains of felspar are visible. The Japanese poets never weary in celebrating the praises of Fuji-san, and its conical form is one of the most familiar objects in Japanese painting and decorative art. See the notice of Sir R. Alcock's ascent in *Journal R. G. Soc.*, 1861; of A. Jeffery's ascent in August 1872, in *Proc. of R. Soc.*, 1873; and of Dr von Drasche's in his "Bemerkungen über die japanischen Vulkanen Asama . . . und Fusi-yama," in *Jahrbuch K. K. Geol. Reichsanstalt*, 1877; also J. Rein's "Der Fuji-no-yama und seine Besteigung," in *Petermann's Mittheilungen*, 1879.

1. Fuji-san 12,365 feet (above high-water mark at the town of Numazu).
2. Asama-yama 8,500 "
3. Nantai-san (the loftiest hill in the Nikkô range) 7,800 "
4. Oyama, in Sagami 5,400 "
5. Tsukuba-san 5,000 "
6. Onsen-ga-take 4,100 " (according to Siebold).

Rivers.—The rivers of Japan, although very numerous, are in no case of any great length. This of course is easily explained by the fact that the islands are narrow and hilly. The longest and widest river is the Tōnégawa, which rises in the province of Kōdžukū, and flows due east to the Pacific, throwing off, however, at Sékiyado in Shimōsa, a branch that flows into Yedo Bay near the capital.¹ The length of the Tōnégawa is over 170 miles. At Sékiyado (which is a large and thriving river-port) the water is no less than 40 feet in depth, while a few hundred yards above that town foot-passengers can ford the stream without any great difficulty. The Shinanogawa and Kiso-gawa, both of which take their rise in the province of Shinano, rank next to the Tōnégawa. The former flows first in a north-westerly direction, next due north, and then north-east through Echigo to the sea at Niigata; the Kiso-gawa flows to the westward and then to the south, between the provinces of Mino and Owari, and finally falls into the sea at Kuwana. The Ō-gawa rises in the south-west of Kai, and traverses the province of Tōtōmi; it is less remarkable for the length of its course than for the great breadth of its bed, which near the mouth is 2½ miles across, its current being also very swift. The Fuji-kawa, flowing due south from the mountains of Kai through the province of Suruga, is famous as being one of the swiftest streams in all Japan. In the north, the Sakata-gawa flows due west from the range of mountains separating the provinces of Uzen and Rikuzen, and enters the Sea of Japan at the town of Sakata, from which it takes its name. Nearly all the rivers are fed by countless tributary streams, which in many cases form a complete network in the lower portions of the country, and thus greatly facilitate transport from the interior to the coast. On the Tōnégawa and a few other streams of greater depth small river steamers ply for several miles; but in general large flat-bottomed boats, drawing as a rule but a few inches of water, are employed. It is by no means uncommon to see boats of this description in process of construction even in remote country villages on the banks of streams in which the depth of water is but from 12 to 18 inches at ordinary times. Floods are of frequent occurrence, especially at the commencement of summer, when the melting of the snows on the mountain ranges causes at times an almost incredible downflow from the higher lands to the plains. These floods invariably occasion great destruction of property, as the bridges spanning the rivers are only built of wood and turf, supported by piles. In some localities, notably in the western portion of the province of Shimōsa, traversed by the southern branch of the Tōnégawa, large tracts of rice-land are almost entirely destroyed by the fine sand from the bed of the river, swept over the fields during inundations. In addition to boats, long rafts of timber are constantly to be seen descending the larger rivers; the logs are floated down in a rough state, to be afterwards thinned and sawn up at the seaport towns where the timber trade is carried on.

Lakes.—Japan contains a large number of lakes, but only one—the Biwa Lake, in the province of Ōmi—is worthy of special notice on account of its size. Its length is about 50 miles, and its greatest breadth about 20 miles. At

a village called Katada, some 10 miles from its southern extremity, it suddenly contracts to a breadth of only a mile and a half, after which it again slightly expands. This lake derives its name from a fancied resemblance to the *biwa* or Japanese lute; the scenery around it is particularly beautiful, and it is a favourite resort for sightseers from Kiōto. An ancient Japanese legend asserts that in the year 286 A.D., in the reign of the emperor Kōrei, there occurred a terrible earthquake, when the earth opened and Lake Biwa was formed; at the same time rose the mountain called Fuji-san. In Ōmi there is a small hill called Migami, which in shape slightly resembles Fuji-san, and this fact is quoted by the natives in support of the theory connecting the lake with the sacred mountain; and the inhabitants of Ōmi were privileged to undertake the ascent of Fuji-san after only seven days' purification, instead of one hundred days', the prescribed term for all other persons. After Biwa may be noted the lakes of Chizuzeji, Suwa, and Hakoné, all of which lie far above the level of the sea. That of Chizuzeji is situated at the foot of the mountain called Nantai-san, in the Nikkō range in the province of Shimotsukū. The scenery in its vicinity has given rise to the proverb that he who has not seen Nikkō should not pronounce the word "beautiful." The lake of Suwa is in the province of Shinano, and can be reached by a road called the Nakasendō, running north-west from Tōkiō through the heart of the country to Kiōto. The Hakoné Lake lies in the range of hills bearing the same name just to the east of Fuji-san; the water is exceedingly cold, and of great depth. A Japanese legend, indeed, asserts that it has never been fathomed. The hill scenery around it is very picturesque, and large numbers of foreign residents from Tōkiō and the neighbouring port of Yokohama visit it during the summer months. The Inawashiro Lake, in the province of Iwashiro, is said to be about 10 miles in length. It is fed by two streams flowing from the east and north-east, while out of it flows the Aka-no-gawa, which falls into the sea near Niigata. It is surrounded by hills of no great elevation; the temperature there is cool, and in winter the streams are frozen for several weeks. On the boundary line of the provinces of Hitachi and Shimōsa there are also large tracts of water, or lagoons (Japanese *numa*), fed by the Tōnégawa; these, though not actually lakes, may almost be classed under that heading, as their connexion with the river itself consists in many cases of but one narrow outlet. Those of chief note are the Ushiku-numa in Hitachi, and the Imba-numa, Tōga-numa, and Naga-numa in Shimōsa. The country in this vicinity is as a rule exceedingly flat, but the Imba-numa is for some distance along its eastern shore bordered by small hills, thickly wooded down to the water's edge, the whole forming a very pretty landscape. The lagoons are well stocked with fish, the large eels found in the Ushiku-numa being especially prized for excellence of flavour; in the winter months they team with wild fowl. The inhabitants of the numerous villages along the shores are, in fact, almost entirely maintained by fishing and shooting or trapping.

Minerals.—Japan is particularly rich in minerals. Minerals, among which may be specially mentioned gold, silver, iron, copper, coal, and stone of various kinds. The gold was first discovered and melted in the year 749 A.D., during the reign of the emperor Shōmu; it came from the department of Ōda in the province of Ōshiu, and in the following year more was found in the province of Suruga. During the long period of Japan's seclusion from the rest of the world, the gold discovered remained in the country, and the amount augmented year by year; and this no doubt tended in a great degree to convey to the earlier foreign visitors the

¹ See Naumann's excellent paper, "Ueber die Ebene von Yedo," in Petermann's *Mittheilungen*, 1879.

impression that the supply was far more abundant than was actually the fact. The quantity of bullion exported by the Portuguese during their stay in Japan (1550-1639) may be estimated at the least at fifty-nine and a half millions sterling, or an average of £660,000 yearly. Dr Knempfer even speaks of some years with an export of two and a half millions of gold. From 1649 to 1671 the Dutch also exported large quantities, together with silver and copper, and the total value of gold and silver alone sent out of Japan during the 16th and 17th centuries may be estimated at nearly one hundred and three millions sterling. At an exhibition held in Kiôto in 1875 were shown about twenty samples of gold ore found in different provinces. The ore is generally poor, and many gold-yielding places are now lying unworked, because the increased cost of labour renders it very difficult to work them with profit. Pure auriferous quartz has been found in the provinces of Satsuma and Kai, gravel in Ôsumi, and quartz in Rikuchiu and at the mine of Aikawa in the island of Sado. The mode in which the Japanese work the gold ores nearly resembles Western methods. They understand perfectly the separation of even the smallest quantities of gold dust from stones and gravel by means of a system of washing and levigation. They do not, however, possess any good process for the separation of gold from silver, and hence all Japanese gold contains a greater or less proportion of the latter metal. Silver ore was discovered accidentally in the year 667 A.D., in the island of Tsushima; this ore produced the first Japanese silver metal, in the year 674. From 1400 to 1600 it was obtained and melted in Japan in far larger quantities than at the present time. It generally occurs in comparatively small quantities as an admixture in several copper and lead ores. The principal mines are in the provinces of Joshiu, Iwami, and Setzu; but it is also found mixed with lead in Hida, Iwashiro, Echizen, Echigo, Rikuchiu, Sawô, Hiuga, and Higo. Of the numerous iron ores to be found, the principal is magnetic iron ore, which forms the main basis of the Japanese iron industry. Loadstone was discovered in the year 713 in the province of Ômi. The exact date of the first manufacture of iron is unknown; it is certain only that the Japanese have worked their iron ores from the 10th century onward. The principal seats of the industry are in the provinces of Idzumo, Bingo, Ôshiu, Hiuga, Tajima, Wakasa, Bizen, Bitchiu, Shinano, Tôdômi, Kai, Suruga, and Satsuma. The best steel is manufactured in Horima, Hôki, Idzumo, and Iwami. The excellent temper of the Japanese sword-blades is well known. The most noted smiths formerly resided in the provinces of Sagami, Bizen, and Kishiu, and in the neighbourhood of Kiôto. Japanese legends assert that the first sword was forged in the reign of the emperor Sûjin (97-30 B.C.), but this statement is of course open to considerable doubt. Copper was, it is said, smelted in Japan for the first time in the year 698 at Inaba in the province of Suwô; and in the year 708 the first Japanese copper coin was cast, in the province of Musashi. Since the 10th century enormous quantities of ore have been smelted, and this metal formed the chief trade of the Dutch and Chinese at Nagasaki from 1609 to 1858,—the amount exported by the former being more than four millions of piculs and by the latter undoubtedly still more.¹ It is perhaps the metal most commonly found in Japan, and is used for all kinds of household goods, doors to storehouses, ornaments, temple-furniture, mirrors, bronzes, smoking utensils, and current coinage. It is found and smelted in all parts of the country, particularly in the northern and western

provinces, and its export figures considerably in the trade returns of the treaty ports during the past few years. As a rule Japanese copper is exceedingly free from the presence of injurious metals. After the year 1600 many bronze guns were cast in Japan, the workmanship being exceedingly good; these old guns are often to be seen even now, though by far the larger number, together with the temple bells, &c., were made from the same material, have been broken up and exported as old bronze by European merchants. Of other metals Japan also produces lead, quicksilver, and tin. Coal is found in large quantities, particularly in Kinshiu, where the province of Hiizen contains the well-known mines of Karatsu, and in the island of Takashima, near the treaty port of Nagasaki. Coal-fields also exist in the large northern island of Yezo. Nearly all the steamers plying between Japan and China coal at Nagasaki, where this trade attracts a good deal of enterprise. The numerous quarries throughout the empire afford large quantities of stone. Marble and granite are found principally in the provinces of Shinano, Mino, and Kôdzuki; freestone is also procured from Setzu and Idzu. The huge blocks of which the ramparts of the castle at the capital are built were originally brought from the latter province. In the old castle of Ôzaka, in Setzu, there is an enormous piece of granite measuring thirteen paces in length and about 9 feet in height. The foundations of all the more ancient temples throughout the country are formed of large blocks, and these, together with the long flights of steps, still remain to prove the durability of the old style of architecture. It is strange, however, that at the present moment stone is but sparingly used for building purposes; even in the great cities the dwelling-houses are almost entirely constructed of timber, stone being used only for bridges and for edifices on a larger scale than ordinary.²

Climate.—The climate of Japan, as might naturally be expected in view of the great length of the chain of islands, varies to a considerable extent in different localities.³ Thus we find that while the Riukiu and Bonin groups, lying close to the tropics, enjoy perpetual summer, the Kurile Islands in the far north of the empire share the arctic temperature of Kamtschatka. The climate is, on the whole, favourable for Europeans, although its frequent changes often prove trying to foreign residents. All the mountain ranges are wrapped deep in snow throughout the winter months; indeed, from many peaks snow never entirely disappears. In the northern provinces it has been known to fall to a depth of no less than 8 feet, and the province of Echigo is specially noted in this respect. At the treaty port of Niigata, in that province, small bamboo sheds are built out from the fronts of the dwelling-houses so as to form a covered way along which pedestrians can pass when the rest of the town is snowed up. At Tôkiô snow falls some three or four times during the winter; it covers the ground to a depth of from 3 to 5 inches on an average, but does not lie long. In January 1876, however, a remarkably severe snowstorm occurred, when the whole city was covered to a depth of 2 feet or more; so unusual was this phenomenon deemed that a large number of photographs of the landscape were taken to perpetuate the memory of the event. Farther to the south and west the

Oesterr. Ges. f. Meteor.*, 1878; and T. H. Tizard's *Contributions to the Meteorology of Japan* (London, 1876).

¹ 1 picul = 133½ lb. avoirdupois.

cold is not, as a rule, so intense, while in the summer months the heat is far greater. Near Yokohama and Tôkiô the summer commences in May, but the heat only becomes oppressive in July and August, when the thermometer has been known to register 104° F. At the break-up of the summer there are heavy rains, which render the interior of the houses exceedingly damp and uncomfortable. After the winter there also occurs a short rainy season. The best months for making excursions into the interior are April and October, as the weather is then generally of a mean temperature. Southerly winds blow from the middle of May, and often even from April, until the end of August. On the Sea of Japan south-west winds (known as the south-west monsoon) prevail, while in Yokohama and all parts of the country adjacent to the Pacific Ocean southerly winds predominate. The south-west monsoon sets in in April and prevails until the middle or end of September; but the regularity with which the monsoons set in and blow on the Chinese coasts is unknown in Japan. On calm days land and sea breezes alternate on the Japanese coast in the same manner as elsewhere. Mention should here be made of the violent revolving storms, known as typhoons, which are closely related to the West Indian hurricanes and to the cyclones of the Indian seas. These generally occur in the months of July, August, or September; they invariably occasion great damage, not only to shipping, but also to property on land. Large trees are often snapped asunder like mere twigs, while the roofs and chimneys of foreign-built edifices suffer severely. As a rule, one of these storms is experienced every year.

Earth-
quakes.

Destructive earthquakes have often taken place, while slight shocks are of frequent occurrence, several having been felt lately within the space of a few days. Japanese histories furnish numerous records of these phenomena. The ancient legend of the great earthquake in 286 a.c., when Mount Fuji rose and the Biwa Lake was formed, has already been noticed; but it is not possible to procure reliable information for several centuries later than the date mentioned in that fanciful tale. The earliest authentic instance is perhaps that which is said to have occurred in 416 a.d., when the imperial palace at Kiôto was thrown to the ground. Again, in 599, the buildings throughout the province of Yamato were all destroyed, and special prayers were ordered to be offered up to the deity of earthquakes. In 679 a tremendous shock caused many fissures or chasms to open in the provinces of Chikuzen and Chikugo, in Kiushiu; the largest of these fissures was over 4 miles in length and about 20 feet in width. In 829 the northern province of Déwa was visited in similar manner; the castle of Akita was overthrown, deep rifts were formed in the ground in every direction, and the Akita river was dried up. To descend to more recent instances, in 1702 the lofty walls of the outside and inside moats of the castle of Yedo were destroyed, tidal waves broke along the coast in the vicinity, and the road leading through the famous pass of Hakoné (in the hills to the east of Fuji-san) was closed up by the alteration in the surface of the earth. Of late years these disastrous earthquakes have fortunately been of more rare occurrence, and the last really severe shocks were those felt in 1854 and 1855. In the former year the provinces of Suruga, Mikawa, Tôtômi, Isé, Iga, Setsu, and Harima, and also the large island of Shikoku, were severely shaken. It was this earthquake which destroyed the town of Shimoda, in the province of Idzumi, which had been opened as a foreign port in Japan, while a Russian frigate, the "Diana," lying in the harbour at the time was so severely damaged by the waves caused by the shock that she had to be abandoned. The earthquake of 1855 was felt most severely at Yedo, though its destructive power extended for some distance to the west,

along the line of the Tôkaidô. It is stated that on this occasion there were in all 14,241 dwelling-houses and 1649 fire-proof storehouses overturned in the city, and a destructive fire which raged at the same time further increased the loss of life and property.

Meteorological observations have for some time back been carefully taken at the college in Tôkiô, and efforts are now (1881) being made to start a seismological society in the capital. Japan is peculiarly a country where a learned society of this nature could gather most interesting and useful information from actual observation.

General Aspect of the Country.—The physical structure of the islands alternates between mountain ranges, rugged upland regions, wide plains, and lands consisting of an endless succession of dale and down, level fields and small ridges. Yezo has not yet become thoroughly known to foreigners; but it possesses both hills and plains, the latter being in some cases very sandy. The northern portion of the main island of Japan is exceedingly mountainous, though large moors and uncultivated steppes are to be observed on all sides. To the south-east lies the wide plain of Yedo, remarkably fertile, and closed in by lofty ranges. From this away to the west the country is hilly in the centre, with lower ground to the north and south; while in the large islands of Kiushiu and Shikoku the high ground is far in excess of the plain.

Vegetable Products.—The greater part of the cultivated rice land consists of rice-fields, commonly termed "paddy-fields." These are to be seen in every valley or even dell where farming is practicable; they are divided off into plots of square, oblong, or triangular shape by small grass-grown ridges a few inches in height, and on an average a foot in breadth,—the rice being planted in the soft mud thus enclosed. Narrow pathways intersect these rice-valleys at intervals, and rivulets (generally flowing between low banks covered with clumps of bamboo) feed the ditches cut for purposes of irrigation. The fields are generally kept under water to a depth of a few inches while the crops are young, but are drained immediately before harvesting. They are then dug up, and again flooded before the second crop is planted out. The rising grounds which skirt the rice-land are tilled by the hoe, and produce Indian corn, millet, and edible roots of all kinds. The well-wooded slopes supply the peasants with timber and firewood. The rice-fields yield two crops yearly. The seed is sown in small beds, and the seedlings are planted out in the fields after attaining the height of about 4 inches. The finest rice is produced in the fertile plains watered by the Tônégawa in the province of Shimôsa, but the grain of Kaga and of the two central provinces of Setsu and Harima is also very good. Prior to the revolution of 1868-9 the fiefs of the various *daimiô* or territorial nobles were assessed at the estimated total yield of rice. Until very recently there existed a Government prohibition against the export of the grain. Rice not only forms the chief food of the natives, but the national beverage, called *Saké*, is brewed from it. In colour the best *saké* resembles very pale sherry; the taste is rather acid. None but the very best grain is used in its manufacture, and the principal breweries are at Itami, Nada, and Hiôgo, all in the province of Setsu. Of *saké* there are many varieties, from the best quality down to *shiro-saké*, or "white *saké*," and the turbid sort, drunk only in the poorer districts, known as *migori-saké*; there is also a sweet sort, called *mirin*.

The whole country is clothed with most luxuriant vegetation, except in some of the very hilly regions. The principal forests consist of *Cryptomeria* (Japanese cedar) and pine; the ilex, maple, mulberry, and giant camellia also abound. Some of the timber is remarkably fine, and the long avenues following the line of the Shikoku high roads

afford a most grateful shade in summer. On the road from Tókio to the celebrated temples at the foot of the Nikkō hills is an avenue nearly 50 miles in length, of cedars and pines, some of the trees being fully 50 or 60 feet in height. Unfortunately these noble specimens are fast disappearing, as the wood-cutter's axe and saw have been ruthlessly plied during the past few years. In Japanese wood-felling a common plan is to kindle a fire at the roots of the tree; this dries up the sap in the trunk, and renders the wood harder and firmer. Two principal varieties of the pine occur, called respectively the red and the black, from the colour of the bark. The former thrives in sandy ground, while the latter grows in softer black soil. It is said that, if one of these varieties be transplanted to the soil bearing the other, it will also in time change in colour till it resembles its new companions. The tints of the maple foliage, bright green in summer and brown-red in autumn, contribute in no slight degree to the beauty of a Japanese landscape. The mulberry tree grows well in the eastern regions, where the silkworm is reared and the silk industry carried on. The bamboo is especially useful and plentiful. Bamboo clumps are seen at frequent intervals in the rice-land; they line the river banks, and flourish equally well on the higher grounds; and it would be impossible to enumerate the multifarious purposes for which the cane is used. Of fruit-trees Japan possesses the orange, apple, walnut, chestnut, plum, persimmon, damson, peach, and vine. The fruit, however, is in most cases of quality far below that of European orchards. The best oranges come from the province of Kishiu; these have a smooth and very thin rind, and no seeds. The larger oranges, with thick and rough rind, grow throughout the country. The so-called apple resembles the large russet, but only in colour and shape; it has absolutely no flavour, and is hard and stinging. The plum, of which there are several varieties, may be said to be the best fruit obtained, next to the orange and persimmon. This latter is exceedingly plentiful and has two varieties, the soft and the hard; it is often dried, and sold packed in boxes like figs. The peaches are not remarkable either for size or flavour. The best grapes are grown in the provinces of Kai and Kawachi; both the black and the white are found, but the fruit is small, and only continues in season for a short time. The tea-plant grows well in Japan, and tea forms one of the chief exports to foreign countries. The best leaf comes from the neighbourhood of Uji, in the province of Yamashiro, to the south-east of Kiōto; but it is also largely exported from Yokohama, being produced in the fertile district in the east of the main island. The production of vegetable wax has always formed one of the principal industries of the island of Kishiu, and the trees bearing the wax berries grow in great number on the hill slopes and round the edges of most of the cultivated fields (excepting rice-land) in the provinces of Hizen, Higo, Chikuzen, and Chikugo; in Satsuma, however, they are not so plentiful. The cotton-plant, introduced from India in 799, also thrives. The camphor tree is found in most parts of the country, particularly in some of the higher regions; on account of its agreeable smell the wood is largely used in the manufacture of small cabinets and boxes. Amongst the minor vegetable products the sweet potato is particularly plentiful; it has several varieties, that known as the Satsuma potato being perhaps the best. Water melons and gourds of various sizes and shapes thrive in the more sandy soil; and onions, carrots, small turnips, tomatoes, and beet-root are also cultivated. The brinjal bears a dark purple fruit shaped like a pear. The long white radish, called by the Japanese *daiton* (lit. "great root"), is exceedingly common, and forms one of the chief articles of food amongst the

lower classes, who eat it either raw or dried and pickled; the average size of the root is from 18 inches to 2½ feet in length, and 1½ inches or so in diameter. Beans and peas can also be grown. The climate of Yezo is said to be very favourable for both wheat and barley, and it is probable that in future years this large island may thus prove a source of considerable gain to the Japanese. In the island of Shikoku the indigo plant is found in abundance, and it also occurs in the eastern portion of the main island. The poppy is grown in Shikoku. In ferns and cressets of various kinds Japan is particularly rich, but her list of flowers is not very lengthy. The rose, peony, azalea, camellia, lotus, and iris are, however, to be seen.¹

Animals.—As regards animal life Japan is well provided. Mammals.

The domestic animals comprise the horse, ox, dog, and cat; while the wilder tribes are represented by the bear, deer, antelope, boar, fox, monkey, and badger. In Yezo are found very large bears, so powerful as to be able to pull down a pony; in the central provinces of Shimotsuké and Shinano a small black species exists. The deer, antelope, and monkey are caught in nearly all the hilly regions throughout the whole country. Sheep do not thrive, although the hardier goat does,—the reason assigned for this being that the "bamboo grass" with its sharp-edged and serrated blade, proves very deleterious as pasture. In the western part of the province of Shímōsa a sheep-farm was started a few years ago; but it is not yet possible to judge whether the venture will prove successful in any great degree. In the meantime sheep are usually imported from China. The Japanese horses, or rather ponies, are not very powerful animals; they stand on an average from 13 hands 2 inches to 14 hands 2 inches in height. They are thick-necked and rather high-shouldered, but fall off in the hind quarters. Large numbers of ponies are imported from China. At the Shímōsa farm experiments have been made in putting an Arab or Barb to a Japanese mare; the half-bred animal thus obtained compares very favourably with the pure native breed, being of better shape and of far superior speed. The oxen are small but sturdy, and it is probable that, if the vast tracts of moorland at present lying uncultivated in the northern provinces were utilized for breeding cattle, substantial gains would be secured. The ordinary Japanese dog is very like the Eskimo dog, and is generally white, grey, or black in colour. A few, however, are red-brown, and much resemble the fox; these are used by the hunters in the pursuit of game. There are several species of monkeys, and large numbers of these animals, taken in the hills of Kai and Shinano, are brought into the Tókio market, where they are sold for food; the flesh is white and very palatable. Wild birds² are represented in

¹ The great authority on the Japanese flora is Franchet and Savatier's *Enumeratio plantarum in Japonia sponte crescentium*, Paris, 1875-1879, 2 vols., which contains 2743 species of phanerogam plants,—700 species more than, than were given by Miquel, who in 1866 contributed a survey of the subject to the *Mémoires* of the *E. Acad. des Sciences* (Amsterdam), and in 1870 published *Catal. Florae Japonicæ* (Leyden, part 1., *Flora Japonicæ*), on the basis of the rich collections of the Leyden Museum. Much interesting matter will also be found in Rein's contributions to *Petermann's Mittheilungen*, 1875 and 1879; in the *Mittheil. der deutsch. Ges. Ost-Asien*; and in Knipping, "*Onaka, Kiōto, &c., in Nippon*" in *Petermann's Mittheil.*, 1878. It has been shown that the Japanese flora as a whole has a great similarity not only to that of the neighbouring Asiatic continent but also to that of North America, the coincidences being most frequent, however, not with the flora of the eastern but with that of the western coast.

² T. Blackiston and H. Pryer, in their "*Catalogue of the Birds of Japan*" (*Trans. of the Ac. Soc. of Japan*, 1880), mention three hundred and twenty-five species of birds, and they do not consider the list as anything like complete. Of these, one hundred and eighty species also occur in China, and about one hundred are identical with those of Great Britain. The Straits of Tsugara (15 or 20 miles across) appear to be a line of zoological demarcation, as neither the shield-faced antelope (*Nemorhaeus crepus*), the Japanese monkey (*Trinacrus*

Birds. Japan by the cormorant, the crane (*Grus leucogaster*, Jap. *Tan-chayan*, is the national crane), wild goose (at least eight species), swan (*Cygnus muscus*), mallard, widgeon, teal (four species, including falcated teal or Yoshi-gamo), pheasant, woodcock, wood-pigeon, plover, and snipe. There are also found the bittern, the heron, and the white wader, commonly known as the "paddy-bird." Prior to 1868 there existed very stringent laws prohibiting the ordinary Japanese from shooting or snaring the crane, goose, or swan. One species of bittern was even deemed worthy of a special rank of nobility, and is to this day known as the *go-i sagi*, or "bittern of the fifth grade,"—a quaint conceit, reminding us of the well-known jest of Henry VIII. in knighting the loin of beef. Many varieties of domestic fowls exist, the tiny bantam being one of the most celebrated; there is also a large game-cock said to have been originally imported from Siam. Flocks of tame pigeons are to be seen in nearly every farm-yard. The lark, swallow, and common sparrow are as numerous as in England. One of the most beautiful birds is the drake of the species generally called the "mandarin-duck" (*Aix galericulata*, Jap. *Oshi-dori*), found on small streams in country districts. When in full plumage this drake presents an exquisite combination of bright colours, and two broad feathers, of a deep golden tint and shaped like a fan, stand erect above the back from under the wings. The Japanese fisheries are marvellously productive, and afford occupation to the inhabitants of the countless villages along the coasts. Herrings are caught off the island of Yezo, and the bonito, cod, sole, crab, and lobster are found in great plenty on nearly every part of the coast. In some of the rivers in Yezo, and also in the Tonegawa, fair-sized salmon are caught; and there is also a fish very much resembling the trout. The *tsai*, a large fish of the carp species, is esteemed a special delicacy: of this there are two varieties,—the red *tsai*, caught in rivers with sandy beds, and the black *tsai*, found at the mouths of streams where the darker soil of the sea bed commences. Eels, small carp, and fish of many other kinds are freely taken in nearly all the minor lakes and streams. The oyster is found in considerable quantities in the shallows at the head of the Bay of Yedo and elsewhere. To any student of zoology a visit to Japan would prove in the highest degree interesting.¹

Communication.—The means of transport, although not exceptionally good, have yet improved considerably during

the past few years. There are but two lines of railway in Japan, both very short. The first (opened to traffic in 1872) runs from Tôkiô to Yokohama, and is but 18 miles in length. Shortly afterwards a line of about the same length was completed between the port of Hiogo and the city of Ôzaka, and this line was in 1877 extended from the latter place to the city of Kiôto, the opening ceremony taking place on the 5th of February in that year. Both these lines were opened by the emperor in person. Surveying operations have been going on for some years, with a view to the construction of other railways, and in some districts the direction of future lines has already been staked out. Mention has been already made of the great facilities for transport afforded by the network of small streams throughout the country. The system of Roads, too, is very fair, although in remote districts the work of supervision and repair is not done so carefully as is really necessary. Of the highways the Tôkaidô is that best known to foreigners. This is nearly 307 miles in length, and connects Kiôto and Tôkiô. Its course lies along the south-eastern coast of the main island, and it is the only road in the country which is named after the circuit that it traverses. Dr Kaempfer, one of the early residents in the Dutch factory at Nagasaki, gives in his well-known *History of Japan* a graphic and entertaining account of his journey from Nagasaki to Yedo in 1691, part of which he made by the Tôkaidô. One of the most remarkable works recently completed by Japanese labour, without aid from foreign engineers, is a tunnel on this road. It is situated about 6 miles to the westward of the large town of Shizuoka, and about 106 miles west of Tôkiô. The tunnel is cut through a high ridge of hills intersecting the Tôkaidô. The old line of road passed over the summit of the ridge, but this engineering work renders the journey far shorter and easier. A good roadway, some 18 feet in breadth, leads up the ridge on either side, in a zigzag direction, so as to admit of wheeled vehicles passing along it with perfect safety; and the tunnel runs through the centre of the hill, thus connecting the two roadways. The passage is about 200 yards in length; at the eastern end it is faced with stone, then the roof is supported by timber arches for some distance; a small portion is next hewn out of a stratum of solid rock; and finally the timber arches are again continued as far as the western extremity. The breadth throughout is about 12 feet, and the height about 10 feet. As the tunnel runs in a curved line, owing to the formation of the hill, and is thus very dark, lamps are placed in it at intervals; while at each end are fixed in the ground several posts, each surmounted by a brightly polished oblong plate of tin, to reflect the rays of the sun into the interior. This important work was commenced in 1873, but was not completed until March 1876. Another road between Kiôto and Tôkiô is the Nakasendô, also called the Kiso-kaidô; this runs through the heart of the country, to the north of the Tôkaidô, and is a little over 323 miles in length. Some of the hill scenery on the western half of this road is exceptionally grand; the elevation in many parts is so great that in winter the roadway is much obstructed by snow. The longest high road in Japan is the Ôshio-kaidô, running northward from Tôkiô to Awamori on the Tsugan Straits. It traverses the provinces of Musashi, Shimotsuké, Iwashiro, Rikuzen, Rikuchiu, and Michinoku, and its length is given at nearly 444 miles. Two roads from Tôkiô to Niigata exist, the longer being about 264 and the shorter about 225 miles in length; the latter is said to be impassable in winter. Neither of these possesses a name, and for a considerable distance each is identical with the Nakasendô. Another road, which, though far shorter than those already mentioned, still possesses great interest for the traveller on

species), nor the boar (*Sus leucomystax*) have crossed into Yezo. *Haradella placialis*, *Tetrates bonasia*, *Picus minor*, *Dryocopus martius*, *Corvus corax*, *Angelica goriatis*, *Aerolalia caudata*, *Leucosticte brunneicauda*, *Gastrea crassa*, *Ge. rubra Bonelli*, are apparently confined to Yezo, while *Lobocaulis honoensis*, *Phasianus versicolor*, and *Phasianus versicolor* (the two species of pheasant peculiar to the country), *Gastrea ovulata*, *Cyanopicus cyaneus*, *Gerrulus japonicus*, *Aerolalia tripartita*, are not found north of Tsugan Straits. One species of cuckoo (*Heterocercus fuyea*, Horsf.) is supposed to portend earthquakes, its cry resembling the Jap. *tsishin*, earthquake. Among favourite cage-birds are *Zosterops japonica* (Jap. *Mei-ro*); *Parus versus* (Jap. *Tama-gawa*); the Japanese nightingale, *Cettia cantans* (Jap. *Uguisu*); the thrush, *Turdus caesia* (Jap. *Kuro tsuyu*); and *Emberiza sulphurea*, the bunting. The robin, the most expensive bird sold by the dealers, seems to be imported from Corea. Compare Temminck and Schlegel, *Fauna Japonica*, and papers by Blackiston, H. Whitley, and Swinhoe, in *Ibis*, 1862, 1867, 1874, and 1877.

¹ A. R. Wallace has devoted a chapter of his *Island Life* to the treatment of Japan and Formosa. He points out that 40 species of mammals are known to exist in Japan, and that 26 of these are peculiar; whereas of the 165 bird-birds already registered only 16 species are peculiar. He gives a list of 10 species of birds which are common to Great Britain and Japan, and adds that it does not sufficiently indicate the resemblance, as there are many birds which, though distinct species from the British, have the same general appearance. Blesker, the great Dutch naturalist, has *Bijdr. tot de kennis der vishdij, fauna van Japan* (Amsterdam and Batavia, 1851, &c.), and "Énumération des espèces de poissons actuellement connues du Japon," in *Verhandl. der Kon. Akad. v. Wet.* (Amsterdam, 1879). See also Adams's *Travels of a Naturalist in Japan and Manchuria* (London, 1870).

account of the beauty of its mountain scenery, is the Kōshū-kaidō. It unites Tōkiō and Kōfu, the chief town in the province of Kai, and is 77 miles in length; from Kōfu a continuation of it joins the Nakasendō at Shimonosawa, in the province of Shinano, some 32 miles further. To the west of Kiōto he many other roads, but they are of less importance because there is little traffic in the Sanūdō, while that of the Sanyōdō is conducted in junks which ply on the Inland Sea. In the islands of Shikoku and Kiushū the roads are stated to be very bad, particularly in the mountainous regions lying in the southern portion of the latter, on the confines of the provinces of Hiogo, Higo, and Satsuma.

The question of road superintendence is one of which the Japanese Government has fully realized the importance. At a general assembly of the local prefects held at Tōkiō in June 1875 there was brought forward a bill to classify the different roads throughout the empire, and to determine the several sources from which the sums necessary for their due maintenance and repair should be drawn. After several days' discussion all roads were eventually ranged under one or other of the following heads:—

I. National roads, consisting of—

Class 1. Roads leading from Tōkiō to the various treaty ports.

Class 2. Roads leading from Tōkiō to the ancestral shrines of Japan in the province of Isé, and also to the various *fu* ("prefectures"), or to the military stations.

Class 3. Roads leading from Tōkiō to the various *ken* ("prefecture") offices, and those forming the lines of connexion between the various *fu* and military stations.

II. *Kōu* ("prefecture") roads consisting of—

Class 1. Roads connecting different prefectures, or leading from the various military stations to their several outposts.

Class 2. Roads connecting the head offices of the various cities and prefectures with their several branch offices.

Class 3. Roads connecting noted localities with the chief town of such neighbourhoods, or leading to the seaports convenient of access from those localities.

III. Village roads, consisting of—

Class 1. Roads passing through several localities in succession, or merely leading from one locality to another.

Class 2. Roads specially constructed, for benefit of irrigation, pasturage, mines, manufactures, &c., consequent upon measures determined by the local population.

Class 3. Roads constructed for the benefit of Shintō shrines, Buddhist temples, or for cultivation of rice-fields and arable land.

Of the above three headings, it was decided that all national roads should be maintained at the national expense, the regulations for their repair, cleansing, &c., being entrusted to the care of the prefectures along the line of route, but the cost incurred being paid from the imperial treasury. *Kōu* roads are to be kept up by a joint contribution from the Government and from the particular prefecture, each paying one-half of the sum needed. Village roads, being for the convenience of the local districts alone, are to be maintained at the expense of such districts under the general supervision of the corresponding prefecture. The width of the national roads was determined at 7 ¹/₂ ken for class 1, 6 ken for class 2, and 5 ken for class 3; the prefecture roads were to be from 4 to 5 ken; and the village roads were optional, according to the necessity of the case.

Vehicles. On most of the high roads run small stage waggons of various sizes, but these are as a rule badly made, insecure, and for the conveyance of passengers alone. In the mountainous regions, and especially in the hills immediately behind the foreign settlement (Kōbē) at Hiogo, in the province of Setsu, small bullock cars are to be seen. These are roughly made of untrimmed timber, and are anything but strong; each rests on three wheels of solid wood, and is drawn by one bullock. They are, however, very useful for the conveyance of blocks of stone from the hills, and for rough country work. In the large towns, and also on all fairly level roads, passengers may travel in small two-wheeled carriages called *jūn-riki-sha*; these are in shape like a miniature gig, and are as a rule drawn by a single coolie, though for rapid travelling two men are

usually employed. In the city of Tōkiō alone there exist over 10,000 of these *jūn-riki-sha*, and various improvements as regards their style, shape, and build have been introduced since 1870, the year in which they first came into use. Many are of sufficient size to carry two persons, and on a good road they travel at the rate of about 6 miles an hour; the rate of hire is about 6d. per Japanese *ri*, or about 2d. per mile. For the transport of baggage or heavy goods large two-wheeled carts are in use; these are pushed along by four or six coolies. Until very lately the only vehicle employed in travelling was the palanquin. Of these there were two kinds, viz., the *norimon*, a large litter carried by several bearers, and principally used by persons of the better class, and the *kago*, still to be seen in hilly districts where carriages cannot pass. The *kago* is a mere basket-work conveyance, slung from a pole carried across the shoulders of two coolies; and it is easy to see that the substitution of the wheeled *jūn-riki-sha* drawn by only one man was a great improvement as regards both economy of labour and facility of locomotion. In country districts, and wherever the roads are stony or narrow, long strings of pack-horses meet the eye. These animals are shod with straw sandals to protect the frog of the hoof, and their burden is attached by ropes to a rough pack-saddle without stirrups. They go in single file, and move only at a walk. To their necks is attached a string of small metal bells,—a survival of the ancient usage whereby a state courier was provided with bells to give timely warning of his approach at the different barriers along his route, and so to guard against any impediment or delay. The passants also often employ oxen as beasts of burden in hilly regions; these animals, too, are shod with straw sandals, having a portion raised so as to fit into the cleft in the hoof. Burdens of moderate weight are usually carried by coolies, one package being fastened at each end of a pole borne across the shoulder. In remote districts even the Government mails are thus forwarded by runners. In all the post-towns and in most of the larger villages are established transport offices, generally branches of some head office in the capital, at which travellers can engage *jūn-riki-sha*, *kago*, pack-horses, and coolies, or make arrangements for forwarding baggage, &c. The tariff of hire is fixed by the Government, and this is paid in advance, a stamped receipt being given in return. Most of the inns in the travel-post-towns subscribe to one or another of the so-called *gūda*, travelling guilds, each of which has a head office in Tōkiō, and often in Kiōto and Ōzaka. Upon application at this office, the traveller can obtain a small book furnishing general information as to the route by which he proposes to proceed,—such as the distances between the halting places, the names of rivers and ferries, and hints as to places of interest along his road. It also contains a full list of the inns, &c., enrolled on the books of that guild, a distinction being made between lodging-houses and places where meals alone are provided. To this list each landlord is obliged, at the traveller's request, to affix his stamp or seal at the time of presenting his account; and by this system cases of incivility or overcharge can be reported at the head office, or application made there in the event of articles being forgotten and left behind at any inn. The Japanese themselves seldom travel in the interior except under this system, and were foreign visitors only to follow their example they might avoid a good deal of the inconvenience they not unfrequently experience.

Towns.—The towns and villages are very numerous along the line of the great roads. The three great cities are Tōkiō (Yedo), Ōzaka, and Kiōto. The last-named was the ancient capital, and had been in existence for centuries before Tōkiō, and also for a very considerable time before

¹ 1 ken = 7 ¹/₂ inches.

Treaty
ports.

Ōzaka was built. Now, however, these two have rapidly outstripped Kiōto both in size and importance, and are in fact the two great centres of trade throughout the whole country. The emperor's court now resides at Tōkiō, and it is there that the foreign legations are stationed. The city of Ōzaka (often wrongly spelt Osaka) is purely mercantile; it is intersected by numberless canals spanned by bridges that are in some cases of great length, and a very large proportion of the buildings are storerooms for merchandise. The Japanese mint (opened in April 1871) is at Ōzaka. Next in importance to these three cities may fairly be classed the various ports thrown open, under the treaties with Western powers, to foreign trade. Commencing from the north, we come first to Hakodadé (erroneously spelt Hakodadi) in the south of the island of Yezo. There is here no distinct foreign settlement, the houses of the few Europeans being mingled with those of the natives. The chief exports are dried fish and seaweed. On the main island the most northern port is Niigata, in the province of Echigo, where also no foreign settlement as yet exists. The trade is exceedingly small, owing to the bad anchorage. A bar of sand at the mouth of the river (the Shinano-gawa) prevents the approach of foreign-built vessels, and the roads off the river mouth are so unprotected that when a heavy gale blows the European ships often run across to the island of Sado for shelter. Some little trade, however, is carried on, the neighbourhood being very fertile; rice and copper are the chief productions. Yokohama, about 18 miles to the south of the capital, and situated on the western shore of the Bay of Yedo, enjoys by far the greater proportion of the whole foreign trade of Japan. The foreign settlement is very large, and numerous bungalows and small villas of the European residents are also built on a hill (known as the "Bluff") overlooking the "settlement" proper. The chief exports are tea and silk; the former goes principally to the United States and to England, and the latter to the French markets. Large business transactions also take place in silkworm eggs and cocoons, as well as in copper, camphor, and sundry other articles of trade. Proceeding westward, we come to the port of Hiogo, in the province of Setsu. The foreign settlement, generally called Kōbē, is not so large as that of Yokohama, but the streets are wider and more commodious. A railway connects this place with Ōzaka, where there is also a foreign settlement, though of very small size. The principal exports here are tea, silk, camphor, vegetable wax, &c. Nagasaki, the best known by name of all the open ports, is in the province of Hizen, in the large southwestern island of Kiushiu. The foreign settlement is small, though the native town is of considerable extent. Coal is the staple export. Dr Kaempfer's *History of Japan* gives a most exhaustive and interesting description of the everyday life of the early Dutch residents at this port, where they were pent up in the tiny peninsula of Deshima (commonly misspelt Decima or Dezima) in the harbour. Throughout the rest of the country the largest towns are as a rule those that were formerly the seats of the territorial nobles (*daimiō*), and are even now commonly known as "castle-towns." It is easy to conceive that in the olden days, under the feudal system, the residence of the lord of the district formed a kind of small metropolis for that particular locality; and the importance thus attaching to the castle-towns has in most cases survived the departure of the nobles to the capital. The castles usually stood some slight distance from the rest of the town, often on a hill or rising ground overlooking it. In the centre rose the keep or citadel, a strong tower of three or five stories, commanding the whole of the fortifications; this was surrounded by high earthen ramparts, faced on the outside with rough-hewn blocks of stone and

Castle
towns.

defended by a moat, which was often of considerable width. The gateways were square, with an outer and an inner entrance, constructed of stone and heavy timbers. The lines of fortification were as a rule three in number. Above the ramparts rose a slight superstructure of wattled stakes, whitewashed on the outside and loopholed for musketry and archers' shafts. The whole produced a very striking effect when viewed from some slight distance, the grey stone and the brighter whitewash showing distinctly from among the dark foliage of the trees in the pleasure grounds within the enclosure. It was not, however, every castle that was built on the scale just described; many of them were exceedingly small, and were defended only by narrow ditches and weak wooden gates, the buildings within being thatched with straw and hardly superior to the ordinary peasant's dwelling. Most of these castles have been demolished, but a few yet remain nearly intact to tell the tale of the former pomp and state of the feudal nobility. On the outskirts of the castle dwelt the retainers of the *daimiō*, their houses being sometimes situated within the outermost fence, and, sometimes, again, completely beyond it. The houses of the townspeople still stand in their original positions. They are constructed almost entirely of wooden posts, beams, and planks, the roofs being generally tiled. The floors are raised to a height of about 18 inches from the level of the ground, and are covered with large straw mats an inch and a half in thickness. These mats are nearly all 6 feet in length by 3 in breadth, are covered with a layer of finely plaited straw, and have the edges bound with some dark cloth. The doors to the rooms are formed of sliding screens of wooden framework covered with paper; these are 6 feet high, and move in grooves in the beams fixed above and below them. In the houses of well-to-do persons, these slides are often covered with coarse silken stuff, or formed of finely planed boards, usually decorated with paintings. At one side of the room is generally seen a recess, with a low dais; on this various ornaments or curiosities are ranged, and a painted scroll is hung at the back of the whole. A few years back, before the wearing of swords was prohibited, a large sword-rack (often of finely lacquered wood) usually occupied the place of honour on the dais. The ceilings are of thin boards, with slender cross-beams laid over them at intervals. Except in the larger towns, there are hardly any buildings of more than two stories, though the inns and lodging-houses sometimes have as many as four. The front of the dwelling is either left entirely open, or, with the better class of tradespeople, is closed by a kind of wooden grille with slender bars. Those who can afford it usually shut in the frontage altogether by a fence, through which a low gateway opens upon a small garden immediately in front of the entrance to the dwelling. At the back there is generally another tiny garden. All round the house runs a narrow wooden verandah, of the same height as the floor, over which the roof protrudes; this verandah is completely closed at night or in stormy weather by wooden slides known as "rain-doors," moving in grooves like the slides dividing the rooms in the interior. Next in importance to the castle-towns come the post-towns (*Post-towns*), along the high roads, where travellers can obtain accommodation for the night, or engage conveyances and coolies for the road. The houses are similar to those already described, but are built on a smaller scale, and most of them are thatched instead of being tiled. The inns and tea-houses are the grand feature of these towns; as a rule the accommodation there to be obtained is excellent, though this is of course only on the great highways. In remote country districts the traveller is frequently forced to rough it, and put up with what he can find in the way of shelter. Each post-town possesses an office for the receipt, for-

warding, and delivery of the postal mails; as a rule the mayor or vice-mayor of the district is charged with this duty.

Villages. *Rural Life*.—The agricultural villages are often very poor places, the houses being dilapidated, and the food and clothing of the peasants meagre in the extreme. In many instances the farm-buildings are situated in the midst of the rice-fields or on a hill slope, at some little distance from the road. Even the women and children go out to till the ground from early morn until late in the evening, their labour being sometimes varied by felling trees or cutting brushwood on the hills. In some localities they eke out their means of livelihood by snaring birds, or by fishing in the numerous ponds and rivulets. Those who can afford to do so keep a pack-horse or an ox to be used either as a beast of burden or to draw the plough. The farming implements are in many cases very primitive.

Farming
operations.

The plough is exceedingly small, with but one handle, and is easily pulled through the soft mud of the rice-fields by a single pony or a couple of coolies. To separate the ears of grain from the stalks the latter are pulled by hand through a row of long iron teeth projecting from a small log of timber; the winnowing fans are two in number, one being worked by each hand at the same time. The spades and hoes used are tolerably good implements, but the sickle consists merely of a straight iron blade, some 4 inches in length, pointed, and sharpened on one side, which projects from a short wooden handle about 15 inches long. When the grain is gathered in, the straw is stacked in small sheaves and left in the fields to dry, after which it is used for thatching or as litter for cattle. In the wilder districts the peasantry are wretchedly poor, and cannot indeed afford to eat even of the rice they cultivate; their ordinary food is millet, sometimes mixed with a little coarse barley. The potato and the long radish (*daikon*) are almost the only other articles of food within their means. Agrarian riots are not unfrequently occasioned by bad harvests or scarcity from other causes, and the consequences are sometimes very disastrous, the peasants, when once excited, being prone to burn or pillage the residences of the local officials or headmen of the villages. These riots do not, however, arise as in former days from the exactions of the lords of the soil. There is no doubt that prior to the revolution of 1868-69 the peasantry were in too many cases grievously oppressed by their feudal chiefs, especially on those estates owned by the *hatamoto* or petty nobility of the *shōgun's* court at Yedo. These nobles, with some very rare exceptions, resided continuously in the city, leaving their fiefs under the control and management of stewards or other officers; whenever money was needed to replenish the coffers of the lord, fresh taxes were laid on the peasantry, and, should the first levies prove insufficient, now and meretricious exactions were made. Under the present central Government, however, the condition of the Japanese agricultural classes has been greatly ameliorated. A fixed land-tax is levied, so that the exact amount of dues payable is known beforehand. In the event of inundations, poor harvests, or similar calamities, Government grants are constantly made to the sufferers.

Education.

Education.—Throughout the whole country schools have been established, for the support of which the Government often gives substantial assistance. The cost of tuition in these establishments is generally fixed at a rate within the means of the poorest classes. In most of the remote villages the schoolhouse is now the most imposing building.

Adminis-
tration.

Administration.—Court-houses have been erected in each prefecture, where the laws are administered by Government officials appointed by the department of justice at the capital. These courts are placed under a smaller number of superior courts, to which appeals lie, and these

are in turn subordinate to a supreme court of appeal in Tōkiō. By a Government edict issued on the 13th of Law-September 1876 the titles and jurisdiction of the various courts were fixed as follows:—

1. Tōkiō court. Tōkiō *fu*, Chiba *ken*.
2. Kiōto court. Kiōto *fu*, Shiga *ken*.
3. Ōzaka court. Ōzaka *fu*, Sakai *ken*, and Waka-
yama *ken*.
4. Yokohama court. Kanagawa *ken*.
5. Hakodātē court. Hokkaidō.
6. Kōbe court. Hyōgo *ken*, Ohayama *ken*.
7. Nagata court. Nii-gata *ken*.
8. Nagasaki court. Nagasaki *ken*, Fukuoka *ken*.
9. Tochi-gi court. Tochi-gi *ken*, Iba-taki *ken*.
10. Urawa court. Gunma *ken*, Saitama *ken*.
11. Awamori court. Awamori *ken*, Akita *ken*.
12. Ichinoseki court. Iwate *ken*, Miyagi *ken*.
13. Yonézawa court. Yamagata *ken*, Fukushima *ken*.
14. Shizunaka court. Shizunaka *ken*, Yamaguchi *ken*.
15. Matsumoto court. Nagano *ken*, Gifu *ken*.
16. Kanazawa court. Ishikawa *ken*.
17. Nagoya court. Aichi *ken*, Miyé *ken*.
18. Matsuyé court. Simanésu *ken*.
19. Matsuyama court. Ehime *ken*.
20. Kōchi court. Kōchi *ken*.
21. Iwakuni court. Yamaguchi *ken*, Hiroshima *ken*.
22. Kumamoto court. Kumamoto *ken*, Ōita *ken*.
23. Kagoshima court. Kagoshima *ken*.

Four superior courts, having jurisdiction over the above, were then also established, viz. —

1. Tōkiō superior court. Tōkiō, Yokohama, Tochi-gi, Ura-
wa, Aichi, Shizunaka, Nagata,
and Matsumoto courts.
2. Ōzaka superior court. Kiōto, Ōzaka, Kōbe, Kanazawa,
Matsuyama, Kōchi, Matsuyé,
and Iwakuni courts.
3. Miyagi superior court. Awamori, Ichinoseki, Yonézawa,
and Hakodātē courts.
4. Nagasaki superior court. Nagasaki, Kumamoto, and Kago-
shima courts.

Small police stations have been erected in all towns. Police and villages of any importance; along the high roads the system is carefully organized and well carried out, though in distant localities the police force is often wholly inadequate to the numbers of the population. The Japanese lower orders are, however, essentially a quiet and peaceable people, and thus are easily superintended even by a very small body of police. In the capital and the large garrison towns it is a different matter, and collisions frequently occur with the riotous soldiery. The military stations are established in some of the larger castles throughout the country, the principal garrisons being at Tōkiō, Sakura in Shimōsa, Takasaki in Kōzūzō, Nagoya in Owari, Ōzaka in Setsu, Hiroshima in Aki, and Kumamoto in Higo.

Since the restoration of the *miyako* Japan has undergone many internal changes. Immense measures of reform in the internal administration of the country have been introduced. The former territorial nobles surrendered their castles and muster-rolls of retainers to the central Government, and are now, in common with the old court nobles of Kiōto, classed under the one name of *kazekaki*, or simply "nobles." They now reside in Tōkiō, the capital of the empire. To this class of nobles belongs the former king of the Rikkin Islands. After the *kazekaki* come two other grades, called respectively the *shōzoku* and the *heimin*, or, as they may be termed, the gentry and commoners. The former comprises the old *hatamoto*, or petty nobility of the shōgunate, and the *samurai*, or military families, from whom the retainers of the *daimiō* were recruited. The *heimin* include the peasantry, artisans, and traders. Thus the ancient "four classes" of the population have been reduced to three. The *han* system has been abolished, and the system of *ken*, or prefectures, directly under the control of officers of the central Government, established in its stead. The debts of the *han*, contracted over, and this measure certainly involved the present administration in considerable financial difficulties from the very outset, so much so that large issues of Government notes and bonds have become necessary. A grand scheme for the capitalization of incomes was put into operation in August 1876. The *daimiō*, on surrendering their muster-rolls to the crown, were relieved from the necessity of paying the incomes of their retainers, and, with the old

Luft class, received certain allowances from the Government. It is probable that only the wealthier nobles found any hardship entailed upon them by this arrangement, for, if we take into consideration the payments that had to be made by a *daimio* under the old régime in the way of dues to the *shōgun* and allowances to retainers, &c., it cannot be doubted that the lower grades of the former territorial chieftains are in many cases better off at present than they were before the revolution. Their old retainers, too, relieved from the Government entail fixed incomes, or persons, calculated upon their former rates of pay, and thus became direct dependants of the nation instead of one particular *han*. In 1876, however, these allowances to both *zuwaku* and *shōzoku* alike were commuted, according to an elaborate scheme drawn up by the finance department. Government bonds for a total commutation sum were given to each person, to be paid off yearly, by lot, to a certain amount, and bearing in the meantime interest varying from 5 to 7 per cent, due every half year. In course of time, therefore, the Government will be entirely relieved from its heavy responsibility in this respect. Amongst other reforms, the wearing of swords by the *samurai* was also, about this time, prohibited by public edict. This, as might have been foreseen, occasioned considerable dissatisfaction for a while, especially in the southern provinces of Satsuma and Ōsa, but, as it had been wisely prepared for, some time before, by a notification making the carrying of these weapons optional, large numbers of the military class had already discarded them as the second notice was issued, and the task was thus rendered far more easy of accomplishment. An exception was, however, made in the case of officers and men of the newly-organized army and navy. These two branches of the public service are now on a fixed system, formed on the model of those adopted by Western nations; and large numbers of foreign instructors have been from time to time employed by the Japanese Government.

Numerous departments or bureaux now exist for the direction of public affairs, the principal being those for home affairs, finance, public works, foreign affairs, war, admiralty, education, justice, and police. Many of these are subdivided into several sections, varying considerably in number according to circumstances. The whole constitution is avowedly modelled after the Western systems.

There does not as yet exist any house of parliament, but already the seeds have been sown from which it may rise at some future day. A *chiefs' council*, termed the *genrōin* or "council of elders," exists, and throughout the whole country are found numerous "assemblies," the members of which are elected by vote. These assemblies, however, do not possess any share in the administration; their functions are as a rule very limited, and the subjects discussed by them are chiefly matters relating to roads, drainage, bridges, and other local affairs of but minor importance. The local prefects also meet at intervals to discuss various points of local interest. This is not wanting indications that the establishment of a parliament, like that of England, would be welcomed with joy by a very large proportion of the people. The press is under the supervision of the Government officials in each district, and many restrictions are imposed upon any excess of freedom of speech in the newspapers. The editors have in many instances been subjected to fine or imprisonment for having permitted the publication of certain articles that proved distasteful to the Government. The press laws under which these punishments were awarded were issued in 1875.

Popula-
tion.

Population.—The number of inhabitants in Japan was until lately very uncertain. To the ordinary traveller it would seem to be very dense, as the roadways are lined with villages; but in the wilder regions the population is widely scattered, and indeed in certain localities not a single dwelling-house is to be seen for miles together. Dr Kaempfer's ideas on the subject may be taken as rather exaggerated, for it must be remembered that they were derived merely from that portion of the country traversed by him in his journeys from Nagasaki to Yedo. As he visited on his route the large city of Ōzaka, and as he then passed along the Tōkaidō—the most populous and frequented of all the roads throughout the whole empire—it is easy to understand that his theory as to the enormous population was based upon a very deceptive impression. The total has been generally asserted by the Japanese themselves to be about 30,000,000, the authority being a census made so far back as in 1804. A return compiled in 1876, however, put the exact total at 33,997,449; and the still later census of 1880 gave it as 34,338,404, of whom 17,419,786 were males, and 16,918,619 females. The population of the city of Tōkiō is variously stated, but

is probably not much over 800,000. According to a computation made in the year 1870, Kiōto had then about 370,000 inhabitants. Next in importance after these two cities comes Ōzaka, with a population of 414,000 souls. After Ōzaka may be mentioned Nagoya, the chief town of the province of Owari, followed closely by Hiroshima in Aki, Saga in Hizen, Kagoshima in Satsuma, Kanazawa in Kaga, and Himéji in Harima,—most of which are said to possess over 100,000 inhabitants. Fuku in Echizen and Gifu in Mino rank in the second class. Of the ports open to foreign trade, Ōzaka being excluded, Nagasaki is said to have the largest population, being very slightly in excess of Yokohama; Hakodaté and Niigata have perhaps about 30,000 each. The foreign communities are very small: they may be numbered at a few hundreds at Yokohama, Tōkiō, Kōbe, and Nagasaki, while at Ōzaka, Hakodaté, and Niigata the European residents may be reckoned by tens.¹

National Wealth.—Although possessed of considerable National mineral wealth, Japan cannot be called a rich country. wealth. The early foreign residents, from the time the treaties were made in 1853 and following years, were perhaps over- sanguine in their expectations. Recent commercial returns show that the balance of trade has been against Japan, her exports being considerably in arrear of the imports.² Up to the present time this deficiency has been chiefly supplied by an export of bullion, paper money being issued in large quantities for use in the country itself. The value of the notes now in circulation is very great, and it is hard to say how or when they can be redeemed. The notes issued at the time of the revolution of 1868 bore an endorsement to the effect that they were to be redeemed within thirteen years; but, instead of this, they have been replaced by another issue, without any such endorsement. In 1879–80 the Japanese paper currency paid to a discount of above 50 per cent, as compared with the silver Mexican dollar in use amongst the foreign merchants.

Public Works.—In spite of these financial difficulties, Public the Japanese have made great advances in public works. works.

In the number of its lighthouses Japan may compare favorably with many a Western nation. Though all have been erected by foreign engineers during the past ten or twelve years, there is hardly a promontory or island lying in the direct track of the shipping but is possessed of a lighthouse. Many of the lights are very powerful; but in localities of less importance, or lying off the track of foreign vessels, smaller junk lights are used. Buoys and beacons of various sizes have been moored in many places. The whole system is under the superintendence of a special Government bureau (the lighthouse department), which despatches steamers at stated periods to make the tour of the coast and convey stores and provisions to the different posts. At the more important lighthouses foreign lightkeepers are employed, but in many instances the service is performed by natives alone. The rocky and dangerous character of the Japanese coasts makes this system one of peculiar utility. As already mentioned, good progress is being made in railway construction. Numerous lines of telegraph have been erected throughout the country, not only between the treaty ports but also in the interior, particularly to the garrison towns and local Government offices. The mint at Ōzaka has been working since the year 1871. At Yokosuka, on the western shore of the Bay of Yedo, are a dockyard and arsenal, superintended by French engineers; those

¹ According to an official report published in 1880 there are in Japan 108 towns with 10,000 inhabitants and upwards.

² The consular trade reports for the open ports in Japan, published yearly in the blue books, afford minute information on all subjects connected with commerce between Japan and other nations.

have proved of great utility. Large numbers of foreign men-of-war and other vessels have there been docked and repaired. Paper-mills have been established in different localities, and manufactories of various descriptions started. The postal system is exceedingly well managed, and extends over the whole empire. Attention is also given to custom-house arrangements at the open ports. In the capital there are numerous colleges and Government schools, notably for military, naval, and scientific instruction, conducted in many instances by foreign teachers. The mail service along the coast deserves special mention. The steamers employed belong chiefly to the Japanese steamship company known as the Mitsubishi Company; these ply along the entire length of the coast and also to Shanghai, passing through the "Inland Sea," and smaller boats run to Newchwang in China, and to the Riukiu islands. The company is subsidized by the Government.

Religion.—The religious beliefs of the Japanese people may be divided under two heads, the *Shintô* and the Buddhist. By the former is meant the religious belief of the natives prior to the introduction from abroad of Buddhism and the Confucian philosophy.

Shintô. *Shintô* means literally "the way of the gods." Though often styled by foreign writers a religion, it really is not one. No concise definition of it appears to exist, but the following are some of its leading points.¹ It contains no moral code, the writer Motoori (a high authority on this subject, born 1730, died 1801) even asserting that in Japan there was no necessity for any system of morals, as every Japanese acted aright if he only consulted his own heart. He also declared that the whole duty of a good Japanese consisted in obeying implicitly and without question the commands of the *mikado*. In *Shintô* Japan is held to be the country of the gods, and the *mikado* to be the direct descendant and actual representative of the Sun goddess. In it there also seems to be mixed up a system of hero worship, many renowned warriors and other personages of ancient days being exalted into what we should term demi-gods; thus it inculcates a reverential feeling toward the dead. By it, too, spiritual agencies are attributed to the elements or natural phenomena. The *Shintô* shrines throughout the country are built in very simple style, being generally constructed of white wood, unadorned by brilliant colouring as in Buddhist temples, and roofed with thatch. Before each shrine stand one or more *torii*, archways formed of two upright posts with a projecting cross bar laid on their summits, beneath which is a smaller horizontal beam, the ends of which do not project. As its name implies, the *torii* was originally a porch for the fowls offered to the gods, not as food, but to give warning of daybreak. This archway gradually assumed the character of a general symbol of *Shintô*, and the number which might be erected in honour of a deity became practically unlimited. The special peculiarity distinguishing the pure *Shintô* shrines from the Buddhist temples is the absence of images exposed as objects for the veneration of the worshipper; but at the same time the former nearly always contain some object in which the spirit of the deity therein enshrined is supposed to reside. The principal *Shintô* shrines are those in the department of Watarai in the province of Isé, known as *Isé Dai-jin-gu* ("the great divine palaces of Isé"), and maintained by Government.

The first Buddhist images and Sûtras were brought to Japan from Corea in the year 552, if we can believe the *Nihongi*; but it was long before the religion obtained much hold on the people. In the beginning of the 9th century the priest Kūkai (now better known as Kôbô Daishi) compounded out of Buddhism, Confucianism, and *Shintô* a

system of doctrine called *Kôben Shintô*, the most prominent characteristic of which was the theory that *Shintô* deities were nothing more than transmutations of Buddhist divinities. Buddhism, thus fairly introduced, ere long obtained complete ascendancy; it became the religion of the whole nation, and held that position until the Tokugawa dynasty of *shôgun*, when it was supplanted in the intellects of the educated class by the philosophy of Choo He. Its teachings were calculated to awaken man to a sense of his own shortcomings and to cause him to long for perfection; it encouraged belief in a succession of lives and transmigration of souls; and the highest reward promised to the true believer was to be absorbed into Buddha and to attain to absolute perfection. Under the Tokugawa family, many grants were made from their treasuries to famous Buddhist temples, notably to that of Zôjôji in the district of Shiba, in Yedo, which was endowed by Iyâyasa himself in the concluding years of the 16th century. These grants were, however, withdrawn after the restoration of the *mikado* in 1868, and Buddhism has been virtually disestablished since 1st January 1874. Many temples are still kept up, but these are maintained by voluntary contributions from the people and from former patrons.

Since the admission of foreigners into Japan, various Christian missions have been established, principally in Tôkiô and Yokohama, and a tolerably large number of missionaries reside in different parts of the country. Churches have been built, and schools opened for the instruction of children. Christianity is no longer prohibited, as of old, by Government edict, and the number of the native converts is said to be increasing.²

HISTORY.

The ancient history of Japan, as recorded in the native annals, is Early so completely enshrouded in mythological legend as to be absolutely legendary. In these legends numerous deities play a conspicuous part, the country itself being styled the "land of the gods," and the progenies of the sovereign traced back to *Tenchi* *Tejima*, the "Sun goddess." It is asserted that three first-crested seven generations of "heavenly deities," who were followed by five generations of "earthly deities," who in turn were succeeded by the mortal sovereigns, of whom the present *mikado* or emperor is the 122d. The earliest date accepted amongst the Japanese themselves corresponds to 660 B.C., when the first emperor (Jimmu) succeeded to the throne. The present year (1881) is thus the 2541st year of the Japanese era. This long line of sovereigns comprises one hundred and eleven emperors and eleven reigning empresses. A strong ground for disbelieving the accuracy of ancient Japanese chronology, even after 660 B.C., is the extraordinary longevity assigned by it to the early *mikados*. Of the fifteen emperors from Jimmu onwards, eleven are said to have lived considerably over one hundred years, one of them, Suinin, reached the age of one hundred and forty-one years, while his successor Keitoku attained to one hundred and forty-three. After the year 869 A.D., however, these wonderful assertions are no longer made. From the commencement of the 10th century the Japanese annals are more to be trusted, and, although many discrepancies no doubt exist, still the events recorded are generally accepted as authentic.³

The precise origin of the Japanese race is by no means easy to Origin determine, and it would seem probable that it is an amalgamation of several different races. The present Aino tribes of the Japanese island of Yezo are supposed to be the descendants of the ancient aborigines of the empire. These aborigines, or "savages," as Japanese historians are wont to style them, were as first pygmy over by far the greater portion of the country, but were gradually driven towards the north by an opposing race who advanced from the south-west.⁴ This latter race, the ancestors of the present true

¹ On July 1, 1878, the nine American and six British Protestant missions in Japan had 104 missionaries (77 American), 24 churches, 113 chapels, &c., 1617 church members, 3 theological schools, 173 students, 9 ordained preachers, and 98 assistant preachers, besides many largely attended schools for children. The Roman Catholics and the Greek Church claim many converts also.

Buddhism.

Japanese people, are by some writers supposed to have been of Chinese origin, and Japanese annals certainly make mention of such a colony as founded during the reign of the seventh emperor, Kōrei (290-315 A.D.). It is, however, beyond all doubt that the Malay tribes are also represented in the Japanese people, and history further notes an invasion by "black savages," which would seem to point to the natives of Papua or New Guinea. From the relative positions of Japan and China, too, it seems probable that some of the inhabitants of the latter place may also have crossed the narrow seas dividing them from Tashuma and the main island of Japan. Ethnologists are not unanimous in their opinions on these points, but it is generally conceded that there did exist an ancient indigenous race, who were subsequently subjugated and driven towards the north by certain tribes advancing from the southwest. Thus, in the early history of Japan we find that Kōtō and the provinces immediately around it were occupied by the conquerors, from whom descended the modern Japanese; while the aboriginal tribes were with difficulty restrained and pent up in the eastern and northern regions.

Relation of the *muikado* and military class.

The *muikado* himself dwelt at Kōtō, with his court. The nobles composing the court were styled *zugō*, and were themselves descended from cadet branches of the imperial family. There was but one sovereign, and to him the whole empire owed allegiance; he lived in extremely simple style both as regards food and dress, and sole out to the chase surrounded by his retainers. But the inroads of the savages on the eastern borders necessitated constant and vigilant measures for their repression. In such expeditions, however, no special class of generals was created; everything was ordered in the name of the *muikado* himself, or in some cases an imperial prince acted as his representative, so that in no instance did the power even appear to pass from the hands of the sovereign. In the Middle Ages, however, the Chinese military system was adopted as a model, and generals were appointed; the able-bodied males in each province were forced into distinct military corps, and men were told off according to the muster-rolls to garrison the capital or to guard the frontiers. Expeditions were carefully organized, being placed under a general (*shōgun*), who was assisted by subordinate officers. All weapons of war and other appliances were kept in the military stores, and issued as occasion required; when warlike operations were suspended, the arms were returned to the stores for safe keeping. As time passed on the powerful family of Fujiwara began to exert an administrative power, hereditary, in virtue of its relationship to the throne by the female side, and it then became the usage that high descent should be the only qualification for office. The rank and title of general were constantly conferred on the two rival clans of *Tōtō* and *Gen*, or *Taira* and *Minamoto*, as they are also termed. Upon this there first arose the expression "military class," and during the period 770-780 the complete severance of the agricultural class and the soldiery took place. From this time onwards the military domination acquired yearly greater strength, while the power of the *muikado* decreased in proportion. The turbulent common people of the provinces of Ōshū, Dewa, and the Kantō were always in the possession of arms and horses, and openly styled themselves "warriors." In the 10th and 11th centuries the clans of Taira and Minamoto increased in warlike power and influence, became deadly rivals, and virtually ruled the whole country, all the inhabitants owing fealty to one or other of the two factions. A terrible civil war ensued, extending from the middle to the end of the 12th century, when the Taira clan was annihilated by its rivals, who thereupon seized the supremacy. They in their turn succumbed and were succeeded by others, down to the last dynasty (that of the Tokugawa family), which existed from 1603 till 1868. All this time the *muikados* were in reality merely puppets swayed at will by the military faction in power at the time; the ancient state of affairs was overturned, and the sovereign himself was kept almost a prisoner in his palace at Kōtō. In 1868, however, the revolution shattered the might of the then ruling clan of Tokugawa, the restoration of the *muikado* was effected, and the present position of the sovereign is at last almost perfectly similar to what it was in the very ancient times.

Taira and Minamoto class.

The most interesting portion of Japanese history is that of the rise and fall in the Middle Ages of the warlike families which in turn seized the power and overawed the crown. Of these the Taira clan stands pre-eminent, though much of its history is mixed up with that of its rival, the Minamoto clan. The two came first into notice in the 10th century, and quickly increased in influence and strength. It would appear indeed that the civil strife to play off the one against the other, being moved by fear that the power of either might become too great. Thus, if one of the Taira rebelled, the Minamoto were authorized by the emperor to subdue him; while, if any members of the latter clan proved unruly, the Taira were only too glad to obtain an imperial commission to proceed against them. This gave rise to incessant intrigue and frequent bloodshed, ending at last, in the middle of the 12th century, in open warfare. Taira no Kiyomori was at that time the head of his clan; he was a man of unscrupulous character and unbounded ambition,

and constantly strove to secure offices at court for himself, his family, and his adherents. In 1156-59 severe fighting took place at the capital between the rival clans, each side striving to obtain possession of the person of the sovereign in order to give some colour of right to its actions. In 1159 Kiyomori eventually triumphed, and the sword of the executioner ruthlessly completed, supra the measure of his success in the field. Nearly the whole of the many Minamoto chiefs were cut off—among them being Yoshitomo, the head of the clan. A boy named Yoritomo, the third son of Yoshitomo, was, however, spared, through the intercession of Kiyomori's step-mother; and Yoshitsune, also Yoshitomo's son by a concubine, was, with his mother and two brothers, permitted to live. Yoritomo and his half-brother Yoshitsune were destined eventually to avenge the death of their kinsmen and completely to overthrow the Taira house, but this did not take place till thirty years later. In the meantime Kiyomori's power varied, greater and greater; he was himself appointed *daijō-dairi* ("prince minister"), and he married his daughter to the emperor Takakura, whom, in 1180, he forced to abdicate in favour of the hereditary, who was Kiyomori's own grandson. After raising his family to the highest pinnacle of pride and power, Kiyomori died in 1181, and retribution speedily overtook the surviving members of his clan. The once almost annihilated Minamoto clan, headed by Yoritomo, mustered their forces in the Kantō and other eastern regions for a final attempt to recover their former influence. Marching westwards under the command of Yoshitsune, they started on one grand series of triumphs, terminating (1185) in a crowning victory in a sea-fight off Dan-no-ura, near Shimonoski, in the province of Chōshū. The overthrow of the Taira family was complete: the greater number perished in the battle, and many were either drowned or delivered over to the executioner. The emperor himself (Antoku, 824 of his line), then only in the seventh year of his age, was drowned, with other members of the imperial house. The Taira supremacy here came to an end, having existed during the reigns of nine emperors.

The period of the Minamoto supremacy lasted from this time Minamoto until the year 1219. Yoritomo was the leading spirit, as his sons Noriyori and Sanetomo, who succeeded him in turn, did not in any way attain to special fame. Having secured himself against any molestation from the Taira, Yoritomo directed his efforts systematically to the consolidation of his power in the east. Consequently, from the Kantō, he soon extended the sway of his northern provinces, and also extended what was virtually his dominion to the westward in the direction of Kōtō. Kamakura, a town on the sea-shore in the province of Sagami, an old seat of the Minamoto family, was made his metropolis. The site of this town faces the sea, and is completely shut in on the rear by a semi-circular ridge of steep hills, through which narrow cuttings or passes lead to the country beyond. Under Yoritomo Kamakura prospered and increased in size and importance; a large palace was built, barracks were created, and it became the capital of the east of Japan. In the year 1192 the emperor Takahira (also known as Go-Toba no In) issued a decree ordering Yoritomo *Sei-i-tai-shōgun* Shōgun (literally, "barbarian-subjugating generalissimo"), and dispatched also an imperial envoy from Kōtō to Kamakura to invest him with the office. He and each *shōgun* who came after him were thus nominated commanders-in-chief, holding the office by order of and investment from the emperor, to preserve peace and tranquillity on the eastern marches of Japan. This has given rise, in numerous works on Japan published by different authors (Dr. Kaempfer among them), to the common assertion that Japan possessed two emperors.—The one "spiritual," residing at Kōtō, and the other "temporal," residing at Kamakura and afterwards at Yedo. This idea, though entirely erroneous, is not unnatural; for, although each successive *shōgun* owed allegiance to the emperor and was invested by the latter, still his own position as supreme head of the military organization of the country and his influence over the powerful territorial nobles made him *de facto* almost the equal of a sovereign in his own right. This condition of affairs continued until the revolution of 1868, when the *shōgun's* power was shattered, the military domination swept away, and the *muikado* reinstated in his early position of supreme authority. Yoritomo's two sons Noriyori and Sanetomo were in turn invested with the office of *shōgun*; they both dwelt at Kamakura. In 1219 Sanetomo was killed by Noriyori's son, in revenge for the supposed murder of Noriyori himself, and, as he died without issue, the main line of the Minamoto family thus came to an end.

Upon this commenced the supremacy of the Hōjō family, who had Hōjō for years been adherents of the Minamotos. The heirs of this latter family, having failed, the office of *shōgun* was conferred upon different members of the illustrious house of Fujiwara, who all resided at Kamakura. The military administration, however, was invariably in the hands of the Hōjōs, who acted as regents of the *shōgun*; their supremacy lasted from 1225 to 1333, through what are commonly called the "seven generations of the Hōjō family." The Mongol conquest of principal importance during this period was the repulse of the Mongol invasion, which occurred in the year 1281. Kublai sons

Khan, founder of the Yuan dynasty in China, had for some years been repeatedly sent to demand submission from Japan, but, this being refused, about 10,000 of his troops attacked Tsushima and Ōki in 1274. This expedition was repulsed, and some envoys despatched to Japan in 1275 and also in 1279 were decapitated by the regent, Hōjō no Tokumune. Exasperated at this defiance, the Mongol chief collected a mighty armament, which was despatched to Japan in 1281. The numbers of this invading force are by Japanese writers estimated at no less than one hundred thousand Chinese, Mongol, and Korean troops. They descended upon the coast of Kinsin, where several engagements were fought; eventually a severe storm destroyed and dispersed the fleet, and the Japanese taking advantage of this favourable opportunity vigorously attacked and completely annihilated the invaders, of whom but three are said to have escaped to tell the tale. It is not surprising that no further attempt to conquer Japan should have been made by the Mongols. In 1331, towards the close of the Hōjō supremacy, the succession to the crown was disputed, and from that time until 1392 there existed two courts, known as the northern and the southern, in the latter year, however, the southern dynasty (established at the town of Ōtō, near Kōbe) handed over the regalia to the emperor Go-Komatsu, from that time was recognized as the legitimate *miyako*. During the period of anarchy and civil war that took place in this century, Kamakura was attacked and destroyed, in 1333, by Minamoto Yoshiaki, head of a family descended from the Minamoto clan. The rule of the Hōjō was thus terminated, and by 1388 the family had well nigh disappeared.

During the confusion and disturbance created by the contest between the rival courts, and also throughout the whole of the 15th century, Japan was devastated by fire and sword in civil wars of the most terrible description. Several families endeavoured in succession to acquire the supremacy, but none were able to wield it long. The dynasty of *shōgun* (the Ashikaga line) proved bad rulers, and, though the families of Kito, Uyesugi, and others came prominently into notice, they were unable to pacify the whole empire. In the early part of the 16th century what was termed the "later Hōjō" family arose in the Kunitō, and for "four generations" established their chief seat at the town of Odawara, in the province of Sagami, immediately to the east of the Hakonō hills. At this time, too, lived the famous generals Ōta Nobunaga and Toyotomi Hideyoshi. The latter is perhaps best known to Europeans as the Taikō Hideyoshi, or simply as Taikō-san, "my lord the Taikō." *Taikō* it may be remarked, is no name (as commonly supposed) but a title, and signifies literally "great lord." Another common error is to speak of Hideyoshi as the *shōgun*; he never held that office. The 16th century also saw the first persecutions directed against the native Christians; the religion had been introduced by the Portuguese in 1549, when Xavier first came to Japan. In 1586 Ōta Nobunaga was assassinated, and the *tribe* succeeded him in the chief military power. In 1590 the family of the "later Hōjō" was overthrown by him, and the town of Odawara, and Hidōyoshi then bestowed upon his general Tokugawa Iyeyasu the eight provinces of the Kunitō, at the same time directing him to take up his residence at Yedo, which was at that period a town of very small importance. Hidōyoshi died in 1594.

The Tokugawa dynasty lasted from the appointment of Iyeyasu to the office of *shōgun* in 1603 until the resignation of the last *shōgun*, Yoshinobu (usually called Keiki), in 1867. This dynasty comprised fifteen generations of the family, and is undoubtedly the most important throughout the whole of Japanese history. Iyeyasu was a consummate politician as well as a successful general, and to him the powerful territorial nobles (*daimiō*) throughout the whole country specially submitted, some from motives of personal interest, and others under compulsion after a crowning victory obtained over them by the Tokugawa chief at Sōkigahara, on the confines of the provinces of Mino and Ōmi, in 1600. This famous battle completely established the supremacy of Iyeyasu, and his rule was gladly accepted by the country as putting an end to the scenes of bloodshed and anarchy from which all classes had so severely suffered for well nigh two centuries back. Under this dynasty of *shōgun* Yedo became a large and populous city, as the presence of their court gave a grand impetus to trade and manufactures of all kinds. The attendants of the *miyako* at Kōbe were the old *knights*, or court nobles, descended from endō branches of the imperial line; they were, as a rule, of anything but ample means, yet their rank and prestige received full recognition from all classes. The court of the *shōgun* at Yedo was, on the contrary, mainly composed of men who were more noted for their territorial possessions and influence than for their intellect, for skill in warfare accomplishments rather than in literature and arts. This court of Yedo was formed from the territorial nobles (*daimiō*), the petty nobles of the Tokugawa clan (called *hatamoto*), and lower attendants, &c., known as *gōkei-miya*. The *hatamoto* were originally no less than 80,000 in number, and were in fact the soldiers composing the victorious army of Iyeyasu and ennobled by him; they resided continuously in Yedo, very rarely even visiting their country fiefs. The *daimiō*, on the other hand, were

forced to attend in Yedo only at certain stated intervals varying considerably in different cases, and spent the rest of their time at their castle-towns in the provinces,—their wives and families remaining behind in Yedo, virtually as hostages for the good behaviour of the heads of their respective clans. The feudal system was thus introduced by Iyeyasu, but he was too wary to force his yoke in a precipitate manner upon the great nobles. He gathered around him his own immediate adherents, upon whom he conferred the more important positions of trust (notably those of the *senjō*, or *senjō*, as a *corollary* of minor strongholds around his own castle at Yedo); and as the power of his clan became more and more firmly established he was enabled more effectively to impose terms and restrictions upon the *daimiō*. It was, however, reserved for his grandson Iyémitsu (1623-1650) to complete the system thus inaugurated: by the latter the nobles were treated solely as feudal vassals, and many very stringent regulations for their guidance and direction were put into force. A similar course was adopted by the successors of Iyémitsu, and this system prevailed until the fall of the Tokugawa dynasty in 1868. Under their rule, however, Japan enjoyed the benefit of almost uninterrupted peace for more than two hundred and fifty years; and though the burden imposed by them grew in the end too heavy to be longer borne, it was only cast off after fifteen members of the clan had in turn succeeded to the chieftainship. Instead of being, as of old, one united empire acknowledging as its sovereign the outside world, Japan was now partitioned out into numerous fiefs, in Han many ways resembling petty kingdoms. The chief or territory was ruled by a *han* or clan of which the *daimiō* was the chief, assisted by hereditary *heralds*, or "councillors," and other officials. According to the will of each *daimiō* did the usages and rules to be observed in the respective fiefs differ. Districts adjacent to each other might be placed under totally opposite regulations, both as regards taxes and imposts and with respect to the paper money there in circulation. The various *han* issued notes of different denominations, for use in that district alone, and this was done without the slightest reference to the paper currency of neighbouring fiefs. The permission of the *shōgun's* ministers at Yedo had to be obtained for the purpose, but it is beyond all doubt that large quantities of paper money were issued by the *han*, when pressed by want of funds, without any such authority. The chief evil was that these notes were only local currency, and did not pass freely throughout the whole country; thus a person undertaking a long journey might be put to considerable inconvenience as soon as he crossed the boundary of his own clan's territory. The levying of taxes, too, afforded opportunities for frequent abuse of power: in many *han*, it is certain, taxes were collected with due regard to the condition of the peasantry, but in other instances cruel oppression and ruthless extortion were but too prevalent. This, as has already been remarked, was chiefly the case on the estates of the *hatamoto*, who enjoyed a life of ease and pleasure in Yedo, and who cared little or nothing as to the means by which their stipends were wrung from their miserable serfs. Some of the *daimiō* ruled very large territories,—often a whole province or even more; while others, again, owned an estate measuring but a few square miles. The military class, or gentry, who were entitled to wear two swords as a sign of gentle birth, formed the retainers or clansmen of the great nobles, and were recognized as the first of the "four classes" into which the whole population was divided. These classes were—(1) The four military families, commonly known as the *samurai*; (2) the classes agricultural or farming population; (3) the artisans; and (4) the mercantile or trading class. But, though by this arrangement the peasants were placed immediately under the authority of the nobles, undoubtedly far harder than that of the artisans or traders, seeing that they were at the mercy of any capricious or tyrannical feudal noble who might be made lord over the villages in which they dwelt. There existed a small number of independent yeomen (called *gōshi*) who owned no allegiance to any chieftain; but they also were included in the second of the "four classes." The succession to the *shōgunate* was vested in the head branch of the Tokugawa clan, but, in the event of a direct heir failing, it was determined that the dignity and office should pass to one of the three kindred clans of Mito, Ōrari, and Kishin, or, failing these, to one of the three noble families of Tayasu, Shimizu, and Hitoasabashi. These two lines of kinsmen of the *shōgun's* house were termed the *go-san-kei* and the *go-san-kei* respectively. The ceremonial investiture of each *shōgun* by the *miyako* was always kept up, the latter being thus still recognized as the sovereign, although there only remained to him the title without the power. The *shōgun* was, in fact, nothing more nor less than the chief subject of the *miyako*. The chief power and the direction of political affairs were certainly in his hands, but the name of sovereign was never even assumed by him; and in point of actual rank the mighty territorial chieftains were held to be inferior to the poverty-stricken nobles of the *miyako's* court.

The earlier period of the Tokugawa supremacy was disgraced by Persecution of the native Christians. By an edict issued in 1613 of Iyeyasu (who had resigned in 1605 in favour of his son Hidōyoshi), but still continued to exercise administrative functions) Chris-

Nobles.

Christianity was finally proscribed, a decree of expulsion was directed against the Jesuit missionaries then in Japan, and persecution began until 1637. In that year the peasantry of a convict district in the province of Hizen, oppressed past endurance by the cruelties to which they were subjected, assembled to the number of 30,000, and fortifying an old feudal castle at the town of Shimabara, declared open rebellion to the Government. Iyemitsu, who was then *shōgun* (1623-1650), despatched an army against them, and after a brief but desperate struggle the Christians were all massacred. These stern measures repressed the peasantry of the religion, but many clung to it in secret, and several prohibitory edicts were issued throughout the 17th and 18th centuries. So lately, indeed, as 1868 these proclamations might still be seen on the public notice-boards in every village throughout the country.

Fuods of nobles.

Although the Tokugawa period was not disturbed by the various expeditions or civil conflicts from which Japan had until then suffered, there nevertheless existed considerable causes of uneasiness in the numberless intrigues or petty conspiracies which prevailed among the great lords and in the families of the feudal nobles. The question of succession to the chieftainship of a clan not unfrequently stirred up strife among the retainers, and in many cases the most unscrupulous means were adopted in order to obtain the desired result. Towards the close of the dynasty several conspiracies were set on foot, but these were promptly stamped out. Japan was now in seclusion from the rest of the world, the misanthropists having been forbidden to leave its shores without express permission under pain of severe punishments, but the direction of the internal affairs of the country was a task that fully occupied the ruling house. The jealousy and private feuds of the *daimiōs* increased to such an extent that on several occasions even the sacred precincts of the *shōgun's* palace became the scene of quarrel and bloodshed. The great nobles gradually rebelled more and more against the rule of enforced attendance in Yedo, and became far less disposed to brook the restrictions imposed upon them by a lord who was virtually but one of their own class; while to the peasants the feudal system was in most cases exceedingly distasteful. Reaction against the military domination thus set in, and men's eyes naturally turned towards the renewal of the ancient régime when the *miyako* was the sole sovereign, before whose authority every subject, whether gentle or simple, bowed in submission. These, among other causes, gradually led to the revolution of 1868, by which the *miyako's* power was restored. In the meantime, since 1655, treaties had been entered into with several of the Western powers, and the foreign element had thus been introduced into Japanese political affairs. By some writers undue stress has been laid upon this fact, as if the advent of Western nations had been the main cause of the downfall of the Tokugawa supremacy. From an attentive perusal, however, of native works treating of political matters for some time previous, it would appear that

there existed a Japanese colony or settlement at Goa. It is also known that vessels sailed from Japan to the western coast of Mexico. The Mongol invasion in 1281 has been already noticed. In the 16th century Europeans approached the shores of Japan. As early as 1542 Portuguese trading vessels began to visit the empire, and a system of trade by means of barter was carried on. Seven years later three Portuguese missionaries, Xavier, Torres, and Fernandez, took passage in one of these merchant ships, and landed at Kagoshima in Satsuma. The island of Hirado off the coast of Hizen appears to have been then the rendezvous of trade between the two nations. From that time commercial relations continued until the Portuguese were expelled the country in 1639. A second expedition against Corea was undertaken by the *takō* Hidayoshi in 1592; the Japanese troops not only withdrawn till 1698, and it is interesting to note that a number of Coreans were then brought over to Japan, where they procured the art of making pottery. Descendants of these Coreans still occupy a village in the province of Satsuma. Towards the end of the 16th century Spanish vessels visited Japan, and in 1602 an embassy was despatched by Iyāsū to the Philippines, but the relations between the two nations were never very close. The Dutch first arrived in 1610, and from that date down to the close of the Tokugawa dynasty they enjoyed almost a monopoly of the Japanese trade. They at first settled in the island of Hirado, but afterwards removed to Nagasaki, where they were virtually imprisoned in their factory, on the small peninsula of Deshima in the harbour, connected by narrow causeways with the town itself. Dr Kromp's *History of Japan* gives a full and graphic description of the mode of life of the early Dutch settlers, he himself dwelt in Japan during the rule of Tenmōyoshi, the fifth *shōgun* of the house of Tokugawa, 1680-1709. The first Englishman who visited the shores of Japan was William Adams, a Kentish man, who came out to the East as pilot to a Dutch vessel. He lived in the city of Yedo for a considerable time in the opening years of the 17th century, during which period he is stated to have frequently been at the court of Iyāsū. He instructed the Japanese in the art of shipbuilding, and the title of *katanabō* was conferred upon him. In 1613 Captain Siris succeeded in founding an English factory in Hirado, but it did not exist for any length of time. Finally, in 1854, Commodore Perry's expedition from America took place, when a *quasi* treaty was made between him and the ministers of the shōgunate at Uraga, on the Bay of Yedo; and later in the same year Admiral Sir James Stewart effected a negotiation, at Nagasaki, on behalf of Great Britain. In 1858 these treaties were extended, and others were concluded with the Dutch and French, under which the ports of Nagasaki, Hakodati, and Kanagawa (now known as Yokohama) were thrown open to foreign traders belonging to those nationalities, from the year 1859. Other European powers gradually followed the example, and at the present moment Japan is in treaty with no less than eighteen nations, viz., Austria-Hungary, Belgium, China, Denmark, France, Germany, Great Britain, Hawaii, Holland, Italy, Peru, Portugal, Russia, Spain, Sweden, Switzerland, and the United States. Prior to the recent revolution the foreign treaties were concluded with the ministers of the *shōgun*, at Yedo, under the erroneous impression that he was the emperor of Japan. The *Taishū*, worthy of note that even in these earlier treaties the title of *taihu* (often misspelt *tyōu*) was then for the first time used; it means literally the "great ruler," and was employed for the occasion by the Tokugawa officials to convey the impression that their chief was in reality the lord paramount. It is, however, worthy of note that even in these earlier treaties the title corresponding to "His Majesty" was never assumed by the *shōgun*. The actual position of this official remained unknown to the foreign envoys until 1868, when the British, Dutch, and French ministers proceeded to Kōfō, and there obtained from the *miyako* his formal ratification of the treaties already concluded with his powerful subject. Since that time all treaties with Western powers are made out in the name of the emperor of Japan. It was thus that the foreigners came prominently into notice at the time of the revolution, with which, however, beyond that they had really no connexion. In 1879 a Japan sent an expedition against the aboriginal tribes of Formosa inhabiting the island of Formosa, off the eastern coast of China, to expel demand satisfaction for the murder, some years before, of certain Japanese subjects who had been shipwrecked on that island. Some skirmishing took place, in which the Japanese gained the advantage. The most important point in the whole matter was the negotiation with China. Formosa is Chinese territory, but the Japanese contended that, if the Chinese Government would not exact reparation from the aboriginal tribes, they would themselves attack the latter. This they did, and although at one period it appeared highly probable that war would be declared between China and Japan, the matter was eventually settled amicably, China paying a sum, as indemnity for the outrages complained of. Towards the end of Corean 1875 a dispute arose with Corea, a Japanese gunboat having been dispirited fired on from a shore fort while engaged in surveying operations close by the Corean capital. The gunboat returned the fire, and landed a party of men, who attacked and destroyed the fort and stockades, and seized upon the weapons, &c., found in it. Some

diplomatic negotiations ensued, by which the matter was settled peaceably, and on February 27, 1876, a treaty was concluded in Corea, by two Japanese high commissioners despatched for that purpose. Japanese officials and traders now reside in Corea on precisely the same terms as those on which foreigners have dwelt at the open ports in Japan since 1858.

Satsuma
insurrec-
tion.

It could not, of course, be expected that the numerous reforms and changes introduced by the present Government would all be accepted without murmur by the people. Riots have of late years occurred in different parts of the country among the farming classes; and outbreaks of a yet more serious character have been stirred up among the *shōzoku*. The latter took place chiefly in the western provinces, but were soon quelled. The only one of real magnitude was the insurrection in Satsuma, which broke out in the spring of 1877. Excited by various seditious cries, over 10,000 insurgents collected together and marched in a body northwards from Kagoshima. Their avowed object was to make certain representations to the emperor in person. Delaying in their advance to attack the Government garrison stationed in the castle-town of Kumamoto, in Higo, the rebels allowed time for large bodies of troops to be despatched against them from Ōkita. The scene of action was thus confined to the island of Kikushū, and after severe fighting, which lasted for several months, the rebels were annihilated, their leaders either dying on the field or committing suicide. This deplorable attempt was, however, useful inasmuch as it proved the strength of the Government; and in view of its complete failure it would seem unlikely that any effort of a similar nature should be made in future. The restoration of the ancient régime has united and strengthened the empire, instead of letting it remain broken up into numberless petty territories, each unlike its neighbours, as was the case under the old feudal system.

LANGUAGE.

The Japanese language is by some philologists thought to have an affinity with the Aryan family, but, as the points of resemblance are very slight and the differences exceedingly great, it is evident that, if there be any affinity at all, the divergence must have taken place at a period when the common ancestor of the Japanese and Aryan tongues was a language exceedingly rude and undeveloped. Nor has any relationship been clearly established with any other language of Asia. Japanese thus stands, as it were, by itself, and must be regarded as an almost entirely separate tongue.

Japanese may be considered under the two distinct heads of the spoken and the written languages; the former is the ordinary colloquial, and the latter more classical style,—of late years to a great degree mixed up with Chinese. According to native historians, the end of the Chinese classics was introduced in 285 A.D.; but this assertion may certainly be questioned, and it seems probable that the actual date was considerably later. At the present day, however, the Chinese characters occupy by far the most important place in the Japanese style of writing.

The Japanese *kana*, or syllabary, consists of fifty-seven syllables, viz. *a, i, e, o, ha, hi, ho, he, lo, chi, ri, nu, ru, iya, he, ya, he, ra, so, tsu, ne, na, ra, mu, u, i, no, o, ku, ya, ma, ka, fu, ko, ye, te, a, su, ki, ya, ma, me, shi, yi, hi, mo, so, su*—to which may be added *n* final. The following modifications of some of these syllables increase the number to seventy-two—*k* and *s* sometimes become *d* or *p*; *t* may be modified to *d*, *ts* to *dz*, *s* to *sh* and *ch* to *f*, and *k* to *g*. This change is called in Japanese the *migori*

a is pronounced like *a* in *father*.

e " " *ay* as *may*.

i " " *ee* as *meet*.

o " " *ore* as *more*.

u " " *oo* as *fool*.

I and *u* are frequently almost inaudible; in such cases they have been written *i*, *u*. A final *u*, in particular, is very seldom sounded in full. The distinction between long and short vowels, and single and double consonants, demands careful attention, as the meaning often depends upon it. Long vowels generally represent the contraction of two others; thus *au* or *ou* becomes in sound *o*, *ai* becomes *i*, and so on. The consonants are pronounced as in English, with the exception of *r*, *h*, *f*, *u*, *d*, *t*, and *g*, which differ somewhat from the corresponding English sounds. The true pronunciation of these letters must be learned from a Japanese. In the case of double consonants, both must be sounded.

Kata-
kana and
hira-
gana.

In writing there is a character for each of the forty-seven *kana* and syllables given above; and each character may be written in either the *katakana* or the *hiragana* style. The former is the "square" hand, consisting in each case of a portion of the particular Chinese character whose sound (to the Japanese ear) is most closely imitated by the sound of the Japanese syllable in question; the latter is the cursive or "running" hand, adapted from the *katakana* characters, and having several varying styles. Except by the lower and uneducated classes, these written syllabaries are seldom used in writing letters, &c., unless as mere terminations to be taken in connexion with a Chinese character immediately preceding, as,

for instance, to mark the tense of a verb, &c. As in writing the pure Chinese characters, in the letters of the educated class, the "square" and "running" hands are also used, the syllabic characters attached are also, according to circumstances, usually written in the *katakana* or the *hiragana* for the sake of appearance.

The spoken language may be classified under the heads of noun Spoken and particles, pronoun, adjective, verb, adverb, preposition, conjunction, interjection. There is also a distinct class of numerals.

The nouns have no inflexions to distinguish gender, number, or case, but they are preceded or followed by particles which serve these and other purposes. Except in the case of a few common words, no distinction is made between the masculine and the feminine; when necessary, however, there may be used the prefix *o* or *on* for the former, and *me* or *men* for the latter. The neuter has no prefix at all. In general there is no mark of the plural, but whenever necessary the plural idea may be expressed by the addition of *ra*, *gata*, *domo*, *tachi*, or other particles, a few nouns, again, have a kind of plural formed by a repetition of the noun itself. Compound nouns are formed in various ways, the first letter of the second part of such compounds generally changing in sound by the *supori* already noted.

The personal pronoun does not demand much attention, except as regards that of the second person. Its use is very difficult according to the rank or condition of the person or persons addressed. This idea of "honorable" terms is also to be noted in the use of verbs. As a rule, there are three modes of address,—to superiors, to equals and friends, and to inferiors. The plural of personal pronouns is often formed by the addition of the plural particles noticed under the heading of nouns. The personal pronoun is not to be used too frequently in speaking; as a rule, it is not employed by natives except where its omission might cause ambiguity. Possessive pronouns are virtually personal pronouns, with the addition of the possessive particles *no* or *ga*. Demonstrative and interrogative pronouns also exist; by the addition of certain particles to the former, the indefinite pronoun is formed. There are but few reflexive pronouns, and the relative pronoun does not exist. To express that idea, however, the verb of the relative clause is put before the word to which the relative pronoun refers.

The adjective may be declined,—the chief part being what may be termed the root, from which (by the addition of certain syllables) various other forms (including the adverb) are obtained. The Japanese adjective has no degrees of comparison, but an idea of comparison can be expressed by the use of certain particles and by turning the sentence in a peculiar way. Many nouns do duty as adjectives, and are often considered such.

The verb has no means of expressing the distinctions of number or person. In the spoken language there are two conjugations of verbs, in each of which there are four principal parts, viz. the root, the base for negative and future forms, the present indicative, and the base for conditional forms. To each of the principal parts of the verb a number of particles or terminations are annexed; and in this way there are produced forms somewhat similar to the moods and tenses of European grammars. There are, however, a few irregular verbs, in the conjugation of which slight differences are to be noticed. The conjunctions and the interjections are but few in number, and do not call for any special remark.¹

In a sentence the first place is occupied by the nominative case, the second by the objective or other cases, and the last by the verb. The adjective precedes the noun, and the adverb the verb. Prepositions are placed after the nouns to which they refer. Conjunctions and interrogative particles are placed at the end of the clause or sentence to which they belong.

The above parts of speech are also to be found in use in the Written language. Here, however, there is to be noticed a great difference in the inflexions, which are in most cases totally distinct from those used in the ordinary colloquial. Many old expressions and words that have fallen into disuse in conversation are here still retained, and the written language is by far the more classical of the two.²

In the writing hand at present in use Chinese characters predominate. In official documents, despatches, &c., the square character is commonly used, generally with *katakana* terminations. In ordinary letter-writing the cursive hand, more or less abbreviated, is employed, being supplemented, when required, by the *hiragana*. The characters, though identical with those used in China, are arranged in different order, so much so that, though the general meaning and sense of a Japanese document might be intelligible to a Chinese, the latter would scarcely be able to give an exact rendering of it. The sounds of the characters are also in most cases entirely different, the Japanese reading them by what is to them the nearest approach to the true Chinese pronunciation. Thus, a final

Foreign
words.

ng preceded by a vowel in Chinese is generally rendered in Japanese reading by a long *a*, while an initial *h* is not unfrequently changed into *k*. Of late years, since the restoration, there has come into prominent notice an ever-increasing tendency to introduce into ordinary conversation numerous Chinese words that had in many cases been never heard before that time. This style is, of course, affected chiefly by men of letters, and by officials, and several successive editions of small dictionaries containing these newly introduced expressions alone have been published at intervals; the increase in bulk of the last edition as compared with the first is very perceptible. A rather stilted style of address has always found favour with the military and literary class; the personal pronoun of the second person being usually rendered by the word *sensei*, "teacher," or *kuni*, "lord." Interference with foreign countries has of late years naturally created a demand for certain words and phrases hitherto unnecessary and consequently unknown, and these have therefore been freshly coined as it were for the occasion. It is worthy of remark that certain European words have for years back been in such common use as to be now deemed actually Japanese. Among them may be mentioned the following:—

Pan, bread, derived from the Latin, through the Spanish or Italian.
Kawata, a kind of sponge-cake, an adaptation from the Spanish (Castile).
Tobacco, tobacco.
Donsai, Sunday, derived from the Dutch.

The English words "minute," "second" (of time), "ton," "electric," &c., are now freely used, the pronunciation being only slightly at fault. Several Malay expressions have also from time to time crept into use; but these are as a rule heard only among the lower classes at the treaty ports.

Dialects. Although differences of dialect are distinctly apparent in various localities, these are not by any means so marked as is the case in China. As a rule, a man speaking the pure Yedo dialect might travel through nearly the whole of Japan without experiencing any considerable difficulty; his words would generally be fully understood, though he might now and again be unable to catch the true meaning of the answers he received. In the capital a slight *r* sound is given before the consonant *g*, making it almost *ng*; and in the case of an initial *h*, a slight sibilant is plainly perceptible, giving almost the sound of *sh*. The intersection *ni* is often heard in the vulgar Yedo dialect; it has no meaning, is little used by men, and serves merely to draw the attention of the person addressed. In the north this *ni* is changed to *ne*, and in other parts of Japan to *né*. In most of the northern provinces, and also in the far west, a series of aspirate sounds take almost an initial *f* instead of *h*; it is thus apparent, for instance, why the name of the large island off the coast of Hizen is so often termed *Frimido* instead of its true name *Fuzudo*. A nasal intonation is very noticeable in Ōshū and other northern districts, particularly in the neighbourhood of Sendai, and this is also heard in the Osaka dialect. In Osaka and its vicinity too, the *Yé* sound is rendered by the exclamation *sakei*; at Kiōto, as might be expected, many of the older forms of expression prevail. The Satsuma dialect presents, perhaps, the greatest difficulty: the letter *r*, particularly at the commencement of a word, is replaced by a very decidedly *f*, and there is a strong tendency to clip off final vowels in all words. This dialect possesses, too, many words peculiar to its own province, so much so indeed that a conversation carried on between two Satsuma men is often all but unintelligible to a native of Yōkō, although the latter might be able to make himself understood by either of the others. In many country districts also a *patois* is used known only to the peasants, and presenting great difficulty to any Japanese of the better class who comes from a different locality. Even in cases where the word or expression itself is identical, a peculiar intonation or pronunciation so completely disguises it as to convey the impression that it is totally different.

Reading and writing are often almost unknown in remote districts, and the obscure Chinese characters are beyond the knowledge of the ordinary Japanese peasant. Some few of the easier characters are used, and the *kana* supplies the place of the rest; on most of the Government notice boards, &c., and also in the newspapers published for the express benefit of the lower classes, the reading of any Chinese characters used is generally added at the side in *kana*. It is only among the better-educated ranks that the Chinese writing is well understood and in common use. The dictionaries used are arranged after the Chinese style, each character being looked out, according to the number of strokes contained in it, under its proper radical. The list of radicals is the same as in China, and they are always printed in regular index form at the commencement of the dictionary. At the side of each character in the work is placed the Japanese attempt at the rendering of the true Chinese sound, and underneath is given the meaning in Japanese colloquial. There are special dictionaries for the running hand. This style consists of the ordinary square hand, which is not as a rule very unlike the square hand, and also of what is termed the "grass" hand, which is very much abbreviated and exceedingly difficult to acquire. Unless the square hand of a particular "grass" character be known, it is often wholly impossible to look it up in a

dictionary. The pens and ink used in writing are precisely the same as the Chinese; the lines of writing are perpendicular, and are read materials downwards, commencing with the column to the extreme right of the reader. The beginning of a Japanese book is thus where our usages, volumes end. The paper used for letters is thin, and in rolls, the written part being torn off when the note is finished; for official despatches large ruled sheets of superior paper are now in fashion. The signature of the writer is always placed at the foot of the page, while the name of the person addressed is written near the top, with some honorific title appended to it. Whenever the title of the sovereign occurs in an official document, it is either placed as the first character in a fresh column, or else a small space, generally of size sufficient to contain one character, is left vacant immediately above it. In a letter numerous honorifics are used, and these serve to distinguish the second person; in speaking of himself the writer omits these, and sometimes also writes the characters in a rather smaller hand and slightly towards the side of the column instead of in the centre. This is of course done in affection of humility, and is a truly Asiatic idea. The honorific expressions applied only to the *mikado* himself would suffice to compose a small glossary; some of these are exceedingly flowery, as, for instance, the "Phoenix Car," the "Dragon Chariot," the "Jewelled Throne," &c.

The language of the Aino tribes in the island of Yezo is totally Aino.

distinct from the pure Japanese tongue. There does not as yet exist any satisfactory dictionary to throw light upon it, and it can now only be regarded as a kind of lost *patois*, unintelligible to the Ainos alone. Whether this be the descendant of the most ancient form of speech amongst the inhabitants of Japan, it is impossible to conjecture. It does not in sound resemble pure Japanese, being guttural, and spoken in a much lower key.

The natives of the Rukita group also possess a language of their Rukita. own, but this does not differ in any great degree from Japanese. Many of the persons of the better classes speak Japanese with perfect correctness, and it is also stated that the higher officials are acquainted with the court dialect of China. The Rukita tongue may be described as nothing more than a very strongly marked dialect of Japanese, and in it there are still preserved many words long since obsolete in Japan itself. In writing, the Chinese characters are chiefly used.¹

LITERATURE.

Literature in Japan has of late years received far more attention and careful study than in ancient times, if we are to judge by the multitude of recently published books as compared with those existing even less than a century ago. The introduction of printing presses with movable type has no doubt been the principal cause of this; wooden blocks were in use far earlier, but it was a great labour to prepare them; and, as only a certain number of copies could be struck from them, in the case of any work much sought after the demand very soon exceeded the supply. As many of the old manuscripts have been set up in type and published, the modern style, there is no great difficulty in procuring specimens of the ancient literature.

In the earliest times Kiōto was the principal if not almost the only seat of learning and literature in Japan. Intestible wars and feuds kept the inhabitants of the eastern portion of the empire too fully occupied with military affairs to allow of their being able to engage in more learned and peaceful pursuits, even had they so wished. The court of the *mikado* at Kiōto enjoyed a far more tranquil existence, and the nobles composed that court devoted themselves with zest to literary pursuits. Poetry was by them held in high honour, and received perhaps the greater share of their attention; but the writing of diaries seems also to have been a favourite occupation, and examples of these, still extant, afford a very interesting insight into the mode of life then prevalent at the court and in the neighbourhood of Kiōto.

The ancient literature of Japan contains but few works of a popular character. Almost everything then composed that is still extant was written by and for the members of the learned circle around the court, and was thus exclusively adapted to the minds of the well-read and highly educated class. Later on, in the 16th century, when the learned were devoted chiefly to the study of Chinese, the cultivation of the Japanese language was in a great measure abandoned to the ladies of the court. A very large proportion of the best writings of the best ages of Japanese literature was the work of women; and the names of numerous poetesses and authoresses are quoted with admiration even at the present time.

¹ The scientific study of Japanese in Europe is of comparatively modern date. The chief names associated with it are Franz von Siebold, J. Hoffmann, Léon de Rosny, and Hamaker. Among Léon de Rosny's works may be mentioned *Notice sur la lecture de la langue japonaise* (1847), *Manuel de la lecture japonaise* (1849), *Recueil de textes japonais* (1852), *Cours de japonais* (1853), *Dictionnaire japonais-français-anglais* (Paris, 1857). Hamaker is the author of a Japanese-German-English Dictionary (Vienna, 1851), of a Japanese-English Dictionary (Vienna, 1851), *Untersuchungen über den Bau der Aino Sprache* (1852), &c., and has published a variety of essays upon Japanese texts in the *Steinbücherei der Wiener Akademie*. English workers in Japanese are E. Saitō, Aston, Chamberlain, Alcock, Hepburn.

Ancient records.

The earliest of the extant Japanese records is a work entitled the *Kojiki*, or "Record of Ancient Matters," commonly ascribed to date from the year 711. Prior to that time, in 620 and again in 651, two other works treating of ancient Japanese history are said to have been compiled, but neither has been preserved. The emperor Temmu (673-686 A.D.), according to the preface to the *Kojiki*, resolved to take measures to preserve the true traditions from oblivion, and he therefore had all the records then existing carefully examined, compared, and purged of their faults. Their contents were then committed to memory by a person in the imperial household, named Hiyeida no Ase. Before this record could be reduced to writing, the emperor died, and for twenty-five years Ase's memory was the sole depository of what afterwards became the *Kojiki*. At the end of this interval the empress Gemmō (709-716) commanded one of her ministers to write it down from the mouth of Ase, and the work was thus completed at the end of the year 711. Soon after this, in 720, another work was completed entitled the *Nihongi*, or "Japanese Record," which is said to have so far superseded the *Kojiki* that the latter was almost forgotten. The *Nihongi*, like the *Kojiki*, appeared during the reign of an empress (Genshō, 716-723), and the yet earlier work of the year 620 was commenced under the auspices of the empress Suiko (593-628); the person called Ase is also by some supposed to have been a woman. The *Kojiki* is to what may be called pure Japanese, while in the *Nihongi* there are to be found numerous traces of direct Chinese influence; the chief object of the one was to preserve the form and spirit of Japanese antiquity, while the other rather fell in with the growing adoption of Chinese ideas. Both works may be described as ancient histories, purporting to commence from the "divine age" and the very origin of all things, and replete with allusions to Japanese cosmogony and legends of antiquity; they are held to be the chief exponents of the *Shinto* faith, or "way of the gods." They formed a basis for many subsequent works of almost similar style, and were the subject of numerous commentaries. Of these latter writings the one demanding special mention is the *Kojiki-den*, an edition of the *Kojiki* with an elaborate commentary by a renowned scholar named Motoori Norinaga, who lived during the 18th century. It was commenced in 1784, but the first part was not completed until 1786; the second was finished in 1792, and the concluding portion in 1798. The printing of this great work was begun in 1789, and concluded in 1822. Motoori himself having died in 1810.

Later histories.

Forasmuch among the later Japanese historical works is the *Dainihonshi*, *honshi*, or "History of Great Japan," in two hundred and forty books. This was composed under the direction of one of Iyeyasu's grandsons, the famous second lord of Mito (1622-1700), commonly known as Mito no Kōmon sama. This illustrious noble was a noted patron of literature, and collected a vast library by purchasing old books from various temples or shrines and from the people. At the city of Utsunomiya (in the province of Mito) there are still pointed out the ruins of this noble's library buildings, situated for greater safety within the castle moat, and by the palace. Tradition says that among the numerous scholars who aided the lord of Mito in compiling the *Dainihonshi* there were several learned Chinese who had fled to Japan from the tyranny of their Manchu conquerors. This book is the standard history of Japan to the present day, and all subsequent writers on the same subject have taken it as their guide. Of all the succeeding histories the most worthy of note is the *Nihon Gwaishi*, or "External History of Japan," by an author named Ito Sanyō (born 1783, died 1839), who also composed several other works, all of them in classical Chinese. The *Gwaishi* is the most widely read, and forms the chief source from which Japanese men of education derive their knowledge of the history of their own country. It was first published in 1827, and numbers twenty-two volumes; the author was occupied for no less than twenty years in its composition; and it appends a list of two hundred and fifty-nine Japanese and Chinese works from which he drew his materials. The book treats, in order, of the great families that have since altered the government of the country; the military domination and the decadence of the *miikado's* authority, and thus introduces the reader to the Taira, Minamoto, Hōjō, Kusunoki, Nitta, Ashikaga, Irie, Ito, Takada, Yūyō, Mōri, Ōta, Toyotomi, and Tokugawa houses. Many of these sections are necessarily very short; as they treat of only one or perhaps two generations, but the records of the chief clans are of considerable length. The writer invariably identifies himself with the particular family in each case, and thus the transactions of two or more factions who strove together for the supreme power at certain epochs have to be detailed twice or even three, each time from a different point of view and with varied coloring. The whole period thus rehearsed extends from the middle of the 12th century to the beginning of the 18th. Many other historical works exist, written in less learned style, and adapted for popular reading and the instruction of young students. The *Gempō Seimokki*, or "Record of the Rise and Fall of the Gen and Hei," is a noteworthy specimen

of its class; it treats only of the two rival clans of Minamoto and Taira, and of the deeds and feats of arms performed by the heroes on both sides. Most of these popular histories are illustrated by woodcuts, in many cases taken from portraits, &c., in ancient scrolls or paintings.

Poetry having always been a favourite study, it is not surprising Poetry. that there should exist numerous volumes of verses either written or collected by the old court nobles. Of these the most ancient is the *Manyōshū*, or "Collection of Myriad Leaves," which dates probably from early in the 8th century. But this work, notwithstanding its great antiquity, is perhaps less familiar to the Japanese than the *Huakushinshū*, or "Collection of One Hundred Persons," which appeared considerably later, and includes some pieces written by emperors themselves. This was followed by almost numberless minor volumes of the same kind. Verse-making attained to such favour that it was a usual custom for one of the nobles to invite together several of his friends noted for their scholarship, solely for the purpose of passing away the time in this occupation. The collections thus obtained were either kept in the original manuscript or printed for convenience. The verses were in nearly all cases in the style known as *uta*, which may be described as the pure Japanese ode as opposed to the *oké*, or style of Chinese poetry introduced in later years, and much affected by men of learning. The *uta* usually consists of thirty-one syllables, the arrangement being in what may be called 5 lines, containing 6, 7, 4, 7, and 7 syllables respectively. The meaning is continuous though there is often a slight break at the end of the third line, what follows being in antithesis to what has gone before, or a fresh simile with identical meaning but a varied expression. Thus if the position of the two portions of the whole *uta* be reversed, the meaning is generally in no way altered. Each *uta* is complete in itself, and expresses one single idea. The Japanese do not possess any great epic, or any didactic poems, though some of their lyrics are happy examples of quaint ways of thought and modes of expression. It is, however, a hard task to translate them into a foreign tongue with any hope of giving an exact rendering of the allusions contained in the original. The *uta* are often inscribed on long strips of variegated paper; and it is even now a common practice, when offering a present, to send with it a verse composed for the occasion by the donor. Again, even down to very recent times, when a man had determined to commit suicide, or was about to hazard his life in some dangerous enterprise, it was by no means uncommon for him to compose and leave behind him a verse descriptive of his intention and of the motive urging him to the deed. It is stated in Japanese histories that Sanemoto, the third and last *shōgun* of the Minamoto house, was so extravagantly fond of poetry that any criminal could escape punishment by offering him a stanza.

Probably the largest section of Japanese literature is that treating of the local geography of the country itself. The works on this subject are exceedingly numerous, and include guide-books, itineraries, maps and plans, notes on celebrated localities, &c. In most cases only one particular province or neighborhood forms the subject of the one book, but as very minute details are usually given these works are often of considerable length. Every province in Japan possesses many scenes of historic interest, and can boast of ancient temples, monuments, and other memorials of the past; this is especially the case in those lying immediately around Kōbe or Tokiō; and it is to preserve and hand down the old traditions relating to them that these guides to celebrated localities have been compiled. They have much resemblance to the county histories in England. Although mainly geographical, they contain no considerable store of historical information, which, as a rule, is printed at the head of each section. The traveller can thus ascertain without difficulty the names of the principal villages, rivers, hills, &c., and can decide what temples, shrines, or monuments along his route are worthy of a visit. Inns, ferries, lodging-houses, &c., receive particular attention. The Japanese maps are not, as a whole, very maps. correct; the greater part are struck from wooden blocks, copper-plate engraving having been but lately introduced. Many of the sheets are coloured. The roads are laid down with some degree of care, and distinctive marks are allotted to the former castle-towns, the post-towns, and the minor villages; the distance from one town to its nearest neighbour is usually added in small characters along the line indicating the road. Very few maps include the whole of the country; most of them show only a few provinces, and some consist of a series of engravings, each plate being devoted to a single province. Plans of all the cities and of the larger towns are easily procured, and these are drawn for the most part very correctly; there are also road-books of the chief highways showing simply the towns, rivers, &c., along the route in question, much used by travellers in the interior.

There are not many works on art, though there have been *pu*-Art. blished several collections of engravings from drawings by famous Japanese painters. Of late years, however, somewhat impetuous has been given to this branch of literature, and many of the older

¹ See a most interesting paper entitled "The Revival of Pure Shinto," by E. Satow, in the Transactions of the Asiatic Society of Japan, vol. III., 1874-5.

² See the masterly treatise on this subject, entitled *Classical Poetry of the Japanese*, by B. H. Chamberlain, London, 1880.

editions have been reprinted. Some works on ancient pottery and other antiquities have also appeared.

Drama. The drama does not hold in Japan the position it enjoys in European countries. No classic author such as Shakespeare was ever known, and the pieces represented on the stage are as a rule, of a popular character. The style of these plays is often rather stilted, a large number of ancient and almost obsolete words and expressions being used, but the military farces and light pieces are in the everyday colloquial. Theatre-going is a favorite amusement, especially among the lower classes in the larger towns.

News-papers. The growth of the newspaper press during the past few years deserves special attention. At the period of the recent revolution there existed but one publication that could be properly classed under this head,—the so-called "Government Gazette," which was read only by the official class, for whom alone its contents possessed any interest. But since then so many newspapers have come into existence that the list for the whole country now comprises several hundred. In the chief cities they are issued daily, in country districts every two or three days or only once a week. The *Tokio* papers have the widest circulation, and are forwarded even to the most remote post-towns. Among these the *Nichi-nichi Shinbun* ("Daily News"), the *Chōga Shinbun* ("Court and Country News"), and the *Meiji Shinbun* ("Information News") are perhaps the best known; the first-named is a semi-official organ. These journals appear on every day except holidays. They are all similar in style; the first page contains Government notifications and a leading article, the second miscellaneous items of information, and the third contributed articles, sometimes of a political but oftener of a popular or satirical character, while the fourth page is devoted to advertisements. The papers are chiefly printed from movable metal type. The style of composition is principally Chinese, interspersed with *kana* at intervals, but the papers published for the express benefit of the very low classes are almost entirely in *kana*, and are in many cases illustrated by rough woodcuts. Freedom of the press is as yet unknown, and many an editor has been fined or imprisoned for publishing what was deemed by the officials an infraction of the press laws recently notified. These laws are in some respects very stringent, and the newspaper press is in no slight degree trammelled by them. Before a paper is started, a petition requesting the permission of Government must be sent in, and a promise made that if such permission be granted the press laws shall be strictly obeyed. The paper, once it is started, is under the supervision of the local officials, and whatever they may deem to be a contravention of the laws in question is punished by fine, imprisonment, or suspension or total abolition of the offending journal. It is needless to point out that under this system anything like free and open criticism of the proceedings of Government is well nigh impossible, although ingenious plans have been contrived, whereby, though keeping within the actual letter of the law, the editor can proclaim his true views on the subject under discussion. A very common method is to draw a satirical picture of Japan under the name of some other country. The bonds imposed by the Government are felt to be galling, and perfect freedom of the press would be hailed with delight by the exceedingly large and influential class interested in the maintenance and publication of this kind of literature.

Novels. Another large section consists of romances or novels, some of considerable length. In many instances the fiction is woven in with a certain degree of historical fact, as, for instance, in following the supposed adventures of some noble's retainer, during one of the campaigns of the medieval civil wars. In these, as in European works of the same description, the reader is generally introduced to a hero and heroine, whose thrilling adventures are described in graphic terms. Pretty little fairy-tales also abound, and short story-books with small woodcuts fill every bookstall in the streets. Many of these are entirely written in *kana*, and the prices being very moderate, they are within the reach of even the lowest classes. Unfortunately, hardly any of these popular works would bear translation into a foreign language. Children's toy books, illustrated with large and gaudy pictures in colours, and representing chiefly the warlike heroes of ancient days or the noted actors of modern times, complete the final section of the very interesting literature of Japan. (T. M'G.)

ART.

The range of Japanese art, its origin, and its progress, in connexion with some of its most characteristic features, cannot fail to interest all true lovers of art, especially as applied to industries and manufactures. In this latter category should be placed all those applications of art "in the vast and diversified region of human life and action," to quote Mr Gladstone's words, "where a distinct purpose of utility is pursued, and where the instrument employed aspires to an outward form of beauty,"—in which consists "the great mass and substance of the *Kunst-Leben*, the art-life of a people." As it is within these limits that art has taken its chief development in Japan it is in this respect more especially that some account will be given here of its leading characters and principles.

If art in its application to purposes of utility may be taken as the first stage in all countries towards the higher art more especially appealing to the imaginative and intellectual faculties, the degree of perfection attained by any nation in this first *Kunst-Leben* must be taken into account in judging of their artistic power and capabilities. Viewed in this light, it is not too much to say that no nation in ancient or modern times has been richer in *art-necessities* and original types than the Japanese. They undoubtedly have the merit of having created one of the few original schools of decorative art handed down to us from past ages,—a school unimpaired by any foreign admixture, if we except the first rudiments of all their arts and industries, derived in remote periods from their more advanced neighbours the Chinese, but from that time left to native influences and powers of development. A strangely constituted race, unlike even the Chinese, from whom in fact they may have descended, voluntarily maintaining an isolated state for a long succession of centuries, the Japanese nation has grown up under the circumstances best adapted to produce originality, and the "insular pride" so natural in their isolated position among a group of islands in the Pacific Ocean. Thus left to themselves, the genius of the race has led them rather to direct their efforts to confer beauty on objects of common utility and materials of the lowest value than to create masterpieces of art to be immured in palaces or only exhibited in museums. The genius of making common and familiar things tell pleasantly upon the ordinary mind, by little artistic surprises and fresh interpretations of the common aspects of natural objects and scenes, is especially their gift, and a gift as valuable as it is rare. It is from this standpoint that the art of Japan should be viewed for a right appreciation of its claims to admiration, and for the proper apprehension of the lesson it conveys to art-workmen and manufacturers of objects of utility.

Previous to the London International Exhibition of 1862 Japan had in fact been a sealed book to the Western world, save in so far as a small collection of industrial and natural products of the country to be seen at the Hague could afford information. The Portuguese *via* Macao, and later the Dutch traders allowed to occupy a factory at Nagasaki in Japan in the 17th and 18th centuries, were in the habit of shipping a few articles for Europe, of utilitarian rather than ornamental character. These consisted chiefly of dinner services of porcelain made to order after European models—known as "Old Japan" with heavy gilding and striking colours, and unlike any modern work as can well be imagined. Lowly quered cabinets and large coffers or chests of rough workmanship also found their way to Europe, and some of these are still occasionally to be met with in old country houses or curiosity shops, both in England and on the continent. When the London exhibition, therefore, made its display in the "Japanese court," followed, as this was, by a great exhibition in Paris in 1867 and in Vienna in 1875, the Japanese contributions to which were carefully selected on a large scale by the Japanese Government itself, the true treasures of art-work came upon Europe as a new revelation in decorative and industrial arts, and have continued since to exercise a strong and abiding influence on all industrial art-work. In London, as in every Continental capital, specimens of Japanese manufacture in great variety speedily followed in the shop windows; and huge importations, taking place almost monthly at depôts in London, are speedily bought up to be distributed over the country, and sold in retail. In the International Exhibition of Paris in 1875, the "Japanese court" again presented a matchless collection of perfect workmanship and design in every variety of material. In textile articles, such as silks, gowns, crapes, and embroidery; in bronzes, cloisonnés, champlevé, repoussé, inlaid and damascened work; in art-pottery, faience, and porcelain; and in lacquer and carved wood and ivory,—there was a bewildering variety; but only one opinion prevailed as to the palm of superiority due to them. The inferiority of most of the articles of the same class exhibited in the adjoining "Chinese court," which from its close proximity provoked while it afforded every facility for a close comparison, was very marked. If other test of excellence were needed, it is amply supplied by the history of imitation; through the mischievous of merely copying Japanese art work, without any knowledge of the history, religion, popular legends, or the artistic tastes which inspire the workman in Japan, is obvious in the vulgarized reproductions and the incongruous combinations now so common. They may be *Japanesque*, but they are certainly not Japanese in spirit, feeling, or execution. Defects are exaggerated, and excellences are lost sight of altogether.

Before proceeding with a general survey of the most characteristic art features of Japanese art, it may be useful for purposes of reference here to give a list of English works that have appeared in recent years in connection with this subject. Mr John Leighton in the spring of 1888 was the first to draw public attention to the collection of Japanese objects in the exhibition of 1862 and their artistic merit, by a lecture delivered at the Royal Institution, which was afterwards printed. Dr C. Dresser, in his *Art of Decorative Design*, published his opinion that Japan could "supply the world with the most beautiful domestic

articles that we can anywhere procure"; and both in that work and in another entitled *Unity in Variety, as deduced from the Vegetable Kingdom*, he makes particular reference to Japanese decorative work. A series of articles on "Art and Art Industries in Japan," which appeared in the *Art Journal* in 1878-76, were published, with considerable additions, in a single volume in 1878. About the same time two works appeared on the same subject, J. J. Jarves's *Glimpses at the Art of Japan* (1876) and Messrs Amey & Bowas's *Kerama Art of Japan* (1878-80). A fourth work entitled *Famous Hiyaku-Kai, or a Hundred Views of Fusuyama*, by Hokusei, with introductory and explanatory prefaces from the Japanese, and descriptions of the plates by J. V. Dickens of the Middle Temple, reproduces facsimile plates of the original collection of this celebrated native artist, and even to the paper and form of the thin volumes is a perfect counterpart of the original work as published in Japan. Lastly, there has appeared a valuable contribution to our materials for an intelligent judgment, in Thomas Cutler's *Grammar of Japanese Ornament and Design* (1881). The plates, exceeding sixty in number, are preceded by a carefully written introductory essay, giving a discriminative survey of the chief art-industries and the principles of Japanese ornamentation.

Art in Japan, it has been well observed, "is not, as in Europe, the grafting of one style upon another, and the accumulated knowledge of all the various schools from the remotest antiquity." It has been a growth unaffected by any extraneous influences, self-contained and strictly national, and hence the astonishment and delight created when the art of Japan was first revealed to the outside world. It is in comparing the decorative art of Japan with that of China that we see how far the former has distanced its early Chinese masters, and how thoroughly it has produced a school peculiarly its own. Commenting on its application to ceramic ware, lacquer, bronzes, textile fabrics, &c., Mr Cutler has well remarked, "if we study the decorative art of the Japanese, we find the essential elements of beauty in design, fitness for the purpose which the object is intended to fulfil, good workmanship, and constructive soundness, which give a value to the commonest article, and some touch of ornament by a skillful hand, together creating a true work of art."

Native school of art. The school of art due to the native genius of the Japanese as a race is essentially decorative, and, in its application, to a great degree purely industrial. Pictorial art as understood in Europe can hardly be said to have any existence in Japan. Most of their decorative designs consist of natural objects treated in a conventional way. This conventionalism is, however, so perfect and free in its allurement to nature seems to suggest both the motive and the treatment. Though neither botanically nor ornithologically correct, their flowers and their birds show a truth to nature, and a habit of minute observation in the artist, which cannot be too much admired. Every blade of grass, each leaf and feather, has been the object of loving and patient study. It has been rashly assumed by some of the writers on Japanese art that the Japanese do not study from nature. All their work is an emphatic protest against the erroneous supposition. It is impossible to examine even the inferior kind of work without seeing evidences of minute and faithful study. It can in fact be shown conclusively that the Japanese have derived all their fundamental ideas of symmetry, so different from ours, from a close study of nature and her processes in the attainment of endless variety.

Special features. It is a special feature in their art that, while often closely and minutely imitating natural objects, such as birds, flowers, and fishes, the especial objects of their production are, nevertheless, to combine the facts of external nature with a conventional mode of treatment better suited to their purpose. During the long apprenticeship the Japanese serve to acquire the power of writing with the brush the thousand complicated characters borrowed from the Chinese, they unconsciously cultivate the habit of minute observation and the power of accurate imitation, and with these a delicacy of touch and freedom of hand which only long practice could give. A hair's breadth deviation of a line, or the slight inclination of a dot or an angle, is fatal to good calligraphy, both among the Chinese and the Japanese. When they come to use the pencil therefore in drawing, they are possessed of the finest instruments in accuracy of eye and free command of the brush. Whether a Japanese art worker sets himself to copy what he sees before him or to give play to his fancy in combining what he has seen with some ideal in his mind, the result equally shows a perfect facility of execution and easy grace in all the lines.

In their methods of ornamentation the Japanese treat every object flatly, as do the Chinese masters to this day, and this to a certain extent has tended to check any progress in pictorial art, though they have obtained other and very admirable decorative effects. Without being, as Mr Cutler, in common with some other writers, assumes, ignorant of chiaroscuro, or the play of light and shadow, it is true that they usually, though not invariably, paint in flat tones as on a vase, and so dispense with both. It is not a picture so much as a decoration that they produce, but it is a decoration full of beauty in its harmonized tints and graceful freedom of design. The delicacy of touch is everywhere seen, whether bird

or leaf or flower or all combined be chosen as the subject. The Japanese artist especially excels in conveying an idea of motion in the swift flight of birds and gliding movements of fishes, one of the most difficult triumphs of art.

It has been said that the golden age of Japanese art is over and gone, and that the conditions no longer exist, and can never be renewed, under which it has developed its most characteristic excellences. A feudal state, in which the artist and the workman were generally one and the same person, or at least in the same feudal relation to a chief who was looking to his subjects or serfs, or even to the people, for support in their work, and took pride in counting among his subjects or serfs those who could most excel in producing objects of great beauty and artistic value, is a condition as little likely to return in Japan as the former isolation and freedom from all foreign influences of the people. Under these altered circumstances it is to be feared that Japanese art has culminated, and shown the best of which it is capable. But if the hour of decadence has arrived, and a deterioration of taste inevitably set in, by an intermixture of foreign and debasing influences overlaying original thought and *notifs*, and leading to imitations of European vulgaries, we have then no reason to be grateful to those who, like Messrs Bosse & Anisley and Mr Cutler, have undertaken to preserve by costly and faithful examples works produced in the most brilliant period in the life of a singularly gifted people. One of the characteristic features of all Japanese art is individuality of character in the treatment, by which the absence of all uniformity and monotony or sameness is secured. Repetition without any variation is abhorrent to every Japanese. He will not tolerate the stagnation and tedium of a dull uniformity by mechanical reproduction. His temperament will not let him endure the labour of always producing the same pattern. Hence the repetition of two articles the exact copy of each other, and, generally, the diametrical division of any space into equal parts, are instinctively avoided,—as nature avoids the production of any two plants, or even any two leaves of the same tree, which in all points shall be exactly alike. The application of this principle in the same free spirit is the secret of much of the originality and the excellence of the art of Japan. Its artists and artisans alike aim at symmetry, not by an equal division of parts as we do, but rather by a certain balance of corresponding parts, each different from the other, and not numerically even, with an effect of variety and freedom from formality. They seek it in fact, as nature attains the same end. If we take for instance the skins of animals that are symmetrical, we have the material, we have the restraint of nature's methods in this direction. Examining the tiger or the leopard, in all the beauty of their symmetrical adornment, we do not see in any one example an exact repetition of the same lines or spots on each side of the medial line of the spine. They seem to be alike, and yet are all different. The line of division along the spine, it will be observed, is not perfectly continuous or defined, but in part it is suggested; and each radiating stripe on either side is full of variety—in size, direction, and to some extent in colour and depth of shade. Thus nature works, and so following in her footsteps works the Japanese artist. The same law prevailing in all nature's creation, in the plumage of birds, the painting of butterflies' wings, the marking of shells, and in all the infinite variety and beauty of the floral kingdom, the lesson is constantly renewed to the observant eye.

Among flowers the whole family of orchids, with all their fantastic extravagances and mimic imitations of birds and insects, is especially prolific in examples of symmetrical efforts without any repetition of similar parts or divisions into even numbers. We may take any one of this class almost at random for a perfect illustration. The *Oncidium leucostichum* is by no means the most eccentric or *baroque* member of the family of orchids. But in its uneven number of similar parts, and the variety in form and colour by which a symmetrical whole is produced, there is nothing left to be desired. The sepals are nearly alike, but not quite, either in size, shape, or colour-marking. These are balanced, not by three, but by two petals, which match each other, but are broader and more ovate in shape than the sepals, and, instead of being barred, and spotted like the sepals, they are broadly painted for about half their length with a deep chestnut colour; and, while the lip rising from the centre is pure white and wholly different in form, texture, and colour, the crest rising from the base with tubercles is yellowish, with patches of reddish-brown.

This assemblage of parts, so diverse in form, number, and colour, nevertheless forms a single flower of exceeding beauty and symmetry, affording the strongest contrasts and the greatest variety imaginable, such as delight the Japanese artist's mind. The orchid may be taken as offering fair types of all ideal in all art work. And thus, close student of nature's processes, methods, and effects as the Japanese art workman is, he ever seeks to produce humble replicas in his only art master. Thus may we understand how he proceeds in all his decorative work, avoiding studiously the exact repetition of any lines and spaces, and all diametrical divisions, or, if these be forced upon him by the shape of the object, exercising the utmost ingenuity to disguise the fact, and train away the eye from observing the weak point, as nature does in like circumstances.

Thus if a lacquer box in the form of a parallelogram is the object, the artists will not divide it in two equal parts by a perpendicular line, but by a diagonal, as offering a more pleasing line and division. If the box be round they will seek to lead the eye away from the naked regularity of the circle by a pattern distracting attention, as, for example, by a zigzag breaking the circular outline, and supported by other ornaments.

A similar feeling is shown by them as colourists, and, though sometimes eccentric and daring in their contrasts, they very seldom produce discord in their chromatic scale. They have undoubtedly a fine sense of colour in common with other Eastern races, and a similarly delicate and subtle feeling for harmonious blending of brilliant and sober hues. As a rule they seem to prefer a quiet and refined style, using full but low-toned colours. They know the value of bright colours, however, and how best to utilize them cleverly, both supporting and contrasting them with their secondaries and complementaries, as Mr. Leighton remarks.

Having thus taken a very rapid glance at some of the leading features of Japanese decorative art as a whole, and traced the principles that underlie and in great degree determine the processes by which the workman seeks to realize his ideal while taking nature's methods for his guide, we must now pass in review the several art-industries in which they have most excelled. The following account of these, though by no means supplying an exhaustive list, may be considered to include the principal industries. Such, however, is the deficiency of touch and skill in manipulation exhibited by Jap. ware in most of all kinds that, apart from the general principles applied in all decorative processes, the simplest for box of wood or papier-mâché is apt to be made a work of art, and as a piece of constructive workmanship is not easily rivalled, or in danger of being mistaken for the work of any other than Japanese hands.

Pottery and Porcelain.—There has been much discussion as to the source whence the Japanese derived their skill in pottery and porcelain. The general conclusion that, at a remote era, some Korean priests introduced the manufacture of porcelain from China, the country most advanced in civilization in the eastern half of Asia, may be accepted as sufficiently attested. There is evidence that both Chinese and Japanese have since that time borrowed largely from each other, while inventing new forms and processes by their own ingenuity, taste, and skill. Thus differences in treatment and working traditions would become the inheritance of each, giving rise to a characteristic distinction which may be observed in the present day between Chinese and Japanese porcelain and pottery of all kinds, notwithstanding a certain generic likeness. The discovery of the art of making hard porcelain, the *pâte dure* of the French in contradistinction to the *pâte tendre*, cost European workmen much time and labour, and for their first importations of Chinese and Japanese porcelain excited the admiration and envy of Europe; and the secret was never revealed by either Chinese or Japanese to any European.

There are to this day many secrets of these crafts as jealously guarded as ever. The mystery of enameled china, of lac-work translucent porcelain covered with glaze, and of the marvellous egg-shell cups, and the process whereby these are enamelled and covered by a fine woven case of bamboo, as well as the composition and sources of their colours, are still so many secrets to the European manufacturers, although something has been divined or discovered quite lately as to enamel and lac-work porcelain. The Japanese of late have been much given to lacquering their porcelain, but very often this is not burnt in, and washes off—nor even in the beginning has it much beauty to recommend it. Their enamel painting on this porcelain is in many cases very delicate and beautiful both in design and colour,—but perhaps not as a rule equal to the fine specimens of China of the Ming dynasty, or even of the reign of K'anghi, who was a great patron of the arts early in the 18th century. Of the art-pottery and stoneware of Satsuma and Hizen, and indeed of many other provinces in Japan, it may be said that nothing better in the material has ever been produced. The Japanese have no pretension to rival with the classic designs on the Etruscan and Greek vases, because they have never learned to draw the human figure correctly. But in flowers, birds, fishes, and insects the Greeks themselves never approached the perfection of Japanese art, where such objects give a beauty and value often to the very commonest piece of pottery, made with the finger and thumb for the chief relics, and retaining the impress of the skin on the surface.

The great variety of pottery and ceramic ware produced in Japan may most conveniently be arranged under the three heads adopted by Mr. Franks in his useful *Art Handbook for the Collection in the South Kensington Museum*.—(1) common pottery and stoneware; (2) a cream-coloured faience, with a glaze often enameled and delicately painted in colours; (3) hard porcelain. The best account perhaps of the very varied substances used by the Japanese in making these wares and forming their porcelain clay is to be found in the report published under the authority of the Japanese commission, *Le Japon à l'Exposition Universelle de 1876*.

Porcelain painted or enamelled with flowers and other designs is largely produced in the province of Hizen in the island of Kinsiu, of which Nagasaki, where there are large manufactories, is a port; but it is also manufactured in a great number of other provinces and districts. The decoration, whether in enamel colours or metals, is laid on after the final burning of the clay or *pâte*, and above the glaze. But the artists often live apart from the factories and independent of them, working at their own homes, and owning, separately or jointly according to circumstances, small ovens, where at a comparatively low temperature they can fix their easily fused enamels. Thus much of the finer egg-shell porcelain used to be sent in the white state to Tôkiô, Hizen, and other places, there to be decorated by artists of local celebrity. But from the Hizen factories also comes a great quantity of low-class porcelain for shipment at Nagasaki, to suit the demand of the European markets. That for the most part is vulgar in taste, made on European models for domestic use, and consists of toilet sets, tea services, jugs, trays, &c., coarsely even if elaborately painted, akin to the ware so long received from Canton under similar conditions of deterioration. The colours are bad, with no refined tones. Light greens, red, and blue, all poor in quality, are most common, and have a vulgar and disagreeable effect. This is the result of a demand for cheap articles by tradesmen who have no taste themselves. But Arita, Kôto, Kaga, Satsuma, and Owari are all centres whence the most characteristic and admired ceramic wares of Japan are obtained. Several varieties of enamelled and painted faience are produced in all, and from Satsuma and Owari, especially the former, the faience is very rich. The delicate tints of the paste, and the better ground which the *pâte tendre* furnishes for the reception of enamel colours compared with the *pâte dure* of the polished porcelain, give a special beauty to all this ware, while the soft creamy-looking enameled glaze adds an additional charm.

There is a kind of terra cotta and pottery or earthenware industry in Japan of which the produce has been largely exported of late years in the form of jars and censers or flower-pots. The objects selected for the decorative part are usually in very high relief and roughly modelled, consisting of flowers, foliages, or animals, but their artistic merit is not great, though as specimens of technical skill and mastery of all the difficulties offered by subject and material they are very remarkable.

Lacquer Ware.—China has given its name to all porcelain in the Lacquer Western world, as the country whence it was first imported. So ware has Japan given its name to all lacquer ware, first introduced to the knowledge and admiration of Europe in the 17th century after the discovery of that country. The beauty and excellence of Japanese lacquer ware have never been matched in Europe. Not even in China, where the varnish tree is also indigenous, and the industry may date quite as far back, has equality been ever established. Japan reigns supreme, now as at first, in this, the most beautiful and perfect product of all her skilled labour and artistic power.

The unmatched and apparently marvellous beauty of Japanese lacquer may be due to many causes. The varnish trees of several kinds, and the *Urushi* tree growing in Japan (the fruit of which yields the vegetable wax), from which is derived the lacquer varnish, supplies, it is said, a finer gum than any other of the same species. It is extracted from the tree at particular seasons only, by incisions in the bark, and from first to last is subjected to many manipulations and refining processes, conducted with a patient attention and a delicacy such as could with difficulty be secured in any other country,—perhaps not in Europe at any cost. It admits in these processes of various admixtures of colouring matter, and from the first, according to the last use of it in highly finished work, increasing care as to the dryness or moisture of the atmosphere, the exclusion of every particle of dust, and other conditions is essential. The articles to be lacquered, whether cabinets or boxes of infinite variety in size and form, are generally made of light fine-grained Japanese wood, very carefully seasoned, and smoothed so that not the slightest inequality of texture or roughness of edge remains. Layer after layer of the lacquer is laid on at stated intervals of days or weeks, and after each step the same smoothing process is repeated, generally with a lump of fine charcoal and the fingers, as the finest and most perfect of polishing instruments. These layers vary in number, according to the intended effect and perfection of the article, and also in relation to the design. Very frequently this is either in basso or alto rilievo, in which ivory and agates, coral, or precious stones are inserted, as well as gold and silver in rich profusion. Some of the older and finer pieces of lacquer, which even in the early days of treaty relations in 1859 were rarely in the market, and now are exceedingly scarce in Japan itself, represent the labour of months and even years of the most skilled workmen, who must be artists as well as masters of the manual craft. On these articles they lavish all their art, and enrich them by every kind of decoration.

Fret patterns are in constant use in all Japanese art, sometimes in fret, the form of borders, and more frequently in diapers, which they use patterns with excellent effect on surfaces in filling up and varying the spaces, and in combination with floral and other designs. Their love of variety diapers leads them to adopt several different diapers in covering any sur-

face, often enclosing them in irregular-shaped compartments, fitting into each other or detached according to the fancy of the artist and the shape of the object ornamented. The same kind of ornamentation and decorative art is carried out in their woodwork, and may constantly be seen in their cabinets of marquetry and inlaid boxes. Their predilection for geometrical forms is best to be seen in their great variety of diapers.

Nor must their floral diapers be overlooked consisting as they do of an almost infinite variety for covering whole surfaces, in which flowers and foliage form the material. In the spaces of decoration as in all else, the Japanese artist studiously avoids uniformity or repetition of exact spacing. He repeats, but with the greatest irregularity possible, to disguise as it were the repetition of what is in effect the same design or pattern. In close connexion with the diaper system of ornamentation is that known as powdering, familiar enough in European art; but in Japan, following the principle of irregularity, the decorator avoids any regular distribution of the design adopted. Lastly, there is a style of ornamentation peculiarly Japanese which consists in the use of medallions grouped or scattered over a surface—of various colours and forms—and filled in with different diapers, the whole producing an effect as pleasing as it was novel when first introduced to European eyes. And in this treatment of medallion powdering may best be seen the triumph of this system for the avoidance of uniformity and diametrical division. The medallions being of definite forms, and usually geometrical in outline, the ingenuity displayed in overcoming the difficulty such forms present is very instructive. They are placed either singly or in groups—in the latter case partially, overlapping, and of different outlines—in different colours, and filled in with various diapers, the whole being irregularly distributed over the surface in such a way as to avoid diametrical division or uniformity of any kind.

This applies to the finer specimens of the work, where all the principles of surface ornamentation and design adopted by the Japanese may be seen in their greatest perfection. But lacquer is the common ware for domestic use, almost as common as pottery and earthenware are in Europe. Cups and saucers, trays and saké bottles, medicine boxes and dishes, are in the poorest houses; and so excellent is the varnish that neither boiling water nor oil will affect the surface. In the finer and older specimens this hardness increases with age, so that some of them can with difficulty be scratched with nails or needles. The value of such specimens, first introduced into England at the London exhibition of 1862, has now been fully recognized, and the cost of the best and oldest lacquer, always high, has greatly increased of late years. Dr Dresser mentioned in a recent lecture a box of about six inches square, for which he was asked in Japan £100, and he was told that in Yedo (now Tôkyô) fine specimens were "bringing their weight in gold." In the Paris exhibition of 1878 there was a large lacquer screen of great beauty valued at 65,000 francs. It, however, was modern, and, with all its beauty, was over-painted. The Japanese also, besides applying lacquer with colours on porcelain, possess in rare perfection the art of lacquering on tortoiseshell and ivory. On these they present minute figures and landscapes with a mixture of gilding and rich colours, sometimes in relief, at other times engraved and sunk, and in this manner they ornament miniature cabinets, jewel boxes, and other quaintly formed miniature boxes, medicine cases, &c., in a way to defy competition in their marvellous beauty and delicacy of execution.

Metals and Bronze.—In all manipulations of metals and amalgams the Japanese are great masters. They not only "are in possession of secret processes unknown to workmen in Europe," by which they produce effects beyond the reach of the latter, but show a mastery of their material in the moulding and designing of their productions which imparts a peculiar freedom and grace to their best work. A lotus leaf and flower and seed-pod they will produce with marvellous fidelity in the subtle curves and undulating lines and surfaces, and in the most minute markings of leaf and flower. So birds and fishes and insects cast in bronze seem busied with life, as true as they to nature while at other times the same objects are adopted for a purely conventional mode of treatment. Their inlaying and overlaying of metals, bronze, silver, and steel, more than rival the best productions of the ateliers of Paris or Berlin, and constitute a special art-industry, with some features of finish and excellence not yet attained in Europe.

Shakudô. Of the metallurgical triumphs of art which the Japanese may justly claim over all competitors, Chinese, Indian, or European, perhaps the greatest is the perfection to which they have brought the designs in "Shakudô," an amalgam of which are usually made the inoshees or pipes used to fasten their tobacco pouches and pocket-books, or to ornament the handles of their swords. Shakudô is chiefly of iron, relieved by partial overlaying of gold, silver, and bronze. One of the purors (the late Mr Hunt) of the London exhibition of 1862, an employer of the highest artistic and mechanical skill in the working of the precious metals, was convinced, as he stated in his report to the commissioners, that "the Japanese were in possession of some means not known in Europe of forming amal-

gams, and of overlaying one metal on another, and in the most minute and delicate details introducing into the same subject, not covering an inch, silver, gold, bronze, &c., so as to make a variegated picture of divers colours."

Cloisonné, Champlevé, and Repoussé Work.—In the varied applications of the art of enamelling, the Japanese have run their great some rivals in cloisonné work very close, although upon the whole the work Chinese have the superiority, their colouring being more brilliant and finely toned in harmony, and their work more solid and satisfactory both to the eye and the touch. A dull and sombrous tone is generally adopted in Japanese cloisonné work, which much impairs the beauty of their good workmanship in its general effect.

The mode of producing cloisonné work has often been described. It derives this name from the process of building up the design in cells formed by raised septa varying from $\frac{1}{16}$ to $\frac{1}{8}$ of an inch in depth; these labyrinthine cells forming elaborate patterns of flowers, diapers, frets, &c., are soldered on the surface of the vessel selected, made generally of copper; and into these cells the enamel of the consistence of oil paints and of the various colours required by the pattern is carefully pressed by a wooden spatula. When complete the piece is placed in a primitive kind of oven or "muffle," where it is fired with a regulated heat until the paste is fused and converted into a vitreous substance, when it is allowed very gradually to cool. This is a process which, however primitively conducted, as most things are both in China and Japan, and with very simple tools and rude contrivances, is nevertheless one which requires to be watched with the greatest care and judgment. Too much heat would injure the colours, and might fuse the septa or the copper foundation, in which case the whole vessel would become misshapen, or clouded in colour and otherwise marred and rendered worthless. Apart from the risky nature of the process, the enamel colours are very valuable, and the artistic labour required in the pattern and manipulation is too great to allow cloisonné articles to become otherwise than costly even in China or Japan. And as to their reproduction in Europe, or any rivalling there, M. Christophe of Paris is understood to have devoted much time and money for the attainment of this object, and succeeded in procuring some very beautiful specimens which were exhibited at one of the international exhibitions in London; but the production proved too costly to pay as a matter of business. A good deal has been manufactured in China of late years, it is true, to meet a somewhat indiscriminating demand for articles in this great request. That these modern productions should be inferior to the original work produced in a much more leisurely way, and for temples or palaces rather than for sale in open market, will be readily understood.

The arts of champlevé and repoussé are not unknown to the Japanese, but both are less practised than the other kinds of metal work above described. Of the latter Mr Mouney, late secretary of legation in Japan, succeeded in finding and bringing away many very fine specimens in silver.

Carving.—A nation showing such artistic power in metals, and in more fictile materials such as clay, could not fail to excel in wood and ivory carving. Perhaps in no department are they better known, owing to the large number of "netsuké," as the little ivory groups of figures are called, replete with life and humour, that are to be seen in a hundred shops in every capital. These in the days now rapidly passing away used to be employed as buttons, and were as much matters of costly fancy as seals and rings or brooches with us. Whether they take wood or ivory for their material, the result is equally admirable. There are native and imported, however, as there are artists and artists. Many of the netsuké that have been imported into Europe in vast quantities of late years are but poor specimens of the Japanese carver's skill, fancy, and invention.

Wall Papers.—There is a great field for the display of their origin. Wall ality and love of variety in the wall papers, which are much used papers, to ornament their walls and screens. What has already been said of their decorative system and methods of surface ornamentation applies to their wall papers; and the system itself is nowhere so severely tried, because consisting of mechanical reproduction is unvariable. Whether stencilled or printed, the design of a single square must of necessity be the same in each. By what force of imagination and ingenuity they disguise the effect of exact repetition, and lead the eye away from noticing the uniformity, can only be realized by inspection of the papers covering the walls of an apartment, and no description could supply a substitute. Suffice it to say that their art-principles triumph, even under this servile trial.

Textile Fabrics and Embroidery.—Of textile fabrics and embroidery, in both of which they have developed an industry scarcely their own, something of the same kind may be said as of their wall papers. These fabrics have, however, been so familiarized in England by the eager adoption of the best and most novel in female costumes that their chief characteristics must be very generally known. It was the custom in former times for each daimio to have his private looms, for weaving the broadsides which he himself and his wife and family required, and also the fabrics of less costly materials for his retainers. The robes manufactured for the court at Kiôto and Yedo were in like manner only to be

Metals
and
bronze.

had from the imperial looms; some of these, a gift from the shōgun to a minister, being left of his court, were to be seen in the London exhibition of 1862.

But in many of the most common textile fabrics the best evidence perhaps may be found of the artistic feeling of the nation, and the universality of art work. Towels and dusters of the least expensive material often display very choice designs—as do also the Turkish and Syrian fabrics of the same quality. A piece of bamboo, a broken branch of blossoms, or a light of birds in counter-changed colours, suffices in their hands to produce the most charming effect, in the most perfect taste. Their embroidery has never been excelled in beauty of design, assortment of colours, and perfection of needlework.

This summary of the leading characteristics of Japanese art, and the industries to which it has been applied with such unequalled success, is much too brief to be otherwise than imperfect. The art works and the art thought of a people so truly artistic as the Japanese have proved themselves to be form a subject of wide scope and great complexity. The reports issued by the Japanese commissioners at the great exhibitions held successively in Paris in 1867 and 1873, in Vienna in 1875, and in Philadelphia in 1876; and the report written by direction of the Japanese Government for the South Kensington Museum, and now embodied in the valuable *Art Handbook on Japanese Pottery*, by Mr A. W. Franks, its editor, afford the best evidence of the extent and variety of art work for which as a nation they have now a world-wide reputation.

It is true, and strange as true, that the Japanese have apparently never sought to overstep the limits of a purely decorative art, and have thus stopped short of the art development of other nations. Whether this limitation may be from some organic defect, or is merely a result of their neglect to study the human figure and master the difficulties of rendering the fine harmony of line and proportion seen in greatest perfection there, it is difficult to determine. Certain it is, they have never advanced so far. They have always been content to treat the human figure in a conventional style, not much in advance of the Egyptian rendering, and quite incompatible with good drawing. (R. AL.)

JAPANING is the art of coating surfaces of metal, wood, &c., with a variety of varnishes, which are dried and hardened on, by means of a high temperature, in stoves or hot chambers, which drying processes constitute the main distinguishing features of the art. The trade owes its name to the fact that it is an imitation of the famous lacquering of Japan, although the latter is prepared with entirely different materials and processes, and is in all respects much more brilliant, durable, and beautiful than any ordinary japan work. Japaning is done in clear transparent varnishes, in black, and in body colours; but black japan is the most characteristic and common style of work. The varnish for black japan consists essentially of pure natural asphaltum with a proportion of gum animé dissolved in linseed oil and thinned with turpentine; but there are numerous receipts given for the varnish, and manufacturers generally conceal the composition of their own preparations. In thin layers such a japan has a rich dark brown colour, and only shows a brilliant black in thicker coatings. For fine work, which has to be smoothed and polished, several coats of black are applied in succession, each being separately dried in the stove at a heat which may rise to near 300° Fahr. Body colours consist of a basis of transparent varnish mixed with the special mineral paints of the desired colours or with bronze powders. The transparent varnish used by japaners is a copal varnish which contains less drying oil and more turpentine than is contained in ordinary painter's oil varnish. By japaning a very brilliant polished surface may be secured which is much more durable and less easily affected by heat, moisture, or other influences than any ordinary painted and varnished work. Japaning may be regarded as a process intermediate between ordinary painting and enamelling. It is very extensively applied in the finishing of ordinary ironmongery goods, and domestic iron work, deed boxes, clock dials, and papier mâché articles. The process is also applied to blocks of slate for making imita-

Bibliography.—For its knowledge of Japan Europe was for a long time indebted mainly to the members of the Dutch colony, but since the restoration of intercourse between Japan and the Western nations a very extensive literature has been accumulated, and the study of the Japanese language has become an important work among the more important. —F. Caron, *Beschryving van het malaische Koninkrijk Japan*, Amst., 1649. —F. Menjé's English version of Caron, Amst., 1669. —Kaempfer, *History of Japan*, Lond., 1725, a translation by J. Davis, 1726. —G. F. Much interesting information on Japanese matters will be found in *Annuaire de l'Extrême Orient*; *Werk der Deutschen Ges. für Natur- u. Volkskunde Ostasien* (Tokyo and Berlin), as well as in the *Transactions of the Asiatic Society of Japan* and the *Annuaire de la Soc. des Etudes japonaises*, Chinese, &c., for 1875, &c., published with assistance of Em. Burnout and other Orientalists of note.

tion of black and other marbles for chimney pieces, &c., and a modified form of japaning is employed for prepared enamelled, japan, or patent leather.

The beautiful lacquer work of Japan owes its hardness and durable qualities solely to the natural varnish which forms the basis of the lacquer. That varnish is simply an exudation from a tree (*Rhus vernicefera*) cultivated for the sake of this product throughout a wide area in Japan. The varnish is obtained by making incisions in the bark of the tree, from which a mingled clear and milky juice flows abundantly, which on exposure quickly darkens and blackens in colour. After resting in tubs for some time the juice becomes thick and viscous, the thicker portions settle at the bottom of the vessel, and from it the thinner top stratum is separated by decanting. Both qualities are strained to free them from impurities, and when ready for use they have a rich brown-black appearance, which, however, in thin layers presents a yellow transparent aspect. This varnish when applied to any object becomes exceedingly hard and unalterable, and with it as a basis all the coloured lacquers of Japan are prepared. The black variety of the lacquer is prepared by stirring the crude varnish for a day or two in the open air, by which it becomes a deep brownish black. Towards the completion of the process a quantity of highly ferruginous water, or of an infusion of gall nuts darkened with iron, is mixed with the varnish, and the stirring and exposure are continued till the added water has entirely evaporated, leaving a rich jet black varnish of proper consistence. In preparing the fine qualities of Japanese lacquer, the material receives numerous coats, and between each coating the surface is carefully ground and smoothed. The final coating is highly polished by rubbing, and the manner in which such lacquered work is finished and ornamented presents endless variations. The durability of Japanese lacquer work is such that it can be used for vessels to contain hot tea and other food, and it is even unaffected by highly heated spirituous liquors.

JAPHETH (יֶפֶת), son of Noah. The most natural rendering of Gen. x. 21 is that which makes Shem the elder brother of Japheth, though the opposite view of the passage in the A. V. follows the Hebrew accents. Interpreters are not agreed whether the sacred text regards Japheth as the second or third son of Noah. In Gen. ix. 24 "youngest" is an easier rendering than "younger," but the name of Ham is always placed between those of his brothers. The whole Biblical importance of the sons of Noah is geographical or ethnographical; even in the narrative of Gen. ix. 20-27 the point lies in the blessings assigned to the nations or groups of nations named after each. The distribution of the Japhetic group is sketched in Gen. x. 2-4 from the geographical standpoint of the Levitical narrator, that is, according to the most recent criticism, of the 6th century B.C. The seven sons of Japheth are the nations lying north of the Semitic group or westward across the Mediterranean. The details are in part obscure. Madai certainly means the Medians and Javan the Ionians, but in our passage the latter name is used in an extended sense, not so much for the Greeks proper—a common Eastern usage of the word—as for the inhabitants of the trading ports and coast-lands of the Mediterranean known to Phœnician commerce. Thus Javan includes Elishah (probably Carthage), Tarshish (Tartessus in Spain), Kittim (Cyprus), and Dodanim, for which we must rather read Rodanim (Rhodes), with the LXX. In our passage and the Hebrew of 1 Chron. i. 7. Tubal and Meshech appear in Ezek. xxvii. 13 as associated with Javan in exporting slaves and bronze to Tyre, and the same nations along with Gomer occur in Ezek. xxxviii. in the great army of Magog which issues from the "extreme north" (A. V. "north quarters," vv. 6, 15). Magog in fact means the Scythians, and whatever doubt there may be as to the identification of the associated names (Gomer, Cimmerians or Cappadocians, with the subdivisions Ascanians, Paphlagonians, and perhaps Teuthranians; Tubal, Tibareni; Meshech, Moschi), the whole group appears to be connected with the shores of the Black Sea or to be known from Phœnician voyages in that direction. The seventh son Tiras is quite unidentified; Thracians and Tyrenians are more guesses. The wide range of the Japhetic lands sufficiently explains the blessing in Gen. ix. 27, "May God enlarge Japheth." In the succeeding clause, "and let him dwell in the tents of Shem" it is disputed whether the subject is God or Japheth. In the latter case the allusion must be to friendly intercommunication and common settlements on equal terms, in contrast to the position of the subjugated Hamites (Canaan) under the lordship of the victorious Semites (Israel). The precise point of view from which the northern nations, and particularly those over the sea (Gen. x. 5), came to be grouped as sons of Japheth is the more obscure because the etymology of the name is quite uncertain. The resemblance in sound to the Greek Ιαπετός has been often noticed, but leads to nothing.

Wiss.*, February 1859; Lagarde, *Abhandlungen*, Leipzig, 1868; Slade, *Javan*, Giessen, 1880; Delitzsch, *Wo lag das Paradies*, p. 245 *sq.*, 1881.

JAROHL. See KASHI.

JARNAC, chief town of a canton in the arrondissement of Cognac, in the department of Charente, France, is situated on the right bank of the river Charente, about 8 miles east of Cognac, and 18 miles west of Angoulême. The town is well built; and a handsome avenue, planted with poplar trees, leads to the striking suspension bridge. The church contains an interesting ogival crypt. Brandy, wine, and wine-casks are made in the town. At the battle of Jarnac, fought in 1569 between 26,000 Catholics under the Duc

d'Anjou and 15,000 Protestants under Coligny and Condé, the last was treacherously shot after surrendering. A pyramid marks the spot where he fell. In the vicinity of the town are some Roman remains. Jarnac gave name to an old French family, of which the best known member is Gui Chabot, baron de Jarnac (*d. cir.* 1575), who gave rise to the proverbial phrase *coup de Jarnac* by a sudden thrust during a duel. The population in 1876 was 4390.

JAROMIERZ, a town in the department of Königinhof, Bohemia, situated at the junction of the Anpa and Elbe. It possesses a district court, a suspension-bridge, a pretty church, and a hospital, and manufactures beet-root sugar. On June 29, 1866, a skirmish between the Austrians and Prussians took place in the neighbourhood. The population in 1869 was 5442.

JARRAH WOOD is the product of a large tree (*Eucalyptus marginata*) found in western Australia, where it is said to be very abundant. The trees grow straight in the stem to a great size, and yield squared timber up to 40 feet in length and 24 inches in diameter. The wood is very hard, heavy (sp. gr. 1010), and close-grained, with a mahogany-red colour, and sometimes sufficient "figure" to render it suitable for cabinetmakers' use. The timber possesses several useful characteristics; and great expectations have been formed as to its value for shipbuilding and general constructive purposes. These expectations have not, however, been realized, and the exclusive possession of the tree has not proved that source of wealth to western Australia which was at one time expected. Its greatest merit for shipbuilding and marine purposes is due to the fact that it resists, better than any other timber, the attacks of the *Teredo navalis* and other marine borers, and on land it is equally exempt, in tropical countries, from the ravages of white ants. When felled with the sap at its lowest point and well seasoned, the wood stands exposure in the air, earth, or sea remarkably well, on which account it is in request for railway sleepers, telegraph poles, and piles in the British colonies and India. The wood, however, frequently shows longitudinal blisters, or lacunæ, filled with resin, the same as may be observed in spruce fir timber; and it is deficient in fibre, breaking with a short fracture under comparatively moderate pressure. It has been classed at Lloyd's for shipbuilding purposes in line three, table A, of the registry rules.

JARROW-ON-TYNE, a town and municipal burgh of Durham, is situated on the south bank of the Tyne, 3 miles south-west by west of South Shields, and 7 miles south-east of Newcastle, with which it is connected by rail. The parish church of St Paul, rebuilt in 1783 and again in 1866, still retains some fragments of the original Saxon edifice founded about 685. Close by are the scattered ruins of the monastery begun by the pious Bishop in 681, and consecrated with the church by Ceolfrid in 685. Within the walls of this monastery the Venerable Bede spent his life from childhood; and his body was at first buried within the church, whither, until it was removed under Edward the Confessor to Durham, it attracted many pilgrims. The other chief buildings are the various chapels, the mechanics' institute, and the hospital. Jarrow Slake is a river bay, 1 mile long by $\frac{1}{2}$ mile broad, in which it is said the fleet of King Egfrid found a station. On its banks are the new Tyne docks, formed at a great expense by the North-Eastern Railway Company. These with the quays and adjacencies cover about 300 acres, of which 50 are water surface with a tidal basin of 10 acres. The erection of the docks gave a great impetus to the trade of Jarrow. In 1877, 4,000,000 tons of coal were shipped thence. Iron shipbuilding (one yard employing 5000 hands), iron-founding, and the manufacture of paper and chemicals are the chief sources of wealth, in addition to coal-mining. In

1875 Jarrow was constituted a municipal borough, with an extent of 851 acres. The population in 1881 was 25,296. Previous to 1875 Jarrow had been a local board district; this had the population in 1871 of 18,115.

JASHAR, Book of. See HERREW LANGUAGE AND LITERATURE, vol. xi. p. 598.

JASHPUR, a tributary state of Chutiá Nággur, Bengal, between 22° 17' 5" and 23° 15' 30" N. lat., and between 83° 32' 50" and 84° 26' 15" E. long., with an area of 1947 square miles, is bounded on the N. and W. by the tributary state of Sargujá, on the S. by Gángpur and Udáipur, and on the E. by Lohárdágá district. The state of Jashpur consists in almost equal proportions of highland and lowland areas. On its eastern side the tableland of the Upághát (2200 feet above the sea) forms an integral part of the plateau of Chutiá Nággur; towards the west it springs abruptly from the Hetghát, with a wall buttressed at places by projecting masses of rock. The lowlands of Hetghát and of Jashpur proper lie to the south in successive steppes, broken by low hills. The plateau of Khuriá (3000–3700 feet) occupies the north-west corner of the state. The principal peaks in Jashpur are Ranjúlá (3527 feet), Kohlar (3393 feet), Bharamurio (3390 feet). The chief river is the Ib, which flows through the state from north to south; but numerous rapids render it unnavigable. The small rivers to the north are feeders of the Kanhar. Iron and gold are found; *sál*, *sínd*, ebony, and other valuable timber trees abound. Lac, *tassar*-silk, and beeswax, with cereals, oil-seeds, fibres, and cotton are produced. Jashpur, with the rest of the Sargujá group of states, was ceded to the British by the provisional engagement concluded with Madhují Bhoisá (Apa Sáhib) in 1818. Although noticed as a separate state, it was at first treated as a fief of Sargujá. It is, however, dealt with as a distinct territory.

The chief of Jashpur's annual income is £2000; the tribute to Government is £77, 10s. The total population in 1872 was 66,926, comprising 34,648 males and 32,278 females,—the Dravidian aborigines numbering 40,935; Kolarian aborigines, 14,070; semi-Hinduized aborigines, 6974; Hindus, 5124; Mahomedans, 423. The residence of the rájá is at Jagdiur or Jashpuragar.

JASMIN, JACQUES (1798–1864), a noted Gascon poet, was born at Agen, March 6, 1798. His childhood was spent in the midst of privations and all the straits of poverty, and he boasted in after-life that he had succeeded in breaking up the traditional chair in which the Jasmíns had hitherto been carried to the workhouse in sickness and old age. His father, who was a tailor, had a certain facility for making doggerel verses, which he sang or recited at fairs and such like popular gatherings; and the younger Jasmin, who used generally to accompany him, was thus early familiarized with the double part which he afterwards so successfully filled himself. When sixteen years of age he found employment at a hairdresser's shop, and subsequently started a similar business of his own on the Gravier at Agen. It is opposite this scene of his ripening genius and daily work that a statue has been erected to his memory by public subscription. In 1835 he published his first volume of *Papillotes* ("Curl Papers"), containing poems in French (a language he used with a certain sense of restraint), and in the familiar Agen patois—the popular speech of the working classes—in which he was to achieve all his literary triumphs. Many of the pieces in this volume had already been printed and submitted to the public. The dialect which Jasmin spoke, though still harmonious and full of picturesque idioms, was now almost exclusively used by illiterate persons, and was greatly modified by a daily contact with French. It was, however, his native speech—the one in which he found spontaneous and adequate expression, and he lost no opportunity of making himself complete master of it

by intercourse with the rural population in outlying districts where it was spoken with less admixture. He rehabilitated, disencumbered, and in a measure reconstructed his literary medium, and then, fully realizing that his poems needed other exposition than the mere printed text, he began those numerous public recitations which so largely added to his reputation. His real poetic gift, and his flexible voice and action, fitted him admirably for this double rôle of troubadour and jongleur. In 1835 he recited his "Blind Girl of Castel-Cuille" at Bordeaux, in 1836 at Toulouse; and he met with an enthusiastic reception in both those important cities. Most of his public recitations were given for benevolent purposes,—1,500,000 francs, the proceeds of his poetical rounds, being contributed by him to the restoration of the church of Vergt and other good works. Four successive volumes of *Papillotes* were published during his lifetime, and contained amongst others the following remarkable poems, quoted in order: "The Charivari," "My Recollections" (supplemented after an interval of many years), "The Blind Girl," "Franconetto," "Martha the Simple," and "The Twin Brothers." With the exception of the "Charivari," these are all touching pictures of humble life,—in most cases real episodes,—carefully elaborated by the poet till the graphic descriptions, full of light and colour, and the admirably varied and melodious verse, seem too spontaneous and easy to have cost an effort. Jasmin was not a prolific writer, and, in spite of his impetuous nature, would work a long time at one poem, striving to realize every feeling he wished to describe, and give it its most lucid and natural expression. A verse from his spirited poem, "The Third of May," written in honour of Henry IV., and published in the first volume of *Papillotes*, is engraved on the base of the statue erected to that king at Nérac. In 1852 Jasmin's works were crowned by the Académie Française, and a pension was awarded him. The medal struck on the occasion bore the inscription "Au poëte moral et populaire." His title of "Maître es Jeux" is a distinction only conferred by the academy of Toulouse on illustrious writers. Pius IX. sent him the insignia of a knight of St Gregory the Great, and he was made chevalier of the legion of honour. He spent the latter years of his life on a small estate which he had bought near Agen and named "Papillotes," and which he describes in *Ma Bigno* ("My Vine"). Though invited to represent his native city, he refused to do so, preferring the pleasures and leisure of a country life, and wisely judging that he was no really eligible candidate for electoral honours. He died October 4, 1864. His last poem, an answer to Roman, was placed between his folded hands in his coffin.

The linguistic and literary revival in the south of France, which received such lustre from the genius of Jasmin, has now become a well-organized movement, and has extended from Gascony to Languedoc, and to Provence, where it is most marked.

JASMINE, or JESSAMINE, botanically *Jasminum*, a genus of shrubs or climbers constituting the principal part of the natural order *Jasminaceæ*, and comprising about sixty species, of which forty or more occur in the gardens of Britain. The plants of the genus are mostly natives of the warmer regions of the Old World, but there are one or two South American species. The leaves are pinnate or ternate, or sometimes apparently simple, consisting of one leaflet, articulated to the petiole. The flowers, usually white or yellow, are arranged in terminal or axillary panicles, and have a tubular 5- or 8-cleft calyx, and a cylindrical corolla-tube, with a spreading limb, two included stamens, and a two-celled ovary.

The name is derived from the Persian *yâsmîn*. Linnæus obtained a fancied etymology from *ia*, violets, and *δωμή*,

smell, but the odour of its flowers bears no resemblance to that of the violet; it is in fact so peculiar as to be incomparable, and is probably the only floral perfume which cannot be imitated by art. The common white jasmine, *Jasminum officinale*, one of the best known and most highly esteemed of British hardy ligneous climbers, is said to be a native of India, and to have been introduced about the middle of the 16th century. In the centre and south of Europe it is thoroughly acclimatized. Although it grows to the height of 12 and sometimes 20 feet, its stem is feeble and requires support; its leaves are opposite, pinnated, and dark green, the leaflets are in three pairs, with an odd one, and are pointed, the terminal one larger and with a tapering point. The fragrant white flowers bloom from June to October; and, as they are found chiefly on the young shoots, the plant should only be pruned in the autumn. Varieties with golden and silver-edged leaves and one with double flowers are known.

FIG. 1.—*Jasminum grandiflorum*, half nat. size; flower, natural size.

The Zambak or Arabian jasmine, *Jasminum Sambac*, is an evergreen white-flowered climber, 6 or 8 feet high, introduced into Britain in the latter part of the 17th century. Two varieties introduced somewhat later are respectively 3-leaved and double-flowered, and these, as well as that with normal flowers, bloom throughout the greater part of the year. On account of their exquisite fragrance the flowers are highly esteemed in the East, and are frequently referred to by the Persian and Arabian poets. An oil obtained by boiling the leaves is used to anoint the head for complaints of the eye, and an oil obtained from the roots is used medicinally to arrest the secretion of milk. The flowers of one of the double varieties, known as "Moogree," are held sacred to Vishnu, and used as votive offerings in Hindu religious ceremonies. In China the flowers of this plant, under the name of "Mo-le-hwa," are used for scenting tea. The Spanish, or Catalonian jasmine, *J. grandiflorum* (fig. 2), which grows wild on the island of Tobago, is very like *J. officinale*, but differs in the size of the leaflets; the branches are shorter and stouter, and the flowers very

much larger, and reddish underneath. By grafting it on two-year-old plants of *J. officinale*, an erect bush about 3 feet high is obtained, requiring no supports. In this way it is very extensively cultivated at Cannes and Grasse, in the south of France; the plants are set in rows, fully exposed to the sun; they come into full bearing the second year after grafting; the blossoms, which are very large and intensely fragrant, are produced from July till the end of October, but those of August and September are the most odiferous. An acre of land is said to yield about 500 lb of blossoms during the season, value £25 to £35. The aroma is extracted by the process known as "enfleurage," i.e., absorption by a fatty body, such as purified lard or olive oil. Square glass trays framed with wood about 3 inches deep are spread over with grease about half an inch thick, in which ridges are made to facilitate absorption, and sprinkled with freshly gathered flowers, which are renewed every morning during the whole time the plant remains in blossom; the trays are piled up in stacks to prevent the evaporation of the aroma; and finally the pomade is scraped off the glass, melted at as low a temperature as possible, and strained. When oil is employed as the absorbent, coarse cotton cloths previously saturated with the finest olive oil are laid on wire-gauze frames, and repeatedly covered in the same manner with fresh flowers; they are then squeezed under a press, yielding what is termed "huile antique au jasmin." 3 lb of flowers will perfume 1 lb of grease,—this is exhausted by maceration in 1 pint of rectified spirit to form the "extract."

An essential oil is distilled from jasmine in Tunis and Algeria, but its high price prevents its being used to any extent. The East Indian oil of jasmine is a compound largely contaminated with sandalwood-oil. The distinguishing characters of *J. odoratissimum* consist principally in the alternate, obtuse, ternate, and pinnate leaves, the 3-flowered terminal peduncles, and the 5-cleft yellow corolla with obtuse segments. The flowers have the advantage of retaining when dry their natural perfume, which is suggestive of a mixture of jasmine, jonquille, and orange-blossom. In China the *J. paniculatum* is cultivated as an erect shrub, known as *Sieu-hing-hwa*; it is valued for its flowers, which are used with those of *J. Sambac*, in the proportion of 10 lb of the former to 30 lb of the latter, for scenting tea—40 lb of the mixture being required for 100 lb of tea. The "narrow leaved jasmine," *J. angustifolium*, is a beautiful evergreen climber 10 to 12 feet high, found in the Coromandel forests, and introduced into Britain during the present century. Its leaves are of a bright shining green; its large terminal flowers are white with a faint tinge of red, fragrant, and blooming throughout the year. The bitter root, ground small and mixed with lime-juice and root of *Acorus Calamus*, is considered in India a good remedy for ringworm and herpes. In Cochinchina a decoction of the leaves and branches of *J. nervosum* is taken as a blood-purifier; and the bitter leaves of *J. floribundum* (called in Abyssinia "Habbez-zelim") mixed with Kousoo is considered a powerful antelmintic, especially for tape-worm; the leaves and branches are added to some fermented liquors to increase their intoxicating quality. In Sierra Leone a poultice made with the leaves of *J. noctiflorum* is applied to ulcers. The leaves of *J. hirsutum* boiled in oil are applied in India and China in cases of ophthalmia, and its root is said to be a really good remedy for snake bites. In Catalonia and in Turkey the wood of the jasmine is made into long, slender pipe-stems, highly prized by the Moors and Turks. Syrup of jasmine is made by placing in a jar alternate layers of the flowers and sugar, covering the whole with wet cloths and standing it in a cool place; the perfume is absorbed by the sugar, which is converted into a very palatable syrup.

The plant known in America as the "Carolina jasmine" (fig. 2) is not a true jasmine (see *GELSEMIUM*). Other hardy species commonly cultivated in gardens are the low or Italian yellow-flowered jasmine, *J. humile*, an erect shrub 3 or 4 feet high, with angular branches, alternate and

FIG. 2.—*Gelsemium*, half natural size; flower, nat. size.

mostly ternate leaves, blossoming from June to September; the common yellow jasmine, *J. fruticans*, a hardy deciduous shrub, 10 to 12 feet high, with weak, slender stems requiring support, and bearing yellow, odourless flowers from spring to autumn; and *J. nudiflorum*, which flowers before the leaves appear. (J. CH. S.)

JASON, grandson of the god Poseidon or of the king Cretheus, is by this descent as by his name (*Iáson*, *Iáoros*, *Iáorís*, *Iáorís*, &c., can hardly be separated from *Iás*, *Iáorí*, *Iáoves* &c., see Curt., *Gr. Gesch.*, i, note 34) connected with the seafaring Ionians and their Poseidon religion. He was the leader of the Argonautic expedition, for the details of which see ARGO NAUTS. After he returned from it he lived at Corinth with his wife Medea for many years. At last he put away Medea, in order to marry Glauce, daughter of the Corinthian king Creon. The revenge which Medea took on Jason's new wife and on her own children by him, is the subject of Euripides's greatest play. The story of Jason is one of the most famous in Greek mythology, and has run through a long course of development. Stripping off the later embellishments of poetic fancy, we find that the main outlines were not completed till the voyages of the Euboean mariners to the Hellespont and the Euxine determined the order of the incidents of the outward voyage. Beneath this outward form we find that the scenes of Jason's life are the places where Ionian mariners exerted most influence—the coasts of Thessaly and Boeotia, the Ægean islands, Corinth, and the Adriatic shores; moreover, the Minyæ, who supplied most of the Argo's crew, are closely connected with the old Ionians. The myth therefore was an accompaniment of the religion carried with them by these mariners, and preserves to us the memory of a genuine connexion once existing between these widely separate places. We can analyse the legend still further, determining the religious centre round which this historical framework has been constructed; this we shall find to be one of the commonest naturalistic myths. The sun, the ram with the golden fleece, flies through the air to the land at once of setting and of rising sun; there he is sacrificed on the shore in the fire of sunset; his skin is hung upon the tree of the nightly heaven, and guarded by

the envious power, the dragon, till it is captured by the solar hero, by whom the darkness is dispelled and the dragon slain.

JASPER, an opaque close-grained variety of quartz, variously tinted, but usually either red or brown,—the colour being due in the former case to the presence of peroxide of iron, and in the latter to the same oxide in a hydrated condition. Frequently the colour is not uniform, and if the tints be disposed in stripes or bands the mineral is termed *riband jasper*. A brown jasper occurring in nodules, and exhibiting variations of tint arranged in zones, is termed, from its locality, *Egyptian jasper*. Although the term jasper is now restricted to such varieties of quartz as present opacity, it is certain from the descriptions of classical writers that their *jaspis* or *iactris* was a stone of considerable translucency. The original jasper appears to have been green, inasmuch as it is often compared with the emerald and other green objects. Probably the jasper of the ancients included stones which we should now class as chalcedony and agate, while our jasper was then known as the *achates*. The emerald-like jasper appears to have been a green chalcedony, like the plasma and chrysoprase of modern mineralogists.

See Rev. C. W. King's *Natural History of Precious Stones*, 1865.

JASSY, JASII, or JASCHII, formerly the capital of the principality of Moldavia, and now the chief town of a district in Roumania, is situated in the valley of the Bahlui (a tributary of the Pruthi), in 47° 10' N. lat. and 27° 30' E. long., about 200 miles to the north of Bucharest. The surrounding country consists of hill and dale, and the town with its widely scattered houses intermingled with trees occupies two eminences, of which the one has a rapid and the other a very gradual ascent. The exterior aspect of the place is decidedly attractive and imposing; but the character and condition of the interior is disappointing. A large number of the houses are built of wood, the streets are irregular and dirty, and there is no satisfactory drainage. Since 1873, however, the principal streets have been paved with asphalt, &c. by W. O. Callender of London, at a cost to the town of £200,000. Jassy is the residence of a prefect, and the see of the archbishop of Moldavia; and it has a court of the first instance, a court of appeal, a number of synagogues, and about forty-seven Greek churches, including the cathedral and the church of the monastery of St Spiridon, a museum with a public library, a fine hall, and a theatre. Besides the university (which has three faculties—law, letters, and philosophy—and in 1876 numbered 22 professors and 146 pupils), there are two gymnasia in the town, one academy, several national schools (both girls' and boys'), and upwards of twenty private schools. The foundation of St Spiridon (due to the liberality of Gregorius Ghika in 1727, and available for the sick of all countries and creeds) has an income of nearly £50,000 per annum, and maintains hospitals in several towns of Moldavia. The main hospital in Jassy is a large building, and possesses a maternity institution, a midwifery school, and other auxiliaries. A society of physicians and naturalists has existed in Jassy since the early part of the century, and a number of periodicals are published in the town. In the vicinity are Belvedere Castle (the residence formerly of Stourza Citacnic), the mineral springs and convent of Galata, the water-cure establishment of Rapide, and the great ecclesiastical college of Socola. The industrial activity of Jassy is but slight,—a tobacco factory, a flour-mill, a brewery, and two or three small manufactories of aerated water making the total sum in 1878. The trade of the town is mainly in the hands of the Jews, who form a large and increasing proportion of its 90,000 inhabitants. By a branch line to Pascani, Jassy communicates with the Austrian railway system, and by a

line to Ughani with that of Russia. The town is governed by a mayor and council. Its income is to a considerable extent derived from a tax on the wines.

The inscription by which the existence of a Jassiorum municipium in the time of the Roman empire is sought to be proved lies open to grave suspicion; but the town is mentioned as early as the 14th century, and probably does derive its name from the Jassians, or Jazygians, who accompanied the Cumanian invaders. About 1564 it was made the capital of Mohlavia, instead of Szuczava, by Alexander Lapsenus. It was reduced to ashes by Sultan Soliman in 1588, and by Sobieski in 1686. By the peace of Jassy the second Russo-Turkish war was brought to a close in 1792. A Greek insurrection under Ypsilanti in 1821 led to the storming of the town by the Turks in 1822. In 1844 there was a severe conflagration. For the loss caused to the town in 1861 by the removal of the seat of government to Bucharest the constituent assembly voted £148,160, to be paid in ten annual instalments, but no payment has been made.

JÁSZ-BERÉNY, a corporate town of Hungary, and formerly capital of the Jászság (Jazygia) district (since 1876 incorporated with the Cis-Tisian county of Jász-Nagy-Kun-Szolnok), is pleasantly situated on both banks of the Zagyva, crossed there by a stone bridge, and on the Htvau-Szolnok line of railway, 39 miles east of Budapest, 47° 29' N. lat., 19° 57' E. long. It is the seat of a royal court of law and a circuit court, and has several churches, one of which is large and handsome, a Franciscan monastery, a Roman Catholic gymnasium, a high school, a guard house, and an elegant town-hall, in which are preserved archives of considerable importance. In the centre of the town the channels of the Zagyva form two islands, which are planted with trees and laid out as promenades. On one of these stands a marble bust erected (1797) in honour of the Palatine Archduke Joseph. Not far from the same place are the ruins of a fortress, where it is popularly believed that Attila, king of the Huns, was buried (453). The inhabitants of the town and neighbourhood are much engaged in agricultural pursuits and in pasturing horses, cattle, and sheep on the vast communal lands. Fairs are periodically held in the town, and the trade in field produce, fruit, grain, and cattle is generally brisk. The population at the end of 1880 amounted to 21,781, chiefly Magyars by nationality, and Roman Catholics by creed.

JÁTIVA, or SAN FELIPE DE JÁTIVA, according to the old orthography JATIVA, a city of Spain in the province of Valencia, is picturesquely situated on the margin of a beautiful and fertile huerta or plain, at the foot of an overhanging eminence, on the right bank of the Albuída, a tributary of the Júcar. The principal public building is the collegiate church, begun in 1414, it has a fine dome. There are three parish churches besides, and twelve religious houses, also a hospital. The manufactures of the place are unimportant, and its trade purely local. The population in 1877 was 14,534.

Játiva, the Scetabis of Pliny and Martial, was celebrated in the time of the Romans for its linen manufactures. It was then known also as *Veneria Augusta*. It is believed to have been of Phœnician origin. During the time of the Moors, who knew how to utilize its fine situation and fertile neighbourhood, it enjoyed great prosperity. It was taken in 1241 by James I. of Valencia, and in 1347 it received the rank of a city. In the succession war it sustained a long siege with great firmness and bravery, and, when taken at last, received from its captors the name of San Felipe. Játiva was the birthplace of the painter Ribera (1588), and to it also the historical family of the Borgas or Bojas originally belonged.

JÁTSI, an Indian people estimated to form two-fifths of the entire population of the Punjab and half that of the Rājput states. They are also widely spread through Sind, Baluchistan, and the North-Western Provinces. Their traditions indicate an immigration from Ghazni or Kandahar, but writers of authority have identified them with the ancient Getae,¹ and there is strong reason to

believe them a degraded tribe of Rājputs, whose Scythian origin has also been maintained. Dr Trumpp,² however, regards them as the first Aryan settlers in the valley of the Indus, and their language strongly favours this view. The Játaki, or Ját vernacular, retained by them with singular tenacity, is a variety of Sindhi, and a pure Sanskrit tongue, exhibiting unusually early grammatical forms. Hindu legends point to a prehistoric occupation of the Indus valley by this people, and at the time of the Mahometan conquest of Sind (712 A.D.) they, with a cognate tribe called Meds, constituted the bulk of the population. They enlisted under the banners of Mohammed Kásim, but at a later date offered a vigorous resistance to the Arab invaders. In 836 they were overthrown by Amran, who imposed on them a tribute of dogs, and used their arms to vanquish the Meds. In 1025, however, they had gathered audacity, not only to invade Mansura, and compel the abjuration of the Mussulman emir, but to attack the victorious army of Mahmūd, laden with the spoil of Somnāth. Chastisement duly ensued: a formidable flotilla, collected at Multan, shattered in thousands the comparatively defenceless Ját boats on the Indus, and annihilated their national pretensions. In recent times the valour of the race showed itself in the two sieges of Bhatpur, the seat of a Ját dynasty, in 1805 and 1826, and has long been conspicuous in the military qualities of the Sikhs. They are a migratory stock. We hear of early Ját settlements on the shores of the Persian Gulf, there was in the 9th century a Ját quarter in Antioch; and a colony established in the Chaldean marshes defied during twenty-four years the power of the caliphs, and was finally vanquished and deported to the Cilician frontier in 834. The Játas are now mainly agriculturists and cattle breeders, rearing with extraordinary skill and care large flocks of camels, in the Mekran and the desert tracts of Sind. In their settlements on the Ganges and Jumna, extending as far east as Bareilly, they are divided into two great clans, the Dhs and the Hele; while in the Punjab there are said to be one hundred different tribes. Their religion varies with locality. East of the Rávi they profess a modified Brahmanism, discarding the restrictions of caste; in the Punjab they have largely embraced Sikh tenets; while in Sind and Baluchistan they are Mahometans. They are in general a harmless, industrious people, preserving in songs and legends the memory of better times. Under favourable conditions, however, old predatory habits revive, and their wandering instinct leads them, in the guise of itinerant traders, far into Central Asia. Indeed, there is plausible though not conclusive evidence that the Gipsies owned them as progenitors.³ In appearance they are not ill-favoured, though extremely dark; they have good teeth, and large beards, sometimes stained with indigo. Their inferiority of social position, however, to some extent betrays itself in their aspect, and tends to be perpetuated by their intellectual apathy.

JAUBERT, PIERRE AMÉDÉE ÉMILIEN PROBE (1779–1847), French Orientalist, was born at Aix in Provence, June 3, 1779. He was one of the most distinguished pupils of the Orientalist Silvestre de Sacy, whose funeral discourse he pronounced in 1838. Jaubert acted as interpreter to Napoleon in Egypt in 1798–99, and on his return to Paris held various posts under Government. In 1802 he accompanied Sebastiani on his Eastern mission; and in 1804 he was with General Brune at Constantinople. Next year he was despatched to Persia to arrange an

alliance with the shah; but on the way he was seized and imprisoned in a dry cistern for four months by the pasha of Bayazid. The pasha's death freed Jaubert, who successfully accomplished his mission, and rejoined Napoleon at Warsaw in 1807. In 1818 he undertook a journey with Government aid to Tibet, whence he succeeded in introducing into France 400 Cashmere goats. The rest of his life Jaubert spent in study, in writing, and in teaching. He became professor of Persian in the Collège de France, and in 1830 was elected member of the Académie des Inscriptions. In 1841 his erudite services were still further rewarded by admission to the peerage of France, and by the rank of counsellor of state. He died at Paris, January 27, 1847.

Besides articles in the *Journal Asiatique*, we have from Jaubert *Voyage en Arménie et en Persie, fait dans les années 1805-6, 1821* (the edition of 1860 has a notice of Jaubert, by M. Sébillot); *Éléments de la Grammaire Turque*, 1823; *Géographie d'Edriss*, 1824; *Vue de Djenghis Khan*, 1841; and *Relation de l'expédition de Mohammed Saïd Ibrahim Rifaati (Tartar Turque)*, 1848. He also revised Meyendorff's *Voyage d'Orenbourg à Boukhara*, 1826; and abridged Venturi's "Grammaire et Dictionnaire de la langue Berbère," 1824 (in *Recueil de Voyages de la Société de Géographie*, tome vii.). See notices in the *Journal Asiatique*, January 1847, and the *Journal des Débats*, January 30, 1847.

JAUER, chief town of a circle in the government district of Liegnitz, in the province of Silesia, Prussia, is situated on the Wuthende Neisse. St Martin's church, recently renovated, dates from 1287-90, and the evangelical church from 1655. The castle has been a penitentiary since 1746; and in the town there is a Protestant gymnasium and a hospital. Jauer manufactures leather, buckskin, carpets, cigars, carriages, and gloves, and is especially famous for its sausages. Its weekly grain and cattle market was instituted in 1404. The population in 1875 was 10,404.

Jauer was formerly the capital of a principality embracing 1200 square miles of the principality of Schwednitz, now occupied by the circles of Jauer, Bunzlau, Löwenberg, Hirschberg, and Schönan. It was separated from Schwednitz in 1814, but lapsed to the Bohemian crown in 1822. Jauer was formerly the prosperous seat of the Silesian linen trade, but the troubles of the Thirty Years' War, in the course of which it was burned down three times, permanently injured it.

JAUHARY. Abu Nasr Isma'il ibn Hammād al-Janhary of Fārah, a district beyond the Jaxartes, on the borders of Turkestan, is one of the fathers of Arabic lexicography. After the fashion of the older Arabic philologists he completed his studies by a residence among the tribes of the Arabian desert, and finally established himself at Naisāpur, where he died by a fall from the roof of his house, leaving the revision of his great lexicon, the *Siḥāḥ al-Lughah*, incomplete. According to some accounts he committed suicide in a fit of insanity. Hajji Khalfa (iv. 91) places his death 303 A.H. (1002-3 A.D.); others give 398 or 400.

The *Siḥāḥ* has been repeatedly printed in the East, as at Bīlāik 1288 (1865), and again in 1876. Of the edition projected by Ev. Seheideus, only one part appeared in 1776. See Hamaker, *Spec. Cat.*, p. 48; Dozy, *Leyden Catalogue*, i. 67; Peters, *Gotha Cat.*, No. 878; H. Khalifa, *ut supra*.

JAULNA. See JĀLNA.

JAUNDICE (Fr. *Jaunisse*, from *jaune*, yellow), or Icterus (from its resemblance to the colour of the golden oriole, of which Pliny relates that if a jaundiced person looks upon it he recovers but the bird dies), a term in medicine applied to a yellow coloration of the skin and other parts of the body, depending in most instances on some derangement affecting the liver. This yellow colour is due to the presence in the blood of bile or of some of the elements of that secretion. Jaundice, however, must be regarded more as a symptom of some morbid condition previously existing than as a disease *per se*.

The manner in which jaundice is produced is still a

matter of debate among physicians, but it is generally admitted that there are two classes of causes, either of which may bring about this condition. In the first place any obstruction to the passage of bile from the liver into the intestinal canal is sooner or later followed by the appearance of jaundice, which in such circumstances is due to the excessive absorption of bile into the blood. To this variety the term *obstructive jaundice* is applied. But secondly, a form of jaundice may be produced by causes not embracing obstruction, but including a variety of morbid conditions affecting either the secreting structure of the liver or the state of the blood, and to this the term *non-obstructive jaundice* is applied.

Obstructive jaundice may be due to the following causes:

—(1) simple catarrh of the hepatic and common bile duct (see DIGESTIVE ORGANS), whereby the calibre of these channels is narrowed (this is frequently the result of cold or of temporary gastric disturbance, but it may become a chronic condition); (2) impaction of gall stones or plugs of hardened mucus in the ducts; (3) general congestion of the liver, either alone or in connexion with pre-existing disease in the heart or lungs; and (4) pressure of morbid growths either external to the liver or in its substance.

Obstruction from these causes may be partial or complete, and the degree of jaundice will vary accordingly, but it is to be noted that extensive organic disease of the liver may exist without the evidence of obstructive jaundice.

The effect upon the liver of impediments to the outflow of bile such as those above indicated is in the first place an increase in its size, the whole biliary passages and the liver cells being distended with retained bile. This enlargement, however, speedily subsides when the obstruction is removed, but should it persist the liver ultimately shrinks and undergoes atrophy in its whole texture. The bile thus retained is absorbed into the system, and shows itself by the yellow staining seen to a greater or less extent in all the tissues and many of the fluids of the body. The kidneys, which in such circumstances act in some measure vicariously to the liver and excrete a portion of the retained bile, are apt to become affected in their structure by the long continuance of jaundice.

The symptoms of obstructive jaundice necessarily vary according to the nature of the exciting cause, but there generally exists evidence of some morbid condition before the yellow coloration appears. Thus, if the obstruction be due to an impacted gall stone in the common or hepatic duct, there will probably be the symptoms of intense suffering characterizing "hepatic colic" (see COLIC), after which the jaundice appears. In the cases most frequently seen—those, namely, arising from simple catarrh of the bile ducts due to gastro-duodenal irritation spreading on to the liver through the common duct—the first sign to attract attention is the yellow appearance of the white of the eye, which is speedily followed by a similar colour on the skin over the body generally. The yellow tinge is most distinct where the skin is thin, as on the forehead, breast, elbows, &c. It may be also well seen in the roof of the mouth, but in the lips and gums the colour is not observed till the blood is first pressed from them. The tint varies, being in the milder cases faint, in the more severe a deep saffron yellow, while in extreme degrees of obstruction it may be of dark brown or greenish hue. The colour can scarcely, if at all, be observed in artificial light.

The urine exhibits well marked and characteristic changes in jaundice which exist even before any evidence can be detected on the skin or elsewhere. It is always of dark brown colour resembling portor, but after standing in the air it acquires a greenish tint. Its froth is greenish-yellow, and it stains with this colour any white substance. It contains not only the bile colouring matter, but also the

bile acids. The former is detected by the play of colours yielded on the addition of nitric acid, the latter by the purple colour produced by placing a piece of lump sugar in the urine tested, and adding thereto a few drops of strong sulphuric acid. This test for the bile acids is dwelt upon by Dr George Harley as an important point in serving to distinguish jaundice with obstruction from jaundice without obstruction, in the latter of which, although there is bile pigment in the urine, the bile acids are absent.

The contents of the bowels also undergo changes, being characterized chiefly by their pale clay colour, which is in proportion to the amount of hepatic obstruction, and to their consequent want of admixture with bile. For the same reason they contain a large amount of unabsorbed fatty matter, and have an extremely offensive odour.

Constitutional symptoms always attend jaundice with obstruction. The patient becomes languid, drowsy, and irritable, and has generally a slow pulse. The appetite is usually but not always diminished, a bitter taste in the mouth is complained of, while flatulent eructations arise from the stomach. Intolerable itching of the skin is a common accompaniment of jaundice, and cutaneous eruptions or boils are occasionally seen. Yellow vision appears to be present in some very rare cases. Should the jaundice depend on advancing organic disease of the liver, such as cancer, the tinge becomes gradually deeper, and the emaciation and debility more marked towards the fatal termination, which in such cases is seldom long postponed. Apart from this, however, jaundice from obstruction may exist for many years, as in those instances where the walls of the bile ducts are thickened from chronic catarrh, but where they are only partially occluded. In the common cases of acute catarrhal jaundice recovery usually takes place in two or three weeks.

The treatment of this form of jaundice bears reference to the cause giving rise to the obstruction. In the ordinary cases of simple catarrhal jaundice, or that following the passing of gall stones, a light nutritious diet (milk, soups, &c., avoiding saccharine and farinaceous substances and alcoholic stimulants), along with counter-irritation applied over the right side, and after a few days the use of laxatives which tend to promote the flow of bile, will be found to be advantageous. Rhubarb, taraxacum, podophyllum, mercury, are among the remedies which have long been employed for this purpose, but the recent researches of Professor Rutherford have brought to light certain other agents (eunymmin, iridin, leptandrin, &c.), which exercise a powerful influence as chologogues, and are now coming into use. Diaphoretics and diuretics to promote the action of the skin and kidneys are useful in jaundice. In the more chronic forms, besides the remedies above named, the waters of Carlsbad are of special efficacy. Where the jaundice depends on changes in the substance of the liver, altering its structure, such as cancerous deposit, all that can be accomplished is the palliation of symptoms, including the jaundice, which may be mitigated by the treatment already indicated. With the view of supplying bile to the alimentary canal, Dr Harley recommends the use of inspissated ox-gall in doses of 5 to 10 grains administered in capsules of gelatin.

2. *Jaundice without obstruction* is observed to occur as a symptom in certain fevers, *e.g.*, yellow fever, ague, and relapsing fever, and in pyæmia (blood poisoning), also as the effect of the action of certain poisonous substances, such as copper, mercury, antimony, phosphorus, &c., and the venom of snake bites. It is occasionally seen in new-born infants. It is sometimes suddenly induced as the result of strong mental excitement or emotion. Much difficulty has always been felt to account for this form of jaundice, and numerous theories have been advanced to explain its

occurrence. Many of such cases might probably, as Virchow observes, be found on careful investigation to depend on some obstruction in the biliary passages; but there can be no doubt that many others admit of no such explanation, and as regards these it is generally held that they are probably connected with some alteration in the colouring matter of the blood, the source, it is believed, of the bile pigment. Others suppose this form of jaundice to be due to an excess in the normal reabsorption of bile into the blood. The pathology, however, is still unsettled. Jaundice of this kind is almost always slight, and neither the urine nor the discharges from the bowels exhibit changes in appearance to such a degree as in the obstructive variety. Grave constitutional symptoms are often present, but they are less to be ascribed to the jaundice than to the disease with which it is associated.

The name *malignant jaundice* is sometimes applied to that very fatal form of disease otherwise termed acute yellow atrophy of the liver. See ATROPHY. (J. O. A.)

JAUNPUR, a British district in the lieutenant-governorship of the North-Western Provinces, India, lying between 25° 23' 15" and 26° 12' N. lat., and between 82° 10' and 83° 7' 45" E. long. It forms the north-eastern district of the Allahabad division, and is bounded on the N. and N.W. by the Oudh districts of Faizabad, Partabgarh, and Sultanpur, on the E. and N.E. by Ghazipur and Azamgarh, on the S. by Benares and Mirzapur, and on the W. by Allahabad.

The district of Jaunpur forms part of the wide Gangetic plain, and its surface is accordingly composed of a thick alluvial deposit. The whole country is closely tilled, and no waste lands break the continuous prospect of cultivated fields. The northern and central positions are richly wooded. The district is divided into two unequal parts by the sinuous channel of the Gumti, a tributary of the Ganges, which flows past the city of Jaunpur. Its total course within the district is about 90 miles, and it is nowhere fordable. It is crossed by two famous bridges, one at Jaunpur and the other 2 miles lower down. The other rivers are the Sai, Barna, Pili, and Baschi. Lakes are numerous in the north and south; the largest has a length of 8 miles.

The census of 1872 was taken upon an area of 1556 square miles, and it disclosed a total population of 1,025,961, of whom 545,752 were males and 480,209 females. Jaunpur is essentially a Hindu district, in spite of its long subjection to Mahometan rulers. The returns show 929,525 Hindus to 96,819 Mahometans, the Christian population (European and native) numbers 117. There are only two towns with more than 5000 inhabitants,—Jaunpur, 23,927, and Macchilishahr, 8715.

The ordinary soil of Jaunpur is a mixture of mould, clay, and sand; but in old river beds and the basins of temporary lakes a rich black alluvial deposit may occasionally be found. The harvests are those common to the rest of Upper India. The crops yielded are cotton, rice, *bajra*, *jowar*, *moh*, wheat, barley, oats, pulse, and other pulses. Sugar yields the greatest profit, but it requires great care. Indigo, poppy, tobacco, and vegetables are also cultivated. The Gumti is liable to sudden inundations during the rainy season, owing to the high banks it has piled up at its entrance into the Ganges, which act as dams to prevent the prompt outflow of its flooded waters. These inundations extend to its tributary the Sai. Much damage was thus effected in 1774, but the greatest recorded flood took place in September 1871, when 4000 houses in the city were swept away, besides 9000 more in villages along its banks. On the other hand, Jaunpur has been comparatively free from drought, the great plague of the north-west generally, as of the rest of India. The district is almost entirely devoted to agriculture, and its trade is confined to raw materials and food-stuffs. The principal fairs are held at Mariani in September, and at Karchuli in March; they are attended by from 20,000 to 25,000 pilgrims and traders. The Oudh and Rohilkhand railway passes through the district. There are 145 miles of metalled and 364 of unmetalled roads. The Gumti and Sai are navigable for boats of moderate burden. The climate is moist, and the temperature is more equable, and the rain more evenly distributed throughout the year, than in most districts of the North-Western Provinces. The average rainfall for 1861-70 was

43 inches; during that period the maximum was 51·6 inches, the minimum 22 inches. There are two charitable dispensaries.

In prehistoric times Jaunpur seems to have formed a portion of the Ajodhya principality, and when it first makes an appearance in authentic history it was subject to the rulers of Benares. With the rest of their dominions it fell under the yoke of the Muslimán invaders in 1194. From that time the district appears to have been ruled by a prince of the Kannyú dynasty, as a tributary of the Mahometan sultan. In 1585 Malik Sarwar Khán was sent by Muhammad Tughlak to govern the eastern province. He fixed his residence at Jaunpur, made himself independent of the Delhi court, and assumed the title of Sultan-us-Shark, or eastern emperor. For nearly a century the Sharki dynasty ruled at Jaunpur, and proved formidable rivals to the sovereigns of Delhi. The last of the dynasty was Sultan Hussain, who passed his life in a fierce and chequered struggle for supremacy with Bahol Lodi, then actual emperor at Delhi. At length, in 1478, Bahol succeeded in defeating his rival in a series of decisive engagements. He took the city of Jaunpur, but permitted the conquered Hussain to reside there, and to complete the building of his great mosque, the Jamá Masjid, which now forms the chief ornament of the town. Many other architectural works in the district still bear witness to its greatness under its independent Muslimán rulers. Under the Lodi dynasty the history of Jaunpur contains nothing more than the stereotyped narrative of provincial intrigue, contest, revolt, and bloody repression. When the last of that line was killed, a local kingdom was once more established for a short time in the district, but after the fall of Agra and Delhi Jaunpur was recovered, and the district thenceforward formed a portion of the Mughal empire. Nothing worthy of note occurred in connexion with this district until 1722, when it was transferred, with Benares, Ghásipur, and Chunar, to the nawáb wazir of Oudh, who appointed a commander to the districts with the title of *ráy* of Benares. The first connexion of the British with the district arose in 1765, when it passed for a short time into their hands after the battle of Baxar. In 1775 it was finally made over

to them by the treaty of Lucknow. From that time nothing occurred which calls for notice till the date of the mutiny. On the 5th June 1857, when the news of the Benares revolt reached Jaunpur, the Sikhs maintained. The district continued in a state of complete anarchy till the arrival of the Gurkha force from Azamgarh in September. In November the surrounding country was lost again, and it was not till May 1858 that the last smouldering embers of disaffection were stifled by the repulse of the insurgent leader at the hands of the people themselves.

JAUNPUR, a municipal town and the administrative headquarters of the above district, situated in 25° 41' 31" N. lat. and 82° 43' 38" E. long., on the northern bank of the river Gumti. Jaunpur is a very ancient city, the former capital of a considerable Mahometan kingdom, which once extended from Budáun and Etáwáh to Behar. It abounds in splendid architectural monuments, most of which belong to the Pathán period, when the rulers of Jaunpur made themselves independent of Delhi. Among the remains are the fort of Firoz, the *kannams* or baths, the Atála Masjid and the Jinjiri Masjid, mosques built by Ibrahim, the Dariba mosque constructed by two of Ibrahim's governors, the Lal Darwázá erected by the queen of Mahmud, the Jamá Masjid or great mosque of Hussain, and the splendid bridge over the Gumti, erected by Mumin Khán, governor under the Mughals, in 1569-73. During the mutiny of 1857 Jaunpur formed a centre of great disaffection. The town still possesses a considerable trade. There are two railway stations there. The population in 1872 was 23,327, comprising 12,369 Hindus and 10,949 Mahometans and 9 "others."

J A V A

Plate VIII. **A**MONG the islands of the Indian archipelago Java is not the largest, being surpassed in this regard by Borneo, New Guinea, Sumatra, and Celebes; but in every other respect it is the most important of them all. It has passed through the most remarkable vicissitudes, has been the scene of the most eventful occurrences, and possesses the noblest memorials of bygone splendour. It supports a larger population than all the other islands of the Indian Ocean together, a population as dense indeed as that of the most populous of European countries. In natural beauty it rivals the most favoured regions of the world. Through the mildness of its climate and the industry of its people it possesses a richer store of valuable productions than almost any country of equal extent can boast: its rice-fields make it the granary of the East Indian islands, and its coffee and sugar plantations are a perpetual source of wealth to Holland, the country which has the good fortune to claim its allegiance.¹

Java lies between 105° 10' and 114° 34' E. long., and between 5° 53' and 8° 40' S. lat. Its greatest length—measured from Pepper Bay in the west to Banyuwangi in the east—amounts to no less than 622 miles; its greatest breadth—from Cape Bugel in Jacara to the south coast of Jokjakarta—is only 121. The area is estimated at 49,176 square miles, nearly four times that of Holland (12,731 square miles). Both physically and administratively the island of Madura, separated from the main island by a narrow strait, must be taken along with Java; and the same is more or less the case with a number of smaller islands—Pulú Panitan or Princes' Island, lying off the most western promontory, the Thousand Islands, the Karimon-Djawa (Carimon Java) archipelago, about 50 miles to the north of Jacara, Bawaen (Bawaen), a little further to the north of Madura, the Sunanap Islands to the north-east of Madura, and Deli, Timajil, Nusa Kambangan, Sempu, and Nusa Barung off the south coast. These all being

included, the area of what is officially known as Java and Madura amounts to 51,961 square miles.²

There is a striking difference between western and eastern Java in the main features of relief. The western portion, exclusive of the northern alluvial coast-land, is a compact mass of mountains culminating in volcanic peaks nowhere interrupted by plains or lowland valleys. In the eastern and larger portion the volcanoes rise in independent clusters, and the valleys between open out into wide *champlains*. Even in the east the number of volcanic eminences is exceptionally large; and, if the whole island be taken into view, there is scarcely any region of the world of equal extent which can boast of so many. The following are those which are still in a state of activity:—Gedé (the western), Tangkuban Prahu, Guntur, Papanudyan, Tolaga Bodas, Galung-gung, Tjermé, the Slamet (sometimes called Gedé), Sendará, Sumbing, Merapi, Lawu, Welis (?), Koint, Ardjuna, Kawi (?), Tenger, Semeru or Semeru, Lamongan, Rawun, and Idjen. The loftiest of them all is Semeru, with a height of 12,238 English feet.³

¹ The orthography of East Indian names is far from constant. Even in the same Dutch book Madura and Madura, Jokjakarta, Djokjakarta, and Djekdjokarta are to be found. In the present article the *J* or *J* is usually given in the more English form of *J*, the *oe* as *oe*, and so on.

² See Jughnha's *Java*. Chronological lists of the eruptive and seismic phenomena of the island, and indeed of all the Indian archipelago, are given from time to time in the *Nat. Tijds. voor Ned. Ind.* From Dr Bergsma's report in the volume for 1880 it appears that in 1878 there were sixteen distinct earthquakes registered throughout the island. That both volcanoes and earthquakes are not without present importance among the physical agencies engaged in the new shaping of the land is shown by such facts as the following:—in 1843, according to Jughnha's estimate, Mount Guntur flung forth ashes and sand to the extent of 30 million tons; by the great eruption of Mount Galung-gung in 1822, no fewer than 114 villages were laid waste and 4000 persons destroyed; in 1867 an earthquake caused the death of 1000 people in the town of Jokjakarta alone; in 1872 the eruption of Merapi (one of the most active of the volcanoes) proved fatal to many of the inhabitants of Kadu; and the damage to be feared from the ashes thrown out by the same mountain interferes with the

³ The above general description is taken from the *Java* of Professor Veth of Leyden, the standard work on the subject.

The central ridge, in which, with the single exception of Muriá, all the volcanic peaks are situated, contains a large number of other summits upwards of 6000 feet in height, and several—such as Wallet, Pangerangu, Merbabu, Gunung Butak, G. Weliran, G. Argowulan, the Yang (Jang) mountains, G. Rante—rise beyond 9000 feet. On both the north and south sides the volcanic chain is flanked by ranges composed of Tertiary rocks; these attain an elevation on the south frequently of between 2000 and 4000 feet, and occasionally in the Praeger Regencies of 5000 or 6000 feet. To the northern flanking range belongs the whole of the island of Madura, which has its highest point in Gunung Tambuko (1541 feet). The northern versant of Java differs from the southern in the great development of its alluvial border, which in one or two places widens out into considerable plains, and from this it naturally results that the streams flowing into the Sea of Java are both in length of course and volume of water more important than those that fall into the Indian Ocean. Their number in both cases is very great; but none even of the northern streams are navigable for vessels of burden, and only a few for boats beyond the reach of the tide. They are all more or less obstructed by mud or sandbanks at their mouths. In the Sunda lands the river names are usually introduced by *Tji*, the Sunda word for river; the equivalent *Kali* is prefixed less frequently to the names in the Javanese portions of the island. The largest and in some aspects the most useful of all the rivers is the Bengawan, or river of Solo, so called from Solo, the popular name of the city of Surakarta. It is in the residency of Surakarta that it takes its rise in the plain bounded by Merapi on the W., by Lawu on the E., and by Gunung Kidul on the S., and it flows through the residencies of Madiun, Reinbang, and Surabaya. Except for the last three months of the dry season it is navigable for large boats, and during the whole year for small ones. Next in magnitude to the Solo is the Brantas, called in its lower part the Kalimas, and by Europeans the river of Surabaya. Both rivers debouch into the strait of Madura, and the rapid formation of alluvial deposits in the neighbourhood of their mouths gives abundant proof of their disintegrating agency. In 1818 the largest vessels were able to anchor in the roadstead of Surabaya; by 1825 considerable caution had to be observed; and it speedily became evident that the northern approach would soon be completely closed. Between 1850 and 1854 the lower part of the Solo river was diverted into a new channel, and a permanent fairway seemed to be secured. But the condition of the strait has again been the object of solicitude, and two different schemes have been under consideration for the removal of the lower course of the river still further to the north. All along the north coast of Java similar accretions of land are taking place; and steam dredgers have to be kept at work in all the important harbours.

The endless disturbances produced in the original condition of the strait by the continued activity of the volcanic forces render the task of the geologist peculiarly difficult. The volcanic rocks for the most part appear to rest on sedimentary rocks, and these in their turn are pretty certainly supported by granite and syenite. That the sedimentary rocks should all (the modern alluvium of course being excluded) be assigned to the Tertiary period was argued by Junghuhn from the fact that in spite of

their difference in composition and character they all contain the same class of fossils; but a few striking examples of fossils and formations that must belong to the diluvial division of the Quaternary period have been pointed out by Staring and Verbeek. Throughout the rocks remains of vertebrates are exceedingly scarce; but of invertebrates there is a great profusion.¹

In keeping with its geological structure, Java appears in general to be in the matter of economic minerals the poorest of the great islands of the archipelago.² Coal is very common, in thin strata and small "pockets," both in Java itself and in Madura and the lesser islands, but it has hitherto been found impossible to turn it to any considerable account. A variety of clays fit for bricks, earthenware, and porcelain, a peculiar kind of clay (*ampo*) eaten as a dainty by the natives, good limestone and marble, petroleum, and sulphur have been more or less regularly worked. Salt is obtained from the mud wells of Kuvu and Solo (Samarang), and saltpetre at Sutji in the department of Gresik.

Climate.—Java being situated but a short distance from the equator, with the wide expanse of the Indian Ocean extending to the south, the climate is one of tropical heat and moisture.

At Batavia, the only place where a long series of meteorological observations is available, the greatest maximum temperature of the air between 1866 and 1875 was 96.05 Fahr. in November 1877, and the lowest minimum 68.02, in September of the same year. The mean temperature during the same period, was 78.69. Taking the monthly means we find January 77.45, February 77.52, March 78.24, April 79.34, May 79.59, June 78.83, July 78.26, August 79.14, September 79.35, October 79.50, November 79.28, December 77.86. It is this long unbroken continuity of high temperatures which proves trying to the European constitution, for the new-comer seldom feels himself much oppressed by the heat. The maximum daily temperature occurs in January, June, and July at 2 o'clock and in the other months at 1 o'clock, a.m. The highest maximum of barometric pressure recorded between 1866 and 1878 was 30 inches in July 1877, and the lowest minimum 29.64 inches in December 1870. In the ten years 1866–1875 the difference between the highest daily mean and the lowest was only 0.285 of an inch.

Java is situated in the region of the south-east trade wind, and that is the prevailing direction of the wind during one half of the year, from April to October. During the other half of the year a north-west or west wind (the physical continuation of the north-east trade wind) blows with nearly equal steadiness. The former period is known as the dry season or east monsoon, and the latter as the rainy season or the west monsoon. The distinction between the dry and the rainy seasons is most marked in the eastern portion of the island; and indeed when we come as far west as Batavia it cannot be said that there is any part of the year altogether free from rain. During the dry season the well-known phenomenon of land and sea breezes is very distinctly exhibited; during the rainy season, through obvious causes, the alternation becomes much less regular.

planting of coffee in the districts of Probolinggo and Remanéh. In 1879 the Praeger Regencies were visited by several severe shocks, and a number of persons were killed. Besides the volcanoes themselves, there are a number of striking forms of volcanic activity to be observed in the island, such as the so-called mud-volcano at Grobogan, the gas-fountains or holy-fires of Melati Dorat, and the Pakarman or Gawa Upan (Valley of Poison) in Banyumas on the Dieng mountains. Hot springs are common.

¹ See Staring, "Sur l'existence du terrain diluvien à Java," in *Archives Néerlandaises*, 1867, and "Voorkomen van dil. gronden op Java," in *Verh. of Kon. Akad. van Wet., Afdel. Naturk.*, 1866; Verbeek, "Geologie van Java," in *Tijdschr. van Nat. Aardk. Veroot.*, part i.; Lorté, *Bijdrage tot de kennis der Jav. eruptiegesteenten*, Rotterdam, 1879; Martin, *Die Tertiärschichten auf Java nach den Entdeckungen von Fr. Junghuhn*, Leyden, 1879; "Sur les volcans de l'île de Java et leurs rapports avec le réseau pentagonal," in *Comptes Rendus*, tom. lxxxix. pp. 1068–1061. There has as yet been no regular geological survey of Java; and much new light may be expected from the labours which the Government has at last determined to prosecute. From Verbeek and Faurens's "Nouv. faits géol. observés à Java," in *Arch. Néerland.*, 1881, we learn that the existence of granite and other pre-Tertiary rocks, the absence of which has long been regarded as one of the chief points of difference between Java and Sumatra, is now ascertained beyond all dispute.

² See Verbeek, *De Afzwaarten in Ned. Ind.*, Batavia, 1879.

In a country of such bold and varied relief as Java, the rainfall naturally differs very strikingly according to locality both in annual amount and in distribution in time. In 1878, for example, the number of rainy days (*Natuurk. Tijds. voor Ned. Ind.*, 1880) was for Batavia (at 23 feet above the sea-level) 131, at Buitenzorg (1069 feet) 220, at Wiradessa in Pekalongan (at the sea-level) 118, and so on. According to the Batavian observations for 1864-1878, the following figures show the annual rainfall—

	Inches		Inches		Inches
1864	61.57	1869	76.22	1874	77.75
1865	73.32	1870	80.78	1875	75.82
1866	84.88	1871	89.40	1876	96.67
1867	91.03	1872	99.38	1877	85.46
1868	54.21	1873	56.77	1878	89.90

This gives a mean annual fall of 75.89 inches. During these fifteen years the largest amount registered for any twenty-four hours was 6.9 inches; and during the thirteen years from 1866 to 1878 the largest amount registered in any single hour was 3.6 inches. More than half of the annual amount of rain on an average falls in the three months December, January, and February. The following figures are the percentages for all the months according to the 1864-1878 observations:—

January	21.0	May	4.4	September	3.8
February	15.3	June	1.9	October	6.2
March	9.4	July	2.9	November	6.4
April	6.9	August	2.6	December	14.2

Between 1867 and 1877 1041 thunderstorms were observed at Batavia.—November, December, and January being the months with the greatest number, and June, July, and August those with the least.¹

Vegetation.—The vegetation of Java is rich and diversified. Few of the plants being deciduous, the island at all times presents the same appearance as the most fertile temperate regions at the height of summer. The villages and even the smaller towns are in great measure concealed from view by the abundant and abiding verdure; and their position in the landscape is to be recognized mainly by the different appearance presented by their groves and orchards. The character of the vegetation as a matter of course varies with the character of the soil; but at once more obvious and more general are the modifications conditioned by increase of elevation. Jungbunn divided the island into four botanical zones, and his division has been commonly adopted by his successors. The first or tropical zone extends from the seaboard to a height of 2000 feet; the second or that of moderate heat has its upper limit at a height of about 4500 feet; the third or comparatively cool region reaches a height of 7500 feet; and the fourth or coldest region comprises all that lies above that elevation. It need hardly be added that the lines of demarcation are far from rigid, and, if they were to follow the actual appearance of certain definite vegetable forms, would dip and rise at every advance. It is at once evident also that from the structure of the island the lowest zone has by far the most extensive area; the second indeed is only a fiftieth of the first, and the third is only a five-thousandth. The lowest zone is the region of the rice-fields and sugar plantations, of cocoa-nuts, cinnamon, and cotton. According to their character the coasts are fringed with mangroves, nipah, and other palm trees, and the kayu gabas (*Distonia scholaris*); the ponds and lakelets are covered with *Utricularia* and lotus flowers; vast prairies are clothed with the silvery alang-alang grass, broken by thickets of bamboos and patches of the taller iris grass and glagh. The second zone is the region more especially of the coffee and the tea plantations, of the areng or sugar palm, and of maize. In the forests there is a great profusion of woody lianas, rotangs, and cissus varieties. In the third zone, which consists mainly of the slopes of volcanic mountains, but also comprises a few plateaus, there is little cultivation except in the Tenger mountains, where the natives raise Indian corn, cabbage, and potatoes, and at Sumpingan

¹ See Observations made at the *Meteorological and Meteorological Observatory at Batavia* (vol. i., 1871; vol. iv., 1879).

(the highest village in Java, 6880 feet) on the Dieng plateau, where even tobacco is most successfully cultivated. The fourth zone, so far as phanerogamous plants are concerned, has a very restricted vegetation, somewhere about one hundred species being known; but there is a corresponding abundance of cryptogams: fungi are common, and mosses cover the ground and invest the trees. The whole flora of this upper region bears a strong European cast.

According to a writer in the *Tydschrift van Nijverheid en Landbouw*, 1879, not less than one-fourth to one-fifth of the area of Java is still covered with forest, in spite of the fact that in various quarters reckless destruction has been allowed to go on. The abundant moisture of the vegetation happily prevents the spread of the fires by which the natives often clear the prairies or jungles. Extensive tracts of virgin forest exist, more particularly in the south of the residences of Bantam, the Preanger Regencies, Banyumas, Pasuruan, Kediri, Probolinggo, Besuki, and Banyuwangi; and many of the principal mountains—G. Ayang, G. Tjermé, G. Slamet, G. Willis, G. Ardjuna, G. Raen, &c.—still preserve their natural covering of luxuriant foliage. In the first zone the forests are largely composed of *Magnoliaceae* and *Anonaceae*; but the loftiest trees are rather the *Mimosa acuminata*, the *Spachloca grandis*, and the *Iruba glabra*, which reach a height of 120 feet. In the second zone the first mark must be given to the mssals (*Liquidularia alingia*), the trunks of which run straight up for 90 or 100 feet before they break into branches. The tree, however, is only found in the Preanger Regencies and the contiguous portions of Buitenzorg. Among the other trees more generally characteristic of the zone are the pupa (*Schima Noronhai*), yielding fine, red, heavy timber, the ki sap (*Gordonia exaltata*), the galok (*Bischofia javanica*), the bayur (*Pterospermum Blumeana*), and *Eucalyptus densiflora*. Throughout the greater part of both the lower regions the banyan-tree and several closely allied forms are extremely common.

Hitherto comparatively little advantage has been taken of the Javanese wealth of timber. If the native states and Madura be left out of account, all the woods and forest, with the exception of such portions as have been formally disposed of to private possessors, are considered as Government property, and are managed under a new system introduced in 1874. By this the tenk forests or plantations are singled out for particular treatment. They exist in the residences of Tagal, Samarang, Jepara, Surabaya, Medjina, Kediri, and are estimated to occupy 2300 square miles. The exports where the timber trade is chiefly carried on are Batavia, Samarang, Surabaya, and Gresik. The net profit realized by the Government from the forest department was only £58,000 in 1879.

Reforestation has been commenced in various places—more particularly on the Sumbing, Sondhat, Meribatu, and Unarang. The *Eucalyptus globulus*, the jar (*Cassia florida*, Vahl), a natively growing tree indigenous to Sumatra, and the siriau (*Calophyllum pinnatum*, Bl.), are being largely employed by the Government for this purpose.

Zoology.—In respect of its fauna, Java differs from Borneo, Sumatra, and the Malay peninsula far more than these differ among themselves; and at the same time it shows close resemblances—not exhibited by Borneo and Sumatra—to the Siamese peninsula and also to the Malaya. No genus and only five or six of the ninety species of Javanese mammals are confined to the island; and of the two hundred and seventy species of land birds only forty are peculiar. Thirteen genera of mammals, including the elephant, the tapir, and the Malay bear, found in the rest of the Malay region, are altogether absent; and twenty-five Malayan genera of birds—comprising jays, gapers, bee-eaters, woodpeckers, hornbills, cuckoos, pheasants, and partridges—are in like case.²

The Javanese rhinoceros, the largest of the mammals in the island, differs from that of Sumatra in having only one horn instead of two. It ranges over the highest mountains, and its regular paths—worn into deep channels—may be traced up the steepest slopes and round the rims of even active volcanoes. Of wild swine there are two species, *Sus vittatus* in the hot region and *Sus verrucosus* in the temperate. Both are extremely abundant, and their depredations are the cause of much loss; in the residency of Japan, for instance, upwards of five thousand have been killed in two months. Not much less than the rhinoceros is the hunting or *Boa suvaticus*, to be found in all the uninhabited districts between 2000 and 7000 feet at elevation. The kilang or mink (*Cervulus orientalis*) and the rusa (*Rusa hippelaphus*) are the chief representatives of the deer

² See A. R. Wallace, *Island Life*, 1881.

kind; the former is a delicate little creature occurring singly or in pairs both in the mountains and in the coast districts; the latter, living in herds of from fifty to one hundred in the grassy "openings," gives excellent sport to the native hunters. The kangjil (*Tragulus javanicus*) is little bigger than a hare. The royal tiger—the same species as that of India—is still frequent enough in the forests to make a tiger-hunt a characteristic Javanese scene, and to permit the native princes to exhibit at times a tiger and buffalo fight.¹ The leopard is also common: in the warm region specimens are occasionally found in which the coat is almost uniformly black, the spots, however, being visible on inspection. In the tree tops, the birds find a treacherous enemy in the matjan rempak or wild cat (*Felis mindora* or *Leopardus javanicus*), about the size of a common cat, with the markings of its larger namesake. The dog-tribe is represented by the fox-hike adjag (*Cynus rutilans*), which hunts in ferocious packs.

The *Chiroptera* hold a prominent place in the fauna. Remarkable especially for its size is the hanging or flying-fox (*Pteropus edulis*), a fruit-eating bat, which may be seen hanging during the day in black clusters asleep on the trees, and in the evening hastening in dark flocks to its favourite feeding grounds in the forest. The damage these do to the young cocoa-nut trees, the maize, and the sugar-palm leads the native to snare and shoot them; and their flesh is good to eat. Smaller kinds of bats are not less abundant,—perhaps the most common species being the *Nyctidiscus Temminckii*. In certain places they congregate in myriads like swarms on the cliffs, and their excrements produce extensive guano deposits, which the natives of Surakarta and Maduin, for example, utilize as sources of saltpetre. The house of Camamen, near Besuki, is the chosen haunt of a monstrous colony which have successfully defied all efforts made to expel them. The creature known to the Europeans as a flying cat, and to the natives as the kubin, is the *Galeopithecus variegatus*, marking a sort of transition from the bats to the lemurs. Of these last Java has several species, but it is the natives for their supposed power of fascination. The apes are represented by the wou-wou (*Hylobates leuciscus*), the lutung, and kowi (*Presbytis manius* and *prius*), the surili (*Presbytis mitatus*), and, most general of all, *Macaca cynomolgus*. The existence of bantus of the wou-wous is only too distinctly proved in the second zone by the loud and cacophonous outcry from which their name is derived. The lutung or black ape prefers the temperate region, though it is met with as high as 7000 feet above the sea and as low as 2000. The *Macaca* keeps for the most part in the warm coast regions. Rats, mice, porcupines, a particular kind of hare (*Lepus javanicus*),—confined to a very limited habitat, squirrels, flying squirrels, are the Javanese representatives of the *Rodentia*; and the *Insectivora* comprise a shrew mouse, three species of *Cladobates*, and *Zylomyia sulilis*, peculiar to Java and Sumatra.

Agriculture.—In the eyes of a Javanese to lack rice is to lack food. About the introduction of this divine cereal he tells strange legends, considering it the offspring of the body of Dewi Sri. The priesthood of this goddess is more influential often than that of the Prophet; at an autumn festival the worshippers may be heard uttering the Mahometan Bismillah, and following it up with the seven-fold repetition of her name. For a full harvest the choice of a lucky day is of greater importance than the careful tillage of the field; and to ensure a proper selection the Javanese must have the "windu," the year, the month, the day, the hour. In each of the eight years of the windu a special method of ploughing, of sacrificing, praying, &c., must be employed.² The Javanese is thus far from being an enlightened cultivator even of his one indispensable grain; and, though the ancestral custom must in many cases be really the result of ancient experience, the blindfold way in which it is applied results in very bad husbandry. The cultivation of the rice appears at present to be often carried on at a dead loss. The varieties of the cereal known to the Javanese are numerous; but they are commonly grouped as *Oryza sativa*, *præcox*, *montana*, and *glutinosa*. The first is the kind mainly sown in the *sawahs* or irrigation-fields; the *montana*, on the other hand, is suited

for those in which there is no artificial irrigation,—either gogo-land, which has been only rudely cleared from the forest and brought under imperfect or temporary tillage, or the tugal, which is regularly subject year after year to the processes of husbandry.

Some idea may be formed of the extent of agricultural activity in Java from the following statement of the amount of land (in bouws,—the bouw or bahu being about 1½ acres) cultivated for their own use by the natives of Java and Madura, excluding the native states and the private properties—

	Total, i. e., 2d and 3d Columns.	With Rice as First Crop.	With any other Plant as First Crop.	With Rice as Second Crop.	With any other Plant as Second Crop.
1874	2,481,708	2,183,146	299,550	22,802	732,249
1875	2,399,770	2,095,132	297,618	91,521	685,128
1876	2,581,307	2,247,400	334,117	68,210	870,726
1877	2,613,900	2,291,135	324,711	67,860	871,662
1878	2,840,805	2,417,480	423,570	109,222	905,372

In 1879, leaving out of view the native territories and the private estates, the area under cultivation was 2,929,644 bouws. Of this aggregate, 1,554,052 bouws were *sawahs* capable of irrigation, 813,153 *sawahs* dependent on the rains, 49,218 marsh-sawahs, and 563,220 tugal fields. The system of communal proprietorship and annual redistribution of the soil largely holds throughout Java, especially in the case of the irrigated lands; in a large number of instances, it has taken the place of individual ownership within quite recent years, and in other instances the opposite process has been carried through. There are villages where the redistribution is repeated regularly every year, others where this is only done as often as the number of legitimate share-takers is increased or diminished. In some to prevent the excessive parceling of the land a certain quota of the claimants are kept in abeyance at each term of allotment. To the remainder of virgin land belongs the ownership of the same. Details will be found in the official *Betendresverre van het endrook naar de rechten van den inlander op den grond*, of which an epitome appears in *De Indische Gids*, 1880.

Besides rice the Javanese cultivate for their own use, on a smaller scale, maize (*gungau*), ground nuts, yams, *Colocasia antiquorum*, *Oleas tuberosa*, and cassava. The gardens and orchards in which their hives are culboured contain a great variety of fruits. The cocoa-nut holds an increasingly important place,—the best of the many varieties being the *idjo*; and the banana is even more common. For an account of these as well as other fruits cultivated in the native orchards (*Arctocarpus integrifolia*, &c.) see a paper by Gelpke in *De Indische Gids*, 1880.

The Javanese possess buffaloes, ordinary cattle, horses, dogs, and cats. Attempts made by the Government to introduce the ass (1841) and the camel (1848-49) were not successful. The buffalo was probably introduced by the Hindus. The ordinary cattle are of very mixed race; the Indian zebu having been crossed with the banting and with European cattle of miscellaneous origin. The horses, though small, are of excellent character, and their masters, according to their own ideas, are extremely particular in regard to purity of race. Riding comes very naturally to the Javanese; horse-races and tournaments have been in vogue amongst them from early times. The native sheep are of no value for their wool, and the finest merino, introduced by Halls in 1879, soon degenerated to the same condition.³ Bees (apparently the small stingless *Apis mellifica*) are kept by the natives of the Preanger. The attempt to introduce the European varieties made in 1877-8 has proved very much of a failure. See Buitenzorg Report, 1879.

The production of rice is not of more importance to the native Javanese than the cultivation of the coffee-plant is to their European masters. The first coffee-plants grown in Java of which we have historical accounts were brought from Kananore on the coast of Malabar in 1696; but they perished in the earthquake and flood of 1699, and the honour of reintroducing the precious shrub belongs to Hendrik Zwaardkroon.⁴ The first shipment of Javanese

¹ See, in Beauvoir's *Voyage Round the World*, a description of the mangrove of the prince of Jokjakarta.

² In the first year, for example, of the windu, *Alip*, the work is begun on Friday, and the first furrow is drawn from south to north in the middle of the field. The sacrificial feast consists mainly of rice not cooked in steam (*Soga liwet*). For details as to rice culture, its superstitions, &c., see *Bijdr. tot de T. L. en V. Kunde van Ned. Ind.*, 1874.

³ The number of buffaloes in Java (exclusive of Batavia, Surakarta, and Jokjakarta) in 1837 was 1,046,544; of cattle, 340,126; and of horses, 221,150. By 1876 the corresponding numbers were 2,285,613 buffaloes, 1,290,649 cattle, 532,616 horses. Since 1879 there are statistics for the whole island: in 1877 the buffaloes numbered 2,754,498; the cattle, 1,727,841; and the horses, 618,411. The cattle plague made its appearance in the island in 1879. See Kasteren, "De Veestapal van Java," in *De Indische Gids*, 1880.

⁴ See N. P. van den Berg, "Voortbrenging en Verbruik van Koffie" (*Tydsch. voor Nijver. en Landb.*, 1879). Widi Kawah is mentioned in a Kawi inscription of 856, and "Bean-soup" is included in the list of Javanese beverages by David Tappen (1867-1868).

coffee to the Netherlands was made in 1711-12; but it was not till after 1721 that the yearly exports reached any considerable amount. The aggregate quantity sold in the home market from 1711 to 1791 was 2,036,437 piculs (of 133 lb avoidr.), and this must have represented nearly the whole production of the island. By the beginning of the 19th century the annual production was 120,000 piculs, and in spite of political interruptions this had increased by 1825 to 268,000 piculs. After the introduction of the Van den Bosch system a further augmentation was effected; and from the official reports it appears that from 1840 to 1873 the amount has ranged from 769,000 to 1,334,000 piculs. During the ten years 1869-1878 the average annual produce of the Government plantations was 878,000, that of the private planters 156,000 piculs. In 1878 the actual quantity of Government coffee was 831,515 piculs, and it was estimated that the total number of full grown plants in the island was 14,180,000. The collecting warehouses were 367.

Next in importance to the coffee plant is the sugar cane. Between 1853 and 1867 the average production of Java was 1,652,112 piculs, between 1860 and 1873, 2,809,968, and between 1875 and 1880, 3,438,012, the corresponding numbers for Brazil being 1,683,200, 2,176,000 and 2,110,256. The largest harvest in any single year in Java during all that period was that of 1877, 3,721,984 piculs. The cultivation of tea, commenced by Du Bus, has also attained a considerable development; in 1879 the production amounted to upwards of 5,700,000 lb. The plantations are private enterprises on lands leased or granted as freehold by the Government. Most of them are in Batavia (Depat. Buitenzorg) and the Preanger Regencies. Cinchona is largely grown by the Government, and to some extent by the private planters. In 1879 the Government had 1,678,870 trees, the production was about 116,000 lb. Ten distinct varieties are in cultivation. *Succuba* and *Calsaya javanica* preponderating. The tobacco plant is grown nearly all the island, but most extensively in Kedu and Banjarnegara. The production for the foreign market amounted in 1879 to 7,050,000 lb.¹

The cultivation of the great wealth-giving crops of Java has long been carried on in the interest of the Government, the native peasantry being obliged to devote so much of their soil and toll to satisfy the demands of their European masters. The system by which, in this regard, the relations of the Government to the native were for a long time determined is generally known as the "culture system." Introduced in 1880 by Van den Bosch, it contained in force till 1873, and has not altogether disappeared even yet. As far back as 1856 modifications of its arrangements were introduced by Duljmaer van Twist; and the position of the native was further improved by Sloet van de Beele. The reforms were for a time retarded by Governor Myer; but in 1870, under the colonial minister, Waal, a new agrarian law was passed which permitted the cession of uncultivated ground to Europeans on a lease of seventy-five years. The principal object of the "culture system" was the coffee plant, and it is only gradually that the restrictions of the old regulation have been relaxed. In 1873 a new regulation was introduced into the Preanger Regencies; in 1875 it was extended to the rest of the island with the exception of Pasuruan and the Tenger mountains; and in 1877 it was made applicable in Pasuruan likewise. By this new system the large plantations at a distance from the abodes of the "culture" peasants are to be replaced by smaller plantations near the villages; no service is demanded from those whose lands and gardens are below a definite minimum, and the people cannot be called out for field work on *any* day; after the coffee plants is the greatest number that any one can be called on to plant in a year. The general scope of the new legislation is to leave as much as possible to private initiative, native and European, and it will be a long time before the leading strings can be altogether dropped. In the words of Mr Kosteren,—"The Javaanse knows no freedom. His whole existence is 'regimentation' if he is bound to render 'culture'-service, the administration shows him to what department to apply himself, and he must obey. If he is not bound to render 'culture'-service, but has the position of a so-called free agriculturalist, the administration prescribes the time and method of sowing and planting his land. If he wishes to fix his habitation outside his village, the village chief may prevent him. If he has a dwelling of his own, the administration decides for him what sort of materials he must use for the roof. If he has a hanging night lamp in his bamboo hut, he must not hang it against the wall."

¹ In regard to coffee, sugar, cinchona, &c., see K. W. van Gorkom, *De Oost-Indische Cultures in Betrekking tot Handel en Nijverheid*, Amsterdam, 1881.

dual being 52 per annum. To watch the Government warehouses, to escort prisoners, to keep the roads and bridges in repair, to give assistance to persons travelling in the public service, are some of the many tasks which the native is called on to perform.

Mechanic Arts.—In these the Javanese are in advance of the other peoples of the archipelago. Of thirty different crafts practised among them, the most important are those of the blacksmith or cutter, the carpenter, the kris-sheath-maker, the copper-smith, the goldsmith, and the potter. Their skill in the working of the metals is the more noteworthy as they have to import the raw materials. The most esteemed product of the blacksmith's skill is the kris, every man and boy above the age of fourteen wears one at least as part of his ordinary dress, and men of rank two and sometimes four. In the finishing and adornment of the finer weapons no expense is spared; and ancient kris of good workmanship sometimes fetch enormous prices.² The Javanese gold and silver work possesses considerable beauty, but there is nothing equal to the filigree of Sumatra; the brass musical instruments are of exceptional excellence. Both bricks and tiles are largely made, as well as a coarse unglazed pottery similar to that of Hindustan; but all the finer wares are imported from China. Cotton spinning, weaving, and dyeing are carried on for the most part as purely domestic operations by the women. The usual mode of giving variety of colour is by weaving in stripes with a succession of different-coloured yarns, but another mode is to cover with melted wax or damar the part of the cloth not intended to receive the dye. This process is naturally a slow one, and has to be repeated according to the number of colours required. As a consequence the "batiks" as the cloths thus treated are called, are in request by the wealthier classes. European imitations are easily detected, and do not pass muster; but a more rapid process of batikting by means of hand stamps has begun to be employed both by native and Chinese workers. For the most part quiet colours are preferred. To the Javanese of the present day the ancient buildings of the Hindin periods are the work of supernatural power. Except when employed by his European master he seldom builds anything more substantial than a bamboo or timber frame work; but in the details of such erections he exhibits both skill and taste. When Europeans first came to the island they found native vessels of large size well entitled to the name of ships; and, though shipbuilding proper is now carried on only under the direction of Europeans, boat-building is a very extensive native industry along the whole of the north coast—the boats sometimes reaching a burden of 50 tons.

The only one of the higher arts which the Javanese have carried to any degree of perfection is music; and in regard to the value of their efforts in this direction Europeans differ greatly. The orchestra (*gamelan*) consists of wind, string, and percussion instruments, the latter being in preponderance to the other two. (Details on the instruments will be found in Raffles, and a description of a performance in the *Tour du Monde*, 1869.) In connexion with this attention may be called to the wayang or puppet plays, in which grotesque figures of gilded leather are moved by the performer, who recites the appropriate speeches, and as occasion demands plays the part of chorus. At least one Javanese, Raden Saleh, has attained unquivalency as a painter.

Population.—The data for tracing the increase of the population are far from satisfactory; and the returns even of the present time can only be accepted as rough approximations.³ Of the following tables the first gives the totals for Java and Madura for several years, and the second the details for the individual provinces at December 31, 1878, according to the *Kolonial Tiersley* of 1880.

	Europeans,	Chinese,	Arabs, &c.	Natives.
1868	28,466	167,629	15,712	15,355,631
1869	29,139	172,280	16,826	15,610,114
1870	27,668	174,640	16,843	15,452,108
1871	28,008	161,738	19,355	16,491,068
1877	28,672	186,293	15,210	16,567,076

² The reader will find drawings of a great variety of kris blades in Raffles, Java, vol. 1.

³ In 1781 Radermacher estimated the population of Java at 2,029,915 souls; in 1798 Norderburg gave it as at least three and a half millions, and Daendels in 1808-1811 as over 3,770,000. It was certainly not on the side of excess that these estimates erred. About 1815 the first census of the population, carried out by Raffles, gave an aggregate of 4,615,270—Java 4,590,061, and Madura 25,209—of whom 4,409,250 were natives. According to Blakely's estimate (*Tydscheer Ned. Ind. Tijds.*, 1847), the total about 1846 was 9,542,045, of whom 8,973,899 were natives. The only year since 1849 in which, according to the official returns, there has been a decrease in the population is 1850, due to the famine and pestilence that prevailed in Denak and Grobogan. There appears to be about the same preponderance of male over female births in Java as in Europe.

Residences	Square Miles.	Europeans.	Chinese	Arabs and other Orientals	Natives.	Total.

Total		29,998	200,803	9,610	18,824,574	19,067,929

The population has thus increased considerably since 1872, when the return showed a total of 17,291,200. The most densely peopled districts (those occupied by the Javanese proper) have a greater number of inhabitants to the square mile than Belgium; the Sunda lands,² on the other hand, and the Madurese districts have in comparison a sparse population.

The Government returns furnish the population of only the three largest towns. At the close of 1878 Batavia (town and suburbs) contained 97,585 inhabitants, of whom 4227 were Europeans, 23,466 Chinese, 68,822 natives, and 860 Arabs, &c.; the numbers for Samarang total 78,445; were Europeans 2976, Chinese 7088, natives, 68,691, Arabs, &c., 2638, and for Surabaya (total 118,824), Europeans 4471, Chinese 8993, natives 106,599, and Arabs, &c., 1491. It thus appears that in respect of population Batavia is only second. The great bulk of the population is distributed over the country in villages usually called by Europeans *desams*, from the Low Javanese word *desa* (High Javanese *desuran*).³ Every *desa*, however small (and those containing from 100 to 1000 families are exceptionally large), forms an independent community; and no sooner does it attain to any considerable size than it sends off a score of families or so to form a new *desa*. Each lies in the midst of its own *desa* of cultivation. The general enclosure is formed by an impervious hedge of bamboos 40 to 70 feet high. Within this lie the houses, each with its own enclosure or garth, which, even when the fields are the communal property, belongs to the individual householder. In the centre of the *desa* or farm there is usually a giant *warung* or *warung* tree (*Urosigma benjanninum*), and on the west side stands the mosque. The capital of a district is only a larger *desa*, and that of a regency (in Sundanese *dayuk*, in Low Javanese *negari*), hence the familiar *negari* has the same general type, but consists of several *kompongs* or villages. The houses in the strictly Javanese districts are always built on the ground; in the Sunda lands they are raised on piles.

Administration.—The principal local European authority is known as the *resident*, who exercises judicial, financial, and administrative functions. As president of the council (*landraad*) and judge of the residency court he deals both with civil and with criminal cases; and he also acts as police magistrate in his more immediate district. Each of the *assistant residents* administers under his supervision one of the territorial departments (*afdeelingen*) into which each residency is divided. Next in rank is the European secretary of the resident, who, as occasion demands, acts as the resident's substitute as president of the council, and performs a great variety of duties as recorder, notary public, registrar, &c. Subject to the assistant resident is

the controller. "It is his first duty to look after the interests of the native population, and he may be considered as the link that connects the European with the native functionaries." His district is of so limited an extent that he is able to make a personal inspection of every portion of it once a month, and to become intimately acquainted with all the native officials within its boundaries. There is almost nothing which can be considered as affecting either the welfare of the population or the success of the Government administration which lies beyond the scope of his supervision. At the same time he is entrusted with a very small share of executive authority; his function is to observe, to advise, to report. Under the perpetual guidance of these residents, assistant residents, and controllers, a large part of the administration of the country is carried on by the native functionaries. Of these the highest is the *regent*, whose rank and right of precedence is superior even to that of all European officials below the resident. Always belonging to one of the ancient noble families, he maintains the state and retinue of an independent prince, with all the elaborate environment of Oriental etiquette. He receives a large salary from the Dutch Government, possesses, in virtue of his office, a landed estate, and exercises large authority over the people of his regency. By the European officials also he is treated with full respect and consideration. But, appointed by the governor-general, he, as with any ordinary official in the civil service, holds his office by the good-will of the Dutch Government. Insubordination is followed by dismissal; and dismissal involves the forfeiture of all the wealth and prestige which he possessed as regent. The regent's substitute is known as *patih*. The several districts of the regency (there are usually five or six) are administered by a *wedana* (*wedono*) or *demang*; and secondary subdivisions by *assistant wedanas* or *mantris* (salariat). The *wedana* has also at his disposal a considerable number of volunteer mantris not officially recognized.⁴

The following table shows the residencies and departments into which Java (with Madura) is divided.—

Bantam : Anyer, Pandeglang, Tyrlang, Lebok.
 Batavia : Batavia (town and suburbs), Moesia-Cornelis, Tangerang, Buitenzorg, Koenig.
 Preanger Regency : Bandung, Tjiralongka, Tj. Anduy (Tjanduy), Sukalumi, Sumedang, Tjak-malya, Limbangan, Sukapura, Sukapura-Jodot, Cerdan, Cheribon, Indramayu (Oemeyen), Gilah, Madjilengka, Kuningan, Tegal, Tegal (Tegal), Brebes, Pemalang.
 Pekalongan : Pekalongan, Blalang.
 Semarang : Semarang (Semarang), Salemba, Amburana (Emball-ore or Bah-roon), Umanang (Oemang), Demak, Giogolan, Kendal.
 Japara : Japara (Djeparan), Kudus, Joana (Juwana), Curuman Jawa (Kasuman Jhwa).
 Rembang : Rembang, Tuban, Bodo-Negoro, Blora.
 Surabaja : Surabaja, Givice (Giek), Mojokerto, Sidoarjo, Sidoarjo, Limanang, and the island of Bawean.
 Madura : Pamekasan, Madura, Sampanan (Sampanen), Sampang.
 Pasuruan : Pasuruan, Malang, Bangil.
 Padoeloe : Probolinggo, Kraksaan (Karskuan), Lumajang.
 Besuki : Besuki, Pematikan, Bondowoso.
 Bengawan : Banguwang, Indeleng, and Jembrana (the last two in Baly).
 Banyumas : Banyumas, Tjilatip, Purokerto, Puloagung, Bangkengana.
 Bojonegara : Bojonegara, Klaton, Lebok (Wesobok), Kebumen, Kawagayur.
 Kadja (Kedja) : Magelang, Temanggung.
 Kojolaria : Sultan territory, with eight regencies, and Paku Alams territory, forming one regency.
 Surakarta : Surakarta, Sragen, Boyohali, Klaten, Wonogiri.
 Medun : Medun, Ngawi, Puyitan, Pemojo, Magetan.
 Keters : Kediri, Ngrobo, Berbel, Blitar.

There are thus (excluding the governor-general) 22 residents and 73 assistant residents. The normal number of controllers is 100, and of *aspirant* controllers 48, there being no controllers in Batavia, Jokjokarta, or Surakarta.

Chief Towns.—The principal town of the residency of Bantam is Serang (6° 6' 45" S. lat. and 106° 8' 37" E. long.), bearing the same relation to the town of Bantam (about 6 miles distant) as New Batavia bears to Old Batavia. It is only 100 feet above the sea-level, but even this elevation renders the climate much better for Europeans than that of Bantam, and it is owing to this that Serang has come to supplant the older city. For BANTAM, see vol. iii. p. 847. Anyer lies on the coast at the narrowest part of the Sunda Straits, and vessels from Europe usually receive fresh

¹ These areas are the result of the Government survey begun in 1854. See Hengsen, *Aperçu de l'origine et du développement des royaumes. n. l. & J. Ind. (Bat., 1878)*.

² That is, the residencies of Bantam, Batavia, Kiawang, Cheribon, and the Praanger Regencies.

³ This is really a Sanskrit word, known also in British India in the compounds *desai* (i.e., *desadhipati*), *desamukhi* (i.e., *desa-mukha*), equivalent to village chief. The Sundanese quasi-equivalent is *lumbur*, and several *lumburs* or *kompongs* compose a *kalurahan* or *lurah-ship*.

⁴ See further in J. W. B. Moyer's *Java*, London, 1861.

⁵ The correct form of this name, Bantam, is getting into use in Dutch works.

provisions and water there. *Pandaglay* is 787 feet above the sea, in the vicinity are sulphur springs, both hot and cold.

BATAVIA, the capital of Dutch India, has already been described in vol. iii. p. 481.* *Mleester Cornelis*, between 6 and 7 miles from Batavia on the way to Buitenzorg, was the seat of a fort as early as the time of Valentin. It was there that Daendels established his great entrenched camp, and it was there that the battle was fought (in 1811) which placed Java in the hands of the British. About 14 miles from Batavia, *Wanayasa*, a small but busy place, with several thousand Chinese among its inhabitants. In its vicinity is Bergzigt (Bergzigt), formerly famous for its indigo. For Buitenzorg, see vol. iv. pp. 514-5

The Kravang residency is one of the least populous in the whole island. The great post road does not enter the territory; the resident has less direct authority over his district than is enjoyed by his official compere, and has no assistant resident. *Kraosang*, the old capital, has lost its importance since *Panarakarta* became the administrative centre. This place, laid out by the commissioner Da Bas, has a large native and Chinese population. At *Wanayasa*, a considerable negat, the first tea gardens on a large scale were attempted on the island.

The Preanger Regencies (Bandung, Tjandjur, Sumedang, Limbangan, Sukapura) constitute the most important of all the residencies. *Bandung*, the capital of the residency since 1864, is a flourishing place, with a handsome mosque, and a normal school for native teachers. *Tji Andjur*, which was the administrative centre up to 1864, is of similar character to Bandung, though the removal of the resident and his subordinates has produced a certain decline in its importance. *Tjitalingra*, in the very heart of the coffee districts, has developed greatly since the new system was introduced in 1870, and is certain to make further progress when the projected railways give it better communication with Bandung and Batavia. *Sumedang* is already a populous and prosperous negat. The ancient settlement of this name lay in another part of the regencies. *Cheribon* (Tjienbon) is one of the most important places in Java, though the unhealthiness of the site has caused a number of the principal Europeans to settle about 2 miles to the north at Tangkil. The church erected in 1842, the regent's residence, large warehouses for coffee and salt, and a prison are among the principal buildings. The native part of the town is to some extent laid out in European style. The Chinese quarter, large and populous, possesses the finest Chinese temple in Java. *Cheribon* is the residence of the descendants of the old sultans of Cheribon. The places are not so extensive as those of Surakarta and Jekjakarta. By the mud bank at its mouth, the Tjerbon (Shrimp River) does more harm than good to the town. The harbour is only kept available by constant dredging, but the roadstead is very good all the year round. A strange pleasure palace of Sultan Sepuh, frequently described by travellers, lies about 2 miles from Cheribon near Sunja Raja *Mamau*, a village 4 miles south-east of Cheribon, is remarkable as the only spot on the north coast of Java which is visited by *clown prau* or belly fish, a species about as large as a cod, caught in thousands, and salted by the local fishermen. *Indranayau* lies on both sides of the Tji Manuk, about 8 miles from the coast. It is mentioned as Dermayo in the old Portuguese and Dutch travels. As a port for the rice of the district of Indramayu, and for the coffee of the Preanger and Cheribon, the town seemed at one time to have a great commercial future before it, but the roadstead was safe only during the east monsoon. The river has a tendency to send its waters by the channel of the Kali Rambutan, and a process of silting up is going on rapidly. In 1876 the Government began the construction of works to prevent the change of course.

Tagal has long been one of the chief towns in Java, a foreign commerce, and native trade, industry, and fisheries, being all well developed. About 1845 Dr Bleeker estimated its population at 29,536, and, if the growth of the town has been similar to that of the residency, the total may now be set down as about 80,000. Since 1871 the harbour has been the object of various improvements. The town is regularly and well built. The native stone-cottages, carpenter, dyers, and weavers of Ikal are particularly skilful. *Pangkalang* is a thriving coast village, noteworthy for the quality of the oysters *Pangkalang* ("abodo of the kalangs") is, like Tagal, an important town. It possesses a large mosque, a Protestant church, a fort (now used as a prison and barracks), and a large number of European houses. The Chinese ward consists of neat stone or brick buildings. Dr Bleeker estimated the population at 15,000 in 1848; it must be now considerably more. The name of *Pangkalang* is associated with the smoked ducks prepared in the district. *Balang* is only 5 miles distant.

Semarang lies on the Kali Ngutun near the centre of the north coast. Round the market place are grouped the residences of the regent and his substitute, the mosque, the military hospital, the town-house (erected in 1854-1864), the Government warehouses, &c. The hospital, formerly the palace of the governor of the

north-east coast, has accommodation for 550 European patients. The town was formerly surrounded by a wall and ditch, but these were removed in 1824, and it is now protected by a fort and a coast battery. The old European portion of the town is almost the exact reproduction of a Dutch town, without the slightest accommodation to the exigencies of the climate. A new impulse was given to Semarang by the opening of the railway to Surakarta and Jekjakarta (1878). As a seaport the place is unfortunately situated: the river is long since silted up; the roads are insecure during the west monsoon; it was only after many delays that in 1879 the artificial canal, commenced in 1858 as a substitute for the river, became available, and in the opinion of the Government commissioner of 1876 it would be useless to attempt the erection of works similar to those of Batavia. *Denak*, the chief town of a residency famous in the ancient Javanese history, lies 13 miles north-east of Semarang. The mosque, erected by the first sultan of Denak, was rebuilt in 1845, and only a small part of the old structure has been preserved; but the tombs of several of the sultans are to be seen near at hand. *Salatiga* (that is, "Three Stones," with allusion to three temples now destroyed) was in early times one of the regular resting-places for ambassadors proceeding from the coast to the court of Mataram; and in the European history of Java its name is associated with the peace of 1753 and the capitulation of 1811. It is the headquarters of the only regiment of cavalry in the Dutch East Indian army. Besides the garrison, the European population numbers some 400 or 500 persons. About the same number of Europeans are settled at *Ambanawa*, which consists of the contiguous villages Pandjajir, Ambanawa, Losari, and Kupang, and lies about a mile north of the fortress Willem I., which Van den Bosch intended to make the central point of the Javanese system of defensive works. *Engoren* (1026 feet above the sea) was a place of importance as early as the time of Valentin, and in modern times has become known as a sanatorium.

Jagaya was in Valentin's days one of the most flourishing of the Javanese coast towns; and it was still a place of prosperous commerce during the British occupation; but the harbour has greatly deteriorated, and the town is declining. *Joana* has a strikingly Dutch appearance; it is often mentioned in the early narratives. *Kudus* is a place of more than 14,000 inhabitants. *Rembang*, a well-built town, contains a considerable European settlement and a number of European institutions; its population exceeds 10,000. *Surabaya*, as already mentioned, is the largest town in Java, and ranks next to Batavia in the variety of its religious, educational, charitable, and commercial institutions. It owes this position to the fact that its harbour is the best in the island. Since 1849 it has been the seat of Government dockyards and arsenals; and there are also extensive barracks, a military hospital, &c. The population includes Javanese, Madurese, Indians from Bengal, Moors, and Chinese. *Grassie* (Gresik) has a fairly good harbour, and is of special interest in the early European history of Java. *Ambanawa* ranks as the fourth town in the island; it is well built, and has a considerable European settlement. *Probolinggo* (called by the natives *Banger*), *Deauki*, and *Dangnyuwangi* are all prosperous places of from 7000 to 15,000 inhabitants. The residency of *Banyuwangi* is one of the least opened up of the whole island. *Dangnyumas* contains a population of about 10,000 inhabitants, but there are no objects worthy of particular notice. The name, equivalent to "gold-water," was bestowed by its founder Arya Suroyo Rana from the uniferous character of the river *Serayu* on which it stands. *Tjitalingra*, though not the capital of the residency, is a much more important and interesting place. It possesses the best harbour of all the south coast, situated at the mouth of the canal Kali Sewukan, which runs between the *Serayu* and the sea, and protected by the Island of Nusa Kaulungang; and it has been chosen as the seat of a principal military establishment. A battery was erected close to the town in 1878, and on Kaulungang lie the forts Kanning Holong and Kati Ngaya. The pul-village of the Segara Amukan (as the enclosed bay is called) and the stolid and impenetrable caves of the island are objects of much interest. *Purwodadi*, the chief town of Bagelen, became of some importance during the Java war as a military establishment, and is still occupied by a considerable garrison. It is laid out in a spacious style; and both the native and the Chinese quarters are well kept. The population is large, and it is an important seat of native industry.

Very similar to each other are *Surakarta* and *Jekjakarta*, the chief towns of the independent states. The former contains the palace of the sultanman or emperor, the residence of the independent prince Mangku Ngoro, the fort of Vastenburg, a Protestant church, and a considerable number of European buildings.

Tahitiants.—Leaving out of view the Europeans and the Oriental immigrants—scarcely a seventh part of the

* A plan of the town will be found in *Jaarboek van het Koninkrijk, Batavia*, 1880.

§ The village from which the residency takes its name is situated in the district of Tangreh in the Purwodadi regency. It is so called from a "luks" pillar still revered by the natives.

population—the inhabitants of Java consist of the Javanese proper, the Sundanese, and the Madurese. All three belong to the Malay stock. Between Javanese and Sundanese the distinction is mainly due to the influence of the Hindus on the former and the absence of this on the latter. Between Javanese and Madurese the distinction—not so deeply wrought—is rather to be ascribed to difference of natural environment. The Sundanese have best retained the Malay type, both in physique and fashion of life. They occupy the five residencies of Bantam, Batavia, Krawang, Cheribon, and the Preanger Regencies. The limits of the Madurese area are not so easily given. Besides the island of Madura, the residencies to the east of Surabaya and Kediri are largely occupied by them. The residencies of Tagal, Pekalongan, Banyumas, Bagelen, Kadu, Samarang, Japara, Surakarta, Jokjokarta, Rembang, Madiun, Kediri, and Surabaya have an almost purely Javanese population. Professor Veth estimates the number of the Sundanese at about 4,000,000, the Madurese at 1,600,000, and the Javanese at 11,500,000. The Javanese are the most civilized of the three peoples.

The colour of the skin in all three cases presents various shades of yellowish-brown with a touch of olive-green; and it is observed that, owing perhaps to the Hindu strain, the Javanese are generally darker than the Sundanese. The eyes are always brown or black, the hair of the head black, long, lank, and coarse. Neither breast nor limbs are provided with hair, and there is hardly even the suggestion of a beard. In stature the Malay is usually less than the European. The Sundanese is less than the Javanese proper, being seldom 5 feet in height; at the same time he is more stoutly built. The Madurese is as tall as the Javanese, and as stout as the Sundanese. The eye is usually set straight in the head in the Javanese and Madurese; among the Sundanese it is often oblique. The nose is generally flat and small, with wide nostrils; but among the Javanese it not unfrequently becomes aquiline. The lips are thick but well formed; the teeth are naturally white, but often filed and stained. The cheek bones are well developed, more particularly with the Madurese. In expressiveness of countenance the Javanese and Madurese are far in advance of the Sundanese. The women are not so well made as the men, and among the lower classes especially soon grow absolutely ugly. In the eyes of the Javanese a golden yellow complexion is the perfection of female beauty:—"She shone bright even in the dark" is the highest compliment of poetic allusion (compare Raffles, *Java*, vol. i. p. 92). To judge by their early history, the Javanese must have been a warlike and vigorous people, with somewhat of ferocity to boot. At present they are peaceable, docile, sober, simple, and industrious. The practice of running amuck is of very rare occurrence among them.

Religion.—The Javanese are nominally Mahometans, as in former times they were Buddhists and Brahmans; but in reality, not only such exceptional groups as the Kalangs of Surakarta and Jokjokarta and the Bedawis or nomad tribes of Bantam, but the great mass of the people must be considered as believers rather in the primitive animism of their ancestors, and in the essence of their creed but little removed from their ruder brethren the Dayaks of Borneo and the Battaks of Sumatra. Into the original web indeed they have from time to time introduced fragments from every religious system with which they have come into contact; and no attempt has been made to rationalize into even superficial harmony the rudest of the resulting incongruities. The number of the spirits (Hyang or Yang, and with honorific prefix Sanghyang) worshipped by the Javanese is limitless. Every village has its patron spirit, whose presence was the indispensable condition of its foundation; to his influence all the fortune, good or bad, of the village is ascribed. Under a great shadowy tree stands an altar on which the worshipper lays his offering of incense and flowers, uttering meanwhile in broken Arabic the alien formula—"There is no God but God, and Mahomet is his prophet." To every field likewise belongs its special patron spirit, to whom due reverence must be shown. Nor is protection the only office of the Hyang. Monkias causes a particular disease in the rice; Sawan produces convulsions in children; gout

and rheumatism are ascribed to the influence of Dengen; Ki or Kyai Belorong gives men wealth in exchange for their souls. Ratu Loro Kidul is princess of the southern sea, and has her seat among the caves and fiords of the southern coast. Within the region of her sway the Javanese will not speak loud lest he disturb the repose of her subject spirits. Near Rongkob in Jokjokarta, one of the places where edible nests are collected, the princess has a temple which none may enter save the priest alone; and similar temples exist in similar localities. The whole life of the Javanese, indeed, is enveloped in a mesh of mystery; not the stars only and the heavens rain influence, but from every object a spiritual emanation, invisible for the most part, but potent and exhaustless, flows forth to him for blessing or for curse. Even Mahometanism with its One God has done little more than increase the number of supersensual beings to whom he prays. To Joseph he presents offerings that he may obtain beautiful children, to Solomon for honour and rank, to Moses for bravery, to Jesus for learning. The ritual of his religion—and his whole round of life is part of his religion—is intricate almost beyond conception, and at the same time rigid and precise. Everything must be done by rule and rubric; the unwritten law handed down from father to son allows of no curtailment or modification. Each individual class of offering must be prepared in its own peculiar way; the rice, for example,—which is one of the chief sacrificial substances,—must now be white, now red, now hard, now soft.

As we ascend in the social scale we find the name of Mahometan more and more applicable; and consequently in spite of the paganism of the populace the influence of the Mahometan "priests" (this is their official title in Dutch) is widespread and real. Great prestige attaches to the name of Mecca pilgrim. In every consideration there is a mosque. Compare *INDIAN ARCHIPELAGO*, vol. xii. p. 819.

For the Christianizing of the Javanese very little has been done. In East Java the chief mission stations are Madoja Warno (with a population of 2327 souls in 1878, inclusive of seven out-stations), Kediri (698), and Malang (700), maintained by the Netherlands Missionary Society, and Japara maintained by the Dutch Baptist Society. In West Java the Netherlands Mission Union has seven stations—Tjandjar, Buitenzorg, Indramayu, Sukabumi, Sumelang, Madjalekga, and Cheribon. At Depok, 18 miles from Batavia, the Batavian Missionary Society established in 1878 a seminary for native preachers. The native church of Depok was originated by Cornelis Chastelen, who left his estate to his slaves, whom he liberated on condition of their embracing Christianity. Mr Brinkman of Samarang, appointed to Java in 1812 by the Netherlands Society, translated the New Testament into Javanese, but the work was confiscated by the Government. Gereke, an agent of the Netherlands Bible Society, was more fortunate; his versions of both the Old and the New Testament, as well as his grammar and dictionary (edited by Boorda, Anst., 1843, 1847), have seen more than one edition.¹

Language and Literature.—Javanese, Sundanese, and Madurese are the three native languages of Java and Madura. To take the least important first,—Sundanese is only spoken in its purity in the Preanger Regencies and the neighbouring parts of Bantam, Buitenzorg, Krawang, and Cheribon, and it is gradually losing ground. To Javanese it stands in the relation that Scotch stood to English about a century ago.² The main body of Madurese is distinctly different from both old and new Javanese; but it has incor-

² See Cooleman, *Handleiding tot de beoefening der Soendaneesche taal*; Grashuis, *Soendaneesche talek*, and *Soenda, taalboek*; Riggs, *Dictionary of Sundanese*, Batavia, 1869; Blussé and Kartawinata, *Hollandsch-Soendasch woordenboek*, Samarang, 1877; Oosting, *Soendasch-Nederlandsch woordenboek*, 1879.

porated a very large number of purely Javanese words.¹ In spite of these two languages and the intrusive Malay, Javanese has a full right to its name as the dominant speech of the island. It is not one language, but two. The nobles speak to the commonalty in the language of the commonalty, the commonalty to the nobles in the language of the nobles; and according to clearly understood regulations of etiquette every Javanese plays the part of nobleman or commoner to his interlocutor. The aristocratic form is known as *Krāmā* or court speech, the popular as *Ngoko*, or the "thou-ing speech" (Fr., *tutoyant*, Germ., *dusend*); and between the two forms there is a sort of compromise, the *Madja* or middle speech, employed by those who stand to each other on an equal and friendly footing, or by those who feel little constraint of etiquette. For every idea that can be expressed in the language *Krāmā* has one expression, *Ngoko* another, the two words being sometimes completely different, sometimes only differing in the termination, the beginning, or the middle. Thus every Javanese makes use of two languages, and, what is more difficult, of two languages delicately differentiated from each other. Javanese as now spoken is far from being the same as the language of the old inscriptions and manuscripts. The latter (which is usually called *Kawi*,² though some scholars

insist on the name Old Javanese) was probably based on the Javanese of Mādjakerto, while the *Krāmā* of the present day finds its type in that of Surakarta. It is easy to explain the existence of the *Krāmā* and the *Ngoko*. The Hindu conquerors of Java, in gradually adopting the speech of their Malay subjects modified it to suit their own taste and sense of superiority; and the subjects meanwhile continued to speak as they were wont. In its vocabulary Javanese *Krāmā* has a large number of words of Sanskrit origin; and in modern times there has been a considerable adoption of foreign words from and through the Dutch. *Krāmā* usually takes one form, *Ngoko* another; thus the word *particulier* appears in the former as *pedjahkelir*, in the other as *patikelir*.³ Like all the alphabets of the Indian archipelago except the Malay, the Javanese is derived from the Devanagari. When Javanese is written in Arabic characters it is called *pegon*.

Though a considerable body of Kawi literature is still extant, nothing like a history of it is possible. The date and authorship of most of the works are totally unknown. The first place may be assigned to the *Brata Yuda* (that is Sansk., *Bharata Yudha*, the conflict of the Bharatas), an epic poem dealing with the struggle between the Pandāwas and the Kōrāwas for the throne of Nāstina celebrated in parwas 5-10 of the Mahābhārata. To the conception, however, of the modern Javanese it is a purely native poem;

FIG. 1.—General View of Batavia-Budur.

its kings and heroes find their place in the native history and serve as ancestors to their noble families. (Cohen Stuart published the modern Javanese version with a Dutch translation and notes, *Bridd-Joeda*, &c., Samarang 1877. The Kawi text was lithographed at the Hague by S. Lanckhout.) Of greater antiquity probably is the *Arjuna Wicakha* (or marriage festival of Arjuna), which Professor Kern thinks may be assigned to the first half of the 11th century of the Christian era. The very name indicates its Mahābhārata origin. (Friedrich published the Kawi text from a Bali MS., and more recently we have from him *Wicakha Djarwa en Bridd-Joeda Kawi*, lithographed facsimiles of two palm leaf MSS., Batavia, 1878. *Djarwa* is the name of the poetic diction of modern Javanese.) The oldest poem of which any trace is preserved is probably the mythological *Kāndā* (i.e., tradition); the contents are to some extent known from the modern Javanese version.

In the literature of modern Javanese there exists a great variety of so-called *balada* or chronicles. It is sufficient to mention the "history" of Baron Sakender, which appears to give an account—often hardly recognizable—of the settlement of Europeans in Java (Cohen Stuart has published text and translation; Professor Veth gives an analysis of the contents), and the *Babad Tanah Djawa* (Hague, 1874, 1877), giving the history of the island to 1647 of the Javanese era. Even more numerous are the puppet-plays

which usually take their subjects from the Hindu legends or from those relating to the kingdoms of Matjapahit and Pajoutjaram (see, e.g., H. C. Humme, *Abdāsh, een Javaansche toneelspek*, Lingue, 1878).

Several Javanese specimens are also known of the best fable, which plays so important a part in Sanskrit literature (W. Palmer van den Broek, *Javaansche Vertellingen, bevattende de volgreallen van een konink, een rebel, &c.*, Lingue, 1878). To the Hindu-Javanese literature there has naturally succeeded a Mahomedan-Javanese literature consisting largely of translations or imitations of Arabic originals; it comprises religious romances, moral exhortations, and mystical treatises in great variety.

The reader may consult Rodet, *Etudes sur la littérature javanaise*; Van der Borg's account of the MSS. of the Batavian Society, Lingue, 1877; and a series of papers by C. Poensen in *Meded. van verzeij het Ned. Zendelingengenootschap*, 1880.

Antiquities.—The ruins left by the early Hindu conquerors of Java are among the most remarkable objects of interest throughout the island. Temples (or *tjemdis*, to

¹ See A. C. Vreede, *Handleiding tot de beoefening der Madoerische taal*, Leyden, 1874.

² In full form *tembung* or *būś Kawi*, i.e., the "language of poems."

³ Humboldt's study, *Ueber die Kawi Sprache*, is one of the celebrated works of modern philology; but in the absence of the necessary material it was to some extent a *tour de force*. Professor Kern's *Kawi Studien* form the most important of the more recent contributions to the investigation of the language. For modern Javanese the standard grammar is Groot and Gerike's *Javaansche Spraakkunst*, edited by Roorda (Amst., 1849).

use the Javanese name) are common in both middle and eastern Java,—in Banyumas, Bagelen, Kadu, Jokjakarta, Surakarta, and Samarang, and in Surabaya, Kediri, Pasuruan, and Probolinggo. They are absent from the Sunda lands in the one direction and from Madura in the other.

Most famous of all the temple ruins is that of Barâ-Budur. It lies a little to the west of the right bank of the Prâgâ, which falls into the Indian Ocean. A hill rising above the plain 154 feet afforded a ready site for the structure, and the lava blocks with which the ground was strewn supplied abundance of material. The accompanying view and ground plan will give some idea of the general arrangement and effect.¹ A square terrace, each side 497 feet long, encloses the hill at a height of 50 feet; 5 feet above this there is a second terrace, each side 365 feet; 11 feet higher comes a third terrace of similar shape; and then follow four other ramparts and

FIG. 2.—Ground Plan of Barâ-Budur.

four other terraces. The whole structure is crowned by a cupola 52 feet in diameter, surrounded by sixteen smaller bell-shaped cupolas. It is suggestive of the richness of the style to mention that on the outside of the wall of the second enclosure there are one hundred and four niches, each with its image of Buddha on a lotus throne hewn out of a single block 5 feet high; and between the niches are sitting figures, man and woman alternately. The inside of the same enclosure is even more richly adorned with at least five hundred out of sixty-eight bas-reliefs, representing scenes in the Buddha legend. Of the chronological date of the temple there is no certain knowledge, but it contains evidence enough in itself to fix its position in the historical movement of the Hindu creeds.

"The mixture of Buddhism and Brahmanism is best seen," says R. Friederich (*Tijdsch. der Ind. T. L. en Verkenningen*), "in the three upper and inner galleries of Jora Indur. In the first we see the history of Sakramunt from the annunciation of his descent from the heaven of Indra till his transformation into Buddha, with some scenes of his life. The thirteen first scenes in the second gallery likewise represent Buddha as a teacher with his pupils; after that it would seem as if a concordat had been formed between the different cults; we have first in three separate scenes Buddha, Vishnu (Bâra Guru), and Siva all together, and other groups follow, Buddhistic and Sivaite without distinction. It is only in the fourth gallery that we again find Buddha dominant. . . . Already in the first gallery we also see Brahmanic divinities, Garuda for example, but not in separate scenes." In my opinion the cupola is the principal and the most ancient part of the temple of Barâ-Budur; it must have been intended to serve as a *dâgoba* (*dâgoba*, i.e., a place for the enshrining of relics. I do not as yet know of any other *dâgoba* in Java; but I should not be surprised at their discovery. The *dâgoba* of Ceylon have an exterior resemblance to the Barâ-Budur cupola; but I prefer to classify it rather with the *topes* or stupas of Afghanistan."

The writer goes on to point out that the sculptures of the lower galleries are not so carefully finished; and the lions and some other subjects on the outside of the temple have never been completed. About 3 miles to the north-east of Barâ-Budur, and probably belonging to the same period, stands another beautiful temple—Tjandj Mandut or Mandut—on the left bank of the Elia before it joins the Prâgâ. It was first discovered by Hartmann, the resident of Magelang, in 1834, under the sand and ashes with which the Merapi volcano had covered it. See C. W. Meisinger's *Javaneche Oudheden*, 1852 and 1856; and Colonel Yule's account of his visit in *Journ. Roy. As. Soc. Bengal*, 1862.

On the Dieng plateau in Bagelen, mentioned as a holy mountain

in the oldest known Javanese inscription, there exists a remarkable group of temples—which has been styled the Benares of Central Java. They stand 6500 feet above the sea; and roads and stairways (locally known as Buddha's roads) lead up from the lowlands of Bagelen and Pekalongan. The stairway between Lake Mendjer and Lake Tjebong alone consisted of upwards of 4700 steps. A great subterranean channel served to drain the plateau. The Tjandis are very numerous, the largest and most beautiful being Tjandi Bina, the buildings on the best preserved the Ardja group. The buildings are unfortunately covered to about a third of their height. In the same residency as Dieng are situated the temple caves of Kutâ Ardja discovered by Kinder in 1853. They are distributed in four groups, and apparently from the linga symbol belong to the worship of Siva. Near Râgâ Djampi (Banyuwangi) are the ruins of the town of Matjan Puh—of astonishing extent, but for the most part only shapeless mounds. The town walls were 12 feet high and 6 feet broad. A temple built of white limestone is the chief ruin. It seems to belong to the late Siva period of Javanese Hindu art. The much more famous city of Mâdjâpâhit has left its ruins not far from Mâdjâkerto, in Surabaya.

Of the minor antiquities of Java the most valuable are the inscriptions on stone and copper, though, owing to the variety of the characters which have been employed, the task of deciphering and interpreting is peculiarly difficult. The proposal of the Batavian Society in 1843 to issue a *Corpus of Javanese inscriptions* came to naught; of private investigators the most successful are Friederich and Kern. The inscriptions of Batu Berang (1847) and Payerayung (1856), that on an image of Buddha now in the Berlin Museum, that on a rock in the Dieng mountains discovered by Jungkum, and that preserved at Minto House, in Scotland, are considered of special importance. At Surabaja and on the slope of Lawu, there is a peculiar series in a special character deciphered by Van der Vlis. The famous Menang Kebau inscription, being the work of Javanese settlers, belongs rather to Java than Sumatra; but Professor Kern has shown that, instead of being, as at one time supposed, the oldest epigraphic monument in the Archipelago, they really belong to the most modern Hindu period (cf. Cohen Stuart in *Bijl. tot de T. L. en v. Kijnde*, viii. 1, 1875). Of the Javanese copper plates the most important collection is Cohen Stuart's *Konink Oorkonden in Facsimile*, 1875.

The Name Java.—The origin of this name is very doubtful. It is not improbable that it was first applied either to Sumatra or to what was known of the Indian archipelago—the insular character of the several parts not being at once recognized. Java Dwipa, or "land of mille," may have been the original form² and have given rise both to the Java din of Italy and to the Je-ph-thi of Fattien, the Chinese pilgrim of the 4th or 5th century. The oldest form of the name in Arabic is apparently *Zabab*. The first epigraphic occurrence of Java is in an inscription of 1843. In Marco Polo the name is the common appellation of all the Sunda islands. The Jawa of Ibn Batuta is Sumatra; Java is his *Mul Jawa* (i.e., possibly "original Jawa"). *Jâwa* is the modern Javanese name (in the court speech *Jawi*), sometimes with *Nusa*, "island," or *Tanah*, "country," prefixed.

History.—The history of Java in its main outlines can be very briefly given; in detail it is burdened with endless complications, inconsistent accounts, and imaginative adornments. It is impossible to extract a rational narrative from the earlier *badâs* or native chronicles, and even the later are destitute of any satisfactory chronology. The first great moment in the history is the ascendancy of the Hindus, and that breaks up into three periods,—a period of Buddhism, a period of aggressive Sivaism, and a period of apparent compromise. Of the various Hindu sects that were established in the island, that of Mâdjâpâhit was the most widely dominant; its tributaries were many, and it even extended its sway into other parts of the archipelago.³ The second moment of the history is the invasion of Islam in the beginning of the 15th century; and the third is the establishment of European and more particularly of Dutch influence and authority in the island. In its general features this last and most important section reads very much like the narrative of the British subjugation of India. At the time when the Dutch East India Company began to fix its trading factories on the coast towns, the chief native state was Mataram, which had in the 16th century succeeded to the overlordship possessed by the house of Denak—one of the states that rose after the fall of Mâdjâpâhit. The "emperors of Java," as the princes of Mataram are called in the early accounts, had their capital at Kartasura, now an almost deserted place, 6 miles west of Surakarta. At first and for long the company had only forts and little fragments of territory at Jakarta (Batavia), &c., but in 1706 it obtained definite possession of the Prosegar by treaty with Mataram; and in 1745 its authority was extended over the whole north-east coast, from Cheribon to Banyuwangi. In 1755 the kingdom of Mataram

¹ See Leeman's *Bâb Boeder*, based on the MSS. of Wilsen and Brumund, and accompanied by 894 plates on elephant folio, Leyden, 1878.

² Dwipa is also part of the names *Maldive* and *Laccadive*.

³ The work entitled *Mâdjâpâhit*, by Gramberg, is an historical romance based on the somewhat extravagant accounts of this kingdom.

was divided into the two states of Surakarta and Jogyakarta, which still retain nominal independence. The kingdom of Bantam was finally subjugated in 1803. By the English occupation of the island (1811-18) the European ascendancy was rather strengthened than weakened; and the great Java war (1825-30), in which Dipa Negara made a last great struggle to maintain the position of the native dynasty, resulted in the complete success of the Dutch.

The fullest account of Java is contained in Professor Velt's *Java: Geographisch, Ethnologisch, Historisch*, 3 vols., Haarlem, 1875-80; the first volume consists of a general description of the geography, flora, fauna, inhabitants, language, &c.; the second gives a history of the native states (leaving the growth of the Dutch power already treated in detail by De Jonge, as much as possible out of view); and the third presents a topographical description of each of the

residences. The very existence of such a work implies the previous existence of a vast literature on its subject. Besides Junghuhn, Raffles, and others referred to above, and under the heading *INDIEN ARCHÆOLOGIE*, we may mention Ryckhoff van Goens, *Indische Reize*, . . . in *den Jaar* 1800, Dort, 1806; Hagedorn, *Coup d'œil sur l'île de Java*, Brussels, 1830; Pflüger von Knecht, *Skizzen von der Insel Java*, &c., 1839; Kussendragers, *Natuur en aardrijksk. beschrijving van Java*, Groningen, 1841; W. R. van Hoovel, *Reis over Java*, Amsterdam, 1849, &c.; and *Uit het Ind. leeren*, Zaltbommel, 1860; D'Almeida, *Life in Java*; Pijnappel, *Geographie van Ned. Ind.*; Hollander, *Handteeling voor de land en volkenkunde van Nederlandsch Indië*; Grunberg's historical romances, and E. D. Bokker (Mallatui), *Max Haastad of de Koffievestigten der Nederlandsche Handelsmaatschappij*, Amsterdam, 1860, are of value for their pictures of Javanese life. Professor Velt's work contains physical, historical, and topographical maps. Others on a larger scale will be found in the *Atlas van Nederland en zijne oostelijke Buitelingen*, published by A. W. Sijthoff, 1870. (II. A. W.)

JAWAROW, the chief town of a district in the Austrian crown-land of Galicia, with extensive suburbs. It contains a nunnery, and has a good grain market. The town was a favourite residence of the Polish king John Sobieski, who there received the congratulations of the pope and the Venetian republic on his success against the Turks at Vienna (1683). At Jawarow Peter the Great was betrothed to Catherine I. The population in 1869 was 8699.

JAXARTES. See SIR DARIA.

JAY (French, *Géai*), a well-known and very beautiful European bird, the *Corvus glandarius* of Linnaeus, the *Garrulus glandarius* of modern ornithologists. To this species are more or less closely allied numerous birds inhabiting the Palearctic and Indian Regions, as well as the greater part of America, but not occurring in the Antilles, in the southern portion of the Neotropical Region, or in the Ethiopian or Australian. All these birds are commonly called Jays, and form a group of the Crows or *Corvidæ*, which may fairly be considered a Subfamily, *Garrulina*. Indeed there are, or have been, systematists who would elevate the Jays to the rank of a Family, *Garrulidae*—a proceeding which seems unnecessary. Some of them have an unquestionable resemblance to the Pies, if the group now known by that name can be satisfactorily severed from the true *Corvinæ*. In structure the Jays are not readily differentiated from the Pies; but in habit, so far as is known of them, they are much more arboreal, delighting in thick coverts, seldom appearing in the open, and seeking their food on or under trees. They seem also never to walk or run when on the ground, but always to hop. The body-feathers are commonly loose and soft; and, gaily coloured as are most of the species, in few of them has the plumage the metallic glossiness it generally presents in the Pies, while the proverbial beauty of the "Jay's wing" is due to the vivid tints of blue—turquoise and cobalt, heightened by bars of jet-black, an indication of the same style of ornament being observable in the greater number of the other forms of the group, and in some predominating over nearly the whole surface. Of the many genera that have been proposed by ornithologists, perhaps about nine may be deemed sufficiently well established.

The ordinary European Jay, *Garrulus glandarius* (fig. 1), has of late years suffered so much persecution in the British Islands as to have become in many districts a rare bird. In Ireland it seems now to be indigenous to the southern half of the island only; in England generally, it is far less numerous than formerly; and Mr Lumsden (*Scottish Naturalist*, iii. pp. 230-240) has shewn that in Scotland its numbers have decreased with still greater rapidity. There is little doubt that it would have been exterminated by this time but for its stock being supplied in autumn by immigration, and for its shy and wary behaviour, especially at the breeding-season, when it becomes almost wholly mute, and thereby often escapes detection. No truthful man, however much he may love the bird, will gainsay the depredations on fruit and eggs that it at times commits; but the gardeners and gamekeepers of Britain fall into the usual

error of persons imperfectly acquainted with the ways of Nature, and, instead of taking a few simple steps to guard their charge from injury, or at most of punishing the individual birds from which they suffer, deliberately adopt methods of wholesale destruction—methods that in the case of this species are only too easy and too effectual—by proffering temptation to trespass which it is not in Jay-nature to resist, and accordingly the bird runs great chance of total extirpation. Notwithstanding the war carried on against the Jay, its varied cries and active gesticulations shew it to be a sprightly bird, and at a distance that renders its beauty-spots invisible, it is yet rendered conspicuous by its cinnamon-coloured body and pure white tail-coverts, which contrast with the deep black and rich chestnut that otherwise mark its plumage, and even the young at once assume a dress closely resembling that of the adult. The nest, generally concealed in a leafy tree or bush, is carefully built, with a lining formed of finer roots neatly interwoven. Herein from four to seven eggs, of a greenish-white closely freckled, so as to seem suffused with light olive, are laid in March or April, and the young on quitting it accompany their parents for some weeks.

FIG. 1.—European Jay.

Though the common Jay of Europe inhabits nearly the whole of this quarter of the globe south of 64° N. lat., its territory in the east of Russia is also occupied by *G. brandti*, a kindred form, which replaces it on the other side of the Ural, and ranges thence across Siberia to Japan; and again on the Lower Danube and thence to Constantinople the nearly-allied *G. krynicki* (which alone is found in southern Russia, Caucasus, and Asia Minor) shares its haunts with it.¹ It also crosses the Mediterranean to Algeria and Morocco; but there, as in southern Spain, it is probably but a winter immigrant. The three forms just named have the widest range of any of the genus. Next to them come *G. atricapillus*, reaching from Syria to Belochistan, *G. japonicus*, the ordinary Jay of southern Japan, and *G. sinensis*, the Chinese bird. Other forms have a much more

¹ Further information will possibly shew that these districts are not occupied at the same season of the year by the two forms.

limited area, as *G. cervicalis*, the local and resident Jay of Algeria, *G. hyrcanus*, found on the southern shores of the Caspian Sea, and *G. taevanus* confined to the island of Formosa. The most aberrant of the true Jays is *G. lidzhi*, a very rare species, which seems to come from some part of Japan (*vide* Salvadori, *Atti Accad. Torino*, vii. p. 474), though its exact locality is not known.

Leaving the true Jays of the genus *Garrulus*, it is expedient next to consider those of a group named, in 1831, *Perisoreus* by Bonaparte (*Saggio*, &c., *Anim. Vertebrati*, p. 43) and *Dysornithia* by Swainson (*F. B. Americana*, ii. p. 495).¹

This group contains two species—one the *Lanius infansulus* of Linnaeus and the Siberian Jay of English writers, which ranges throughout the pine-forests of the north of Europe and Asia, and the second the *Corvus canadensis* of the same author, or Canada Jay, occupying a similar station in America. The so-called Siberian Jay is one of the most entertaining birds in the world. Its versatile cries and actions, as seen and heard by those who penetrate the solitude of the northern forests it inhabits, can never

be forgotten by one who has had experience of them, any more than the pleasing sight of its rust-coloured tail, which an occasional gleam of sunshine will light up into a brilliancy quite unexpected by those who have only surveyed the bird's otherwise gloomy appearance in the glass-case of a museum. It seems scarcely to know fear, outtruding itself on the notice of any passenger who invades its haunts, and, should he halt, making itself at once a denizen of his bivouac. In confinement it speedily becomes friendly, but suitable food for it is not easily found. Linnaeus seems to have been under a misapprehension when he applied to it the trivial epithet it bears; for by none of his countrymen is it deemed an unlucky bird, but rather the reverse. In fact, no one can listen to the cheery sound of its ordinary calls with any but a hopeful feeling. The Canada Jay, or "Whiskey-Jack" (the corruption probably of a Cree name), seems to be of a similar nature, but it presents a still more sombre coloration, its nestling plumage,² indeed, being thoroughly Corvine in appearance and suggestive of its being a pristine form.

As though to make amends for the dull plumage of the species last mentioned, North America offers some of the most brilliantly coloured of the Subfamily, and the common

FIG. 2.—American Blue Jay.

Blue Jay of Canada and the Eastern States of the Union, *Cyanurus cristatus* (fig. 2), is one of the most conspicuous birds of the transatlantic woods. The account of its habits by Alexander Wilson is known to every student of ornithology, and Wilson's followers have had little to do but supplement his history with unimportant details.³ In this bird and its many allied forms, coloration, though almost confined to various tints of blue, seems to reach its climax, but want of space forbids more particular notice of them, or of the members of the other genera *Cyanocitta*, *Cyanocorax*, *Xanthura*, *Psilorhinus*, and more, which inhabit various parts of the Western continent. It remains, however, to mention the genus *Cissa*, including many beautiful forms belonging to the Indian Region, and among them the *C. speciosa* and *C. sinensis*, so often represented in Oriental drawings, though doubts may be expressed whether these birds are not more nearly related to the Pies than to the Jays. (A. N.)

JAY, JOHN (1745-1829), American statesman, was the descendant of a refugee Huguenot family, and was born at New York, December 12, 1745. After three years spent in the house of the pastor of the French church at New Rochelle, followed by four under a private tutor at home, he entered King's (now Columbia) College in 1760. On graduating there, May 15, 1764, he entered the office of Mr Kissam, an eminent New York lawyer; and in 1768 he was called to the bar. He rapidly rose into a lucrative practice, and in 1774 was married to Sarah, youngest daughter of William Livingston, afterwards governor of New Jersey. The great crisis in the fate of the American colonies was fast approaching; and, like many other clever young lawyers, Jay took an eager, active part in the proceedings that resulted in the independence of the United States. He was one of the committee of fifty selected by the citizens of New York in 1774 to correspond with other colonial committees on the subject of the Boston Port Bill. He was returned as a delegate from New York city to the continental Congress held at Philadelphia in September 1774, and, though almost the youngest member, was entrusted with drawing up the *Address to the People of Great Britain*. The numerous committees and associations which were from time to time appointed to meet the exigencies of that troubled period almost always included Jay's name. Of the second Congress also, which met at Philadelphia on May 10, 1775, Jay was a member; and his able and eloquent pen was again useful in writing addresses to the peoples of Canada and Ireland. He was a member of the secret committee of Congress for corresponding with the friends of America in Europe. In April 1776, while still retaining his seat in Congress, Jay was returned to the provincial convention of New York by New York city and county; and his consequent absence from Philadelphia deprived him of the honour of affixing his signature to the declaration of independence issued on July 4, 1776. It was Jay who drafted the constitution that was finally adopted by the New York convention; and that statesman, after acting as one of the council of safety for some time, accepted a provisional appointment as chief justice of New York State, which was afterwards confirmed under the organized constitution, with the proviso that he could hold with his judicial post no other save that of delegate to Congress "on special occasion." Such occasion was found in the secession of what is now the State of Vermont from the jurisdiction of New Hampshire and New York. Jay was sent to Congress (December 7, 1778), of which he was immediately elected president. The follow-

¹ Recent writers have preferred the former name, though it was only used subalternatively by its author, who assigned to it no characters, which the inventor of the latter was careful to do, regarding it at the same time as a genus.

² In this it was described and figured (*F. B. Americana*, ii. p. 296, pl. 55) as a distinct species, *G. brachyrhynchus*.

³ The "Blue Jay" of a recent American humorist would, however, from the locality assigned to his humble story, appear to be, not this species, but one of its western kindred—American ornithologists must determine which.

ing September his letter, written in the name of Congress, was addressed to the people of the States on the subject of currency and finance; and before the end of the year, having previously resigned his chief-justiceship and his presidency, he was despatched as plenipotentiary to Spain, where he landed January 22, 1780. The results of the mission were unsatisfactory. In addition to the fact that he was not received by the Spanish court in a formally diplomatic character, he was seriously embarrassed by the action of Congress in drawing bills upon him for more than half a million dollars, in the hope apparently that he would have received a subsidy from Spain before the bills fall due. Although by stooping to the humiliation of importuning the Spanish minister, and by accepting a number on his own personal responsibility, Jay was able to meet some of the bills, he was at length forced to protest others; and the credit of the new country was only saved by a timely subsidy from France, out of which Franklin was enabled to remit from Paris the sum required to meet the bills then due. In 1781 Jay was commissioned to act with Franklin, Adams, Jefferson, and Laurens in negotiating a peace with Great Britain. He arrived in Paris from Spain, June 23, 1782; and after a variety of negotiations, in the course of which Jay evinced a jealous suspicion of the disinterestedness of France and a punctilious attention to the dignity of his country, the provisional articles were signed on November 30, 1782, and the formal treaty on September 3, 1783. Jay resigned his commissions, and on July 24, 1784, landed as a private citizen in New York, where he was presented with the freedom of the city, and elected a delegate to Congress. On May 7th the last-named body had already chosen him to be foreign secretary; and in that post he remained till the beginning of the Federal Government in 1789. In the question of the institution of such a government he had taken a keen interest; he joined Hamilton and Madison in issuing the *Federalist*; he published anonymously (though without succeeding in concealing the authorship) *An Address to the People of New York*, in vindication of the constitution; and he ably seconded Hamilton in inducing his native State to adopt it. On September 26, 1789, he became the first chief-justice of the supreme court of the United States. During one of his sittings Harvard University conferred on him the degree of LL.D. In 1792 he consented to stand for the governorship of New York State; but the "canvassers" who scrutinized the votes disqualified the returns of three counties; and, though Jay had received an actual majority of votes, his opponent General Clinton was declared elected.

During the war between Great Britain and France, the relations between the former and the American States became critical; a definite commercial treaty seemed the only means of averting war. Chief-Justice Jay was chosen envoy to England, though not without strong opposition. He landed at Falmouth in June 1794, signed a treaty with Lord Grenville on November 19, and disembarked again at New York, May 28, 1795. Several of the articles of "Jay's Treaty," especially that which declared that a free ship did not make free cargo, were hailed at home with furious denunciation. Jay was accused of having betrayed his country; his effigy was burnt along with copies of the treaty, and even after Washington signed the ratification in August, the States were in a ferment that prevented for a time the really beneficial action of the treaty. Two days before he landed, and before the particulars of the treaty had been published, Jay had been triumphantly returned as governor of his native State, and, notwithstanding his temporary unpopularity, he was re-elected in April 1798. With the close of this second term of office in 1801, he closed his public career. Although not yet fifty-six years old, he refused all offers of office, and,

retiring to his estate near Bedford in Westchester county, New York, spent the rest of his life in rarely interrupted seclusion. His public utterances from 1821 till 1823 were mostly as president of the American Bible Society. On May 17, 1829, John Jay, in his eighty-fourth year, ended a life whose purity and integrity are commemorated in a sentence by Daniel Webster: "When the spotless ermine of the judicial robe fell on John Jay, it touched nothing less spotless than itself."

The Life of John Jay, with Selections from his Correspondence and Miscellaneous Papers, was published in 2 vols. by his son William Jay in 1833.

JAY, WILLIAM (1769-1853), dissenting preacher and religious author, was born at Tisbury in Wiltshire on May 6, 1769. The son of a stone mason, he had adopted his father's calling, when his appearance attracted the attention of the Rev. Cornelius Winter, the dissenting minister. Mr Winter at that time presided over a religious seminary at Marlborough, in which, with his advice and assistance, the young mason became a student in 1785. During the three years and a half that Jay spent at Marlborough, the wonderful preaching powers which distinguished him till the day of his death were rapidly developed. His first sermon was delivered in his seventeenth year; and before his majority he had preached nearly a thousand times. In 1788 he had even for a season occupied Rowland Hill's pulpit in London. But his youth warned him to seek more time for study, and he therefore accepted the humble pastorate of Christian Malford, near Chippenham, where he remained about two years. He had hardly spent a year in his next charge at the Hot Wells, Clifton, when he was unanimously chosen to be minister of Argyle Independent Chapel in Bath; and on January 30, 1791, he entered the sphere in which he was to spend the rest of his active life, attracting to his chapel hearers of every religious denomination and of every social and literary rank, and winning for himself a wide and solid reputation as a brilliant pulpit orator, as an earnest religious author, and as a pious minister. In 1841 the jubilee of his pastorate was celebrated; in 1852 he was requested to retire; and the continuation of sixty-three years formally ended in January 1853. He died on December 27, 1853.

As a preacher Jay was eloquent and impressive; but his expressions and style at times wanted refinement and delicacy. His sermons were often so practical and direct as to excite suspicion, though quite unfounded, of being aimed at individuals. He was fond of peculiar texts, and did not always restrain his sense of humour when in the pulpit. The popularity which his writings, especially his devotional writings, have found with a wide circle of readers vouches for their worth. In his books he is always earnest, homely, and practical, and at times attains a certain sweetness of diction and aptness of illustration. Perhaps the best known of his works are his *Morning and Evening Exercises*; *The Christian Contemplated*; *The Domestic Minister's Assistant*; and his *Discourses*. For his *Short Discourses for the Use of Families* the diploma of D.D. was conferred upon him by the college of New Jersey; but he did not avail himself of the title. Jay also wrote an excellent *Life of Rev. Cornelius Winter*, and *Memoirs of Rev. John Clarke*. An edition of Jay's Works in 12 vols. 8vo., revised by himself, was issued in 1842-44; again, reduced in price, in 1856. A new edition, in 8 vols. 8vo., was announced in 1876. For further particulars see Jay's *Autobiography*, 1861; Rev. S. Wilson's *Memoir of Jay*, 1864; Wallace's *Portraiture of Jay*, 1864; and Cyrus Jay's *Recollections of William Jay*, 1850.

JEAN D'ANGÉLY, SAINT, chief town of an arrondissement in the department of Charente-Inférieure, France, is situated in a fertile vine-bearing district on the right bank of the river Boutonne, 16 miles south-east of La Rochelle. The most interesting buildings are the ruined abbey, destroyed in 1568, two large towers used as a prison and forming the remains of a 17th century church, an embattled clock-tower dating from 1276, a handsome colonnaded market-place, and a hospital. The inhabitants are engaged in distilling brandy, wool-spinning, and the

manufacture of cast-iron tools, agricultural implements, bridges, &c.; and a trade in spirits, wines, cereals, and oil seeds is carried on. The population in 1876 was 6309.

St Jean d'Angély (*Angeracum*) owes its origin to Pippin the Short, who founded a monastery on the spot about 765. The report that the head of John the Baptist was deposited there attracted crowds of pilgrims, for whose accommodation a town gradually grew up. In 1572 the duke of Anjou captured it from the Huguenots; but they retook it soon after. Its fortifications were razed under Louis XIII.

JEBEL, JUBEL, or DJEBEL, an ancient town of Syria, is pleasantly situated on a slight eminence near the sea, about 20 miles north of Beyrout. It is surrounded by a wall, a mile and a half in circumference, with square towers at the angles, which along with the old castle at the south-east corner are attributed to the crusaders. In the gardens and vineyards that surround the town lie numerous broken granite columns,—these, with the number of ruined houses within the walls, testifying to its former importance. The stele of Jehawmelek, king of Gebal, found here is one of the most important of Phœnician monuments.¹ The small port is almost choked up with sand and ruins. The place has dwindled to a village of some 600 inhabitants.

Jebell is the Phœnician Gebal and the Byblos of the Greeks. Its inhabitants were renowned as stone-cutters (1 Kings v. 18, margin) and as shipbuilders (*Beaked xxvii. 2*); while Arrian (ii. 20, 1) represents Enylas, king of Byblos, as joining Alexander with a fleet, after that monarch had captured the city. Philo of Byblos makes it the most ancient city of Phœnicia, founded by Kronos, i.e., the Moloch (Melek) who appears from the stele of Jehawmelek to have been with Baaltis (באלטיס) the chief deity of the city. Baaltis on this stele has the characteristics of Isis-Hathor. Compare the legend that the ark with the corpse of Osiris was cast ashore at Byblos, and there found by Isis (*Plut. Mor.*, 357). The ruins of Adonis in the temple of Baaltis (Aphrodite Byblia) are described by Pseudo-Isidore, *De Des. Syr.* cap. vi. The river Adonis is the Beldran river, which flows near the town. The crusaders, after failing before it in 1099, captured "Ghblit" in 1103, but lost it again to Saladin in 1189. Under Mahometan rule it has gradually decayed. See Renan, *Mss. de Phen.*; Meyers, *Phœnicia*, ii. 1, 107; Bader-Somm's *Handbook*.

JEDBURGH, a royal and parliamentary burgh of Scotland, the county town of Roxburghshire, is situated on the river Jed, a tributary of the Tyviot, 49 miles south-east of Edinburgh, and 10 miles north of the English border. The town consists mainly of four well-paved streets diverging at right angles from the central market-square. Next to the abbey in point of historical interest is Queen Mary's house, where she resided for some time in 1566. The county prison occupies the site of the ancient castle of Jedburgh, destroyed in 1409. The abbey, one of the grandest ecclesiastical ruins in Scotland, was founded in 1118 by Prince David, afterwards David I., for the reception of certain Austin canons from St Quentin's at Beauvais. The nave, an exquisite example of the transition from Norman to Early English, measures 133½ feet by 59½ feet. With the exception of the north piers and a small portion of the wall above, which are Norman, the whole of the tower, 30 feet square and 86 feet high, belongs to the end of the 15th century. In the choir there is some very early Norman work; the south chapel of the choir affords good specimens of the Decorated period. The total length of the magnificent pile, reduced to ruins by the conflicts of which Jedburgh was so often the scene, is 235 feet. Jedburgh, one of the first Scottish towns to take up the woollen manufacture (its first mill began in 1728), at present has five factories, employing 200 hands, and producing goods—chiefly tweeds—to the annual value of about £70,000. The burgh unites with Haddington, Dunbar, North Berwick, and Lauder in returning a member to parliament. The population in 1881 was 3400.

¹ See the recent discussions by Eyring (*Z. D. M. G.*, 1876), Ilavský, (*Journal. As.*, 1879), and Ganneau (*Ét. d'Arch.*, i., 1880).

Jedburgh, the final form of a name of which eighty-two variations have been collected, does not appear before the 15th century; Jedworth, still lingering among the lower ranks as Jethart, is much more ancient; Egged, bishop of Lindisfarne (830-838), gifted that see with the village and lands of Geddewd. Before the end of the 11th century the village had become a burgh; and under David I (1124-1153) it was a royal residence, and the chief town of the Middle Marches. The town received a charter from Robert I., when in 1366 from Mary. During the troublous times on the borders in the Middle Ages, Jedburgh was an important place, and often experienced the disastrous effects of fire and sword. The phrase "Jethart Justice," meaning hanging a man and trying him afterwards, has passed into a proverb.

JEFFERSON, THOMAS (1743-1826), the third president of the United States, and the most conspicuous apostle of Democracy in America, was born April 2, 1743, at Shadwell, Albemarle county, in the State of Virginia, a region of which his father Peter Jefferson, an obscure and unlettered planter, was the third or fourth settler.

At the early age of five years Thomas was sent to an English school, and from that time until he finished his studies at William and Mary's College in 1762 appears to have enjoyed superior educational advantages, and to have turned them all to good account. He carried with him from college, at nineteen, a tolerably thorough reading knowledge of the Latin, Greek, and French languages, to which he added a familiarity with the higher mathematics and natural sciences only possessed at his age by men who have, as he had, a rare natural faculty for the prosecution of those studies. Soon after leaving college he entered the law office of Mr George Wythe, then at the head of the Virginia bar, and withal, Jefferson being judge, "the best Latin and Greek scholar in the State." In Mr Wythe he found a "faithful and beloved mentor in youth and most affectionate friend through life." In 1767, after five years' close application to the study of his profession, he was admitted to the bar. The death of his father in 1757 left Thomas, who was the eldest son, heir to the estate on which he was born, and which yielded him an income of about £400 a year, a sum in those days sufficient to gratify all his tastes, and to give him, as he matured, the position of an independent country gentleman. At the time of his admission to the bar he is described by his contemporaries as 6 feet 2 inches in height, slim, erect as an arrow, with angular features, a very ruddy complexion, an extremely delicate skin, full deep set hazel eyes, and sandy hair, an expert musician (the violin being his favourite instrument), a good dancer, a dashing rider, and a proficient in all manly exercises. He was, and continued through life, frank, earnest, cordial, and sympathetic in his manner, full of confidence in men, and sanguine in his views of life.

Though mostly known to fame as a statesman, Jefferson's success as a lawyer showed that the bar had no restraints which were not fairly within his reach. He had sixty-eight cases before the chief court of the province the first year of his practice, and nearly twice that number the second. In the fourth, his register shows that he was employed in four hundred and thirty cases. During the eight years that he continued in active practice his income had enabled him to live like a gentleman, and to add a few hundred acres to his landed estate from time to time, until his inheritance of 1900 acres had become, in 1774, 5000 acres, and all paid for. But, while fired with the Virginian passion of the period for acquiring land, Jefferson does not appear to have shared the passion which usually accompanied it, of multiplying slaves to clear and till it. He was one of the first of English-speaking statesmen with foresight enough to discover the thunders with which the dark cloud of slavery was charged, and with courage enough to warn his countrymen against them. It does not appear that he ever acquired any slaves by purchase and as an investment.

In 1787 Governor Banquier, the colonial governor of Virginia, died. The arrival of the new governor, Baron de Botetourt, in October 1768, was followed, according to usage, by the dismissal of the House of Burgesses, and a new election was ordered. Jefferson, offering himself as a candidate, was elected from the county of Albemarle, and continued to be annually re-elected until the House of Burgesses was closed by the revolution. His public career began, like that of some of the greatest parliamentarians before

him, in a mortifying failure. In conformity with a usage brought from the mother country of selecting one of the younger members to draft the reply to the governor's speech, this complimentary duty was devolved upon Jefferson. He confined himself too closely for the taste of the committee to the language of the resolutions which he was expected to amplify and glorify. His address was rejected, and the duty of preparing a substitute was confided to another member. This humiliation doubtless had some share in giving to his pen the parliamentary distinction usually won only by the tongue; for he was no orator—indeed, though one of the foremost members of several deliberative bodies in his time, he can fairly be said to have never made a speech.

Jefferson's legislative duties were not destined to detain him long from his profession. The king having abandoned the policy of levying internal taxes, and directed instead that a duty upon certain leaning articles of foreign commerce should be levied at the custom-houses in the colonies, in the spring of 1769 a messenger arrived at Williamsburg, then the seat of government of Virginia, announcing to the House of Burgesses the firm resolve of Massachusetts to resist these duties by all constitutional means, and asking the concurrence and co-operation of Virginia. On the third day of the session of the House of Burgesses four resolutions were adopted with substantial unanimity, in harmony with those adopted by Massachusetts. The first declared against taxation without representation; the second, that the colonies may concur and co-operate in seeking redress of grievances; the third, that the inexpressible complexity of wrong; the fourth, that they should send an address on these topics to the "father of all his people," beseeching his "royal interposition." On the following day, and without waiting for an official copy of these resolutions to reach him, Governor Botetourt dissolved the House of Burgesses.

Thus in five days terminated, for the present, Jefferson's career as a legislator. But, though brief and crowned with no results to satisfy his ambition, history does not pronounce his first experience as a legislator unprofitable, for it was illustrated by an effort, which was not the less honourable to him because it was unsuccessful, to ameliorate the condition of the African bondmen in Virginia. The law of those days forbade the manumission of a slave, except upon the condition that he was immediately sent out of the State. Jefferson desired the repeal of this law. His efforts were not only unsuccessful, but they developed such a state of feeling upon the subject as to bring into grand relief the courage which even at that early day ventured to oppose a tyrannical law.

The day after the House of Burgesses dispersed, its members met at a public hall in the Raleigh Tavern in Williamsburg, and, following the example of Massachusetts, resolved, with a near approach to unanimity—(1) to be more saving and industrious; (2) never to buy any article taxed by parliament for revenue, except low qualities of paper which they could not dispense with, nor (3) to import any article from Britain or in British ships if they could help it, until the offensive Act was repealed; and (4) to save all their lambs for wool. Every man who signed the agreement was re-elected, and every man who refused lost his election.

On February 1, 1770, while Jefferson and his mother were absent from home, his house was burned down. He had, however, already begun clearing the grounds and preparing for the erection of a new residence at Monticello, which occupied no inconsiderable portion of his time and thoughts for the next two years, and which was destined to become, for more than half a century, the most distinguished residence of hospitality to the American. On the 1st of January 1773 he married Martha Skelton, a widowed daughter of a wealthy neighbour and associate at the bar of Williamsburg, of large fortune in lands and slaves. The lady was very handsome, childless, fond of music, twenty-three; she proved to him a loving and devoted wife, and was the centre of a domestic circle the joys of which seemed only to be intensified and consecrated by the distractions of his public life.

In the spring of 1773 Jefferson was appointed by the House of Burgesses a member of "a Committee of Correspondence and Inquiry for the Dissemination of Intelligence between the Colonies." The appointment of this committee responded to the necessity then beginning to be felt by all the colonies of making common cause against the pretensions of the Crown, and looked to a convention in which their united purposes might find expression. The resolutions which gave birth to this committee provoked an immediate dissolution of the House, but its members were all re-elected. Soon after they had resumed their sittings in the following spring, news reached them of what is known in history as "The Boston Port Bill," by which the chief port of Massachusetts was to be closed to commerce on the 1st of June of that year (1774). The House of Burgesses thereupon sat apart that day for fasting, humiliation, and prayer, thereby provoking from the governor another dissolution, May 20, 1774. This immediately led to the selection of delegates from the several counties to meet at Williamsburg in August, to consider the state of the colony, and to provide for an annual congress of the colonies. Jefferson was chosen a dele-

gate to the State Convention, but, owing to sudden indisposition which overtook him on his way, was unable to attend. His influence there, however, was not to be wanting, for much of the interval between the dissolution of the House and the meeting of the Convention was devoted to the consideration and preparation of a series of instructions for the deputies who were to be sent to the General Congress, which was to meet at Philadelphia in September. In these instructions, which he had intended himself to propose, could have been present, he maintained "that the relation between Great Britain and these colonies was exactly the same as that of England and Scotland after the accession of James III until the Union, and the same as her present relations with Hanover,—having the same executive chief, but no other necessary political connexion; and that our emigration to this country gave no more rights over us than the emigration of the Danes and Saxons gave to the present authorities of the mother country over England." These instructions, though too radical then for the purpose for which they were designed, were laid upon the table of the delegates, read by many, and published in a pamphlet entitled *A Summary View of the Rights of America*, and extensively circulated. It ran through edition after edition in England, after receiving such modifications (attributed to the pen of Burke) as adapted it to the purposes of the Opposition; and it procured for its author, to use his own language, "the honour of having his name inserted in a long list of proscriptions enrolled in a bill of attainder commenced in one of the two Houses of Parliament, but suppressed in embryo by the hasty course of events." This paper placed Jefferson among the leaders, if not at the head of the revolutionary movement in America—events rapidly ripening in the public mind its novel and startling doctrines. The Declaration of Independence two years later, of which he asked that his tombstone should testify as the greatest achievement of his life, was but a perfected transcript of the *Summary View*.

Jefferson was the leading spirit in the succeeding sessions of the Virginia Convention; he was one of a committee of thirteen appointed to report a plan for arming Virginia, he was named a delegate to the General Congress, where he took his seat eight days after Colonel George Washington had been appointed by Congress commander-in-chief of the armies of the colonies; and he was placed upon the committee to draw up a statement of the causes which had impelled the colonies to take up arms against the mother country, and upon another committee to report on Lord North's "conciliatory proposition." In the winter of 1775-6 disastrous news arrived from England. The king in opening parliament had denounced the colonists as rebels, and recommended decisive coercive measures against them; and this was promptly followed by a law authorizing the confiscation of American vessels and cargoes, and those of all nations found trading in American ports, and the impressment of American crews into the British navy. This measure and the large vote by which it was passed instantly crystallized the colonies, and on the 12th of June 1776 Congress appointed Jefferson, Adams, Franklin, Sherman, and Livingston to prepare a Declaration of Independence.

Jefferson at the request of his associates prepared a draft of the Declaration, which, after two or three verbal corrections by them, was taken up for consideration in the House on the 2d of July. In the debate on the Declaration Jefferson took no part, "thinking it a duty to be on that occasion a passive auditor of the opinions of others, more impartial judges than he could be of his own merits as a demagogue." Two or three expressions have been used which gave offence to some members, the words "Scotch and other foreign auxiliaries" were resented by some delegates of Scotch birth; and the strictures on the king's repeated veto of colonial laws repealing the law which permitted the slave trade were disapproved by some of the southern delegates.

On the evening of the 4th of July 1776 the Declaration was reported back from the committee of the whole House, and agreed to. Circumstances have given an historical importance to this document somewhat disproportionate to its merits as a statement of the grievances of the colonies; for it seemed to be the weapon that dismembered a great empire, and that gave birth to a nation of unlimited possibilities; it gave guarantees for the fame of its author which are possessed by no other production of an American pen; for more than a century it has been read to assembled multitudes in every considerable town in the United States on the anniversary of its adoption; and its style and sentiments have been the model for every people which since that time has sought to assert for itself the right of self-government.

Jefferson continued to participate actively in the efforts to organize the government of the confederation, and prepare it for the life and death struggle which was impending, until the 2d of September, when he resigned, to take his seat in the legislature of Virginia, to which he had been elected, and where he thought his services would be most needed. "When I left Congress in '76," he says in his autobiography, "it was in the persuasion that our whole code must be reviewed, adapted to our republican form of government, and, now that we had no negatives of councils, gover-

nors, or kings to restrain us from doing right, that it be corrected in all its parts with a single eye to reason and the good of those for whose government it was framed." To this task he now devoted himself. Of the various measures introduced in furtherance of this purpose he says: "I considered fairs, passes, or reported, as forming a system by which every fibre would be educated of ancient or future aristocracy, and a foundation laid for a government truly republican." These were—the repeal of the laws of entail, the abolition of primogeniture and equal partition of inheritances, the restoration of the rights of conscience and relief of the people from taxation for the support of a religion not theirs, and a system of general education. He tried to add to these, but without success, the introduction of trial by jury into the courts of chancery, and to provide for the gradual emancipation of the slaves. He did, however, introduce a bill, which passed without opposition, forbidding the further importation of slaves into the State—the only important clause effected in the slave system of Virginia during the revolutionary period. The importance he attached to his work in Virginia at this time he showed by resigning his seat in Congress, and by declining the appointment tendered him by Congress in 1776, to go with Franklin to Paris, to assist in negotiating treaties of commerce and alliance with France.

In the third year of the war (1779), and just as the darkest and most threatening clouds were gathering over Virginia, Jefferson was elected governor. The enemy, who had been driving the war into the south. The commonwealth was almost defenceless. All her military resources having been exhausted in sustaining Washington's policy of driving the enemy out of the north. Arnold entered Richmond, recently become the capital, on the 5th of January 1781, and ravaged the place. The legislature, which had taken refuge at Charlottesville, were pursued and dispersed by Tarleton, who immediately sent a party to capture Jefferson at Monticello. He narrowly escaped, his pursuers being in sight of him as he mounted his horse and rode off to join his family. Though Monticello was spared by Tarleton's order, Jefferson's estate of Elk Hill, on the James river, was less fortunate. It was completely despoiled by the orders of Cornwallis. It was natural that the ineffectual resistance made to the enemy in Virginia should have exposed the governor's conduct to criticism, for few knew, as he did, that a more effective defence was impossible without weakening the northern army, and totally deranging the plans upon which the commander-in-chief wisely relied for the ultimate success of the national defence. An investigation of his conduct was therefore demanded. It was ascertained that he had been acting in harmony with the policy of Washington, the investigation was not only abandoned but the legislature shortly after the expiration of his term of office resolved unanimously "That the thanks of the general assembly be given to our former governor, Thomas Jefferson, for his impartial, upright, and attentive administration while in office. The assembly wish to declare in the strongest manner the high opinion which they entertain of Mr. Jefferson's ability, rectitude, and integrity as chief magistrate in this commonwealth, and mean, by thus publicly avowing their opinion, to obviate and to remove all unmerited censure." Jefferson became sensible that in the exhausted condition of Virginia, without money, without equipment, without troops, without any currency except the products of the soil, no governor not a trained soldier could hope to retain the confidence of the people during the crisis, and therefore he determined to decline re-election.

In 1782 he was summoned by Congress to act as one of the plenipotentiaries to negotiate a treaty of peace with the mother country, but the business was found to be so far advanced before he was ready to sail that his appointment was recalled, and we find him at the following winter session again occupying his seat in Congress, where, as chairman of the committee to which it was referred, he reported the definitive treaty of peace with England. At the succeeding session he introduced an elaborate report, and secured the adoption of the system of coinage which is still in vogue in the United States. In the same session he drafted the report of a plan for the government of the new territory lying to the north-west of the Ohio river, which Virginia had ceded to the Federal Government in 1780. Among other provisions which he suggested, and which were adopted, was one big with a rebellion of far more threatening proportions than that which its author had just assisted in bringing to a successful issue. The clause in question provided "that after the year 1800 of the Christian era there shall be neither slavery nor involuntary servitude in any of the said States, otherwise than in punishment of crimes whereof the party shall be duly convicted to have been personally guilty." It was the attempt to organize States from this territory in defiance of this restriction that led to the war of 1861, and to the final, though costly, vindication of Jefferson's sagacity and foresight in 1783.

In 1784 Jefferson was again commissioned by Congress as minister plenipotentiary, this time to assist Franklin and Adams in negotiating treaties of commerce with European states. He joined his associates in Paris in July. The mission upon which he was sent proved somewhat premature. Jefferson, wisely judging that fuller and more correct information about America must pre-

cede any successful attempts to deal with European states to advantage, printed at his own expense, and distributed among his friends, some *Notes on Virginia*, which he had prepared two years before. It was in these notes that the oft-quoted passage occurs: "I tremble for my country when I think that God is just; that his justice cannot sleep for ever; that, considering numbers, nature, and natural means only, a revolution of the wheel of fortune, an exchange of stations, is among possible events; that it may become probable by supernatural interference. The Almightly has no attribute that can take sides with us in such a contest." A very bad translation of a copy of the *Notes* which had found its way to France having made its appearance in Paris, Jefferson felt he had no longer any motive for trying to limit their usefulness to the few discreet friends to whom he had addressed them.¹

In January 1785 Dr Franklin, after eight years' residence at the French court, pressed his application to be relieved, and Jefferson was selected, as he gracefully put it in presenting his letters of credence, "to succeed him, for no one could replace him." Jefferson was exceedingly popular as a minister, and was fortunate in securing several important modifications of the French tariff in the interests of American commerce.

In the summer of 1789 Washington, who had been elected president of the United States under the new constitution, gave Jefferson leave of absence, and soon after his arrival in America, "as well from motives of private regard as a conviction of public propriety," tendered him the office of secretary of state. Reluctant as Jefferson was to leave Paris, he yielded at once to the wishes of the president, and entered upon the duties of his new office in March 1790. Alexander Hamilton, who was the head of the Federal party as distinguished from the Democratic, of which Jefferson was the most conspicuous representative, was appointed the secretary of the treasury. They represented the two great schools of political thought which contended for mastery in American politics, not only during Washington's administration, but for the succeeding sixty years, and until their differences were merged in the graver and more absorbing issues that grew out of the conflict between free and servile labour. Jefferson was an advocate of State sovereignty and of decentralization. He was strongly opposed to the leading features of the British constitution, and in cordial sympathy with the new school of politics which had recently begun to be felt in the government of France. His five years' residence in that country had greatly strengthened him in these views, and they formed the basis of his treatment of all questions that came before him as a cabinet minister. Hamilton's great fear, on the other hand, was that the central government under the new constitution would be too weak, and he favoured all measures that tended to exalt and strengthen the executive, and to bring the government more in harmony with that of England. Washington very prudently gave the victory to the partisan of neither theory, though his sympathies were supposed to be more frequently with the Federal than with the Republican leader.

The most perplexing questions which occupied Jefferson's attention as secretary of state grew out of the war declared by France in 1793 against Holland and Great Britain. What should be the neutral policy and what were to be insisted upon as the neutral rights of the United States? Upon this question both parties put forth their whole strength. The Republicans, under Jefferson's lead, pretty generally sympathized with the French, and were inclined to authorize privateers to be fitted out in American ports to cruise against English vessels. This policy was energetically and wisely resisted by the Federalists, who were for peace with both, and entangling alliances with none. Jefferson advocated the propriety of receiving a diplomatic representative from the French republic. In this his advice prevailed, and Genet was promptly sent as minister. With more zeal than discretion he proceeded at once to fit out privateers, and empower French consuls in the United States to organize courts of admiralty to condemn prizes. This led to heated discussions in the cabinet, and finally to the recall of Genet. Partly from discontent with a position in which he did not feel that he enjoyed the authority which meant pretty much the exclusive control of the president, and partly because of the embarrassed condition of his private affairs, due mainly to the ravages of war, Jefferson resigned his seat in the cabinet December 31, 1793, and retired to Monticello. There he remained till the fall of 1796, when he was made vice-president at the election which called John Adams to the presidency. The duties of this position being limited to presiding over the Senate during its sessions, Jefferson spent most of the four years of his official term in improving his estate, and by his counsels directing the policy of the party of which he was the acknowledged leader. The excesses of this

¹ Jefferson took a very modest view of this book, and in a purely literary point of view he could not afford to take any other; but it was so thoroughly saturated with democratic-republican ideas, of which he was then the most complete living exponent, with the possible exception of Franklin, that it was widely and eagerly read, and no doubt did much to relax the hold the doctrines of divine right and of passive obedience had upon the educated classes of France, and materially contributed to precipitate the great popular uprising in that kingdom, with which Europe was soon to be convulsed.

Reign of Terror had worked a formidable reaction in America against the sympathizers with revolutionists in France. This, with the aggressive policy of the Directory, and the insulting reception given to the American envoys in Paris, for a time paralyzed the Republican party. President Adams, mistaking the resentment felt in the United States towards France for a popular reaction there against republicanism, was betrayed into a series of ill-considered measures, which were not long in telling upon the fortunes of his party.

Among these measures the most unfortunate perhaps were the alien and sedition laws, the former empowering the president to expel from the country such aliens as he should deem dangerous, and the latter punishing as sedition, with fine and imprisonment, the printing or uttering malicious charges against the president or Congress. The Republicans commenced an active agitation against the laws throughout the country, co-operating with a strong and popular sympathy with the Republican doctrines, finally resulting in the election of Jefferson and Burr, the candidates of the Republican party, as president and vice-president, and the defeat of Adams party, as president and vice-president. Washington having died only a few months before, this election proved the *coup de grace* of the Federal party, and established Jeffersonian Republicanism as the permanent policy of the country. Jefferson entered upon the duties of the presidency on the 4th of March 1801, and was re-elected for the term commencing March 4, 1805, by 143 out of 176 electoral votes. His administration of twelve years was characterized by the simplicity with which he distinguished his conduct in private life. He eschewed all pomp and ceremony designed artificially to distinguish the president from the people. His dress "was of plain cloth" on the day of his inauguration. Instead of driving to the capital in a coach and six as had been the practice, he rode there on horseback, without a guard or even a servant in his train, dismounted without assistance, and hitched the bridle of his horse to a fence. Instead of opening Congress in the English fashion, with a speech to which a formal reply was expected, he sent his message by a private hand. Court etiquette was practically abolished, and the weekly levee with it. The code of precedence was essentially modified. Titles of honour were not recognized as such. "Excellency," "Honourable," and even "Mr," were distasteful to him. Between the President and governors of States he recognized no difference in rank, each being the supreme head of an independent state. "If it be possible," he said, "to be certainly conscious of anything, I am conscious of feeling no difference between writing the rights and wrongs of being on earth."

In public official action he regarded himself purely as a trustee for the public. He discontinued the practice of sending ministers abroad in Government vessels, nor would he have his birthday celebrated by state balls; he refused to appoint days of fasting and thanksgiving on the ground that they were religious rites, and no recommendation from him, therefore, could make them more or less binding upon the conscience. To secularize and republicize the Government were the paramount purpose and the distinguishing feature of his administration. His cabinet, of which Madison and Gallatin were the pillars, was in thorough sympathy with Jefferson in his general policy, and its perfect harmony was uninterrupted. He gave his ministers his entire confidence. "If I had the world to choose from," he once said, "I could not change one of my associates to my better satisfaction." The first important act of his administration was to send four of the six vessels constituting the so-called navy of the republic to the Mediterranean, and to exterminate the Algerine pirates who for half a century had preyed upon the commerce of the world, thus initiating a series of events which in a few years rendered the commerce of the Mediterranean as safe as that of the English Channel. Possessed with a conviction of the supreme commercial importance of New Orleans, he directed negotiations to be opened with the French Government, which resulted in the purchase for \$15,000,000 of the territory of Louisiana, which had been ceded by Spain to France. Though the constitutional power under which this important transaction was consummated was far from clear, neither its validity nor its wisdom was ever seriously questioned; and it is now justly regarded by his countrymen as the crowning achievement of his administration, and none the less meritorious for the responsibility he deliberately assumed in bringing it to pass. The remainder of his administration derives most of its historic importance from his unsuccessful attempt to convict Aaron Burr, the late vice-president, of having engaged in treasonable projects in the south-west, and from his efforts to maintain, without war, the rights of neutrals on the high seas. Among the less conspicuous though scarcely less important measures of his administration were the careful exploration of the Western Territories; reducing the public debt, and practically extinguishing from the country the then not unpopular delusion that a national debt is a national blessing; fortifying the seaports; reorganizing and rearming the militia; diminishing the taxes; and extinguishing the Indians' titles by fair purchase, and promoting their emigration beyond the Mississippi. On the 4th of

March 1809 he retired from the presidency, after an almost continuous public service of over forty years. He was pressed to allow himself to be re-elected for a third term, but refused unconditionally, though the legislatures of five States formally requested him to be a candidate.

Jefferson, whose private fortune had been seriously compromised by the usurpations of foreign commerce before and during his administration, and by the expenses incident to his representative position, lived seventeen years after his retirement, and to the last was the most considerable personage in the United States. His immediate successors in the presidency for the next sixteen years were his pupils and devoted personal friends, and rarely ventured upon any important step without the support of his approval. The employments of his closing years were in harmony with the dignified and patriotic purposes of his active life. Nothing that concerned the welfare of the country was a matter of indifference to him. He urged successfully the foundation of a university, and became one of its most efficient trustees. His correspondence during this period is regarded as one of the most interesting and instructive contributions to the early literature of the United States. He had inherited a wonderful constitution and herculean strength, neither of which did he ever abuse.

In the spring of 1826 the decline of his strength, which had been gradually increasing for two or three years, became more rapid, and on the 4th of July he expired, in the eighty-third year of his age. John Adams, his predecessor in the presidency, by an impressive coincidence, died on the same day, — the fiftieth anniversary of an event imperishably associated with the names of both and with the fortunes of a nation.

JEFFERSON CITY, capital of the State of Missouri, occupies an elevated and picturesque site in Cole county, on the right bank of the Missouri river, 125 miles west of St. Louis. The city is well built. It has an efficient school system, and is the seat of an Episcopal college, and of Lincoln Normal Institute, which is maintained by the State for the instruction of coloured youths of both sexes. The State library contains about 25,000 volumes. The manufactures comprise flour, furniture, carriages, farm implements, and iron goods. Population in 1880, 5271.

JEFFERSONVILLE, the county seat of Clark county, Indiana, U.S., is situated on the north bank of the Ohio river. The streets are of a uniform width of 60 feet. The falls of the Ohio afford a fine water-power, so that manufactories are numerous. Among them are locomotive and car works, plate-glass works, two ship-yards, and railway machine shops. The southern State penitentiary and an extensive Government depot of army supplies are situated here. Population in 1880, 9357.

JEFFREY, FRANCIS (1773-1850), a judge in the Scottish Court of Session, with the title of Lord Jeffrey, was the son of a deputy-clerk in the supreme court of Scotland, and was born at Edinburgh, 23d October 1773. After attending the High School six years, he studied at the university of Glasgow from 1787 to May 1789, and at Oxford from September 1791 to June 1792. Having in the following winter begun the study of law at Edinburgh University, he became a member of the Speculative Society, in the debates of which he measured himself not disadvantageously with Scott, Brougham, Francis Horner, the marquis of Lansdowne, Lord Kinaird, and others.

He was admitted to the bar on December 18, 1794, but, having abandoned the Tory principles in which he had been educated, he of course found his father's connexion of little advantage to him; indeed the adoption of Whig politics was at this time almost a complete obstacle to legal success. His failure to obtain sufficient professional employment led him to the conception of a variety of schemes of "literary eminence," none of which were put into execution; and more than one attempt to obtain an

office which would secure him the advantage of a small but fixed salary likewise proved abortive. To the proposal made by Sydney Smith in Jeffrey's house to a company of young men, none of whom had yet achieved fame or occupied any professional position of importance, that they should start a review, Jeffrey was accordingly prepared to give a favourable reception; and, the scheme being received with acclamation, the result was the appearance on the 10th October 1802 of the first number of the *Edinburgh Review*. At the outset the *Review* was not under the charge of any special editor. The first three numbers were, however, practically edited by Sydney Smith, and on his leaving for England the work devolved chiefly on Jeffrey, who, after an arrangement with Constable the publisher, was appointed editor at a fixed salary. Most of those associated in the undertaking were Whigs in their political convictions; but, although the general bias of the *Review* was towards social and political reforms, it was so little of a party organ that for a time it numbered Sir Walter Scott among its contributors; and no distinct emphasis was given to its political leanings until the publication in 1808 of an article on the work of Don Pedro Cevallos on the *French Usurpation of Spain*, which led shortly afterwards to the appearance of the rival *Quarterly*. According to Lord Cockburn the effect of the first number of the *Edinburgh Review* was "electrical," and it is not difficult to understand why it should have been so, for, if its learning was far from being so omniscient as was then imagined, and if much of its speculation was superficial and rambling, and its literary criticisms greatly deficient in true subtlety and discernment, it certainly did not err on the side either of modesty or of dullness. Indeed, not only were its opinions generally expressed in telling and forcible language, but the clever vivacity and wit as well as the external glitter and brilliancy of many of the articles, and their easy and jaunty air, were fitted to produce an imposing impression of latent resources of many-sided talent and comprehensive erudition. The novelty, moreover, of such a voluminous and elaborate periodical, the anonymousness of its contributions, and the fact that it devoted its pages chiefly to extended criticisms—often by no means flattering or complimentary—of living authors, were all elements in its success. Of course, on the other hand, allowance must be made for its early deficiencies, not only on account of the literary inexperience of the writers, but from the fact that it was itself practically a hitherto untried experiment in literature. Its improvement as regards substantiality of matter and genuineness and depth of learning was very marked as soon as its success permitted Jeffrey to enlist in its service a staff of writers who had generally made a special study of the particular subjects on which they wrote, and who, instead of contenting themselves with a summary and an interspersed criticism of the works they reviewed, made them the occasion of an independent and original contribution, often having only a very remote connexion with the works which suggested it. Whatever deductions also it may be necessary to make in distinguishing between the merits of the *Review* and its reputation, its influence both as a literary and as a political organ has much exceeded that of any other English periodical, and its relation to the social, political, and literary history of England during the first half of the present century has been of no small importance. The period of Jeffrey's editorship extended to about twenty-six years, having ceased with the ninety-eighth number, published in June 1829. The *Macvey Napier Correspondence* gives some indication of what must have been the delicacy and difficulty of his task, and enables us to appreciate more intelligently the panegyric of his biographer in regard to the literary skill and practical discernment which gathered together such a brilliant galaxy of talent, the

suave firmness and wise prudence which controlled and utilized to such advantage their several idiosyncracies, and the tact and cleverness which arranged and adjusted their varied lights with such correct appreciation of harmonious unity.

Jeffrey's own contributions, according to a list which has the sanction of his authority, numbered two hundred, all except six being written before his resignation of the editorship, and two immediately subsequent to this. A selection from these contributions was published in 1843 in four volumes. The composition of eight *Review* articles in a year is not an excessive literary task, but the subjects on which Jeffrey elected to give his opinion were very multifarious, and he wrote with great rapidity, at odd moments of leisure, and with little special preparation. Although also he possessed a considerable accumulation of accurate information on a great variety of subjects, and had disciplined his taste by a wide and catholic acquaintance with English literature, he had given no thorough and systematic attention to any particular branch of study. Great fluency and ease of diction, considerable command of illustration, a certain superficial warmth of imagination and moral sentiment, a natural tendency towards mockery and ridicule, and a sharp eye to discover any oddity or peculiarity of style or violation of the accepted canons of good taste, were what lent to his criticisms the kind of pungency and effectiveness they possessed. It must, moreover, be added that, if he failed egregiously in the appreciation of the highest kinds of excellence both in style and in thought, the blemishes and defects which occupied so much of his attention, and which he magnified and distorted, had generally a real existence. Notwithstanding, however, his keen practical judgment and his liberal tendencies, both his political and his literary prognostications were generally falsified by the result. He never showed any proper comprehension of principles, or power of detecting and estimating latent forces either in politics or in matters strictly intellectual and moral; and certain of the higher spheres of reflexion and imagination, as for example, that of the "Lake Poets," his unhappy mistakes in regard to whom have earned for him such unenviable fame, were utterly remote from his understanding and sympathy. Had an adequate share of his attention been concentrated on some special branch of literature, had his fluency been held in check by a more thorough acquaintance with the subjects which engaged his interest, his regard for immediate impressiveness not been exaggerated by the influence of his professional duties, his artistic sense, which was keen and true so far as it went, not been mutilated and deteriorated by untoward circumstances, he would undoubtedly have earned for himself a high place among the writers of his epoch. As it is, his reputation is now unsubstantial and shadowy, and he is remembered chiefly from his accidental and not always gratifying and desirable relation to others who have gained an independent fame.

Notwithstanding the increasing success of the *Review*, Jeffrey always continued to look to the bar as the chief field of his ambition, and indeed he soon experienced that his literary reputation was a help and not an obstruction to professional advancement. Probably one reason of this was that his literary talents were supplemented by a personal character of the highest integrity and honour, and by fine social gifts rooted in true gentility and kindness, and adorned with an agreeable pleasantry and wit never tainted with the venom of bitterness. As an advocate his sharpness and rapidity of insight gave him a formidable advantage in the detection of the weaknesses of a witness and the vulnerable points of his opponent's case, while he grouped his own arguments with an admirable eye to effect, especially excelling in eloquent closing appeals to a jury,

more particularly when an opportunity presented itself for the introduction of the pathetic element. Probably but for his rapid utterance and affected accent, his weak physique, and his too copious command of language, he might have attained to the highest rank as an orator. Jeffrey was twice, in 1820 and 1822, elected lord rector of the university of Glasgow. In 1829 he was chosen dean of the faculty of advocates. On the Whigs obtaining office in 1831, he became lord advocate, and entered parliament as member for the Perth burghs. After the passing of the Reform Act, in the framing of which measure he had the principal charge so far as it related to Scotland, he was returned for Edinburgh; but his parliamentary career, which, though not so brilliantly successful as some expected, had won him high general esteem, was terminated by his elevation to the judicial bench as Lord Jeffrey in May 1834. He died at Edinburgh 26th June 1850.

The Life of Lord Jeffrey, with a Selection from his Correspondence, by Lord Cockburn, appeared in 1852 in two volumes. See also the *Selected Correspondence of Jeffrey, Attorney*, 1877, and the sketch of Jeffrey in Carlyle's *Reminiscences*, vol. II., 1881. (T. F. H.)

JEFFREYS, GEORGE JEFFREYS, LORD (c. 1648–1689), lord chancellor of England, was born probably in 1648 at Acton in Denbighshire, of a respectable but not rich family. He was smitten with the desire of becoming a lawyer by seeing, when a boy at St Paul's school in London, the magnificent procession of the judges to the cathedral; and, although his family was hard put to it by the expense, he spent some time at Westminster school before entering the Inner Temple as a student at sixteen. The allowance he received from home was quite unequal to the demands of the dissolute habits into which he quickly fell, but it is said that the promise of future eminence, afforded by the fits of studiousness which divided his orgies, procured for the dissipated student both long credit and presents of money. He was exceedingly popular as a table companion, especially with the inferior attorneys and attorneys' clerks with whom, then as afterwards, he preferred to drink; and in the low practice which he began at Old Bailey and the London Sessions immediately on being called to the bar in November 1668, he found his boon companions very useful in procuring him briefs. Voluble, unscrupulous, and overbearing, he rapidly developed in his constant dealings with the most degraded criminals the coarse bullying manner which disgraced him throughout his whole career. He sought every means of ingratiating himself with the city aldermen, and in 1671, at the singularly early age of twenty-three, became their common serjeant, and in 1678 recorder of London. He had by that time pushed his way into the higher courts, where his marvellous address in speaking and cross-examination made up for, if it did not conceal, his shallow legal knowledge. Jeffreys had hitherto nominally belonged to the anti-court or liberal party; but, perceiving that they had but little patronage in their gift, he had opened secret negotiations with Charles II., and immediately on taking the oath as recorder he openly declared himself a partisan of the court. The year before he had been knighted and appointed solicitor to the duke of York. To reward him for the servility which he displayed, especially in connexion with the Popish plot trials, he was appointed chief justice of Chester, and advanced to a baronetcy. His insolence and intemperance, already notorious, became in his chief-justiceship well nigh intolerable. He received a rebuff in 1680 when for his conduct in obstructing the assembling of parliament he was reprimanded on his knees by the speaker, and forced to resign his recordership in December of the same year. Such indignities were

merits in the eyes of the king, to whose favour Jeffreys laid additional claims by his efforts to abrogate the charter of London, and by his activity as counsel against the suspected Rye House conspirators. He received his reward. Lord Campbell remarks, "Jeffreys became chief-justice of England, as the only man fit to condemn Algernon Sidney." He was sworn in in November 1683, and shortly became privy councillor and member of the cabinet. In the court of the King's Bench, the new chief-justice let few considerations stand between him and his desire to satisfy the king. His iniquitous servility is to be traced in the *State Trials*. When Charles died in February 1685, Jeffreys exchanged a master who disliked him as a wretch "with no learning, no sense, no manners, and more impudence than ten carted street-walkers," for one who found in him a thoroughly congenial tool. In May 1685 Jeffreys was raised to the peerage by the style of Baron Jeffreys of Wem, and in August went into the western counties as president of a special commission appointed to try the numerous cases of treason arising from the duke of Monmouth's ill-fated rebellion. It was in this "bloody assize" that he was to deepen the stain that already tarnished his fame, and to make the name "Judge Jeffreys," a synonym for a monster of bloodthirsty cruelty, blasphemous rage, and brutish intemperance. In the "campaign" he gave the rein to his ferocity; he was maddened with slaughter, and his appetite for blood grew by what it fed on. The horrible glare of his eye, the savage lines of his face, his fierce shouts of wrath, terrified and confused guilty and innocent alike. With hateful cunning he let it be bruited that the only hope of mercy lay in pleading guilty, and by this cold-blooded artifice lightened his labours. He had a powerful incentive to active butchery: the vacant post of lord chancellor was to be won by good service. The estimates of the numbers of victims of the commission vary: 320 was the official return to the treasury; Lord Lonsdale says 700, and Burnet 600. Upwards of 800 were transported as slaves to the West Indies, while others only escaped by purchasing their pardons from the judge at most exorbitant rates. When the chief-justice returned to Windsor in September, the great seal of England was placed in his blood-stained hands. For the rest of his career the lord chancellor was an unresisting agent of King James in his most illegal schemes. Finding himself losing favour at court, he even revived the ecclesiastical court of high commission, abolished in 1640 by an Act which forbade its revival, and himself engaged to act as president. In the attempt against the rights of the fellows of Magdalen College, Oxford, and in the trial of the seven bishops, Jeffreys was the king's right hand; but, when the proceedings of James had at last roused the indignation that cost him his crown, the lord chancellor was one of the first to advise concession. When the king fled in 1688, Jeffreys was in the utmost consternation. For him, he knew, there could be no mercy. Shaving off his shaggy eyebrows, and disguising himself as a common sailor, he attempted to escape to Hamburg in a small collier, but, while drinking in a low public-house at Wapping, he was recognized by a poor scrivener who had once encountered the wrath of the judge, and had never forgotten the glare of his eye. Jeffreys was only saved from being torn in pieces by the mob by the timely arrival of a strong guard, who conducted the trembling wretch to the Tower. There he lay for some months, tortured by anguish both of mind and body, which he endeavoured to drown in copious draughts of brandy. He died miserably on April 19, 1689. Jeffreys was twice married, and had ten children, but his title became extinct in 1703, in the person of his son John, notorious for having interrupted the funeral of Dryden. It is said that in 1688 Lord Jeffreys was about to be created earl of Flint; and, though

the patent never passed the great seal, a book was dedicated to him, giving him the title.

For the character of Jeffreys not even the most impartial historian can say a good word. Of strong intelligence and clear legal head, and, according to Roger North, when he was in temper and matters indifferent came before him, becoming his seat of justice better than any other that author had seen in his place, he might have risen to a high position among the learned luminaries of the bench, had he not prostituted his talents to unworthy ends, and swamped his faculties in the most brutal intemperance. He treated all from whom he had nothing to expect with coarse insolence, taking an especially malicious delight in giving, as he phrased it, "a lick with the rough side of his tongue" to those whom his maudlin carresses of the night before had encouraged to presume. No less was he pressed to revile at dissenters; "Show me," he said, "a Presbyterian, and I will engage to show a lying knave." He is remarkable as the only politically prominent lawyer of his century who never sat in the House of Commons, nor left a single publication behind him. In the House of Lords he once attempted to use the insolent abuse of his court habits, but was compelled humbly to apologize, in tears of maudlin chagrin, to all whom he had attacked.

The chief sources for particulars about Jeffreys are the *State Trials* and North's *Life of Lord Keeper Guilford*, together with contemporary pamphlets and squibs. These materials have been skillfully used by Lord Campbell in his *Lives of the Lord Chancellors*, and by Macaulay in his *History*. See also Woolrych's *Memoirs of Judge Jeffreys*, 1827.

JEHOL, or CHENG-TE-FU, a city of Mongolia, famous as the seat of the summer palace of the emperor of China, is situated near 118° E. long. and 41° N. lat., about 140 miles north-east of Peking, with which it is connected by an excellent line of road. Though not enclosed by walls, the town, which is about 2 miles long, bears the stamp of "a flourishing Chinese town of the same rank." The population is stated at 10,000. The palace, called *Pi-shu-shun-chuang*, or "mountain lodge for avoiding heat," was built in 1703 on the plan of the palace of Yuan-ming-yan near Peking. A substantial brick wall 6 miles in circuit encloses several well-wooded heights and extensive gardens, rockeries, pavilions, temples, &c., after the usual Chinese style. In the vicinity of Jehol are numerous Lama monasteries and temples, the most remarkable being Putala-su, built on the model of the palace of the grand lama of Tibet at Putala. It is thus described by Mr Bushell (*Journ. R. Geog. Soc.*, Lond., 1874): "The principal building of this temple is a huge square erection with eleven rows of windows, the stories coloured alternately red, green, and yellow, surmounted by a row of five dagobas, and with the roof covered with enamelled tiles of a bright turquoise blue. The general effect is inexpressibly bizarre."

JELIOVAH is the current European transcription of the sacred tetragrammaton יהוה. This was punctuated by the Massorets with the vowels *ä* (for *ä*), *ö*, *a* of the word Adonai which the later Jews habitually substituted in reading the ineffable name. It is now generally agreed that Jahwé (Yahwé) is the true pronunciation, a conclusion which is supported not only by the linguistic argument derived from the fact that the various contracted forms in which the name appears, either separately (Jah) or in compound proper names (Jô, Jêho, Jahu) are all reducible to Jahw, but also by the testimony of ancient tradition (thus Theodoret ascribes the pronunciation *Jaβé* to the Samaritans, Epiphanius gives *Jaβé* or *Iawé*, and Clement apparently *Iawé*). Etymologically, Jahwé may be regarded as the imperfect either of Qal or Hiphil of יהה; the former view seems to be that taken in the Pentateuch, but many critics now incline to the

other, according to which the name may be translated as meaning "He who causes to be." It seems to have come to be invested with new and richer meanings as the religion of Israel developed in spirituality and depth; but as the name of the national deity it must have been older than the time of Moses; at least the name of the mother of Moses is compounded with it. It is conceivable that in the earliest period of its history the word was not associated with any idea so high even as that of "creator"; the Hiphil of יהה in the Aramaic sense of "fall" would give "he who causes (rain or lightning) to fall" as the nearest approach to the original meaning. For the later sense of the name Exod. iii. 14 is the *locus classicus*. The Palestinian tradition finds in this verse the assertion of God's eternity (comp. Rev. i. 8); the Alexandrian exegesis refers it to his absolute existence. More probably the vague "I will be what I will be" (the emphasis lying on the first verb as in Exod. xxxiii. 19) is used to convey the idea of that all-sufficiency of God's grace which is wider than the widest faith (comp. Hos. i. 6, 7).

The literature of the subject is immense. Of older books it is enough to refer to the *Deas Bæroclitæ* collected by Beland (Utrecht, 1707); for the latest aspects of the questions involved, see Gesenius, *Thes.*, s. v.; Ewald, *Gesch.*, ii. 121 sq.; Lagarde, *Psalt. Hieron.* (1874), p. 153 sq.; and *Orientalia*, ii. 27 sq.; Schrader in Schenkel's *Bib. Lex.*, s. v. "Jahwe", W. Aldis Wright in *Journ. of Philol.*, iv. p. 70. Against recent proposals to identify Jahwé with non-Israelite deities, see Banditsin, *Studien*, i. (Leipzig, 1876), and in favour of derivation from an Assyrian form of the Divine name *ia-u* (Acedian *ä*), see Delitzsch, *Wo lag das Paradies*, p. 158 sq., Leipzig, 1881. A summary of recent discussion is given by W. Robertson Smith in *Brit. and For. Eassy. Rev.* January 1876.

JEJEEBHOY, SIR JAMSETJEE (1783-1859), a Parsee merchant and great public benefactor, was born of poor parents in Bombay, July 15, 1783. Left an orphan while still very young, he had many difficulties to overcome at the outset of the mercantile career he chose for himself. On one occasion the ship in which he and all his goods were captured by the French, and the young merchant was landed penniless at the Cape of Good Hope. Thence he procured a passage to Bombay through the charity of some Dutch ladies; and, resolutely beginning life afresh, he rose to be one of the most opulent Parsee merchants in India. His lavish benevolence, which recognized no difference of nation, sect, or class, and extended even to the brute creation, has won him enduring honour. In 1822 he paid the debts of all the poor debtors in Bombay jail; he enriched his native city with a hospital and an educational establishment for Parsee children, a school of art and other benevolent institutions, and contributed largely to the Grant Medical College, while to the public works at Bombay, Nowasree, and elsewhere he gave large grants, as well as to the patriotic fund and the Indian sufferers' fund after the mutiny. Eleven schools owe their foundation to his munificence, in which 2710 Parsee children are educated. It is estimated that he gave away upwards of 26 lakhs of rupees. Knighted in 1842, he was promoted to a baronetcy in 1857; a status was voted to him in 1856, and was unveiled in Bombay town-hall on August 1, 1859. At his death on April 15, 1859, his property was estimated at 8,550,000 rupees. According to an act of the legislative council of India, the name Jamsetjee Jeebhoy must be assumed by all his successors in the baronetcy. His son (1811-1877) was prominent as the head of the Parsee community in Bombay, and exercised a considerable influence among the Europeans. He was a member of the legislative council of Bombay.

JELAL-ED-DÏN, MOHAMMED ER-RÛMÏ (born at Balkh a. 1200 A.D., died at Iconium, 1273, as head of a college for mystic theology), one of the greatest poets and thinkers of Persia. See PERSIA.

JEMMAPES, or JEMAPPES, a village in the arrondissement and 3 miles west of the town of Mons, in the province of Hainault, Belgium, is situated on the Haine, near the "Bassin du Fleu," one of the richest coal-fields in the province. It has manufactures of mining gear, salt, soap, brass, and leather. The population of the commune in 1876 was 10,816.

Jemmapes is famous as the scene of a sanguinary battle fought November 6, 1792, between the French under Dumouriez and the Austrians under the duke of Saxe-Teschén, in which the latter were defeated. The French gained temporary possession of Belgium, and Jemmapes gave its name to a French department, comprising most of Hainault.

JENA, a town in the department of Apolda, in the grand-duchy of Saxe-Weimar-Eisenach, Germany, is situated, about 56 miles south-west of Leipzig by rail, at the junction of the Leutra and Saale, in a beautiful valley, surrounded by romantic hills, and dotted over with villages. The town is tolerably well built, though the houses are quaint, and many of the streets narrow. Besides the university buildings, the more interesting edifices are the 15th century church of St Michael, with a tower 318 feet high, and containing the bronze statue of Luther, originally intended for his tomb; the college-church; the library; the old-fashioned town-house in the market-place; the castle, built in 1620, where Goethe wrote his *Hermann und Dorothea*; the Black Bear tavern (now a hotel), where Luther spent the night after his flight from the Wartburg; and Weigel's house. The career, or students' prison, ceased to be used for academic discipline in 1880. In 1858, the tercentenary of the inauguration of the university, the various houses in Jena that had been occupied by illustrious men were marked by memorial tablets. Close to the town are the Thuringian district court and the large lunatic asylum—both built in 1879. Of the old fortifications there remain only four towers and an ancient gateway; while the moat has been laid out as a promenade, adorned with busts and statues. On the Hausberg to the east rises the gaunt and legendary Fuchsturm; and 2 miles to the west, on the Forstberg, is the tower raised to the students of Jena who fell in the war against France, 1870-71. Among the schools are a gymnasium opened in 1876, and a commercial school. Jena is the seat of an upper appeal court, of a statistical bureau for the Thuringian states, and of a chamber of commerce. The town owes what prosperity it now has to the presence of the university founded by the elector, John Frederick of Saxony, whose statue stands in the market-place. In 1547 that prince, while a captive in the hands of Charles V., conceived the plan of erecting a university at Jena, in place of that of Wittenberg, which he had forfeited. The academy, founded accordingly at Jena in 1548 by the elector's three sons, obtained the necessary charter from the emperor Ferdinand I., and on February 2, 1558, was formally inaugurated as a university. The students were most numerous about the middle of the 18th century, when some 3000 attended; but the most brilliant professoriate was under Duke Karl August, Goethe's patron (1787-1806), when in the different faculties Reinhold, Fichte, Schelling, Hegel, Schlegel, Oken, and Schüller read lectures. Founded as a home for the new religious opinions of the 16th century, Jena has always liberally granted a hearing to new teaching; and it distances perhaps every other German university in the extent to which it carries what are popularly regarded as the characteristics of German student-life—duelling, and the sentimental passion for *Freiheit*. At the end of last and the beginning of the present century, the opening of new universities, co-operating with the suspicions of the various German Governments as to the democratic opinions which obtained at Jena, militated against it, and the university has never regained its former prosperity. In the

session 1880-81 the teaching-staff numbered 80 members; in the winter session 1879-80 the students numbered 481, and in the summer session 1880, 546. Amongst the numerous auxiliaries of the university may be mentioned the library with 180,000 volumes, the seminaries of philology, theology, and education; the institutes for chemistry, pharmacy, zoology, botany (with a botanical garden), and meteorology (with an observatory in the garden of which a bust of Schiller marks the spot where he wrote his *Wallenstein*); the veterinary and agricultural institutions; and the various physical and archeological collections, which now occupy the castle. A clinical institute and the several hospitals assist the study of medicine. The *Jenae Literaturzeitung*, whose issue in its present form began in 1874 under the patronage of the university, is the ultimate successor of the first *Literaturzeitung für Deutschland*, which appeared at Jena in 1785. The manufactures of Jena, which are not important, comprise cigars, pianos, cloth, woollens, cement, beer, and sausages. There is some activity in the book-trade and in vine-growing; and the traffic of wood-rafts on the Saale deserves mention. The population in 1875 was 9020.

Jena appears to have possessed town-rights in 1029. At the beginning of the 14th century it was in the possession of the margraves of Meissen, from whom it passed in 1428 to the elector of Saxony. Since 1485 it has remained in the Ernestine line of the house of Saxony. In 1682 it fell to Bernhard, youngest son of the duke of Weimar, and became the capital of a small separate duchy. Bernhard's line having become extinct in 1809, Jena was united with Eisenach, and in 1741 reverted with that duchy to Weimar. In more modern times Jena has been made famous by the defeat inflicted in the vicinity, on October 14, 1806, by Napoleon upon the Prussian army under the duke of Brunswick.
See Schöcher and Faiber, Jena von seinen Ursprung bis zur neuesten Zeit, 2d ed., 1858; G. Hoff, Jena und Umgegend, 3d ed., 1876.

JENGHIZ KHAN (1162-1227) Mongol emperor, was born in a tent on the banks of the river Onon, in 1162. His father Yesukai was absent at the time of his birth, being engaged in a campaign against a Tatar chieftain named Temuchin. In this conflict the fortune of war favoured the side of Yesukai, who having slain his enemy returned to his encampment in triumph. Here he was met by the news that his wife Yulun had given birth to a son. On examining the child he observed in its clenched fist a clot of congealed blood like a red stone. In the eyes of the superstitious Mongol this circumstance took the shape of a mysterious reference to his victory over the Tatar chieftain, and he therefore named the infant Temuchin. The death of Yesukai, which placed Temuchin, who was then only thirteen years old, on the Mongol throne, was the signal also for the dispersal of several tribes whose allegiance the old chieftain had retained by the exercise of an iron rule. When remonstrated with by Temuchin on their desertion of his banner, the rebels replied: "The deepest wells are sometimes dry, and the hardest stone is sometimes broken; why should we cling to thee?" But Yulun was by no means willing thus to see her son's power melt away, and seizing the national standard she led those retainers who remained faithful against the deserters, and succeeded in bringing back fully one half to their allegiance. With this doubtful material for the maintenance of his chieftainship, Temuchin succeeded in holding his ground against the insidious plots and open hostilities of the neighbouring tribes, more especially of the Naimans, Keraites, and Merkits. With one or other of these he maintained an almost unceasing warfare until the year 1206, when his power was so firmly established that he felt the time had arrived when he might proclaim himself the ruler of an empire. He therefore summoned the notables of his kingdom to an assembly on the banks of the Onon, and at their unanimous request adopted the name and title of Jenghiz Khan (Chinese,

Ching-sze, or "perfect warrior"). At this time there remained to him but one open enemy on the Mongolian steppes, namely, Polo the Naiman khan. Against this chief he now led his troops, and in one battle so completely shattered his forces that Kushlek, the successor of Polo, who was left dead upon the field, fled with his ally Toto, the Merkit khan, to the river Irtysh. Having thus further consolidated his sovereignty, Jenghiz Khan now meditated an invasion of the empire of the Kin Tatars, who had wrested northern China from the emperors of the Sung dynasty. As a first step in this programme he invaded western Hea, and, having captured several strongholds, retired in the summer of 1208 to Lung-tung to escape the great heat of the plains. While there news reached him that Toto and Kushlek, the Merkit and Naiman khans, were preparing for war. He thereupon at once marched against them, and in a pitched battle on the river Irtysh overthrew them completely. Toto was amongst the slain, and Kushlek fled for refuge to the Khitan Tatars. Satisfied with his victory, Jenghiz again directed his forces against Hea. There also good fortune attended him, and, after having defeated the Kin army under the leadership of a son of the sovereign, he captured the Wu-leang-hai Pass in the Great Wall, and penetrated as far as Ning-hea Fu in Kansuh. With unceasing vigour he pushed on his troops into the country, and even established his sway over the province of Leaou-tung. The saying that nothing succeeds like success was eminently true in his case. Several of the Kin commanders, seeing how persistently victory attended his banners, deserted to him, and garrisons surrendered at his bidding. Having thus secured a firm footing within the Great Wall, he despatched three armies in the autumn of 1213 to overrun the empire. The right wing, under the command of his three sons Juji, Jagatai, and Oghotai, marched towards the south; the left wing under his brothers Hochar, Kwang-tsin Noyen, and Chows-to-po-shi, advanced eastward towards the sea; while Jenghiz and his son Tulü with the centre directed their course in a south-easterly direction. Complete success attended all three expeditions. The right wing advanced as far as Honan, and after having captured upwards of twenty-eight cities rejoined headquarters by the great western road. Hochar made himself master of the country as far as Loan-se; and Jenghiz ceased his triumphal career only when he reached the cliffs of the Shan-tung promontory. But either because he was weary of the strife, or because it was necessary to gain a respite that he might revisit his Mongolian empire, he sent an envoy to the Kin emperor in the spring of the following year (1214), saying, "All your possessions in Shan-tung and the whole country north of the Yellow river are now mine with the solitary exception of Yenking (the modern Peking). By the decree of heaven you are now as weak as I am strong, but I am willing to retire from my conquests; as a condition of my doing so, however, it will be necessary that you distribute largess to my officers and men to appease their fierce hostility." These terms of safety the Kin emperor eagerly accepted, and as a peace offering he presented Jenghiz with a daughter of the late emperor, another princess of the imperial house, 500 youths and maidens, and 3000 horses. No sooner, however, had Jenghiz passed beyond the Great Wall than the Kin emperor, fearing to remain any longer so near the Mongol frontier, moved his court to Kai-fung Fu in Honan. This transfer of capital appearing to Jenghiz to indicate a hostile attitude, he again turned southward and once more marched his troops into the doomed empire.

While Jenghiz was thus adding city to city and province to province in China, Kushlek, the fugitive Naiman chief, was not idle. With characteristic treachery he requested

permission from his host, the Khitan khan, to collect the fragments of his army which had been scattered by Jenghiz at the battle on the Irtysh, and thus having collected a considerable force he leagued himself with Muhammed, the shah of Khuarezmi, against the confiding khan. After a short but decisive campaign the allies remained masters of the position, and the khan was compelled to abdicate the throne in favour of his late guest.

With the power and prestige thus acquired, Kushlek prepared once again to measure swords with the Mongol chief. On receiving the news of his hostile preparations, Jenghiz at once took the field, and in the first battle routed the Naiman troops and made Kushlek a prisoner. A short shrift was given to the treacherous Naiman, and his ill-gotten kingdom became an appanage of the Mongol empire. Jenghiz now held sway up to the Khuarezmi frontier. Beyond this he had no immediate desire to go, and he therefore sent envoys to Muhammed, the shah, with presents, saying, "I send thee greeting; I know thy power and the vast extent of thine empire; I regard thee as my most cherished son. On my part thou must know that I have conquered China and all the Turkish nations north of it; thou knowest that my country is a magazine of warriors, a mine of silver, and that I have no need of other lands. I take it that we have an equal interest in encouraging trade between our subjects." This peaceful message was well received by the shah, and in all probability the Mongol armies would never have appeared in Europe but for an unfortunate occurrence which turned Jenghiz's friendly overtures into a declaration of war. Shortly after the despatch of this first mission Jenghiz sent a party of traders into Transoxiana who were seized and put to death as spies by Inaljuk, the governor of Otrar. As satisfaction for this outrage Jenghiz demanded the extradition of the offending governor. Far from yielding to this summons, however, Muhammed beheaded the chief of the Mongol envoys, and sent the others back without their beards. This insult made war inevitable, and in the spring of 1219 Jenghiz set out from Karakoram on a campaign which was destined to be as startling in its immediate results as its ulterior effects were far reaching. The invading force was in the first instance divided into two armies: one commanded by Jenghiz's second son Jagatai was directed to march against the Kankalis, the northern defenders of the Khuarezmi empire; and the other, led by Juji, his eldest son, advanced by way of Signhak against Jend. Against this latter force Muhammed led an army of 400,000 men, who after a bloody battle with the invaders were completely routed, leaving it is said 160,000 dead upon the field. With the remnant of his host Muhammed fled to Samarkand. Meanwhile Jagatai marched down upon the Jaxartes by the pass of Tarns and invested Otrar, the offending city. After a siege of five months the citadel was taken by assault, and Inaljuk and his followers were put to the sword. To mark their sense of the crime of which it had been the scene, the conquerors levelled the walls with the ground, after having given the city over to pillage. At the same time a third army besieged and took Khogend on the Jaxartes; and yet a fourth, led by Jenghiz and his youngest son Tulü, advanced in the direction of Bokhara. Tashkend and Nur surrendered on their approach, and after a short siege Bokhara fell into their hands. On entering the town Jenghiz ascended the steps of the principal mosque, and shouted to his followers, "The hay is cut; give your horses fodder." No second invitation to plunder was needed; the city was sacked, and the inhabitants either escaped beyond the walls or were compelled to submit to infamies which were worse than death. As a final act of vengeance the town was fired, and before the last of the Mongols left the district, the great mosque and

certain palaces were the only buildings left to mark the spot where the "centre of science" once stood. From the ruins of Bokhara Jenghiz advanced along the valley of the Sogd to Samarkand, which, weakened by treachery, surrendered to him, as did also Balkh. But in neither case did submission save either the inhabitants from slaughter or the city from pillage. Beyond this point Jenghiz went no further westward, but sent Tulé, at the head of 70,000 men, to ravage Khorassan, and two flying columns under Chépé and Sabutai Bahadar to pursue after Muhammed, who had taken refuge in Nishapoor. Defeated and almost alone, Muhammed fled before his pursuers to the village of Astrak on the shore of the Caspian Sea, where he died of an attack of pleurisy, leaving the cause of his empire to his son Jaláluddín. Meanwhile Tulé carried his arms into the fertile province of Khorassan, and after having captured Nessa by assault appeared before Merv. By an act of atrocious treachery the Mongols gained possession of the city, and, after their manner, sacked and burnt the town. From Merv Tulé marched upon Nishapoor, where he met with a most determined resistance. For four days the garrison fought desperately on the walls and in the streets, but at length they were overpowered, and, with the exception of 400 artisans who were sent into Mongolia, every man, woman, and child was slain. Herat escaped the fate which had overtaken Merv and Nishapoor by opening its gates to the Mongols. At this point of his victorious career Tulé received an order to join Jenghiz before Talikhan in Badakshan, where that chieftain was preparing to renew his pursuit of Jaláluddín, after a check he sustained in an engagement fought before Ghazni. As soon as sufficient reinforcements arrived Jenghiz advanced against Jaláluddín, who had taken up a position on the banks of the Indus. Here a desperate battle was fought. The Turks, though far outnumbered, defended their ground with undaunted courage, until, beaten at all points, they fled in confusion. Jaláluddín, seeing that all was lost, mounted a fresh horse and jumped into the river, which flowed 20 feet below. With admiring gaze Jenghiz watched the desperate venture of his enemy, and even saw without regret the dripping horseman mount the opposite bank. From the Indus Jenghiz sent in pursuit of Jaláluddín, who fled to Delhi, but failing to capture the fugitive the Mongols returned to Ghazni after having ravaged the provinces of Lahore, Peshawur, and Melikpoor. At this moment news reached Jenghiz that the inhabitants of Herat had deposed the governor whom Tulé had appointed over the city, and had placed one of their own choice in his room. To punish this act of rebellion Jenghiz sent an army of 80,000 men against the offending city, which after a siege of six months was taken by assault. For a whole week the Mongols ceased not to kill, burn, and destroy, and 1,600,000 persons are said to have been massacred within the walls. Having consummated this act of vengeance, Jenghiz returned to Mongolia by way of Balkh, Bokhara, and Samarkand.

Meanwhile Chépé and Sabutai marched through Azerbaijan, and in the spring of 1222 advanced into Georgia. Here they defeated a combined force of Lezgins, Circassians, and Kipchaks, and after taking Astrakhan followed the retreating Kipchaks to the Don. The news of the approach of the mysterious enemy of whose name even they were ignorant was received by the Russian princes at Kiev with dismay. At the instigation, however, of Mitislaf, prince of Galicia, they assembled an opposing force on the Dnieper. Here they received envoys from the Mongol camp, whom they barbarously put to death. "You have killed our envoys," was the answer made by the Mongols; "well, as you wish for war you shall have it. We have done you no harm. God is impartial; He will decide our quarrel." If

the arbitrament was to be thus decided, the Russians must have been grievously in the wrong. In the first battle, on the river Kaleza, they were utterly routed, and fled before the invaders, who after ravaging Great Bulgaria, retired, gorged with booty, through the country of Saksin, along the river Aktuba, on their way to Mongolia.

In China the same success had attended the Mongol arms as in western Asia. The whole of the country north of the Yellow river, with the exception of one or two cities, was added to the Mongol rule, and, on the death of the Kin emperor Seuen Tsung in 1233, the Kin empire virtually ceased to be, and Jenghiz's frontiers thus became continuous with those of the Sung emperors who held sway over the whole of central and southern China. After his return from central Asia, Jenghiz once more took the field in western China. While on this campaign the five planets appeared in a certain conjunction which to the superstitiously minded Mongol chief foretold that evil was awaiting him. With this presentiment strongly impressed upon him he turned his face homewards, and had advanced no farther than the Se-Keang river in Kansuh when he was seized with an illness of which he died a short time afterwards (1227) at his travelling palace at Ha-lou-tu, on the banks of the river Sale in Mongolia. By the terms of his will Oghotai was appointed his successor, but so essential was it considered to be that his death should remain a secret until Oghotai was proclaimed that, as the funeral procession moved northwards to the great ordu on the banks of the Kerulon, the escort killed every one they met. The body was then carried successively to the ordus of his several wives, and was finally laid to rest in the valley of Kelsen.

Thus ended the career of one of the greatest conquerors the world has ever seen. Born and nurtured as the chief of a petty Mongolian tribe, he lived to see his armies victorious from the China Sea to the banks of the Dnieper; and, though the empire which he created ultimately dwindled away under the hands of his degenerate descendants, leaving not a wreck behind, we have in the presence of the Turks in Europe a consequence of his rule, since it was the advance of his armies which drove their Osmanli ancestors from their original home in northern Asia, and thus led to their invasion of Bithynia under Othman, and finally their advance into Europe under Amurrah I.

See H. H. Howarth, *The History of the Mongols*; Robert K. Douglas, *The Life of Jenghis Khan*. (R. K. D.)

JENNER, EDWARD (1749-1823), the discoverer of vaccination, was born at Berkeley, Gloucestershire, on May 17, 1749. His father, the Rev. Stephen Jenner, rector of Rockhampton and vicar of Berkeley, came of a family that had been long established in that county, and was possessed of considerable landed property; he died when the subject of this notice was only six years old, but his place was admirably taken by his eldest son, the Rev. Stephen Jenner, who brought his brother up with paternal care and tenderness. Edward received his early education in local schools at Wotton-under-Edge and Cirencester, where he already showed a strong taste for natural history. The medical profession having been selected for him, he began his studies under Mr Ludlow, a surgeon of Sedbury near Bristol; but in his twenty-first year he proceeded to London, where he became a favourite pupil of the celebrated John Hunter, in whose house he resided for two years. During this period he was employed by Sir Joseph Banks to arrange and prepare the valuable zoological specimens which he had brought back from Captain Cook's first voyage in 1771. He must have acquitted himself satisfactorily in this task, since he was offered the post of naturalist in the second expedition, but declined it as well as other advantageous offers, preferring rather to practise

his profession in his native place, and near his eldest brother, to whom he was much attached. His speedy success in practice did not engross his intellectual activity. He was the principal founder of a local medical society, to which he contributed several papers of marked ability, in one of which he apparently anticipated later discoveries concerning the rheumatic inflammations of the heart. He maintained a correspondence with John Hunter, under whose direction he investigated various points in biology, particularly the hibernation of hedgehogs and the habits of the cuckoo; his paper on the latter subject was laid by Hunter before the Royal Society, and appeared in the *Philosophical Transactions* for 1788. He also devoted considerable attention to the varied geological character of the district in which he lived, collecting fossils from the Oolite and Lias, and constructed the first balloon seen in those parts. He was a great favourite in general society, from his agreeable and instructive conversation, and the many accomplishments he possessed. Thus he was a fair musician, both as a part-singer and as a performer on the violin and flute, and a very successful writer, after the fashion of that time, of fugitive pieces of verse, one of which—"The Signs of Rain"—has been frequently reprinted, and enumerates minutely all the signs of the weather in verse not unworthy of Crabbe. In 1788 he married Catharine Kingscote, a union destined to form a most important element in his happiness. In 1792 he resolved to confine himself to practising as a physician, and accordingly obtained the degree of doctor of medicine from St Andrews. Finding that Berkeley could not support a physician, he began, a few years later, to visit Cheltenham annually.

Meanwhile the discovery that was to immortalize his memory had been slowly maturing in his mind. When only an apprentice at Sodbury, his attention had been directed to the relations between cow-pox and small-pox in connexion with a popular belief which he found current in Gloucestershire, as to the antagonism between these two diseases. During his stay in London he appears to have mentioned the thing repeatedly to Hunter, who, being engrossed by other important pursuits, was not so strongly persuaded as Jenner was of its possible importance, yet spoke of it to his friends and in his lectures. After he began practice in Berkeley, Jenner was always accustomed to inquire what his professional brethren thought of it; but he found that, when medical men had noticed the popular report at all, they supposed it to be based on an imperfect induction of facts. His first careful investigation of the subject dates from about 1775, and five years elapsed before he had succeeded in clearing away the most perplexing difficulties by which it was surrounded. He first satisfied himself that two different forms of disease had been hitherto confounded under the term "cow-pox," only one of which protected against small-pox, and that many of the cases of failure were to be thus accounted for; and his next step was to ascertain that the true cow-pox itself only protects when communicated at a particular stage of the disease. At the same time he came to the conclusion that "the grouse" of horses is the same disease as cow-pox and small-pox, each being modified by the organism in which it was developed—an opinion which is generally held at the present day. For many years, cow-pox being scarce in his county, he had no opportunity of inoculating the disease, and so putting his discovery to the test, but he did all he could in the way of collecting information and communicating what he had ascertained. Thus in 1788 he carried a drawing of the cow-pox, as seen on the hands of a milkmaid, to London, and showed it to Sir E. Home and others, who agreed that it was "an interesting and curious subject," but by no means realized its practical importance. At length, on the 14th of May 1796, he was able

to inoculate James Phipps, a boy about eight years old, with cow-pox matter. On the first of the following July the boy was carefully inoculated with variolous matter, but (as Jenner had predicted) no small-pox followed. The discovery was now complete, but he desired to act without precipitation, and was unable to repeat his experiment until 1798, owing to the disappearance of cow-pox from the dairies. He then repeated his inoculations with the utmost care, and prepared a pamphlet which should announce his discovery to the world. Before publishing it, however, he thought it well to visit London, so as to demonstrate the truth of his assertions to his friends; but he remained in London nearly three months, without being able to find any person who would submit to be vaccinated. Soon after he had returned home, however, Mr Cline, an eminent surgeon, inoculated some vaccine matter over the diseased hip-joint of a child, thinking the counter-irritation might be useful, and found the patient afterwards incapable of acquiring small-pox. In the autumn of the same year, Jenner met with the first opposition to vaccination; and this was the more formidable because it proceeded from Dr Ingenhousz, a celebrated physician and man of science. But meanwhile Mr Cline's case, and his advocacy of vaccination, brought it much more decidedly before the medical profession, of whom the majority were prudent enough to suspend their judgment until they had more ample information. But besides these there were two noisy and troublesome factions, the one of which opposed vaccination as an useless and dangerous practice, while the other endangered its success much more by their rash and self-seeking advocacy. At the head of the latter was one Dr Pearson, who in November 1798 published a pamphlet speculating upon the subject, before even seeing a case of cow-pox, and afterwards endeavoured, by lecturing on the subject, and supplying the virus, to put himself forward as the chief agent in the cause. The matter which he distributed, which had been derived from cows that were found to be infected in London, was found frequently to produce, not the slight disease described by Jenner, but more or less severe eruptions resembling small-pox. Jenner concluded at once that this was due to an accidental contamination of the vaccine with variolous matter, and a visit to London in the spring of 1799 convinced him that this was the case. In the course of this year the practice of vaccination spread over England, being urged principally by non-professional persons of position; and towards its close attempts were made to found institutions for gratuitous vaccination and for supplying lymph to all who might apply for it. Pearson proposed to establish one of these in London, without Jenner's knowledge, in which he offered him the post of honorary corresponding physician! On learning this scheme to supplant him, and to carry on an institution for public vaccination on principles which he knew to be partly erroneous, Jenner once more visited London early in 1800, when he had influence enough to secure the abandonment of the project. He was afterwards presented to the king, the queen, and the prince of Wales, whose encouragement materially aided the spread of vaccination in England. Meanwhile it had made rapid progress in the United States, where it was introduced by Dr Waterhouse, the professor of physic at Cambridge, Massachusetts, and on the continent of Europe, where it was at first diffused by Dr de Carro of Vienna, who practised it with the greatest zeal and discretion, and thence spread to Geneva. In consequence of the war between England and France, the discovery was later in reaching Paris; but, its importance once realized, it spread rapidly over France, Spain, and Italy. It would be tedious and unprofitable to dwell minutely on the extension of vaccination over the whole world; but a few of the inci-

dents connected with it are too remarkable to be omitted. Perhaps the most striking is the expedition which was sent out by the court of Spain in 1803, for the purpose of diffusing cow-pox through all the Spanish possessions in the Old and New Worlds, and which returned in three years, having circumnavigated the globe, and succeeded beyond its utmost expectations. Many of the expressions of enthusiasm seem to us strained and almost ridiculous. Thus we read with surprise how clergymen in Geneva and Holland urged vaccination upon their parishioners from the pulpit; how in Sicily, South America, and Naples religious processions were formed for the purpose of receiving it; how the anniversary of Jenner's birthday, or of the successful vaccination of James Phipps, was for many years celebrated as a feast in Germany; and how the empress of Russia caused the first child operated upon to receive the name of "Vaccinoff," and to be educated at the public expense. The truth is that we who live in that security from the horrible and universal plague of small-pox for which we are indebted to Jenner's immortal discovery cannot realize the greatness of the blessing he conferred upon mankind. This universal enthusiasm caused vaccination to spread over the whole world in the marvellously short period of six years, it being accepted with equal readiness by nations of the most diverse climes, habits, and religions. About the close of the year 1801 Jenner's friends in his native county of Gloucester presented him with a small service of plate as a testimonial of the esteem in which they held his discovery. This was intended merely as a preliminary to the presenting of a petition to Parliament for a grant. He was advised to apply for this, partly to obtain the formal approval of the highest court in this country for vaccination, but also for personal reasons. The premier, Mr Addington, approved fully of this step, and fixed the 17th of March 1802 for the presentation of his petition. This was referred to a committee, of which Admiral Berkeley, one of his warmest friends, was chairman, which examined carefully into the utility of vaccination, and Jenner's claims to its discovery. The investigations of this committee resulted in a report in favour of the grant, and ultimately in a vote of £10,000.

Towards the end of 1802 steps were taken to form a society for the proper spread of vaccination in London, and the "Royal Jennerian Society" was finally established, Jenner returning to town (having retired to Berkeley for three months) to preside at the first meeting. This institution began very prosperously, more than twelve thousand persons having been inoculated in the first eighteen months, and with such effect that the deaths from small-pox, which for the latter half of the last century had averaged 2018 annually, fell, in 1804, to 622. Unfortunately the chief resident inoculator soon set himself up as an authority opposed to Dr Jenner, and this led to such dissensions as caused the society to die out in 1808.

Jenner was led, by the language of the chancellor of the exchequer when his grant was proposed, to attempt practice in London, but after a year's trial he returned to Berkeley. His grant was not paid until 1804, and then, after the deduction of about £1000 for fees, it did little more than pay the expenses attendant upon his discovery. For he was so thoroughly known everywhere as the discoverer of vaccination, that the correspondence of the whole world on this subject was upon him. As he himself said, he was "the vaccine clerk of the whole world"; and, at the same time, he continued to vaccinate gratuitously all the poor who applied to him on certain days, so that he sometimes had as many as three hundred persons waiting at his door. Meanwhile honours began to shower upon him from abroad: he was elected a member of almost all the chief scientific societies on the Continent, the first being

that of Göttingen, where he was proposed by the illustrious Blumenbach. But perhaps the most flattering proof of his influence was derived from France. He endeavoured on several occasions to obtain the release of some of the unfortunate Englishmen who had been detained in France on the sudden termination of the peace of Amiens, but without success, until, in the case of two persons (Dr Williams, a Ratcliffe travelling fellow, and a Mr Williams) he applied to the emperor Napoleon himself. It was on this or some such occasion (for he afterwards repeated his intercession) that Napoleon was about to reject the petition, when Josephine uttered the name of Jenner. The emperor paused and exclaimed—"Ah, we can refuse nothing to that name." Somewhat later he was of the same service to Englishmen confined in Mexico and in Austria; and during the latter part of the great war persons beyond leaving England would sometimes obtain certificates signed by him which served as passports. In his own country his merits were less recognized. His applications on behalf of French prisoners in England were less successful; he never shared in any of the patronage at the disposal of the Government, and was even unable to obtain a living for his nephew George.

In 1806 Lord Henry Petty (afterwards the marquis of Lansdowne) became chancellor of the exchequer, and was so convinced of the inadequacy of the former parliamentary grant that he proposed an address to the crown, praying that the college of physicians should be directed to report upon the success of vaccination. Their report being strongly in its favour, the then chancellor of the exchequer (Mr Spencer Perceval) proposed that a sum of £10,000 without any charge for fee or reward should be paid to Dr Jenner. The anti-vaccinationists found but one advocate in the House of Commons; and finally the sum was raised to £20,000. Jenner, however, at the same time had the mortification of learning that Government did not intend to take any steps towards checking small-pox inoculation, which so persistently kept up that disease. About the same time a subscription for his benefit was begun in India, where his discovery had been gratefully received, but the full amount of this (£7383) only reached him in 1812.

The Royal Jennerian Society having failed, the National Vaccine Establishment was founded, for the extension of vaccination, in 1808. Jenner spent five months in London for the purpose of organizing it, but was then obliged, by the dangerous illness of one of his sons, to return to Berkeley. He had been appointed director of the institution; but he had no sooner left London than Sir Lucas Pepys, the president of the college of physicians, neglected his recommendations, and formed the board out of the officials of that college and the college of surgeons. Jenner at once resigned his post as director, though he continued to give the benefit of his advice whenever it was needed, and this resignation was a bitter mortification to him. In 1810 his eldest son died, and Jenner's grief at his loss, and his incessant labours, materially affected his health. In the following year he happened to be in London when the town was much excited by the case of one of Lord Grosvenor's children, who took the small-pox severely, after having been vaccinated by Jenner himself ten years before. The boy's recovery was no doubt to be ascribed to his vaccination, but the occurrence revived for a time all the clamour with which the discovery had been from the first greeted.

In 1813 the university of Oxford conferred on Jenner the degree of M.D. It was believed that this would lead to his election into the college of physicians, but that learned body decided that he could not be admitted until he had undergone an examination in classics. This

Jenner at once refused; to brush up his classics would, he said, "be irksome beyond measure. I would not do it for a diadem. That indeed would be a bauble; I would not do it for John Hunter's museum."

He visited London for the last time in 1814, when he was presented to the allied sovereigns, and to most of the principal personages that accompanied them. In the next year his wife died after a long illness, and he felt her loss most acutely. It was the signal for him to retire from public life: he never left Berkeley again, except for a day or two, as long as he lived. He found sufficient occupation for the remainder of his life in collecting further evidence on some points connected with his great discovery, and in his engagements as a physician, a naturalist, and a magistrate. In 1818 a severe epidemic of small-pox prevailed, and fresh doubts were thrown on the efficacy of vaccination, in part, apparently, owing to the bad quality of the vaccine lymph employed. This caused Jenner much annoyance, which was relieved by an able defence of the practice, written by Sir Gilbert Blane. But this led him, in 1821, to send a circular letter to most of the medical men in the kingdom inquiring into the effect of other skin diseases in modifying the progress of cow-pox. A year later he published his last work, *On the Influence of Artificial Eruptions in certain Diseases*; and in 1823 he presented his last paper—"On the Migration of Birds"—to the Royal Society. In these pursuits the evening of his days passed happily away. On the 24th of January 1823 he retired to rest apparently as well as usual, and next morning rose and came down to his library, where he was found insensible on the floor, in a state of apoplexy, and with the right side paralysed. He never rallied, and died the following morning, January 26, 1823.

A public subscription was set on foot, shortly after his death, by the medical men of his county, for the purpose of erecting some memorial in his honour, and with much difficulty a sufficient sum was raised to enable a statue to be placed in Gloucester cathedral. In 1850 another attempt was made to set up a monument to him; this appears to have failed, but at length, in 1868, a statue of him was erected by public subscription in London.

Independently of that great discovery which will for ever render his name immortal, Jenner possessed talents of observation and reflexion that would have made him eminent as a naturalist and a physician. These qualities would have been more widely appreciated had not his tastes for rural scenes and domestic life led him to sacrifice such fame as is to be gained only amid the busy throng of men. This resolution was strengthened by his love for the simple pleasures of society, for which his varied accomplishments so well fitted him; indeed, there can be little doubt that he would never have had the perseverance to carry through his great discovery of vaccination had not his earnest benevolence pressed it on him, as a duty, to confer such a great and permanent benefit on the whole human race.

Jenner's life was written by the intimate friend of his later years, Dr Barrow of Gloucester (2 vols. 1827, 1838), and this excellent work is almost the sole source from which the present and other biographies of him have been taken. (J. R. G.)

JENYNS, SOAME (1704-1787), author of the *Free Inquiry into the Nature and Origin of Evil*, was born at London, of a good family, in 1704. He enjoyed the best educational advantages, and studied at St John's College, Cambridge. In 1742 he was chosen M.P. for Cambridgeshire, in which his property lay, and he afterwards sat for the borough of Dunwich and the town of Cambridge. From 1755 to 1780 he was one of the commissioners of the board of trade. He died December 18, 1787.

For the measure of literary repute which he enjoyed during his life Jenyns was indebted as much to his wealth

and social standing as to his accomplishments and talents, though both were considerable. His poetical works, the *Art of Dancing*, 1727, and *Miscellanies*, 1770, contain many passages graceful and lively, though occasionally verging on licence. The first of his prose works was his *Free Inquiry into the Nature and Origin of Evil*, 1756. This essay was severely criticized on its appearance, especially by Dr Johnson in the *Literary Magazine*. Johnson in this critique—the very best paper of the kind he ever wrote—condemned the book strongly as a slight and shallow attempt to solve one of the most difficult of moral problems. Jenyns, a gentle and amiable man in the main, was extremely irritated by his failure. He put forth a second edition of his work with a vindication prefixed, and tried to take vengeance on Johnson after his death by a sarcastic epitaph. In 1776 Jenyns published his *View of the Internal Evidence of the Christian Religion*. Though at one period of his life he had effected a kind of deistic scepticism, he had now returned to the orthodox creed of his youth, and there seems no reason to doubt his sincerity, questioned at the time, in defending Christianity on the ground of its total variance with the principles of human reason. The work was deservedly praised in its day for its literary merits, but is so plainly the production of a dilettante in theology that as a scientific treatise it is valueless. A collected edition of the works of Jenyns appeared in 1790, with a biography by Charles Nelson Cole.

JEPHTHAH (יִפְתָּח, *Yephthā*), one of the "judges" of Israel, was an illegitimate son of "Gilead," and, being expelled from his father's house by his lawful brethren, took refuge in the Syrian land of Tob, where he gathered around him a powerful band of homeless men like himself. The Ammonites pressing hard on his countrymen, the "elders of Gilead" called for his help, which he consented to give on condition that in the event of victory the supremacy should be conferred upon him. The success of his arms was complete, and he became in consequence "judge" of Israel until his death six years afterwards. His name is best known in history and literature in connexion with his "vow," which led to the sacrifice of his daughter as a burnt offering on his return from the war. Much reluctance has been, and continues to be, shown by many writers in accepting the plain sense of the Scripture narrative on this point,—reluctance which proceeds to a large extent on unwarranted assumptions as to the stage of ethical development which had been reached in Israel in the period of the judges, or at the time when the narrative took shape. Several modern writers, on the other hand, are disposed to find a mythical element in the history of Jephthah. In this connexion weight has been laid on his name, "the opener," on the fact that Gilead is not a personal name, and particularly on the circumstance that what is related about his daughter appears to be the popular explanation of a ceremony closely allied to well-known rites connected with solar mythology. The story of Jephthah is told in Judg. x. 15-xii. 7; a great part of this section of that book, however, is occupied with an allocation (xi. 14-27) to the children of Ammon which almost certainly belongs to a later hand.

See Wellhausen-Bleek, *Einführung*; Goldziher's *Mythologie der Hebräer*; and Stüder and Borthaus's commentaries on Judges.

JERBOA, a family of rodent mammals (*Dipodidae*), chiefly characterized by the great length of the hind limbs as compared with those in front, the disproportion being, in most cases, greater even than in the kangaroos. Like the latter, the jerboas, or jumping mice, as they are also called, raise themselves when disturbed on their hind legs, and execute enormous leaps by the aid of a long muscular tail. When undisturbed, however, they make use of all their

limbs in walking, while the front pair are also employed by many species as hands for the conveyance of food to the mouth. The jerboas, of which there are three genera and twenty-two species known, occur chiefly throughout northern and central Africa, south-eastern Europe, and central and southern Asia, while one genus (*Pedetes*) is confined to South Africa and another (*Jaculus*) to North America. Of the third genus (*Dipus*) there are twenty known species, a typical example of which is the Egyptian jerboa (*Dipus egyptius*). The length of its body is 8 inches, and of its tail, which is long, cylindrical, and covered with short hair, terminated by a tuft, 10 inches. Its front limbs are pentadactylous, and only 1 inch in length, the hind pair three-toed and six times as long. When about to spring, it raises its body by means of the hinder extremities, and supports itself at the same time upon its tail, while the fore feet are so closely pressed to the breast as to be scarcely visible. Hence probably the name *Dipus*, or two-footed. It then leaps into the air and alights upon its four feet, but instantaneously erecting itself, it makes another spring, and so on in such rapid succession as to appear as if rather flying than running. It is a gregarious animal, living in considerable colonies in burrows, which it excavates with its nails and teeth in the sandy soil of Egypt and Arabia. In these it remains during great part of the day, emerging at night in search of the herbs on which it feeds. It is exceedingly shy, and this, together with its extraordinary agility, renders it difficult to capture. The Arabs, however, succeed, it is said, in this by closing up all the exits from the burrows with a single exception, by which therefore they are forced to come, and over which a net is placed for their capture. When confined, they will gnaw through the hardest wood in order to make their escape. The Indian jerboa (*Dipus indianus*) is also a nocturnal burrowing animal, feeding chiefly on grain, which it stores up in underground repositories, closing these when full, and only drawing upon them when the supply of food above ground is exhausted. The natives in some parts of India are in the habit of searching for and robbing those granaries. The South African form, known as the spring haas or jumping hare of the colonists (*Pedetes capensis*), is the largest member of the family, measuring about a foot in length, exclusive of the tail, which is somewhat longer, and is bushy throughout. Its molar teeth are rootless, while its toes, which are three in number on each hind foot, are armed with long hoof-like nails. It is a powerful animal, nearly as large as a hare, and progresses when pursued by a series of leaps, each usually from 20 to 30 feet in length. Those jumping hares are found abundantly in the rocky plateaus of South Africa, where colonies of them form extensive burrowings somewhat similar to the rabbit warrens of Britain. Like other jerboas it is chiefly nocturnal, and occasionally it does considerable injury to the grain crops on which it feeds. Of the American genus (*Jaculus*) there is only a single species—the Labrador jumping mouse (*Jaculus hudsonius*). It occurs over a wide area of North America, extending from Missouri northward to Labrador, and from the Atlantic westward to the Pacific coast. It resembles the spring haas, and differs from all other jerboas in having the metatarsal bones separated, and also in having its feet five-toed. It is a small creature, measuring about 5 inches in length, exclusive of the much longer and very rat-like tail, and lives chiefly in the neighbourhood of woods and shrubby places, where it conceals itself by day but roams in companies at night. Its agility is extraordinary; one kept in confinement by General Davies took, he says, "progressive leaps of from 3 to 4 and sometimes of 5 yards"; while Audubon considered it as probably the most agile of all wild animals. On the approach of winter the American

jumping mouse retires into its burrow, and there encloses itself within a hollow ball of mud, in which it passes the cold season in a state of complete torpidity. The North American Indians neither eat its flesh nor make any use of its skin.

JERDAN, WILLIAM (1782–1869), journalist, was born April 16, 1782, at Kelsco, Scotland. After leaving the parochial school of his native town, his erratic youth between the years 1799 and 1806 was spent in the successive spheres of a country lawyer's office, a London West India merchant's counting-house, an Edinburgh solicitor's chambers, and the position of surgeon's mate on board H.M. guardship "Gladiator" in Portsmouth harbour, under his uncle, who was surgeon. In 1806 the insertion of some verses of his in a Portsmouth paper determined Jerdan's choice of literature as a profession; and, proceeding to London, he found employment as a newspaper reporter. By 1812 he had become editor of *The Sun*, a semi-official Tory paper; but a quarrel with the chief proprietor brought that engagement to a close in 1817. He passed next to the editor's chair of *The Literary Gazette*, which he conducted with success for thirty-four years. Jerdan's position as editor introduced him into high social and literary circles; and it is not easy to account for the deference he met with, unless one is content to accept him at his own somewhat self-satisfied estimate, as contained in his *Autobiography* (4 vols., 1852–3), for which, however, there is no other warrant. An account of his acquaintance, among whom Canning was a special intimate, is to be found in his *Men I have Known* (1866). When Jerdan retired in 1850 from the editorship of the *Literary Gazette*, his pecuniary affairs, either through misfortune or imprudence, were far from satisfactory. A testimonial of over £900 was subscribed by his friends; and in 1852 a Government pension of 100 guineas was conferred on him by Lord Aberdeen. Among other works, including translations from the French, Jerdan contributed to *Fisher's National Portrait Gallery of Illustrious and Eminent Personages of the 19th Century*. He died July 11, 1869.

JEREMIAH. 1. Life.—The narrative portions of the Book of Jeremiah are singularly full and precise, and even apart from these the subjective, lyric tone of the prophet's mind enables us to form a more distinct idea of his character than we have of any other prophetic writer. He was the son of a priest named Hilkiah, and it has been held by many both in ancient and in modern times that this Hilkiah was the celebrated high priest of that name, who "found the book of the law (Torah) in the house of Jehovah" (2 Kings xxii. 8). This conjecture, indeed, is not a very probable one, for Hilkiah the high priest was of the house of Eleazar (1 Chron. ii. 13), and Anathoth, where Jeremiah's family lived, was occupied by priests of the line of Ithamar (1 Kings ii. 26). It is certain, however, that the prophet was treated by priests and officials with a consideration which seems to argue that he had high connexions. Jeremiah was still young when he was called to the prophetic career (i. 6); the year is stated by himself (i. 2, xxv. 3) to have been the 13th of Josiah (629 or 627 B.C.). This was before the memorable "discovery" of the Torah, but the year immediately following that in which Josiah "began to purge Judah and Jerusalem from the high places and the images of Asherah" (2 Chron. xxxiv. 3). As yet, it appeared as if Judah was enjoying the peace promised to faithful worshippers of Jehovah; but the punishment of the sins of Manasseh was not to be long delayed. The battle of Megiddo (809 B.C.), which cost Josiah his life, and that of Carchemish (605 B.C.), which determined the Babylonian predominance to the west of the Euphrates, were the heralds of a fatal turn in the fortunes of the kingdom of Judah. Jeremiah (the

Phocion of Judea) saw this, and at once foretold the vast extension of Nebuchadnezzar's power. For the most part, his ministry was exercised in the capital, though from xi. 21 it may perhaps be inferred that he prophesied for some little time in his native place. It was during the reign of Jehoiakim that he went through that baptism of complicated suffering which has made him in a very high and true sense a type of One greater than he. King and people, priests and (official) prophets, were all against him, or at least the number of his supporters was too small to counterbalance the opposition. Only on one occasion, when accused of a capital crime as having "prophesied against this city," the "princes," supported by "certain of the elders" and "the people," were successful in quashing the accusation, and setting the prophet free. At a later time Jeremiah incurred a still greater danger, though he was providentially saved from the hands of his persecutors. In the fourth year of Jehoiakim (which, it is important to remember, was the first of Nebuchadnezzar) Jeremiah was commanded to write down "all the words that I have spoken unto thee against Israel, and against Judah, and against all the nations . . . from the days of Josiah even unto this day" (xxvi. 2). The interpretation of this passage, clear as it seems at first sight, is by no means easy. "First of all, an historically accurate reproduction of the prophecies would not have suited Jeremiah's object, which was not historical but practical; he desired to give a salutary shock to the people, by bringing before them the fatal consequences of their evil deeds. And next, it appears from ver. 20 that the purport of the roll which the king burned was that the king of Babylon should 'come and destroy this land,' whereas it is clear that Jeremiah had uttered many other important declarations in the course of his already long ministry." The most probable view is that of Gritzk, viz., that the roll simply contained chap. xxv., which is in fact (omitting the interpolations in vers. 12, 20) entirely concerned with the invasion of Nebuchadnezzar and its consequences, and which expressly claims to have been written in the fourth year of Jehoiakim. "Is not *this* the prophecy which Jeremiah dictated to Baruch, and is not ver. 2 a loose, inaccurate statement due to a later editor? That the prophetic as well as the historical books have passed through various phases (without detriment to their religious value) is becoming more and more evident. The 7th and 8th chapters of Isaiah, and the 37th and 38th of the same book, have demonstrably been brought into their present shape by an editor; is it not highly reasonable to conjecture that these narrative chapters of Jeremiah have, to a greater or less extent, passed through a similar process?" The "princes," on this as on the former occasion (chap. xxvi.), were disposed to be friendly to Jeremiah and his secretary; but for some reason they felt themselves bound (as they did not feel themselves bound before) to refer the matter to the king. Jehoiakim was enraged at the contents of the prophetic roll, cut it in pieces, and throw them into the fire. This time Jeremiah escaped; but under the weak-minded Zedekiah he was more than once imprisoned (chaps. xxxii., xxxiii., xxxvii., xxxviii.). It is remarkable that, in the tension of feeling, the "princes," who were formerly friendly to Jeremiah, now took up an attitude of decided hostility to him. At last they had him consigned to a murky dungeon, and it was the king who interferred for his relief, though he remained a prisoner till the fall of Jerusalem. Nebuchadnezzar, who had doubtless heard of Jeremiah's constant recommendations of submission, gave him the choice either of going to Babylon or of remaining in the country (chaps. xxxviii., xxxix.). He chose the latter, and resided with Gedaliah, the native governor, at Mizpah. On the murder of Gedaliah he was carried to Egypt against his will (chaps.

xl.-xliii.), where he predicted the approaching conquest and desolation of the Nile valley. A legendary tradition states that he suffered death by stoning.

2. *Character and Literary Style.*—It is interesting to compare Jeremiah with Isaiah. The earlier prophet had advantages which were denied to the latter; he lived at a period of comparative national prosperity, and his moral and intellectual gifts were of a stronger and more striking order. But Jeremiah has this noteworthy point in his favour that he overcame the natural shrinking of a somewhat feminine character, and showed himself able, in a strength not his own, to resist impediments which even Isaiah would have found terribly great. "When," as Ewald says, "the truth and the spirit of Jehovah call him or the resisting world provokes him to the contest, he then knows nothing of diffidence and fear, nothing of tenderness and pliability, he contends before the eyes of all with the most decisive energy against every false prophet who misleads the people (xxviii. 6 *sq.*, xxix. 15 *sq.*, 24 *sq.*); if the truth has not been proclaimed with due faithfulness to the king, he goes still, as Isaiah did in his day, without hesitancy, to the royal palace (xxi. 1-10, xxiv. 2-7); and, although himself of a priestly family, he speaks from the very first with special emphasis against the growing degeneracy of the priests (i. 18, ii. 26, iv. 9), and is never weary of speaking against every kind of arbitrariness wherever and in whatever form it is found (xxiv. 8-22, xxxvii. 14 *sq.*)." Another point of contrast is well worth noticing. Only five years after Jeremiah's first appearance as a prophet that great reform took place which was associated with the "discovery" of the Deuteronomic Torah. It is a highly probable conjecture (comp. chap. xi.) that Jeremiah was at the outset an ardent preacher of the contents of this great book; at any rate, his memory became surcharged with the ideas and even the phrases of Deuteronomy. The consequences of the reforming endeavours of what may be called the Deuteronomic party were both good and evil. The centralization of religion, and the emphasis laid on the moral duties, were steps of the highest importance. "But inasmuch as a sacred book was as such for the first time looked upon with greater reverence as a state authority, there arose thus early a kind of book-science with its pedantic pride and erroneous learned endeavours to interpret and apply the Scriptures; whilst at the same time there arose also a new kind of hypocrisy and idolatry of the letter, through the new protection which the state gave to the religion of the book acknowledged by the law. Thus scholastic wisdom came into conflict with genuine prophecy" (Ewald, *The Prophets*, iii. 63, 64). But something more than this was the result. "Hear ye the words of this covenant," was the address with which Jeremiah began his Deuteronomic preaching; but, as time went on, a deeper view of the covenant forced itself upon his mature mind, and the expression which it has found in xxxi. 31-34 is one of the passages which best deserve to be called "the gospel before Christ." It is sad that Jeremiah could not always keep his spirit under the calming influence of these high thoughts. No book of the Old Testament, except the Book of Job and the Psalms, contains so much which is difficult to reconcile with the character of a self-denying servant of Jehovah. Such expressions as those in xi. 20, xv. 15, and especially xviii. 21-23, contrast powerfully with Luke xxiii. 34, and show that the typical character of Jeremiah is not absolutely complete.

No wonder if Jeremiah's style is feeble compared with that of the "royal prophet" Isaiah,—if he gladly leans on older prophets, and copies or imitates more than a bolder genius would have permitted. His utterance is interrupted by sobs, and he is without the energy to soar to poetic

heights. His brevity is that of "the evening star of prophecy," and Ewald even remarks (with some exuberance, perhaps) that he has "great wealth of new figures with great delicacy of description, a literary facility that readily adapts itself to the most different subjects . . . and with all this an unadorned simplicity which is very unlike the greater artificiality of his contemporary Habakkuk."

3. *Dates of the Prophecies.*—According to Bleek, the following prophecies belong in all probability to the reign of Josiah, (a) ii. 1-iii. 3, (b) iii. 6-vi. 30 (expressly referred to this period), (c) vii. 1-ix. 25, (d) xi. 1-17. Dated prophecies meet us again in the time of Jehoiaikim. Chap. xxvi., according to its own statement, arose in the beginning of his reign; and it is held by some that chap. vii. gives the same prophecy as xxvi. 2-6, only in a fuller form. The prophecy against Egypt in xvi. 2-13, and the prophecy of the vast extension of the Babylonian power in chap. xxv., are both dated in the fourth year of Jehoiaikim (the latter is evidently not free from interpolations). To the same eventful year, according to most scholars, belongs the writing of all Jeremiah's prophecies in the roll which was read before Jehoiaikim; but we have already seen reason to doubt the soundness of this view. At any rate, chap. xxxv. belongs to this period, as the superscription and the contents combine to show. Bleek also refers several other prophecies to the reign of Jehoiaikim, e.g., (a) xvi. 1-xvii. 18, (b) xvii. 19-27, (c) xiv. xv., (d) xviii., (e) xi. 18-xii. 17. To the short reign of Jehoiachin, or to the last period of Jehoiaikim's, we may refer x. 17-23, and perhaps chap. xiii., with its account of a strange symbolical action connected with the Euphrates or more probably (Hitzig) Ephraim, i.e., Bethlehem. Zedekiah's reign is much more fully represented in the prophecies; see chaps. xxii.-xxiv., xxvii.-xxix., and, if ii. 59 is to be followed, chaps. i., ii. A little later in the same reign we may place chaps. xix., xx., which describe some remarkable scenes in Jeremiah's history. Later still, at the beginning of the siege of Jerusalem, fall xxiv. 1-7, chap. xxi., and the group of chapters beginning at chap. xxxii., the important prophecies in chaps. xxx., xxxi., also perhaps belong to this period; and of course chap. xxxvii. and the two following chapters.

It should be mentioned here that there are some portions of the book the Jeremianic authorship of which has been entirely or in part denied. (a) Chap. x. 1-16 was written, according to Movers, Hitzig, Graf, Knobel, and Naegelsbach by a prophet of the captivity—Movers and Hitzig say, by the author of Isaiah xl.-lxvi. (b) Chaps. xxx.-xxxiii., according to Movers and Hitzig, have been brought into their present shape by the author of Isa. xl.-lxvi., though the basis is Jeremianic. (c) Chaps. i., ii., which Bleek assigns to the fourth year of Zedekiah, was according to Movers and Hitzig brought into its present form by a captivity prophet, working on a Jeremianic basis, while Ewald and Knobel hold it to have been entirely written at the close of the captivity. (d) Chap. lii. evidently forms the close of a history of the kings of Judah, and no doubt of the history followed very closely by the editor of the Books of Kings.

We cannot here enter fully into this subject. But something may be said on chaps. i., ii.¹ It is open to grave doubt whether Jeremiah wrote these chapters. That he composed a prophecy against Babylon may be granted, and that he gave it to Seraiah with the charge described in li. 61-64; but it does not follow that the present prophecy on Babylon was the one referred to in ver. 60. There are special reasons for the opposite view, and they are analogous

to these which lead so many students to doubt the Isaianic origin of Isa. xl.-lxvi. For example,—(1) the author of the latter prophecy (or the greater part thereof) writes as if he were living at the close of the Babylonian exile. So does the author of Jer. i., ii. See chap. ii. verses 33, 6 and 45, 11 and 28, 20-23. (2) Although the above statement is literally true of most of Isa. xl.-lxvi., yet there are some passages which are much more suggestive of a Palestinian than of a Babylonian origin (see ISAIAH). Precisely so in Jer. i., ii., at least according to one prevalent interpretation of i. 5, ii. 50 (which are thought to imply a residence in Jerusalem), i. 28, ii. 11, 35, 51 (suggestive, perhaps, of the continuance of Jerusalem and the temple), i. 17, ii. 34 (implying, as some think, that Nebuchadnezzar is still alive). Still there is so much doubt respecting the soundness of the inferences that it is hardly safe to rely too confidently upon them. The case of Jer. i., ii. is therefore in so far rather less favorable to Jeremiah's authorship than that of Isa. xl.-lxvi. is to that of Isaiah. (3) Amongst much that is new and strange in the style and phraseology of Isa. xl.-lxvi., there is not a little that reminds one forcibly of the old Isaiah. Similarly with Jer. i., ii. "Every impartial judge," says Kuenen, "must admit that the number of parallel passages is very large, and that the author of chaps. i., ii. agrees with no one more than with Jeremiah." For instance, the formula, "Thus saith Jehovah Sabaoth, the God of Israel" (i. 18, ii. 33) also occurs in vii. 3, ix. 15, and some twenty-six other passages; comp. also i. 3 with ix. 9; i. 5 with xxxii. 40; i. 7 with ii. 3, xiv. 18, xvii. 13.

The probability would therefore appear to be that, whatever solution we adopt for the literary problems of Isa. xl.-lxvi., an analogous solution must be adopted for Jer. i., ii. The whole question is so large, and connects itself with so many other problems, that the present writer declines to pronounce upon it here. Only it should be observed—(1) that both subject and tone remind us of Isa. xl.-lxvi., and the kindred prophecies scattered about in the first part of the Book of Isaiah, and more especially of Isa. xiii. and the closely related prophecy, Isa. xxvii.; (2) that these two chapters, Jer. i. and ii., present some striking points of contact with Ezekiel, who, though contemporary with Jeremiah, was still a late contemporary, and allusions to whom (since Ezekiel was a literary rather than an oratorical prophet) imply that his prophetic book was already in circulation—in other words, suggest a date well on in the exile for the prophet who alludes to him; (3) that, though there are many Jeremianic allusions in Jer. i., ii., there are also several passages copied almost verbally from prophecies of Jeremiah and applied to Babylon and its assailants (it seems difficult to believe that Jeremiah should have been so economical of his literary work). It deserves to be added (4) that, though Jeremiah is a great student of the earlier prophetic writings, and makes numerous allusions to them (see especially chaps. xli.-xlix.), nothing approaching to the mosaic work in Jer. i., ii. can be pointed to in the undoubted prophecies of Jeremiah. In fact, the author of these chapters has borrowed almost the whole of their contents from other prophets,—his own property, so to speak, being too insignificant to be worth mentioning.

4. *The Massoretic Text and the Septuagint Version.*—The Alexandrian version presents an unusually large amount of variation from the received Hebrew text. Even in the order of the prophecies there is one remarkable discrepancy, viz., in the series of prophecies against foreign nations (chaps. xxv. 15-xlv. become in the LXX. chaps. xxxii.-li., the series of prophecies in question being transposed); and there is no doubt an approach to the truth in the LXX. arrangement. More important are the

¹ In xxvii. all critics agree that for "Jehoiakim" we should substitute, with the Syriac version, "Zedekiah."

² Compare a paper by Budde in *Jahrb. f. D. Theol.*, 1879.

differences of reading. "The LXX. has very few additions, and these only single words or syllables; on the contrary, there are many omissions of words, sentences, verses, and whole passages (altogether about 2700 words are wanting, or the eighth part of the Massoretic text); also alterations of passages, sometimes not without influence on the sense" (Bleek); and these discrepancies are of extremely early date, for the state of the Greek text was already noticed by Origen (*Ep. ad Afric.*, p. 56, Migne). Three principal explanations have been offered:—(1) the error of copyists (Jerome, Grabe); (2) negligence and caprice on the part of the Greek translators (Spohn, Naegelsbach, Wichelhaus, Keil, Graf); (3) the existence of various (or at least two) recensions of the Hebrew, the recension used by LXX. being nearer to the original text than that of the Massorets (J. D. Michaelis, Movers, Hitzig, Bleek). A better view is that adopted by Ewald, Schrader, and Kuonen, according to which the Massoretic text is on the whole the best; but the Greek version, in spite of the manifold errors and caprices of the translator, sometimes approaches more nearly to the original than the Massoretic text.

Modern Literature.—Venema, *Comment. in librum prophet. Jeremiae*, 2 vols., Leeuwarden, 1765; Blayney, *Jeremiah and Lamentations, a new translation, with notes critical, philological, and explanatory*, London, 1784, Spohn, *Jeremias vates e vers. Jud. Alexandr. ac reliq. interp. Græc. emendatus, notisque crit. illustratus*, 2 vols., Leipzig, 1794, 1824 (of little value); Roorda, *Comm. in aliquot Jer. loca*, Groningen, 1824; Movers, *De utriusque recensionis veterum Jeremiae, Græcum Alexandrinum et Hebræum Massoreticum, indolis et origine*, Hamburg, 1837; Kuper, *Jeremias librorum sanctorum interpres atque vindex*, Berlin, 1837; Wichelhaus, *De Jeremia versione Alexandrina*, Halle, 1847; Scholz, *Der Alte Test und die LXX. Uebers. d. 2. Jer.*, 1876; Guthe, *Die Hebräer's Notizen Jeremia's*, 1877. (T. K. C.)

JEREZ DE LA FRONTERA, a city in the province of Cadiz, Spain, near the right bank of the Guadalete, 16 miles N.N.E. of Cadiz (28 by rail), and 67 S.E. of Seville. It is pleasantly situated on an undulating plain of much fertility, and covers a considerable extent of ground. The old crescent Moorish wall by which it was formerly surrounded, but which it has now quite outgrown, still partially exists, as also do some of the ancient gateways. The newer portions of the town are well built, having broad regular streets with numerous "plazas" or squares adorned with fruit trees. The principal buildings are the Alcazar, an old palace fortress belonging to the Moorish period, adjoining the modern "alameda" or promenade; the collegiate church (1695), which, however, though large, presents no attractive architectural features; and the municipal buildings, belonging to the end of the 16th century, which display considerable taste. There are numerous other churches, a theatre, an orphanage, four hospitals, an "institute," a library, and various schools. The bull ring (1875) is a large one, and enjoys a good repute in Andalusia. The staple article of trade is the wine grown in the neighbourhood, known from the name of the town as "sherris" (xeres) or sherry, of which in 1876 a total of 4,607,550 imperial gallons was exported. Of these Great Britain and Ireland took 4,024,114, British colonies 51,122, and other parts of the world 532,314. The population in 1877 was 64,533.

Jerez has sometimes been identified with the ancient *Asta Regia*, but is most probably the *Astio* ("quæ Casaria") of Pliny. The *Sherish* of the Arabs is said to have been a corruption from *Casaria Astio*. It was in this neighbourhood that the decisive battle of the Guadalete (July 711) was fought which practically made Tarik master of the entire Pyrenean peninsula. Jerez, which is frequently mentioned in the chronicles of the Spanish Arabs, was recovered by Alphonse the Wise in 1255.

JEREZ DE LOS CABALLEROS, a city in the province of Badajoz, Spain, is picturesquely situated 39 miles to the south of that city, on two heights near the Ardila, a tributary of the Guadiana. The old town is surrounded by a Moorish wall with six gates; the newer portion of the city is well and regularly built, and adorned with numerous orange and other fruit trees. It has linen and woollen manufactures to a limited extent and several tanneries; but its principal articles of trade are the various agricultural and other products of the district, especially the fine quality of pork which is reared in the oak forests of the neighbourhood. The town is said to have been founded by Alphonso IX. of Leon in 1229; in 1232 it was extended by his son Saint Ferdinand, who gave it to the Knights Templars, whence the name de los *Caballeros*. It was made a city by Charles V. The population in 1877 was 8463.

JERICO (יְרִיכוֹ, "fragrant," or perhaps, according to an old interpretation, "city of the moon") was the first city west of the Jordan occupied by the Israelites. The city was destroyed, and, though it is mentioned from time to time under its usual name (2 Sam. x. 5) or by its epithet "city of palm trees" (Judg. i. 16, iii. 13; comp. Deut. xxxiv. 3), it was not rebuilt as a fortified place till the reign of Ahab (1 Kings xvi. 34), when it became the seat of a prophetic society, and appears in the history of the prophet Elisha (2 Kings ii.). The narrative of the healing of the waters by Elisha is referred by Josephus (*B. J.* iv. 8, 3) to the copious fountain now called the Sultan's Spring, which lies on the western margin of the Jordan valley, 700 feet below the Mediterranean level, and just under the cliffs of M. Quarantania. The mounds surrounding the spring are of sun-dried brick, and show no traces of ancient building. The position of the town, in a district of great fertility, with rose gardens (*Ecdes.* xxiv. 14), various species of date palms, and valuable cultivation of henna, opalsamum, and myrobalan (*Jos.*, *ut supra*; Strabo, xvi. 2), secured its prosperity, while its situation at the gate of the great pass leading up from the Jordan valley to Jerusalem gave it strategic importance. Thus we find that it shared the calamities of the Babylonian exile (*Ezra* ii. 34), was re-occupied on the restoration (*Neh.* iii. 2), and was fortified by Bacchides in the Maccabæan wars (1 Mac. ix. 50). In the time of Strabo there were two forts, Threx and Taurus, protecting the pass above Jericho. Antony gave the groves of Jericho as a rich gift to Cleopatra. From her they passed to Herod the Great, who made the city his winter residence, and adorned it with buildings, crowning the height above with a fortress named after his mother Cyprus. Here it was that the tyrant died. It appears, however, that the Jericho of Herod was not on the site of the old city (*Jos.*, *ut supra*) but a mile to the south, where there are also mounds and the remains of five aqueducts conveying water from three distant springs. A great tank, of which the ruins are still traced, has been conjectured to be the same in which Herod drowned Aristobulus (*Jos.*, *Ant.*, xv. 2, 3). In the time of Christ the pilgrims from Peræa and Galilee appear to have gathered at Jericho on their way to Jerusalem, and so the town is repeatedly mentioned in the Gospels. According to Eusebius (*Onom.*, ed. Lagarde, p. 265) Jericho was destroyed at the time of the fall of Jerusalem, and a new town sprang up, from which he distinguishes the ruins of two earlier cities as still visible. To the third Jericho, which was an episcopal city, may be referred the Byzantine remains immediately east of Tell es Sultân. The present village of Rihâ or Arhâ, which stands nearly half an hour south-east of the Sultan's Spring, is a still more modern site, with a square tower of crussading date. Yâkût, in the beginning of the 13th century, still speaks of Jericho as producing dates, bananas, and excellent sugar, but all these have disappeared with the gradual decay of

the place. The modern village is but a group of squalid huts, and the ancient groves are represented by a thicket of the *Spina Christi* and other trees between the village and the Sultan's Spring.

JEROME, St (HIERONYMUS, in full EUSEBIUS SOPHRONIUS HIERONYMUS), was born at Strido (modern Strigani?), a town on the border of Dalmatia fronting Pannonia, destroyed by the Goths in 377 A.D. Some authorities, following Prosper's chronicle, give 330 or 331 as the date of his birth, but from certain passages in his writings it is more probable that he was not born till 340 or 342. He says, for example, that he was a boy learning grammar when Julian died; but Julian died in 363, and Jerome would scarcely call himself a boy if he had been thirty-three years old. What is known of Jerome has mostly been recovered from his own writings, for he was a gossiping sort of man, and biographers have only to string together extracts from his epistles and prologues to get a very good account of his life. His parents were Christians, orthodox though living among people mostly Arians, and wealthy. He was at first educated at home, Donatus, a life-long friend, sharing his boyish studies, and was afterwards sent to Rome to perfect his education. Donatus, whose Latin grammar was to be the plague of generations of mediæval school-boys from St Andrews to Prague till Corderius and the Reformation drove it out, taught him grammar and explained the Latin poets. Victorinus taught him rhetoric. He attended the law-courts, and listened to the Roman advocates pleading in the Forum. He went to the schools of philosophy, and heard lectures on Plato, Diogenes, Clitomachus, and Carneades; the conjunction of names shows how philosophy had become a dead tradition. His Sundays were spent in the catacombs in discovering graves of the martyrs and deciphering inscriptions. Pope Liberius baptized him in 360; three years later the news of the death of the emperor Julian the Apostate came to Rome, and Christians felt relieved from a great dread.

When his student days were over Jerome returned to Strido, but did not stay there long. His character was formed. He was a scholar, with a scholar's tastes and cravings for knowledge, easily excited, bent on scholarly discoveries. From Strido he went to Aquileia, where he formed some friendships among the monks of the large monastery there, the most notable being his acquaintance with Rufinus, with whom he was destined to quarrel bitterly over the question of Origen's orthodoxy and worth as a commentator; for Jerome was a man who always sacrificed a friend to an opinion, and when he changed sides in a controversy expected his acquaintances to follow him. From Aquileia he went to Gaul, visiting in turn the principal places in that country, from Narbonne and Toulouse in the south to Treves on the north-east frontier. He stayed some time at Treves studying and observing, and it was there that he first began to think seriously upon divine things. From Treves he returned to Strido, and from Strido to Aquileia. He settled down to literary work in Aquileia, and composed there his first original tract, *De Muliere septies perclusa*, in the form of a letter to his friend Innocentius. Some quarrel, no one knows what, caused him to leave Aquileia suddenly; and with some companions, Innocentius, Evagrius, and Heliodorus being among them, he started for a long tour in the East. The epistle to Rufinus (3d in Vallarsi's enumeration) tells us the route. They went through Thrace, visiting Athens, Bithynia, Galatia, Pontus, Cappadocia, and Cilicia, to Antioch, Jerome observing and making notes as they went. He was interested in the theological disputes and schisms in Galatia, in the two languages spoken in Cilicia, &c. At Antioch the party remained some time. Innocentius died of a fever, and Jerome was dangerously ill. This illness brought him face

to face with death; he experienced conversion, and resolved to renounce whatever kept him back from God. His greatest temptation was the study of the literature of pagan Rome. In his dreams God reproached him with caring more to be a Ciceronian than a Christian. He disliked the uncouth style of the Scriptures. "O Lord," he prayed, "Thou knowest that whenever I have and study secular MSS. I deny Thee," and he made a resolve henceforth to devote his scholarship to the Holy Scripture. "David was to be henceforth his Simonides, Pindar, and Alceus, his Plæcæus, Catullus, and Severus." Fortified by these resolves he betook himself to a hermit life in the wastes of Chalcis. Chalcis was the Thebaid or the Marseilles of Syria. Great numbers of monks, each in solitary cell, spent lonely lives, scorched by the sun, ill-clad and scantily fed, pondering on portions of Scripture or copying MSS. to serve as objects of meditation. Jerome at once set himself to such scholarly work as the place afforded. He discovered and copied MSS., and began to study Hebrew. There also he wrote the life of St Paul of Thebes, probably an imaginary tale embodying the facts of the monkish life around him. Just then the Meletian schism, which had to do with the relation of the orthodox to Arian bishops and to those baptized by Arians, distressed the church at Antioch, and Jerome as usual eagerly joined the fray. Here as elsewhere he had but one rule to guide him in matters of doctrine and discipline,—the practice of Rome and the West; for it is singular to see how Jerome, who is daringly original in points of scholarly criticism, was simply a ruthless partisan in all other matters; and, having discovered what was the Western practice, he set tongue and pen to work with his usual bitterness (*Altercatio Luciferiani et Orthodoxi*). From Antioch he went to Constantinople, where he met with the great eastern scholar and theologian Gregory of Nazianzus, and with his aid tried to perfect himself in Greek. The result of his studies there was the translation of the *Chronicon* of Eusebius, with a continuation,¹ of twenty-eight homilies of Origen on Jeremiah and Ezekiel, and of nine homilies of Origen on the Visions of Isaiah.

In 381 Meletius died, and Pope Damasus interfered in the dispute at Antioch, hoping to end it. Jerome was called to Rome in 382 to give help in the matter, and was made secretary during the investigation. His work brought him into intercourse with this great pontiff, who soon saw what he could best do, and how his vast scholarship might be made of use to the church. Damasus suggested to him to revise the existing Latin translation of the Bible; and to this task he henceforth devoted his great abilities (see BIBLE). At Rome were published the Gospels (with a dedication to Pope Damasus, an explanatory introduction, and the canons of Eusebius), the rest of the New Testament, and the version of the Psalms from the LXX. text, known as the *Psalterium Romanum*, which was followed in 385 by the *Psalter Gallicanum*, based on the Hexaplar Greek text. These scholarly labours, however, did not take up his whole time, and it was almost impossible for Jerome to be long anywhere without getting into a dispute. He was a zealous defender of that monastic life which was beginning to take such a large place in the church of the 4th century, and he found enthusiastic disciples among the Roman ladies. A number of widows and maidens met together in the house of Marcella to study the Scriptures with him; he taught them Hebrew, and preached the virtues of the celibate life. His arguments and exhortations may be gathered from many of his epistles and from his tract *Adversus Helvidium*, in which he defends the perpetual virginity of the Virgin Mary

¹ Comp. Schoene's critical edition (Berlin, 1866, 1876).

against Helvidius, who maintained that Mary bore children to Joseph. His influence over these ladies alarmed their relations, and excited the suspicions of the regular priesthood and of the populace, but while Pope Damasus lived Jerome remained secure. Damasus died, however, in 384, and was succeeded by Siricius, who did not show much friendship for Jerome. He found it expedient to leave Rome and set out for the East in 385. His letters (especially Ep. 45) are full of outcries against his enemies and of indignant protestations that he had done nothing unbecoming a Christian, that he had taken no money, nor gifts great nor small, that he had no delight in silken attire, sparkling gems, or gold ornaments, that no matron moved him unless by penitence and fasting, &c. His route is given in the third book *In Rufinum*; he went by Rhcgium and Cyprus, where he was entertained by Bishop Epiphanius, to Antioch. There he was joined by two wealthy Roman ladies, Paula, a widow, and Eustochium her daughter, one of Jerome's Hebrew students. They came accompanied by a band of Roman maidens vowed to live a celibate life in a nunnery in Palestine. Accompanied by these ladies Jerome made the tour of Palestine, carefully noting with a scholar's keenness the various places mentioned in Holy Scripture. The results of this journey may be traced in his translation with emendations of the book of Eusebius on the situation and names of Hebrew places, written probably three years afterwards, when he had settled down at Bethlehem. From Palestine Jerome and his companions went to Egypt, remaining some time in Alexandria; and they visited the convents in the Nitrian desert. Jerome's mind was evidently full of anxiety about his translation of the Old Testament, for we find him in his letters recording the conversations he had with learned men about disputed readings and doubtful renderings; Didymus of Alexandria appears to have been most useful. When they returned to Palestine they all settled at Bethlehem, where Paula built four monasteries, three for nuns and one for monks. She was at the head of the nunneries until her death in 404, when Eustochium succeeded her; Jerome presided over the fourth monastery. In this monastery at Bethlehem Jerome did most of his literary work and, throwing aside his unfinished plan of a translation from Origen's Hexaplar text, translated the Old Testament directly from the Hebrew, with the aid of Jewish scholars. He mentions a rabbi from Lydda, a rabbi from Tiberias, and above all Rabbi Ben Anania, who came to him by night secretly for fear of the Jews. Jerome was not familiar enough with Hebrew to be able to dispense with such assistance, and he makes the synagogue responsible for the accuracy of his version: "Let him who would challenge aught in this translation," he says, "ask the Jews." The result of all this labour was the Latin translation of the Scriptures which, in spite of much opposition from the more conservative party in the church, afterwards became the Vulgate or authorized version; but the Vulgate as we have it now is not exactly Jerome's Vulgate, for it suffered a good deal from changes made under the influence of the older translations; the text became very corrupt during the Middle Ages, and in particular all the Apocrypha, except Tobit and Judith, which Jerome translated from the Chaldaee, were added from the older versions.¹

Notwithstanding the labour involved in translating the Scriptures, Jerome found time to do a great deal of literary work, and also to indulge in violent controversy. Earlier in life he had a great admiration for Origen, and translated many of his works, and this lasted after he had settled at

Bethlehem, for he translated in 389 Origen's homilies on Luke; but he came to change his opinion and wrote violently against the admirers of the great Alexandrian scholar, *Contra Joannem Hierosolymitanum*, and *Adversus Rufinum Lib. III.*, for both John, bishop of Jerusalem, and Rufinus, Jerome's old friend, were followers of Origen. At Bethlehem also he found time to finish *Didymi de Spiritu Sancto Liber*, a translation begun at Rome at the request of Pope Damasus, to denounce the revival of Gnostic heresies by Jovinianus and Vigilantius (*Adv. Jovinianum Lib. II.* and *Contra Vigilantium Liber*), and to repeat his admiration of the hermit life in his *Vita S. Hilarionis Eremita*, in his *Vita Malchi Monachi Captivi*, in his translation of the Rule of St Pachomius (the Benedict of Egypt), and in his *S. Pachomii et S. Theodori Epistolae et Verba Mystica*. He also wrote at Bethlehem *De Viris Illustribus sive de Scripturibus Ecclesiasticis*, a church history in biographies, ending with the life of the author; *De Nominibus Hebraicis*, compiled from Philo and Origen; and *De Situ et Nominibus Locorum Hebraicorum*.² At the same place, too, he wrote *Quaestiones Hebraicae* on Genesis,³ and a series of commentaries on Isaiah, Jeremiah, Ezekiel, Daniel, the Twelve Minor Prophets, Matthew, and the Epistles of St Paul. Jerome engaged in the Pelagian controversy with more than even his usual bitterness (*Dialogi contra Pelagianos*); and it is said that the violence of his invective so provoked his opponents that an armed mob attacked the monastery, and that Jerome was forced to flee and to remain in concealment for nearly two years. He returned to Bethlehem in 418, and after a lingering illness died on September 30, 420.

By far the best edition of Jerome's works is that of Vallarsi (Verona, 1734-42), which contains in prefaces and appendices almost all that is known of the great Western scholar. The student will find the article on "Hieronymus" by Collin in Ersch and Gruber's *Encyclopaedia* very useful, and the English reader will find a succinct account of his writings taken from Vallars in Smith's *Dict. of Greek and Roman Biography and Mythology*, art. "Hieronymus." (T. M. L.)

JEROME OF PRAGUE (c. 1365-1416), the friend and disciple of John Huss, derives the surname by which he is best known from his native town, where he was born somewhere between 1360 and 1370. His family name is sometimes, but erroneously, said to have been Faulfisch. After completing his studies in the university of Prague, he proceeded (about 1396) to Oxford, where in course of a residence of some duration he became acquainted with the teaching and writings of Wycliffe, of which he became a zealous disseminator on his return to his native land. In 1398 he took his bachelor's degree at Prague, and then visited Paris, Heidelberg, and Cologne; at the first-mentioned university he seems to have graduated as master of arts. Returning about 1407 to Prague, he took a prominent part with Huss in the university disputes which led to the withdrawal of the German "nation." So great did his reputation for learning, energy, and sagacity become that he was employed by Ladislaus II., king of Poland, in 1410 to assist in placing the university of Cracow upon a proper footing, while by Sigismund, king of Hungary, he was, although not in orders, invited to preach before him at Ofen. His public discourses in Hungary, however, soon brought him under suspicion of Wycliffite heresy, and he found it necessary to fly the country; taking refuge in Vienna, he was there arrested and thrown into prison, but on the intervention of his friends in Prague obtained his release. He now again became closely asso-

ciated with Huss in his native city, to which he had once more returned, and where he remained after the expulsion of his friend. In 1415 he went spontaneously to Constance, determined to do what he could for Huss, who had meanwhile been imprisoned there; the news he received on his arrival was so discouraging, however, that, panic-stricken, he immediately again withdrew. Though without a safe conduct he would no doubt have reached Prague in safety had he only been able to hold his peace; but while resting at Hirschau he allowed his feelings to gain the mastery of him, and, in the presence of many clergy, broke out in vehement denunciation of the injustice of the council; the consequence was that he was forthwith arrested by order of the duke of Bavaria and sent back a prisoner to Constance (May 1415). There, after enduring the most rigorous confinement for some months, he was brought before a public session of the council on September 23, 1415, when he made a full retraction of all errors against the Catholic faith, especially those of Wycliffe and Huss. His enemies, however, were determined that not even thus should he escape their hands; by Michael de Causis and Stephen Palecz (who also had made themselves conspicuous in the persecution of Huss) it was declared that the recantation was ambiguous, and new articles were exhibited against their victim. Thrice again he was brought before a general congregation of the council. On the last of these occasions (May 26, 1416) all his timidity seems to have finally left him. In a bold and vigorous declamation he solemnly retracted the retraction which had been wrung from him eight months before; "of all the sins that I have committed since my youth, none weigh so heavily on my mind and cause me such keen remorse as that which I committed in this evil place when I approved of the iniquitous sentence given against Wycliffe and against the holy martyr John Huss, my master and friend." Four days afterwards he was condemned as a relapsed heretic; his reply was an appeal to the supreme Judge before whom he and his accusers alike were destined to stand. Two days later he marched with a cheerful countenance to the stake, bidding the executioner light the fire before his face; "had I the least fear, I should not be standing in this place." His ashes, like those of Huss, were gathered and thrown into the Rhine. Jerome owes his fame to his association with Huss, and particularly to the splendid heroism with which in his death he atoned for one moment of faltering in his loyalty to the doctrines to which he had faithfully devoted his life. No literary remains survive by which we might estimate with precision how far the claims to learning and superiority of intellect often made for him can be justified. Of absolute originality he obviously had none. The truth seems to be that, with considerable advantages of birth and early training, and with a mind more variously accomplished than that of Huss, he nevertheless wanted the moral weight which gave his master so great an ascendancy over the minds and hearts of men. Bold even to rashness, his courage was shown rather in bursts of furious vehemence than in the equable tenor of his life, and more than once failed him in critical moments. In this weakness he only reflected the turbulent and unruly spirit of the age he lived in; but it is also a weakness that sufficiently justifies history in assigning to him a comparatively subordinate though still highly honourable place among the pioneers of the Reformation.

JERROLD, DOUGLAS WILLIAM (1803-1857), dramatist, satirist, and one of the most brilliant of the English wits who distinguished the first half of the 19th century, was

born in London, January 3, 1803. His father, Samuel Jerrold, actor, was at that time lessee of the little theatre of Wilsby near Cranbrook in Kent, but in 1807 he removed to Sheerness. There, among the blue-jackets who swarmed in the port during the war with France, little Douglas grew into boyhood, a stout, well made, rosy-cheeked, white-haired urchin, fond of reading and pugnacious withal. Familiarity with the tinsel and glitter of his father's profession robbed it of its chief attractions for the boy; but the glorious renown of Nelson and the anti-Gallic enthusiasm of his father's naval patrons filled his susceptible bosom, and wooed him to his majesty's uniform. From December 1813 till October 1815 Douglas Jerrold served his country as a midshipman. He saw nothing of the war save a cargo of maimed warriors from Waterloo; but till his dying day there lingered traces of his early passion for salt water. The peace of 1815 ruined poor Samuel Jerrold; there was no more prize money. On January 1, 1816, he removed with his family to London, where the plucky little ex-midshipman began the world again as a printer's apprentice, studying hard in the grey of the early morning at Latin, pinching himself to get the *Waverley Novels* from the library, and finding unspeakable delight in the pages of his *Shakespeare*. In 1819 Douglas Jerrold was a compositor in the printing-office of the *Sunday Monitor*. Several short papers and copies of verses by him had already appeared in the sixpenny magazines, but he aspired now to contribute to the *Monitor*; and stealthily one evening he dropped into the editor's box a critique of the opera *Der Freischütz*. Next morning he received his own copy to set up, together with a flattering note from the editor, requesting further contributions from the anonymous author. Thenceforward Jerrold was engaged in journalism.

He soon entered another field where he was to reap no less honourable laurels. In 1821 he had the satisfaction of seeing a comedy that he had composed in his fifteenth year brought out at Sadler's Wells Theatre, under the title *More Frightened than Hurt*. Other pieces followed, and in 1825 the popular young dramatist was engaged for a few pounds weekly to produce dramas and farces to the order of Mr Davidge of the Coburg Theatre. By his marriage in the autumn of 1824 the "little Shakespeare in a camelot cloak," as he was called, had found a less fitful incentive to industry than his mere ambition; and, while he was engaged with the drama at night, he was steadily pushing his way as a journalist by his daily labours. For a short while he was part proprietor of a small Sunday newspaper. In 1829, through a fortunate quarrel with the exacting Davidge, Jerrold left the "Coburg," and *Black-Eyed Susan* was brought out on the "Surrey" boards. The success of the piece was enormous. With its free gallant *à-la-douleur*, it took the town by storm, and "all London went over the water to see it." On the three hundredth night the theatre was illuminated. Elliston, manager of the "Surrey," made thousands of pounds; T. P. Cooke, who played William, made his reputation; Jerrold received about £70. But his fame as a dramatist was achieved. In 1830 it was proposed that he should adapt something from the French for Drury Lane. "No," was his reply to the offer, "I shall come into this theatre as an original dramatist or not at all." In December of the following year he was received on his own terms; *The Bride of Ludgate* was the first of a number of plays which found their way to Drury Lane stages. The other patent houses threw their doors open to him also (the Adelphi had already done so); and in 1836 Jerrold himself became co-manager of the Strand Theatre with Mr Hammond his brother-in-law. The venture was not successful; and the partnership was dissolved. While it lasted Jerrold wrote his only tragedy, *The Painter of Ghent*, and appeared himself in the title rôle, without

any very marked success. His pen continued to be fruitful of sparkling comedies till 1854, when his last piece, *The Heart of Gold*, was written.

Meanwhile he had won his way to the pages of numerous periodicals,—before 1830 of the second-rate magazines only, but after that to those of more importance; and he had almost reached comfort and ease when an obligation, undertaken for an unfortunate friend, drove him forth to fresh years of hard toil. When at last he could settle in comfort he found himself the centre of a host of friends, whose affection was his no less than their admiration; and his last years were spent in peaceful happiness. The *Monthly Magazine*, *Blackwood's*, the *New Monthly*, and the *Athenæum*, all welcomed his brilliant articles. To *Punch*, the publication which of all others is associated with his name, he contributed from its second number in 1841 till within a few days of his death. He founded and edited for some time, though with indifferent success, the *Illuminated Magazine*, *Jerrold's Shilling Magazine*, and *Douglas Jerrold's Weekly Newspaper*, and under his editorship *Lloyd's Weekly Newspaper* rose from almost nonentity to a circulation of 182,000. The history of his later years is little more than a catalogue of his literary productions, interrupted now and again by brief flights to the Continent or to the country. Douglas Jerrold died at his house, Kilburn Priory, in London, on June 8, 1857.

Jerrold's figure was small and spare, and in later years bowed almost to deformity. His features were strongly marked and expressive from the thin humorous lips to the keen blue eyes gleaming from beneath the shaggy eyebrows. He was brisk and active, with the careless bluntness of a sailor. Open and sincere, he concealed neither his anger nor his pleasure; to his simple frankness all polite duplicity was distasteful. Hating the conventionalities of the town, he loved to make his home in some rural retreat where he could roam at ease, with loose coat and straw hat. To his house, always hospitable, he was especially fond of attracting young men, whom he encouraged with strong, cheery words, and often with more material aid. The cynical side of his nature he kept for his writings; in private life his hand was always open. In politics Jerrold was a Liberal, and he gave eager sympathy to Kossuth, Mazzini, and Louis Blanc. In social politics especially he took an eager part, he never tired of declaiming against the horrors of war, the luxury of bishops, and the iniquity of capital punishment.

Douglas Jerrold is now perhaps better known from his reputation as a brilliant wit in conversation than from his writings. In animated talk his retorts and fancies flew from his lips like a shower of sparks. His jests were unpremeditated and unfurled; their spontaneity, which not seldom surprised Jerrold himself, was one of their most telling characteristics, and often robbed his sharpest retorts of their sting. For he let no sentimental or polite consideration stand in the way of a brilliant rejoinder. As Dr Charles Mackay expresses it, "when his jest came to the tip of his tongue, it had to explode though the heavens should crack, and his best friend should take it amiss." Yet no one can accuse Jerrold of being spiteful. Ill-advised and thoughtless, even unjust, his wit often was; but it was not barbed. It did not rankle in the wound. Jerrold's wit was of a tolerably high intellectual order. It is said that no pun is to be found in his writings. Their wit is the wit of burnished epigram and quaint conceit, of happy phrase and lightning retort. But the puns that abounded in his talk were often wise as well as witty. The well-known description of dogmatism as "puppyism come to maturity" is an excellent example of the flashing insight that gave life and meaning to his jests.

As a dramatist Jerrold was very popular, and struck out quite a line for himself in the domestic drama. Here he

dealt with rather humbler forms of social life than had commonly appeared on the stage; and it is worthy of note that plays of this kind have had the greatest run in modern times. Jerrold was one of the first and certainly one of the most successful of those who in defence of the native English drama endeavoured to stem the tide of translation from the French, which threatened early in the 19th century altogether to drown original native talent. Thoroughly English in motive, action, and atmosphere, his plays, whether comedy or domestic drama, are all effective from their freshness, point, and spirit. The author is at his best in construction as well as in sparkling epigram and brilliant dialogue in *Bubbles of the Day*, and *Time Works Wonders*. The latter perhaps excels in plot and human interest. The tales and sketches which form the bulk of Jerrold's collected works vary much in skill and interest; but, although the artistic symmetry is here and there marred by traces of their having been composed from week to week, they are always marked by keen satirical observation and pungent wit. While reading them it is well to remember that they have a higher aim than the beguiling an idle hour by the mere interest of the story; for the author is always trying to call attention to some wrong, to rouse pity for some hardship, to stir up indignation against some form of social oppression or abuse.

Jerrold's writings are scattered over all the periodical literature of his day; but perhaps his most important works are in the following list. *Men of Character* are seven sketches (collected in 1838), in which he throws sarcastic ridicule on various foibles and hypocrisies of every-day men; *Cakes and Ale*, a collection of short papers of all sorts made in 1842, contains whimsical tales directed against the tyranny of riches, the folly of judging by appearances, with similar thrusts at the weaknesses and vices of humanity; *The Story of a Feather*, which originally appeared in *Punch* in 1842-43, tracing the career of an ostrich feather as it passes to successive owners, affords the author opportunities of exposing shams, lashing vice, and gibbeting successful villany in every rank of life. In *The Chronicles of Cloverbrook* he ventilates his philosophy of life, and his objections to existing social and political institutions; in *A Man made of Money*, where the supernatural forms the basis for a story of an eminently matter-of-fact character, he fulminates against the blind worship of lucre; *St Giles and St James*, perhaps his best work of this class, is described in his own words as "an endeavour to show in the person of St Giles the victim of an ignorant disregard of the social claims of the poor upon the rich, . . . to present . . . the picture of the infant pauper reared in brutish ignorance." Of his professedly satirical papers the chief are *Punch's Letters to his Son*, *Punch's Complete Letter-Writer*, and *Sketches of the English*. *Mrs Caville's Curtain Lectures*, possibly the most widely known of all Jerrold's writings, explain themselves by their title. Besides the "Q Papers," which began in the second number of *Punch*, Jerrold wrote various political articles for his own and other newspapers.

Were a reader now to go to Jerrold's writings, he would find much that seems commonplace and trite. The fault is not with Jerrold, but with the host of his imitators who have sought with more or less success to reproduce in the pages of every magazine the social cynicism which is apt at first view to be taken for the essence of Jerrold's style. But Jerrold has his own happy knack of handling ordinary subjects, his own singular method of regarding things. His truths may sometimes be commonplaces, and his moralizings trite; his descriptions may sometimes drag on to tedium, and his characters stiffen into lay figures even his passion may sometimes attenuate to fustian, but every paragraph is lit up by quaint phrase or happy conceit

every page is illumined by some gleaming epigram or flash of originality. Jerrold seems to revel in the sarcastically satirical, perhaps the easiest and most directly effective of all satire. He appears to have reserved the softer side of his nature for his private life. He is far more at home in satirizing the foibles of men than in praising their good points. Here and there there are tender gleams of rarest pathos in his pages; but these do not occur in scenes elaborated to move pity, but in the simple half unconscious finishing touch to some little picture, drawn from the author's heart. That Jerrold has painted for us no full-length portrait of a thoroughly noble character is due to his ultra-keen perception of the bad in human nature. "Mr Capstick" in *St Giles and St James*, who is perhaps the most truly benevolent of all his personages, escapes the difficulty of revealing his excellence in consistent speech by becoming an amiable hypocrite, and poses as "the man with gall in his words and balm in his deeds."

A writer in the *Edinburgh Review* for 1859 accuses Jerrold of being a "sentimentalist,"—"of writing" "to gratify his sympathies and antipathies, and not to bring out the truth." That is an extreme statement, which has some foundation in fact. Jerrold often attacked what he considered an abuse without stopping to weigh the ultimate consequences, and without being swayed by very satisfactory or conclusive reasons. Sometimes too the epigram or the jest seems to have suggested the opinion, rather than the opinion the epigram. That he generally espoused the healthy side was due more to his instinct than to his reason, more to his heart than to his head. His keen feelings often carried him to great lengths in invective. He did not escape the besetting sin of all social reformers. He is tempted to elaborate and intensify the peculiar aspect of the question that best suits the lesson he seeks to read; and although it is impossible to doubt his perfect sincerity and honest intention, yet the darkening of the shadows has a disingenuous air, and we are tempted to suspect that he has been unconsciously impelled to exaggerate reality or distort fact in order to justify his diatribe. Such a suspicion is fatal to satire. It enlists our sympathies, on a most healthy principle, on the side of what is attacked; and it is the cause why so much of what Jerrold wrote has missed fire. This fault of colouring, which earnest social satire can scarcely escape, has been commonly translated by critics as "bitterness"; but bitterness is far too ill-natured a word to describe the vivid, quivering feeling in which there is not the faintest tincture of personal animus, and in which all the sharpness is on behalf of the poor and the oppressed, with whom his own life had taught him sympathy.

Douglas Jerrold's *Works* were collected by himself in 8 vols 8vo, 1851-55, and again in 4 vols. 8vo in 1859. *The Life and Remains of Douglas Jerrold*, by his son Blanchard Jerrold, was published in 1858, 3d ed., 1869. (P. MU.)

JERSEY, the largest and most important of the CHANNEL ISLANDS (*q.v.*), is situated between $49^{\circ} 15' \text{N}$ and $49^{\circ} 10' \text{N}$ lat., and between $2^{\circ} 03' \text{W}$ and $2^{\circ} 15' \text{W}$ long, 16 miles west of Normandy and 125 south of Southampton. The total area comprises 28,717 imperial acres, or about 45 square miles. It is of oblong form, with a length of about 11 miles from east to west, and an average breadth of about $5\frac{1}{2}$ miles. Along the northern part of the island a belt of elevated land runs from east to west, displaying bold and picturesque cliffs towards the sea. The east, south, and west coasts consist of a continuous succession of large open bays with marshy or sandy shores terminated by rocky headlands. The principal bays are Grève an Lançon, Grève de Lecq, and Bouley Bay on the north coast; St Catherine's Bay and Grouville Bay on the east coast; St Clement's Bay, Samarez Bay, St Aubin's Bay, and St Brelade's Bay on the south coast; and St Ouen's Bay on

the west coast. The sea in many places has encroached greatly on the land, and sand drifts have been found very troublesome, especially on the west coast. The surface of the country is broken by winding valleys having a general direction from north to south, and as they approach the south uniting so as to form small plains. The lofty hedges which bound the small enclosures into which Jersey is divided, the trees and shrubbery which line the roads and cluster round the uplands and in almost every nook of the valleys utilized for pasturage or tillage, give the island a rich and luxuriant appearance, and completely neutralize the bare effect of the few sandy plains and sand-covered hills. Some of the coast scenery is grand and striking, presenting many features of special interest.

According to J. A. Bird ("Geology of the Channel Islands," in the *Geological Magazine*, London, 1878), Jersey rests on syenite rocks, which appear in three great masses in the north-west, south-west, and south-east of the island. Between these masses there is in the west an extensive formation of shale and schist, and in the north-west a formation variously composed of porphyries, limestone schist, altered sandstone, quartzite and quartzose conglomerate. In the neighbourhood of St Helier there is an accumulation of volcanic rocks consisting of trap, porphyry, and amygdaloid. China stone clay is obtained in large quantities. There are some veins of lead, and ironstone is occasionally found. The climate of Jersey is somewhat warmer in summer and colder in winter than that of Guernsey. The annual mean temperature is 51° , the annual rainfall about 30½ inches, and the number of days upon which rain falls about one hundred and fifty. The wettest season is from October to January, but rain seldom continues long. The island enjoys a very early spring and a lengthened autumn. Snow and frost are rare, but dense fogs frequently prevail. Fruits and flowers indigenous to warm climates grow freely in the open air. The land is rich and very productive, the soil being chiefly a deep loam, which is lighter upon syenite and granite than upon the other formations; the sandy portions in the vicinity of the bays have become very fruitful through cultivation. The lands are held either as freeholds or on a nine years' lease. On account of the Norman law of succession the farms have become very much subdivided. It is only rarely that they exceed 50 acres, and very many are less than 3 acres. The farmhouses and cottages are remarkably neat and comfortable; and the peasantry, who all farm their own land, are perhaps the most contented and prosperous in the United Kingdom. A five-course shift (turnips, potatoes or parsnips, wheat, hay, hay) is that usually followed. The frequency with which root crops are grown, and the abundant supply of sea manure, have greatly enriched the soil. The seaweed or *wraie* harvest occurs at certain seasons which are prescribed by law. It is only then that it is permissible to cut the wrack from rocks; but loose wrack is gathered in large quantities at all seasons. The implements of husbandry are generally old-fashioned. The peasantry take advantage of every bit of wall and every isolated nook of ground for growing fruit trees. Grapes are ripened under glass; oranges are grown in sheltered situations, but the most common fruits are apples, which are used for cider, and pears. The island is intersected by a network of roads. There is a railway line between St Helier and St Aubin's, and connects St Helier and Gorey.

According to the agricultural returns for 1880 the total area of arable land was 18,950 acres,—a percentage of 66.2 to the total area,—of which 2920 acres were under corn crops, 7456 under green crops, 4359 under rotation grasses, 4087 under permanent pasture, and 128 fallow. Under orchards there were 1345 acres, under market

gardens 186, and under nursery grounds 38. Wheat, which in 1880 occupied 2524 acres, is the principal and almost exclusive corn crop, the kinds grown being principally Velouzé and Petit Blanc. For the crop a manure of burnt seaweed is generally used. The area under potatoes in 1880 was 4671 acres. They are grown chiefly for the Covent Garden Market, the earliest crop being ready about the end of April or beginning of May. Only 1313 acres were under turnips. The pasturage is very rich, and is much improved by the application of seaweed to the surface. The mainstay of Jersey is cattle, which in 1880 numbered 11,022, or the large average of 53 to every 100 acres under cultivation, the average of the United Kingdom being only 207. The breed is that commonly known as the Alderney, and is kept pure by stringent laws against the importation of foreign animals. The number of cows was 5884, of other cattle above two years of age only 756, and of cattle below two years of age 4382. It will thus be seen that cattle are kept chiefly for dairy purposes. The milk is used almost exclusively to manufacture butter. The cattle are always housed in winter, but remain out at night from May till October. Horses in 1880 numbered 2261. Originally there was a small black breed of horses peculiar to the island, but now they are chiefly imported from France or England. Pigs form the staple food of the inhabitants, and numbered 5844. Only a few sheep are kept, 346 in 1880.

The number of ships that entered the ports of Jersey in 1879 was 2001, of 281,603 tons burden.—British vessels numbering 1859, of 276,000 tons, and foreign vessels 142, of 5673 tons. In the same year 2018 vessels, of 279,485 tons burden, cleared.—British vessels numbering 1876, of 278,919 tons, and foreign vessels 142, of 6166 tons. The number of vessels belonging to the island was 234, with a burden of 17,627 tons, in addition to which there is a large number of fishing boats. There is regular steam communication with England via Southampton, Weymouth, and Plymouth, and with France via Granville and St Malo. The principal exports are granite, fruit and vegetables (especially potatoes), oysters, butter, and cattle, and the principal imports coal, wine, iron and other spicuous liquors, sugar, tea, wheat, and eggs. Kelp and iodine are manufactured from seaweed. Fish are not so plentiful as around the shores of Guernsey, but snapper, turbot, cod, mullet, and especially the emger cod, are abundant at the Minguiers. There is a large oyster bed between Jersey and France, but partly on account of over-fishing the supply is not now so abundant as formerly. There is a great variety of other shell-fish. The islanders build their own ships.

Jersey is under a distinct and in several respects different form of administrative government from Guernsey and the smaller islands included in the bailiwick of Guernsey. The administration is under the superintendence of a lieutenant-governor appointed by the crown. The main business of legislature in Jersey is carried on by the "states," which consist of the bailiff or judge of the royal court elected by the crown, twelve jurats of the royal court elected for life by the ratifiers, the rectors of the twelve parishes, twelve constables elected every three years, and fourteen deputies elected every three years. The lieutenant-governor has a deliberative voice, and, though he has no vote, has the power of veto. The states have the power of passing ordinances which unless they obtain the sanction of the sovereignty of England are in force for only three years. English Acts of Parliament after registration become laws in Jersey. Taxation is very light in the island. The only legal tribunal is the royal court, composed of the bailiffs and twelve jurats. The lieutenant-governor has the superintendence of the militia, in which every male between seventeen and sixty-five years of age, who is medically fit, is liable for service. Jersey is divided into twelve parishes, and ecclesiastically it constitutes a deanery in the diocese of Winchester in England.

The only town of importance is St Helier, situated on St Aubin's Bay. It has rather a mean and uninteresting appearance, but beautiful views are obtained from various points. Although the streets are generally narrow and irregular, they are clean and well paved, and the Royal Square is spacious and airy. The town possesses an outer and an inner harbour. Fort Regent, a fortress completed in 1815 at a cost of £1,000,000, is situated on a lofty ridge of granite to the east of the harbour; and on the rocks to the west stands Elizabeth Castle, a disused stronghold erected in the time of Elizabeth on the site of an abbey founded in the 12th century. Closely adjoining it there is an ancient ruin called the hermitage. The other principal buildings are the parish church in

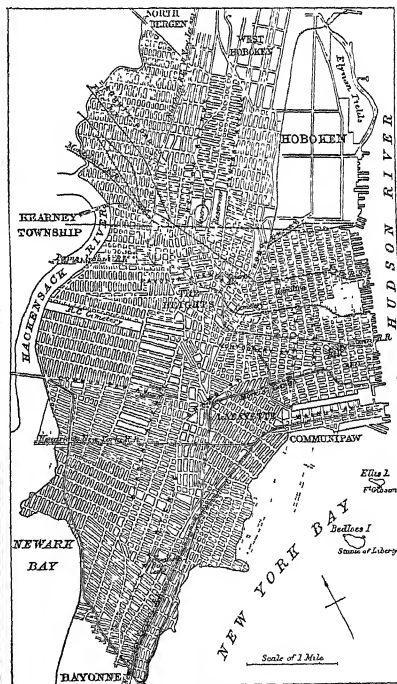

the Early Pointed style, dating from 1341, and lately completely renovated, the court-house the Alcock Hall for concerts and assemblies, Victoria College, the hospital, and the jail. The population of the town and parish in 1881 was 26,893.

The population of Jersey in 1806 was 22,855. From 1831, when it numbered 28,600, it increased rapidly till 1851, when it had reached 37,020. In 1861 it had declined to 55,613; and, although owing to the number of French who sought refuge in the island it increased in 1871 to 56,637, in 1881 it was only 62,372, of whom 28,415 were males and 28,957 females.

An historical account of Jersey will be found under CHANSEL ISLANDS. The principal objects of antiquarian interest are the cromlech near Mont Orgueil; the castle of Mont Orgueil, of very old date; St Brélade's Church, the oldest church in the island, and dating from the 12th century; the remains of an old chapel on whose site Prince's Tower was erected at the close of the last century; and Del Royal, a cottage near St Helier, where Charles II. is said to have concealed himself.

See, in addition to the works mentioned under CHANSEL ISLANDS, T. Lyric, *Sketch of the History and Present State of the Island of Jersey*, 1808; *History of the Island of Jersey* 1810; Charles le Guesne, *A Constitutional History of Jersey*, 1836; Thomas-Yves Huet, *La Normandie Normanne*, 1857; *Report of the Commission appointed to Enquire into the Civil, Municipal, and Ecclesiastical Laws of Jersey*, 1861; Le Hénecq, *Jersey monumental et historique*, 1862; Le Car, *L'Église des Isles Normandes*, 1864; Lefèvre, "Channel Islands," in the *Fortiethly* for October 1879; "L'île de Jersey," in the *2^e part* for 1884; Pegat-Oger, *Histoire des Îles de la Manche*, 1881.

JERSEY CITY, the chief city of Hudson county in the State of New Jersey, U.S., is situated on the west bank of the Hudson, opposite New York, to which it stands in a

Plan of Jersey City.

relation similar to that of Birkenhead to Liverpool. It is laid out irregularly, owing to its being an aggregation of three formerly distinct municipalities. Many of the streets are broad and well paved, and the city is provided with efficient gas, water, and sewerage systems. It has few

striking buildings, the most prominent structures being the immense grain elevators near the river, three hospitals, an orphan's home, and the public school buildings, 21 in number. The public schools are supported by State and city taxes, and administered by a board of education. The trade of the city is very considerable; but, as it is embraced in the New York customs district, separate returns are not made. The fact that it is a terminus for three lines of ocean steamers, five trunk-lines of railways, seven lesser railways, and the Morris canal, greatly facilitates the transport of coal, iron, &c., and materially fosters its industries. Jersey City has iron-foundries, iron, steel, and zinc works, boiler yards, machine shops, railway plant

manufactories, tobacco factories, breweries, and other establishments which turn out watches, glass, crucibles, sugar, soap, candles, and a large variety of hardware and other articles. The extensive abattoirs at Long Dock are noteworthy for their excellent management. The "City of Jersey" was incorporated in 1829; but in 1851 it received another charter, under its present name. Its very rapid growth has been largely owing to its absorption of the townships and cities of Van Voorst in 1851, Hudson and Bergen in 1870, and Greenville in 1872. The population in 1850 was 6856; in 1870, 82,546, and in 1880, 120,722, making it the seventeenth city in point of population in the United States.

J E R U S A L E M

JERUSALEM (Heb. יְרוּשָׁלַיִם, *Yerushalayim*, pronounced as a dual; but the old pronunciation seems to have been *Yerushalem*, whence, through the LXX., *Ἱερουσαλὴμ*, we have the common English form). The meaning of the name is obscure, none of the current interpretations, "vision of peace," "abode of peace," and the like, being free from difficulty. A later abbreviated form is *יְרֵשָׁלַם*, Salem (Ps. lxxvi. 2); whence *Σόλυμα*, Solyma. The ordinary Greek and Latin forms are *Ἱεροσόλυμα*, Hierosolyma. Hadrian changed the name of the city to *Ælia Capitolina*, and *Ælia* long continued the official name, and even passed over into Arabic in the form *Ilīyā*. The Arabs, however, commonly designate Jerusalem by epithets expressive of its sanctity, *Deit el Makdis*, *El Mukaddas*, *El Mukaddis*,² or, in the modern vernacular, more briefly *El Kuds*, "the sanctuary."

I. NATURAL TOPOGRAPHY AND RESULTS OF EXCAVATIONS.

The history of Jerusalem exploration dates from the year 1833, when Bonomi, Catherwood, and Arundel succeeded in obtaining admission into the Haram (Harām) enclosure and made the first survey of its buildings. In 1838 and 1852 the city was visited by the famous American traveller Dr Robinson, and his bold impeachment of the traditional topography, while raising a storm of controversy, laid the foundation of a truer understanding of the antiquities of Jerusalem. In 1849 Jerusalem was surveyed by Lieutenants Aldrich and Symonds of the Royal Engineers, and maps by Vandeveldt, Thrupp, Barclay, and others were subsequently published. All these earlier attempts were, however, superseded in 1866 by the ordnance survey executed by Captain (now Colonel) Wilson, R.E., whose plans of the city and its environs, and of the Haram enclosure and other public buildings are the standard authorities on which all subsequent work has been based. During the years 1867-70 excavations of a most adventurous description were carried on by Captain (now Colonel) Warren, R.E. The results, especially in the vicinity of the Haram, were of primary importance, and many stoutly contested theories have now succumbed to the testimony of the spade. During 1872-75 some further explorations were carried on by Lieutenant Conder, R.E., while for many years a most valuable series of observations of the levels of the rock beneath the rubbish on which the modern city stands has been carried out by Mr C. Schick, architect.³

¹ Whether the narrator of Gen. xiv. 18 means Jerusalem by Salem, the city of Melchizedek, is still disputed, and the decision of the question is embarrassed by the uncertainty attaching to the date of his narrative. If the chapter is early, Salem can hardly mean Jerusalem, but many critics now assign to it a very late date.

² See Yāfekt, iv. 590; *Tāj el 'Aras*, iv. 214.

³ See Zimmermann's *Karten und Pläne zur Top. d. alt. Jerus.*, based on Schick's measurements (Basel, 1876), *Quart. Stat. of P.E.F.*, 1880, p. 82.

The present account of the city is based on the results which have thus been obtained by actual exploration; but, although so much has been done during the last fifteen years to clear up disputed questions, much still remains to be accomplished.

The geographical situation of Jerusalem has now been determined by trigonometry to be 31° 46' 45" N. lat. and 35° 13' 25" E. long. of Greenwich (taken at the dome of the Holy Sepulchre church). The city stands at the extremity of a plateau which shelves down in a south-east direction from the watershed ridge of Judæa, which is here somewhat contorted. About a mile north of the town the ridge coming from the north is deflected towards the west at an elevation averaging 2600 feet above the Mediterranean, and thus passes clear of the city on its west side. From this ridge at the point of deflexion an important spur with steep and rugged eastern slopes runs out south-east for 1½ miles, and thence southwards for 1½ miles more. The spur culminates in two principal summits, the most northerly 2725 feet above the sea, the second (now crowned with a village and a minaret) 2650 feet above the same level; and there is a third summit or knoll on the south terminating the spur and rising to an elevation of 2410 feet. To this chain (but more especially to the central summit with the minaret on it, now called *Jebel et Tîr*) the name Olivet applies. The plateau between this chain and the watershed ridge is drained by two flat open valley heads which form a junction about ½ mile north of the north-east angle of the modern city, and become a deep ravine with sides steep and in places precipitous, running immediately beneath and west of Olivet for a distance of 1½ miles from the junction to a wall called *Bîr Eyâb*, where the bed is 1979 feet above the Mediterranean and 430 feet below the termination of the Olivet chain. This valley is the "brook" (*nahal* or *fumarr*) Kidron, bounding the site of Jerusalem on the east. A second valley (*W. er Rabâty*) has its head in a shallow depression north-west of the city close to the watershed, whence it first runs south for about ½ mile, and then—rapidly deepening and flanked by low precipices—trends east for another ½ mile, joining the Kidron in an open plot close to the *Bîr Eyâb* above noticed. The second valley thus flanking Jerusalem on the west and south encloses an area half a mile wide and rudely quadrangular,—the seat of the city itself whether ancient or modern.

The site thus generally described—a natural fortress standing on spurs of hill surrounded on three sides by valleys 300 to 400 feet deep—is but imperfectly supplied with water. Only one spring exists anywhere near the city, namely, that in the Kidron valley, about 700 yards above the junction with the western ravine, now called the "spring with steps" (*Umm ed Derr*), or the "Virgin's spring." The vicinity of Jerusalem consists of strata of

the Eocene and Chalk formations, having a general dip down from the watershed of about 10° E.S.E. The action of denudation has left patches of the various strata, but generally speaking the oldest are on the west. The upper part of the Olivet chain consists of a soft white limestone, with fossils and flint bands belonging to the Upper Chalk; beneath this are—first, a hard silicious chalk, with flint bands; secondly, a soft white limestone, much used in the ancient buildings of the city; thirdly, a hard chalk, often pink and white in colour, and then known as *Sta. Croce* marble. The underlying beds belonging to the period of the Greensand are not visible, the lowest strata in the Kidron precipices belonging to the Lower Chalk epoch.

The actual position of the city at various times has differed but little in comparison with other capitals. The outline of the small spurs concerning which so many famous controversies have arisen is now much obscured by the accumulation of rubbish, which has been increasing ever since the time of Nehemiah (Neh. iv. 10). There is an average depth of from 30 to 40 feet of this debris throughout the town, and the foundations of the modern houses

Contours of Ancient Jerusalem, with the line of the Walls, according to Lieut. Conder.

often stand upon it. In the valleys there is a depth of 70 feet, and east of the temple in one place shafts were sunk 120 feet before the rock was reached. The natural features of the ground, although unaltered and traceable to a practised eye, are thus less sharply accentuated than in the ancient period of the city's history. As, however, we have now more than two hundred and fifty actual observations of the rock levels in an area of 210 acres, there is no difficulty in recovering the general features of the ancient natural site of the town.

The quadrangle included between the two outer valleys above described is again split up by a valley, the Tyropoeon of Josephus, which divides the plateau into two main spurs,—that on the east being the temple hill, that on the west the seat of the upper city. The Tyropoeon is both shallower and broader than the boundary ravines already noticed, its depth averaging only from 100 to 150 feet below the crests of the ridges. Its real head is immediately outside the

present Damascus gate and the north wall of the modern city, whence it runs with a curved course southwards to join the Kidron just above the junction with the western boundary valley, a distance of about 1600 yards. There is, however, a second affluent or head of the central valley on the west side of its main course—a kind of dell or theatre-shaped depression extending westwards for more than 300 yards, and measuring not quite 200 yards north and south. Thus, while the eastern ridge is unbroken, the western is divided into two summits joined by a narrow saddle which separates the head of the broad central valley just described from the upper part of the western boundary valley.

Of the two western hill tops, that towards the south is the largest and most lofty. It has a trapezoid shape, and terminates on all sides in steep slopes, which are in places precipitous, and it is only joined to the watershed by the connecting saddle, which is scarcely 50 yards in width. This high southern hill measures 2000 feet north and south by about 1300 feet east and west. The highest part is towards the west, where the level of the flat broad summit is about 2520 feet above the Mediterranean. The smaller northern knoll or hill top, bounded on the east by the great central valley of Jerusalem, on the south by the theatre-shaped valley which separates it from the high southern hill, and on the west by a small subsidiary depression running north, rises to a summit not more than 2490 feet in elevation, or 30 feet below the flat top of the larger southern hill.

The eastern ridge, on which the temple stood, has a height towards the north of about 2500 feet; it then becomes narrower, and is artificially divided by a deep rock-cut trench running east and west. Its original form within the temple enclosure was that of a rounded top with a steep western slope and a more gentle gradient on the east, the level of the ridge falling from 2460 to 2300 feet in a length of about 500 yards. The end of this ridge is formed by a tongue of ground between the Kidron and the shallow central valley, falling rapidly in 400 yards to a level only 50 feet above the valley beds.

The identity of the present Haram (or sanctuary) with the ancient temple enclosure is undisputed, the only question which has arisen being whether the boundary walls now existing coincide with the outer ramparts of Herod's temple enclosure. The Haram is a quadrangle containing 35 acres, the interior surface roughly levelled, partly by filling up with earth the portions where the rock is lowest, partly by means of vaulted substructures of various ages. The most important results of Captain Warren's excavations were those connected with the exploration of the rampart walls, which measure 1601 feet on the west, 922 on south, 1530 on east, and 1042 feet on north, the south-west angle being 90° and the south-east 92° 30'. The height of the wall varies from 30 to 170 feet. On the west, on the south, and on the east for probably 1090 feet from the south-east corner, the masonry is all of one style, the stones being of great size with a marginal draft,—the imperfect finish of the faces in some of the lower courses apparently showing that the foundation-stones were never visible above the surface. The north part of the east wall consists, however, of masonry differing somewhat from the rest, the finish being rougher and the stone of inferior quality. It was found that this wall is continued for some distance beyond the north-east corner of the present area. The present north wall is of quite a different kind of masonry, and appears to be much more recent, the substructures immediately inside being only as old as the 12th century. The north-west angle is formed by a projecting scarped block of rock measuring 350 feet east and west and 50 feet north and south, the height

above the interior court being about 30 feet. On this scarp the modern barracks stand, and a fosse 60 feet deep and 165 feet wide is still traceable outside the rock on the north. A valley bed 100 feet below the level of the Haram court ran across the north-east portion of the area into the Kidron; and south of this the remains of a scarp running east and west have been discovered, but are not as yet completely explored. The prolongation of this scarp eastwards cuts the east wall of the Haram at the point 1090 feet from the south angle, at which the change in the character of the masonry above explained probably occurs. The evidence thus obtained seems to indicate that an area of about $7\frac{1}{2}$ acres has been added to the ancient enclosure on the north-east to give it the present quadrangular form, and the rougher masonry on the east appears to have belonged to the city wall constructed by Agrippa and not to the older wall of Herod's temple.

At the south-west angle of the Haram enclosure are the remains of an ancient arch (Robinson's arch), 42 feet span, belonging to a bridge across the Tyropeon, the west pier of which Captain Warren discovered, as well as the fallen voussoirs, lying on a pavement 40 feet beneath the surface, while under the pavement 20 feet lower was found the voussoir of a former bridge on the same site (*cf.* Jos., *B. J.*, i. 7, 2). At the south-east angle of the enclosure Captain Warren found beneath the surface remains of an ancient wall of finely drafted masonry abutting on the east rampart of the Haram, and here some unexplained marks or letters in red paint were discovered on the lower stones. The buried wall runs southward for 250 yards at a height of 70 feet, and is held to be part of the wall of Ophel. The base of a great projecting tower was also laid bare, and identified by the discoverer with the tower of Neh. iii. 25. Another noticeable discovery was the fact that an ancient aqueduct is intersected by the west Haram wall, which must consequently be more recent than the rock tunnel thus destroyed.

The facts thus ascertained allow of the identification of the great walls still standing with those which supported the outer cloisters of the temple enclosure in the time of Herod's reconstruction of the edifice. The original area of Solomon's temple enclosure was doubled by Herod (*B. J.*, i. 21, 1), who took away the ancient foundations and made a quadrangle extending from the fortress of Antonia to the royal cloister, to which a great bridge led from the upper city (*B. J.*, vi. 6, 2), while the eastern limit was formed by the Kidron ravine, the Ophel wall joining the plateau of the temple at the south-east angle (*Ant.*, xv. 11, 5; *B. J.*, v. 4, 2).

The scarped rock at the north-west angle of the Haram, with its outer fosse dividing the temple hill from Bezetha, answers exactly to the description by Josephus of the tower of Antonia (*B. J.*, v. 5, 8) and thus serves to identify the north-west angle of the ancient enclosure with the corresponding angle of the modern Haram. The correspondence of the south-west angles of the two areas is established by the discovery of the great bridge, and that of the south-east angles of the same by the exploration of the Ophel wall. The northern boundary of Herod's temple probably coincided with the scarp already described, 1090 feet north of the south-east angle. The area was thus, roughly speaking, a quadrangle of 1000 feet side, from which the citadel of Antonia, as described by Josephus, projected on the north-west (*cf.* *B. J.*, vi. 5, 4).

The natural water-supply of Jerusalem is from the Virgin's spring already noticed, which comes out from beneath the Ophel ridge in a rocky cave extending 12 feet from the face of the hill, and reached by flights of twenty-eight steps. The water flows with an intermittent action, rising from beneath the lowest steps, at intervals varying,

according to the season and the rainfall, from a few hours to one or even two days.

From this spring a rock-cut tunnel 1708 feet in length leads through the Ophel ridge to the Pool of Siloam (now *Birket Silwan*), which is a rock-cut reservoir with masonry retaining-walls measuring 52 feet by 18 feet, having a rock-cut channel leading away from it to a larger pool formed by damming up the flat valley bed with a thick wall of masonry close to the junction of the Kidron and the Tyropeon.¹ A rock-cut shaft—like the great tunnel a work of immense labour—leads from the spring westwards to an entrance from the surface of the ground 120 feet above and 180 feet west of the spring. The rock tunnel was known in the 17th century, but the shaft which formed a secret entrance to the one spring of Jerusalem was discovered by Captain Warren. The water of Siloam was originally sweet, but has been fouled and made bitter since the 12th century. From the reservoir it runs southwards to the *Bir Eyāl* already noticed, a well 125 feet deep.

The remaining reservoirs of Jerusalem are fed by aqueducts and by the rains. West of the city is the rock-cut Mamilla pool. In the upper part of the valley of Hinnom is *Birket es Sultān*, constructed in the 12th century. Since the 14th century these two tanks have been erroneously named the Upper and Lower Pools of Gihon. Inside the city is the Patriarch's Pool near the west (the ancient Amygdalon or "Tower Pool," *B. J.*, v. 11, 4), while immediately north of the Haram are the Twin Pools made by roofing in part of the ancient fosse, and the *Birket Isrā'īl*, measuring 360 by 130 feet, and apparently constructed after the great destruction of 70 A.D.

The Twin Pools were identified in the 4th century with Bethesda, but since the 12th that name has been given to the Birket Isrā'īl. The site of Bethesda is still doubtful.

Three aqueducts supplied the city, one of which, constructed by Pilato (*Ant.*, xviii. 3, 2), led from the so-called pools of Solomon, 7 miles distant, to the temple, and still conveys water when in repair. Its course appears on the map; the second from the same locality probably fed the Birket Mamilla, but is now lost; the third from the north collected surface drainages and led to the temple enclosure underground, a distance of 2000 feet only. The great reservoirs in this enclosure, about thirty in number, were capable of holding a total supply of 10 million gallons of water. (u. r. c.)

II. ANCIENT JERUSALEM.

Up to the time of David the strong fortress of Jerusalem remained in the hands of the ancient Canaanite inhabitants who were known as *Jebusites*.²

The city was deemed impregnable, but its conquest was one of the first exploits of David, when he became king of all Israel, and had need of a capital that should serve as a base for his military operations and a centre of union for Judah and Israel. Lying on the frontier line between his own tribe of Judah and the difficult country of Benjamin, which had been the centre of the struggle with the Philistines since the fall of Shiloh, Jerusalem was admirably adapted for these purposes. The *Jebusites* were not expelled, but continued to live side by side with the Hebrews (*Josh.* xv. 63; *Judg.* i. 21; 2 Sam. xxiv. 18;

¹ A very ancient Hebrew inscription, referring to the construction of the tunnel, was discovered in June 1880. The date and many points in the reading and interpretation are still obscure.

² In *Julg.* xiv. 10, 1 Chron. x. 4, the city itself is called *Jebus*; but as this part of the Book of Judges (as well as *Josh.* xv. 8, xviii. 28) is probably of late date, and the older records use the name *Jerusalem*, it is not safe to regard *Jebus* as the earliest name of the city. The reference to Jerusalem in *Julg.* i. 7 seems to be an interpolation, and *Josh.* xv. 63, *Judg.* i. 21 to refer to the time after David.

Zech. ix. 7). David himself occupied "the mountain fortress (הַצִּיּוֹן) of Zion," which was strengthened by new walls and received the name of the city of David. Here a palace was built by Tyrian architects, and the new capital was consecrated by the removal to it of the ark.

The site of the city of David forms the fundamental question of Jerusalem topography. The current traditional view (but not that of the most ancient tradition even in the Christian church) makes Zion the southern eminence of the western hill, and places David's fortress there. More recently Messrs Warren and Conder have contended that the city of David is identical with the Acra of Josephus, and place the latter on the northern summit of the western hill, between the two branches of the Tyropæon (see below). A third view places the city of David on the southern part of the Temple hill; and this opinion is not only conformed to the oldest post-Biblical tradition (1 Maccabees, Jerome, &c.), in which Zion certainly means the Temple hill, but is the only view that does justice to the language of the Old Testament.

It is necessary at the outset to clear away the popular idea that the capital of David was already a great town, occupying a site comparable in extent with that of the later city. Certainly if all the Levites and sacred ministers mentioned in Chronicles were actually assembled at Zion in David's time, we might conclude that the town was already a capital on a grand scale. But the Chronicler constantly carries back later institutions into primitive times, and the early history, which alone can be viewed as a safe guide, gives quite another picture. Zion was merely one of the "mountain fortresses" found all over Palestine as places of refuge in time of invasion, and was garrisoned by a handful of mercenaries (the *Gibborim*). The whole levy of Israel in David's time was but 30,000 men (2 Sam. vi. 1; comp. the 40,000 of Judg. v. 8), and before the development of trade among the Hebrews Jerusalem had not the natural conditions for the growth of a great city. In the first instance the town doubtless consisted mainly of the court and its dependants, with the Jebusite population, who must have been predominantly agricultural and limited in number by the limitation of their territory. Now it is quite incredible that the Temple hill was ever excluded from Zion. Throughout the Old Testament Zion appears as the holy mountain, the seat of the sanctuary. It is true at the same time that Zion and the site of Jerusalem are interchangeable ideas in Hebrew literature; but this only proves that the mountain of the sanctuary was essentially the mountain on which the city stood.¹ Further, it is clear from 1 Kings viii. 1 *sq.*, 2 Sam. xxiv. 18, that the temple stood above the city of David, as elsewhere in Hebrew holy places the sanctuary crowned the hill on whose slopes the town stood. Moreover, the graves of the kings, which were certainly in the city of David, encroached on the temple enclosure (Ezek. xliii. 7, 8), which indeed at the time of the captivity was closely built up (*ibid.*), and stood in the middle of the city (Ezek. xi. 23). Again, Micah iv. 8 identifies the ancient "tower of the flock" the original seat of the kingdom at Jerusalem, with "Ophel of the daughter of Zion." But Ophel is one of the few topographical names that can be traced down to the time of Josephus, whose description shows that it lay to the south-east of the temple. Still more precise is the determination given by references to the one fountain of Jerusalem, which, as we have seen, springs out under the temple hill on the east. According to Neh. iii. 15, xii. 37, the city of David was reached by a stair in the

vicinity of the fountain gate and the pool of Siloah.² This ascent led up above David's palace to the water gate, where in Nehemiah's time there was an open space in front of the temple (comp. Neh. viii. 1, 16 with Ezra x. 9). Thus we see that David's palace lay between the temple and the pool of Siloah or King's pool (Neh. ii. 14). These notices are the more important because the water system connected with the Virgin's spring forms almost the only quite certain part of Jerusalem's topography. The spring itself is Gihon, which from its name must have been a true spring, while 2 Chron. xxxiii. 14 teaches us to look for it in the Kidron valley (גִּיחֹן). The subterranean conduit which still exists had for its object to conduct the water inside the city, and appears to be that constructed by Hezekiah (2 Kings xx. 20). In Isa. xxii. 8, 11 we read of a lower pool and an old pool (no doubt identical with the upper pool, Isa. vii. 3; 2 Kings xviii. 17), whose waters were collected in the time of Hezekiah, under apprehension of siege, in a reservoir between the two walls. From this passage, compared with Neh. iii. 15, we gather that Hezekiah's pool was protected by an outer line of fortification, and here lay the gate of the two walls (2 Kings xxv. 4), with the royal gardens beside them. The supplementary notices of the conduit and the outer wall, given in Chronicles, have not the weight of contemporary history, but they show the writer to have still possessed the same tradition as to the place of the city of David, for he describes its outer wall as running along the Kidron valley west of Gihon (i.e., so as to leave the fountain outside, 2 Chron. xxxiii. 14; comp. xxxiii. 3, 4), and tells us that Hezekiah's conduit brought the water of Gihon in a westerly direction to the city of David (chap. xxxii. 30).

According to the Bible, then, the city of David lay on the southern part of the hill which his son crowned with the temple.³ The chief feature in the fortifications was a tower named Milo, perhaps on the site of the modern barracks, protecting the approach to Zion from the north. The town had but little splendour. The king occupied a wooden palace, the work of foreign craftsmen, and the ark still dwelt in curtains. Under Solomon, who had the true Oriental passion for building and luxury, and squandered enormous sums on his court, great improvements were made, especially by the erection of the twin palaces "the house of Jehovah and the house of the king," constructed of stonework strengthened by string courses of wooden beams in the still familiar style of Arabian building. The palace, which took nearly twice as long to erect as the temple, consisted of a great complex of buildings and porticoes, including the porch of judgment, an armoury, and the palace of the queen.

The site of the palace has been variously assigned by topographers. But it lay above the old residence of David.⁴ (1 Kings ix. 24), and all the indications given in the Old Testament lead us to place it quite close to the temple, with which its porticoes seem to have been connected (2 Kings xvi. 18; xxiii. 11). Wellhausen indeed, from an examination of 1 Kings vi., vii., has made it probable that the royal buildings lay within the outer court of the temple (Well.-Bleek, *Bibl.*, p. 232). The clearest details are connected with a court of the palace called the prison court (Jer. xxxii. 2), where there was a gate called the prison gate, and a great projecting tower (Neh. iii. 25-27). This part of the building must have been close to the temple, for it was at the prison gate that the second choir in the

¹ The fountain gate is the gate beside Siloah, which is itself called the fountain (מִקְוֵה) by Josephus (*B. J.*, v. 4, 1).

² The statements of Josephus as to the topography of the city of David and Solomon are of no independent value. He possessed no sources except the Old Testament.

³ So in Neh. iii. 25 it is called the upper palace in distinction from the house of David, chap. xii. 37.

⁴ The explanatory note of an editor in 1 Kings viii. 1, "the city of David, which is Zion," cannot be strained to mean that the removal of the ark from the city of David to the temple was its removal from the mountain of Zion to another hill.

procession of Neh. xii. halted and stood "in the house of God," meeting the other choir, which ascended from Siloah by the stair above David's house and reached the temple at the water gate. It appears further from Neh. iii. 27 that the fortifications of the prison were adjacent to Ophel, so that the palace seems to have stood about the south-east corner of the temple area.¹

After the division of the kingdoms Jerusalem was shorn of its political glory. The city itself was taken by Shishak in the reign of Rehoboam, and lost the riches accumulated by Solomon. The great houses of Omri and Jehu quite overshadowed the kingdom of Judah, which forgot its weakness in the reign of Amaziah only to receive signal chastisement from Jehoash, who took Jerusalem, and partly levelled the walls (2 Kings xiv.). The decline and fall of Samaria raised the relative importance of the southern capital; the writings of the prophets show that wealth had accumulated and luxury increased, and so we find King Jotham adding an upper gate in the northern or higher court of the temple (2 Kings xv. 35; Jer. xxxvi. 10; Ezek. ix. 2), while Hezekiah, as we have already seen, laboured for the improvement of the water supply, and so rendered the city more capable to resist siege. The later history in Chronicles adds details of fortifications erected by Uzziah and Manasseh, which probably express the oral tradition current in the author's day. In the later days of the monarchy Jerusalem had so far increased that we read of a second town or quarter (2 Kings xii. 14; Zeph. i. 10, Heb.; comp. Neh. iii. 9). There was also a trading quarter called the Maktesh, inhabited by Canaanites or Tyrians (Zeph. i. 11), who still formed a large part of the mercantile population after the exile (Neh. xiii.; Zech. xiv. 21). Maktesh means *mortar*, so that we must suppose the traders to have lived in a hollow valley, perhaps the upper part of the Tyropoeon. But the main part of the town was still grouped round the temple plateau, from which steep streets ran down the slope of the hill (Lam. iv. 1), the houses rising tier above tier, so that the roof tops commanded a view of the environs (Isa. xxii.). According to Eastern custom the handicrafts—*e.g.*, the bakers, Jer. xxxvii. 21—had their own streets or bazaars.

For the compass of the walls of Jerusalem at the time of its capture by Nebuchadnezzar the chief document is the account of the restoration of the fortifications by Nehemiah, who followed the old line, and speaks of the various gates and towers by their old names. His description presents many difficulties, the most intelligible part being that which deals with the eastern wall, from Siloah and the fountain gate to the point where the temple and the palace joined one another. The western boundary of the city is particularly obscure, and its position must be mainly determined by reference to the "valley gate" (Neh. ii. 13; iii. 13). The valley (*gay*) is used as a proper name, and is no doubt identical with the valley (*gay*) of the son of Hinnom, the Kidron valley being always called *nahal* *i.e.*, *fiumara*. The common opinion makes this *gay* the valley to the west of modern Jerusalem (Wady er Rababy), in which case the valley gate must necessarily have occupied much the same position as the modern Jaffa gate, and the whole of the later upper city on the south-west hill must already have been included within the walls. This view, however, is far from indisputable. A thousand cubits south of the valley gate was the dung gate, the gate before which the rubbish heaps of the city lay. This on the common theory must have been about the south-west corner

of the hill, near the present Protestant school. Between this point and the fountain gate in the vicinity of the pool of Siloah is nearly half a mile in a straight line, and the intervening wall must have been much longer if it followed the natural line of defence. Yet Nehemiah gives no account of this section of the ramparts (Neh. iii. 14, 15). His record seems to imply that the fountain gate was near the dung gate; and similarly in chap. xii. the procession which went southward to the dung gate is immediately afterwards found at the fountain gate. It is hardly possible that so important a part of the circuit should be twice omitted, and in fact the vast lacuna disappears at once if we suppose that the *gay* is the Tyropoeon, and that the upper city of Josephus on the south-west hill was not enclosed in the circuit of Nehemiah's walls. In that case the valley gate lay on the Tyropoeon, somewhere near the south-east angle of the Haram area, and the wall ran southward along the east side of the valley, till at the pool of Siloah an outwork was thrown out to protect the water supply.

Besides simplifying the topographical difficulties of Neh. iii., this view has several other advantages. On the received view the Tyropoeon is nowhere mentioned in Scripture, though it lay in the heart of the city. This difficulty is removed by the view above suggested, and the third valley (W. er Rababy) appears to be quite out of relation to the circuit of the Biblical Jerusalem, so that one does not look for much mention of it. Again, we have seen that the Canaanite quarter of the city lay in a hollow—presumably in the Tyropoeon, and it is very natural that the seat of Canaanite worship in the valley of Hinnom should be in the vicinity of this quarter. Once more, by placing the valley gate quite near the temple, we understand how it was in this neighbourhood that the sacred procession in Neh. xii. began its course. Even at a much later date the Temple hill was the real stronghold of Jerusalem, which Judas and his successors were concerned to fortify with walls. It would have been folly in Nehemiah to enclose a much vaster and less defensible circuit when the inhabitants were so few that it was necessary to draft one-tenth of the whole people into the capital (Neh. xi. 1).

The course of the wall north of the valley gate must still have skirted the base of the Temple hill east of the Tyropoeon. It is not improbable that the Maktesh or Canaanite trading quarter lay outside the fortifications, a bazaar beyond the gate being a common feature in Eastern towns.² From the lower of furnaces or ovens the "broad wall" ran to the point where in the Persian time the governor of the Syrian provinces had his throne. The throne would stand in an open place by a gateway, and comparison of Neh. iii. 7 with xii. 30 shows that the gate must have been that of Ephraim, *i.e.*, the gate of the main road leading to the north, which then as now must almost of necessity have followed the upper course of the Tyropoeon, and so would skirt the walls for some distance before entering the city. In fact there were 400 cubits between the gate of Ephraim and the corner gate (2 Kings xiv. 18). The corner gate is also named the first gate (Zech. xiv. 10), and so is probably identical with the old gate of Nehemiah. For obvious engineering reasons the entrance at the north-west of the Haram area must always have been a principal point in the fortifications, and here the old gate may very well be placed. It is indeed very likely that this was the site of the ancient bastion of Millo. From the corner gate the north line of the wall ran by the fish gate to the towers of Meah and Hanneel, the latter of which appears in Zech., *loc. cit.*, as the opposite extremity of the city from the royal vine vats in the gardens by Siloah, while in Jer. xxxi. 38 the line between it and the corner gate is named as the natural direction of extension for the city. The tower, therefore, must have stood very near the north-east corner of the wall, but not so far east as the angle of the Haram area, which is here built out, disguising the natural line of the hill side. From Zech., *loc. cit.*, we see that the Benjamin gate was at the east end of the north wall. There was a road into Benjamin territory over the Kidron (1 Kings ii. 37), and to this there was a natural descent by a small valley now nearly obliterated, having its head a little south of the Birket Israil. Here too is the direct way to Anathoth, which was through the Benjamin gate (Jer. xxxvii. 13). In Nehemiah's record the sheep gate seems to have the same position. From the angle near the tower of Hanneel and the Benjamin gate the line of the hill ran southwards, trending to the east. At the extreme east point, beyond the present line of wall, and a little south of the modern

¹ Another view is that Solomon's palace stood on the western hill, and was connected with the temple by a bridge. But "the ascent" of the A. V. of 1 Kings x. 5 does not exist in the original, and seems to rest on a false reading in Chronicles. In Ezek. xiv. the sovereign enters the temple from the east.

² In fact at the siege of Titus the wool and clothes market and the brassworkers' bazaar still lay in much the same quarter, in the new city, outside the old line of fortification, though within the second wall (B. J., v. 8, 1).

golden gate, must be placed the horse gate (Jer. xxxi. 40). South of this again came the fortifications of Ophel and the upper palace, and from this point the enceinte swept round to the pool of Siloah. The lower wall of Manasseh in 2 Chron. xxxiii. 14 is described as an outwork in the Kidron valley extending all along the eastern side of the town and round the north-east corner.

The long blank in the history of the Jews which follows the time of Nehemiah makes it impossible to trace the progress of Jerusalem in any detail. Under the Persian empire the Jews enjoyed little prosperity. Alexander spared the city, but in 320 its walls were raised by Ptolemy I. (Appian, *Syr.*, v). A period of comparative prosperity followed, culminating in the high priesthood of Simon II. (219–199 B.C.), who repaired the temple and strengthened its defences and fortified the city. The walls were again destroyed and the city burned by the army of Antiochus Epiphanes in 168 B.C. When Judas Maccabæus reconsecrated the temple (165) he also fortified the holy mountain of Zion (the Temple hill) with wall and towers. Once more raised by the Greeks, the walls of the city were renewed with hewn stone by Jonathan.

It is plain from 1 Mace. iv. 60, v. 7, x. 11, that up to this time the fortified city was still identical with the Temple hill; but a new topographical problem is raised by what is related of the citadel (Akra) erected by Epiphanes to dominate the town. The Akra is identified by the author with the city of David. It continued to be held by the Greeks after the town was fortified by the Maccabæes, and indeed was ultimately reduced by the erection of a special wall cutting off the Greek garrison from access to the city and market (xii. 86). The natural inference from all this is that the Greek citadel lay on the Temple hill, and presumably on the site of the later Antonia. That hill is certainly the Zion of 1 Mace.; and the city of David, with which the Akra is identified, had always meant the fortress of Zion. The same result seems to follow from the language of Josephus. When Josephus lived Jerusalem was almost a new town. Under the Maccabæes, and again under Herod, the prosperity of the Jews was greater than at any previous time. The sanctuary was a centre of pilgrimage from the most distant lands, and the sovereigns of Jerusalem had an empire greater than any of the kings after Solomon. The growth of the city must have been enormous, and the great buildings of Herod and his successors had wholly changed its aspect, especially in the quarter of the temple and on the western hill where the royal palace stood. These changes were very apt to mislead an uncritical writer with regard to the ancient topography, and in fact Josephus falls into a radical blunder by assuming that the fortress of David belonged to the upper city, like the royal castle of his own day,¹ and that the western hill had always been part of Jerusalem. But of Jerusalem as he himself saw it he gives a vivid description (*B. J.*, v. 4, 1). The city stood on two hills divided by the Tyropœon valley, into which the houses descended tier beneath tier. The higher western hill was called the upper market, the lower hill across the Tyropœon was the citadel hill, and was called indifferently the Akra or the lower city. That this Akra included the ridge south of the temple is clear from several marks: the hill was *ἀκροειρως*, "hog-backed"; it was cut off by ravines on the outer side, and had a continuous approach to the temple, which stood on the higher ground; finally, it extended to Siloah at the mouth of the Tyropœon.² Thus we see that, though Josephus himself has lost the true tradition as to the city of David, he furnishes additional proof that the citadel hill, still identified with it by the author of 1 Mace., was no other than the eastern hill.

A different view of the Akra was maintained by Robinson, and has been elaborated by Moses Warren and Conder³ in connection with recent better observations as to the two heads of the Tyropœon valley. It is maintained that the Akra was a knoll, west of the Temple hill and north of the traditional Zion, between the two heads of the Tyropœon. To gain any show of plausibility for this view it is necessary to lay great weight on a statement of Josephus that the Temple hill was once a third eminence lower than the Akra, and divided from it by a broad ravine, and that Simon after taking the Akra destroyed the citadel and laboured for three years to reduce its site below the level of the temple plateau and fill up the intervening hollow (*B. J.*, v. 4; *Ant.*, xiii. 6, 6). This story is pro-

bably exaggerated, for according to the early and trustworthy evidence of 1 Mace. xiii. the Akra was not destroyed, but only purged, and strengthened by additional fortifications on the sacred mountain. And in any case we know that the Akra was opposite the temple, and that in the time of Josephus there was no longer a ravine between, whereas the city opposite the temple to the west was still cut off by the deep Tyropœon (*Ant.*, xv. 11, 5), except where a bridge led to the palace on the western hill. Nor is it possible that the western head of the Tyropœon can be the deep ravine which, according to Josephus, separated the upper and lower city, for that head is the theatre-shaped basin described in *Ant.*, xv. 11, 6 as facing the temple across the ravine.

Under the Hasmonean dynasty we meet with the first unambiguous evidence that the city had extended to the loftier western hill, where a new palace was erected overlooking the temple (*Ant.*, xx. 8, 11). This continued to be the royal quarter, and was raised to great splendour by Herod, who covered a vast extent of ground with his palace, its courts and pleasure grounds. The palace of Herod embraced two edifices transcending the temple in magnificence, and the three enormous adjoining towers, Hippicus, Phasael, and Mariamne, made the upper city the strongest part of Jerusalem. Here also in Herod's days stood the *xystus* or gymnasium, beneath the Hasmonean palace, where a bridge spanned the Tyropœon. The bridge already existed under the later Hasmoneans, when the new quarter had as yet minor importance and the Temple hill was still the only citadel. Here the warlike high priest Hyrcanus usually dwelt in the castle (*Βάσις*, *בִּרְיָ*) which Herod afterwards converted into the fortress of Antonia in the north-west corner of the enceinte of the temple (*Ant.*, xv. 11, 4; *B. J.*, v. 5, 8). Antonia had the form of a square keep, with loftier towers rising pinnacle-like at the corners. It commanded the temple and therefore the whole lower city, and by its two staircases the Roman soldiers descended into the porticoes of the temple to keep order among the worshippers (comp. Acts xxi. 35).

When Pompey besieged the Temple hill in 65 B.C., the bridge was broken down, and the Tyropœon afforded a complete defence on the west. His assault was made from the north, where there was a strong wall with towers and a deep fosse which was with difficulty filled up to permit the advance of his siege train. This fosse must be identified with the rock-cut trench north of the Haram area, and from Josephus's description seems to have been still the northern limit of the town. The walls destroyed by Pompey were restored by Antipater, and ten years later yielded, after an obstinate resistance, to Herod and the Romans (37 B.C.). The Baris, occupied by Antigonus, was not surrendered till the temple and the rest of the city had been carried by storm, and we now read of two walls which had to be reduced successively.

The most important buildings erected by Herod have already been alluded to, and his reconstruction of the temple will be considered under that heading. But the walls of the city as they existed at the time of the siege by Titus must still be described. They were three in number. The first wall consisted of a rampart to the north of Herod's palace, connecting Hippicus in the citadel of the upper city with the western porch of the temple, and of another line skirting the face of the western hill from Hippicus southward, thence curving round beyond Siloah, and joining the eastern wall of the temple enclosure at Ophel. Several traces of this wall still exist. The second wall, connecting a point in the northern line of the first wall with Antonia, enclosed the new town or trading quarter. Outside both these walls, on the hill side sloping southwards towards the temple, a suburb called Bezetha had grown up, which Agrippa I. in the time of Claudius Caesar began to protect with a third wall conceived on a gigantic scale, but never altogether finished. The precise compass of this wall, which began at Hippicus and rejoined the first wall in the

¹ A perpetuation of this blunder gives the current name Tower of David to the Herodian tower, probably Phasael, which still stands by the Jaffa gate. On this tower compare a paper by Schick in *Zeitschr. d. Deutsch. Palästina-Vereins*, vol. i.

² *B. J.*, vi. 7, 2; comp. v. 4, 1, and the association of Siloah and the Akra in v. 6, 1.

³ See Warren, *The Temple or the Tomb*, London, 1880; and Conder, *Tent Work in Palestine*, London, 1878, vol. i.

Kidron valley, has been much disputed,—the great tower of Psephinus, which stood on very high ground, and formed its north-west angle, being supposed by some to have stood near the modern castle of Goliath (Kasr Jaldad), while others place it as far north as the Russian cathedral. The measurements by which it has been proposed to decide the northern limits of Jerusalem are the distance of 3 stadia from the city to the tomb of Queen Helena of Adiabene (commonly identified with the Tombs of the Kings, *Kubūr as Salāṭīn*), and the circuit of 33 stadia assigned by Josephus to the whole city. These measurements would seem to imply that the ancient city stretched further north than the modern walls, but they can hardly claim to be taken as mathematically accurate; the estimates of the compass of the city vary, and Eusebius places it at 27 stadia. This again would imply a line closely coincident with the north wall of the modern town, agreeing with the remains of ancient scarping still visible, and with the express statement of Josephus that the line of the third wall passed through the royal caves, i.e., the catacombs, or the cotton grotto and grotto of Jeremiah, which are separated by a kind of fosse cut through the live rock, and manifestly forming part of the old wall line.¹ In the siege under Titus the Romans successively carried the third and second walls. They then occupied Antonia, which was levelled to facilitate the approach of the forces for the attack on the temple stronghold. The temple was opened by fire rather than force, and the Jewish leaders having retired to the upper city, the lower town from the temple to Siloah was burned by the Romans. The capture of the upper city was effected by a regular approach with mounds and battering rams (September 70 A.D.), and even then the huge citadel of Herod could only have yielded to famine had it not been abandoned by the Jewish leaders in a vain attempt at escape. Its three great towers, with a portion of the western wall, were left as a memorial, and of this group the so-called tower of David (Phasael) still stands.

The rebuilding of Jerusalem by Hadrian seems to have been originally conceived in a spirit friendly to the Jews, and there is even some evidence that the restoration of the temple was contemplated or commenced. After the great revolt, however, *Elia Capitolina* was transformed into a purely pagan town with seven quarters and many buildings of heathen fashion.² The spread of Christianity and the rise of the practice of pilgrimage gave a new importance to the city of the crucifixion and resurrection, and in the time of Constantine the discovery of the Holy Sepulchre and the erection of the magnificent church of the Anastasis (dedicated 336 A.D.) again made Jerusalem a great religious centre. In the pagan reaction under Julian an attempt was made to rebuild the temple, but was frustrated by an outburst of fire from the foundations (362). The unfortunate empress Eudocia spent her last years at Jerusalem (c. 350–360), repaired the walls, built the church of St Stephen, founded monasteries and hospitals, and enriched the churches. The next great builder was Justinian, part of whose splendid church of St Mary perhaps still remains in or to the east of the mosque El-Aksa. In 614 Jerusalem was taken by Chosroes, and the churches and sepulchre were burned, but the patriarch Modestus restored them as soon as the Persians retired. In 637 Jerusalem capitulated to the caliph Omar, who gave directions for the erection of a place of worship on the site of the “remotest shrine,” i.e., the temple, to which Mahomet, according to Kor. xvii. 1, was transported from Mecca in his famous night journey. From this verse the great sanctuary of Jerusalem received the name El-

Aksa, now generally confined to the building at the south end of the Haram. The original mosque as described by Aenulphus (870) was a rude edifice of wood capable of containing 3000 worshippers; but soon after the sanctuary was reconstructed in a style of great magnificence by the caliph ‘Abd el Malik, whose date (72 A.H. = 691 A.D.) is still read on a Cufic inscription on the Dome of the Rock, though the name of the caliph seems to have been changed to that of El-Mamin, who restored the buildings after a great earthquake, which, according to Mōkaddasy left nothing standing except the part around the *nibhrāb* or niche indicating the direction of Mecca. In their present condition the buildings of the sanctuary show features of very various styles from the Byzantine downwards. The architectural problems which they suggest are closely connected with controversies as to the topography of the temple and the true site of the Holy Sepulchre, both of which subjects will be more conveniently discussed under TEMPLE. Apart from the question of the holy sites, the later topography of Jerusalem presents no feature that need detain us, and the subsequent fortunes of the city belong to the general history of Palestine and the crusades. (W. R. S.)

III. MODERN JERUSALEM.

It appears probable that the crusading wall ran just outside the present one on the north-west side of the town—the remains of mediæval masonry existing all along this line. In 1192 Saladin fortified the same quarter with a second wall and a fosse, and, as remains of an interior wall are still traceable at the ruined tower called *Kal’at Jaldad*, it appears that the two ramparts must have run about 60 yards apart on this side of the town. Dismantled in 1219 and restored again in 1220, the fortifications were again destroyed in 1239, and the present walls were built in 1542 by Sulaiman the Magnificent, as witnessed by inscriptions over the present Jaffa and other gates. The following is a conspectus of the gates at different times in consecutive order:—

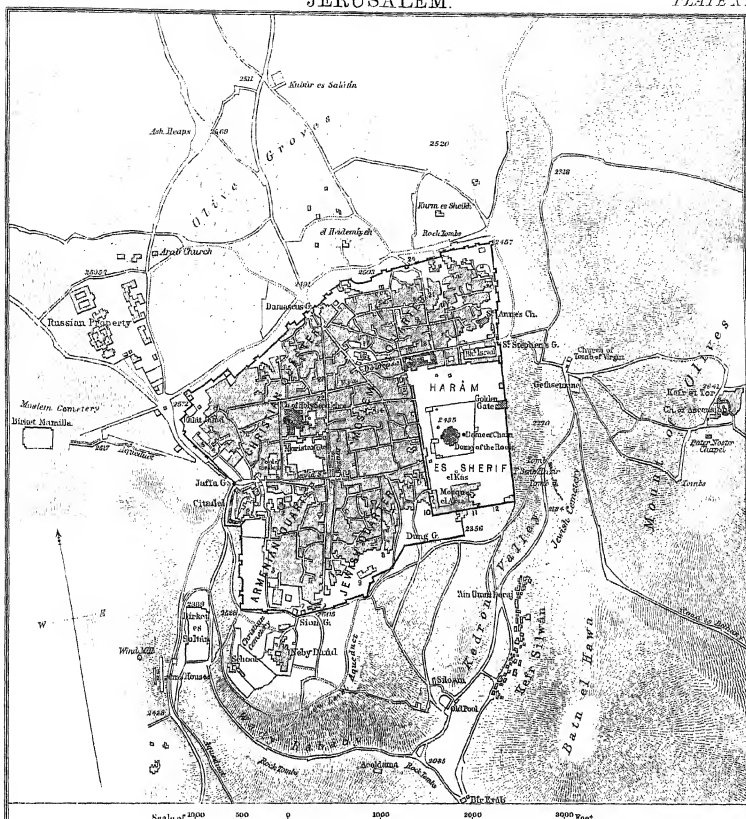

Modern Name.	Twelfth Century.	Fourth or Eighth Centuries.	Position.
1. St Stephen's Gate, <i>Bab Sittā Bāy yon;</i>	Gate of Valley of Psephinus.....	Gate of Valley of Psephinus.....	E. wall.
2. Herod's Gate, <i>Bab ez Zahr'eh</i>	Porten of the Magdalen.....	Gate of Benjamin.....	N. "
3. Damascus Gate, <i>Bab el 'Amūd</i>	Porten of St Peter's Gate.....	Gate of Galilee.....	N. "
4.	St Stephen's Gate, <i>Bab ez Zahr'eh</i>	Gate of Pallas's Field Gate of Judgement.....	N. "
5. Jaffa Gate, <i>Bab el Khail</i>	Gate of David.....	Gate of David.....	W. "
6. Zion Gate, <i>Bab Ziyō Dādd</i>	Zion Gate.....	Zion Gate.....	S. "
7. Dimp Gate, <i>Bab el Naḡhar'eh</i>	Porten of Tannery.....	Gate of Tekoa.....	S. "
8. Golden Gate, <i>Bab el Dshar'eh</i>	Golden Gate.....		E. "

In 680 the city had eighty-four towers. In the 12th century the two principal ones were—first, Tancrèd's tower on the north-west, the present *Kal’at Jaldad* (Goliath's castle), where remains of a mediæval square tower of 80 feet side still exist, and, second, David's tower, still so called (the ancient Phasaelus), forming part of the castle of the Pisans, as the present citadel was called in the 16th century.

The walls of the modern city enclose an area of 210 acres, the greater part thickly crowded with houses, although on the north-east and south there are plots of ground near the ramparts not occupied by buildings. The houses are of stone, with flat stone roofs having small domes supported on arches in the middle, and the aspect of the city is specially colourless and stony. The streets are only narrow lanes running at right angles to one another. The principal streets are the same as in the 12th century, and

¹ The eminence over the grotto of Jeremiah (*El Heidemlyeh* in Plate X.) is supposed by Lieutenant Conder to be Calvary.

² Details in *Chron. Pasch.*, Ol. 224, 3.

Ground plan of Modern Jerusalem

in many cases retain Arabic names at least four hundred years old. They are arched over here and there, and the bazaars, with portions of the Via Dolorosa and of other streets, are entirely covered in. There are now four quarters:—that of the Moslems (including the Haram) on the north-east, the Jewish quarter on the south-east, the Armenian quarter on the south-west, the Christian on the north-west. The quarters are bounded by David (or Temple) Street, running east from the Jaffa gate, and by the street running north and south immediately east of the Holy Sepulchre (called *Hárat el Yehúd* on the south and *Tarîk Báb el 'Amúd* on the north). The quarters are not, however, exclusively occupied by any nationality, many rich Jews having houses in the Armenian and even in the Moslem quarter. In the 12th century the present Moslem quarter was occupied by the Jews, and called the *Juiverie*.

Viewed from the Mount of Olives, the most conspicuous object is the Haram enclosure, occupying nearly one-sixth of the city, with the Dome of the Rock rising in the centre and the Akso mosque extending to the southern wall, while between these two buildings are the tall cypresses which surround the fountain *El Kds*. Arcades with pointed arches stand on the flights of steps leading to the platform surrounding the Dome of the Rock, and three minarets rise from the west and north walls, while the great eastern rampart is unbroken save by the projecting tower of the Golden gate. In the Jewish quarter two large synagogues with domes—one painted green—are conspicuous, while the church and convent of St James is the special feature of the Armenian quarter. Close to the Jaffa gate rise the square tower of David and a minaret within the citadel, while immediately east of this fortress stands the Protestant English church and the large palace of the Anglo-German Protestant bishop. North-east of these are seen the two domes of the rotunda and choir of the Holy Sepulchre, and immediately south of them the minaret of Omar's mosque on the site of the great hospital of St John. The modern Latin cathedral and patriarchate appear behind the Holy Sepulchre church, while the highest ground outside the city on the north-west is occupied by the Russian cathedral, hospice, and consulate, only completed in 1866.

The country round the city is barren and stony. Olive groves exist on the north, and the white slopes of Olivet are dotted with the trees whence it is named. Vineyards also exist on the west, but since the destruction of the fruit trees by Titus (*B. J.*, v. 3, 2) the vicinity of Jerusalem seems always to have presented a sterile appearance.

The number of churches and monasteries in the modern city, without counting many crusading chapels now either in ruins or also converted into mosques, is very large. There are 18 monasteries of the Greek Orthodox sect, 8 Catholic (or Latin), including the patriarchate, 3 Armenian, 2 Coptic, 1 Syrian, 1 Armenian Catholic, 1 Greek Catholic, and 1 Abyssinian. The Protestant institutions, including schools, &c., number 14 in all. In the Jewish quarter there are no less than 14 synagogues and 2 schools. There are also many charitable institutions in and near the city, of which the principal are Rothschild's hospital near the south wall, founded in 1855, and Sir Moses Montefiore's alms-house, west of the great reservoir called *Birket es Sultán*. In the centre of the city excavations have been carried on by the German Government (to whom the site was given by the sultan) in the grounds of the crusading convent of Sta. Maria Magna (now called *El Maristan*) immediately east of the hospital of St John; a Lutheran chapel is now established in the ruins. The Moslem buildings of the city date principally from the 13th, 14th, and 15th centuries, and some of the ancient Moslem schools near the Haram are remarkably solid structures. There are two barracks, one on the scarped rock (Antonia) north

of the Haram, the other in the citadel on the south-west. The *serai* or court-house is near the former. All the European powers are represented by resident consuls, and every nationality has some kind of hospice or hotel for the reception of pilgrims. The market-places have remained unchanged from very early times, the upper or vegetable market being in the upper city opposite the tower of David, and the bazaars or lower markets in the valley north of David Street. The money-changers occupy the site of the old exchange of the 12th century (first established by Charlemagne) in the western portion of David Street.

Jerusalem under the Turks is the capital of southern Palestine (about 2000 square miles), and the seat of a *mutasarrif* under the *sulá* of Syria. The *mejlis* or town council consists of 8 members:—4 Moslem, 3 Christian, 1 Jewish, the latter being the chief rabbi of the Sephardim. The export trade of the city consists chiefly of oil, corn, sesame, cotton (of poor quality), and soap, also of rosaries, crucifixes, and cameos, carved in olive wood and mother of pearl. The imports in 1871 amounted to £72,000, including cotton, wool, hardware, timber, silk, and glass from England and Austria; wines and spirits from France; and £3500 value of flour from Russia. Rice is imported in coasting vessels from Egypt; wine, spirits, dried fish, &c., from Cyprus and the Greek islands; carpets and shawls are brought by the Moslem and Christian pilgrims. There are also a few potteries in the city.

The present cemeteries of Jerusalem are six in number. The Moslem inhabitants bury immediately outside the east wall of the Haram, especially beside and north of the Golden gate, while a second Moslem cemetery exists on the knoll of Jeremiah's grotto, and a third (on the site of the old *Carnarium Leonis*) is close to the Mamilla pool west of the city. The Christians have cemeteries on the south-west of the brow of Sion, and the Jews are buried on Olivet opposite the temple, excepting the Karaites who have a cemetery on the south-east part of Sion.

The remains of an old Christian cemetery, including tombs belonging to the old church of St Sion, are found in the southern boundary valley, and there are a few sepulchres of crusading date near the north-east corner of Jerusalem on the outside. Of the ancient Jewish tombs the most striking are that known as the Tombs of the Kings, and the monument called Absalom's tomb on the east of the Kidron valley, which is perhaps the tomb of Alexander Jannæus (*B. J.*, v. 7, 2).

The climate of Jerusalem is healthy in comparison with that of the plains beneath it. A fresh sea breeze blows throughout the day in summer, and the average daily maximum temperature is 86° F. August is the hottest month, but in May the prevalence of dry east winds is specially trying. The autumn months are very unhealthy. In winter there are occasionally heavy falls of snow, which lies on the hills for several days. The waters of the *Bir Eyûb* overflow annually through a hole in the ground near the well, and a running stream then flows for many days down the Kidron valley. This overflow is a cause of rejoicing to the inhabitants, who make it a holiday occasion. The annual rainfall averages about 18 inches. Years of drought occasionally occur, when the inhabitants of the city suffer much from want of water. The repair of the aqueduct from Bethlehem and of the large reservoirs in the city would, however, be sufficient to ensure a plentiful supply. The present supply is obtained principally from cisterns under the houses. Slight shocks of earthquake are occasionally experienced (as for instance in 1874), and appear to have been specially prevalent in the 8th and 11th centuries (*cf. Zech.* xiv. 5).

The population of Jerusalem, stated in 1838 at about 11,000, has increased rapidly of late years, owing to a

great increase in the Jewish population, which has risen in that time from 3000 to over 10,000 souls. According to a consular estimate in 1872, the population was as follows, the total agreeing very closely with an independent estimate by Frère Livin the Franciscan:—Jews (Sephards, 4600; Ashkenazim, 6000), 10,600; Moslems, 5000; Christians, 5300; total, 20,600.

At Easter this population is increased by about 5000 pilgrims, who crowd the narrow streets until they are almost impassable. Throughout the year there are generally about 100 pilgrims in the Russian hospice. The number of Jews is said to be increasing at the rate of 1300 to 1500 souls per annum, chiefly though fresh arrivals from Russia and Poland. A building-club has been established and 130 houses erected in four years by the Jews, outside the walls. Along the Jaffa road many country villas have also been erected of late by European residents as summer abodes.

A very large majority of the Christians in Jerusalem are either priests, monks, or nuns. The majority belong to the Greek Orthodox church (about 2800 souls). The Greek patriarch has a province including all Palestine, with ten bishops, viz., of Nazareth, Acre, Kerak, Tabor, Bethlehem, Lydda, Gaza, Nablus, Es Salt, and Sebastieh, the last five being residents in Jerusalem. The Russian cathedral is presided over by an archimandrite with two assistant priests and a deacon.

The Latins in Palestine are not numerous, the country villages when Christian belonging generally to the Greek church. The Latin priests and monks are principally Jesuits and Franciscans. The number of Latins in Jerusalem is about 1500. Their churches are the cathedral of St Saviour, close to the patriarchate on the west, and the chapel of the Flagellation. They have established also many useful institutions, including a boys' school for 150 and a girls' school for 100 pupils.

The number of Armenian and Greek Catholics together does not exceed 50 souls. The orthodox Armenians are the richest sect in the city, numbering about 500. Great numbers of Armenian pilgrims visit the city, and their hospices (for 2000) is the largest in Jerusalem. Their principal church is that of St James on Sion. The Protestants (about 300) belong to the English Church and the Lutheran. The bishopric was established by England and Prussia in 1841. The mission to the Jews was established in 1824, and supports a hospital and church with resident chaplain and parsonage, a boys' school, and other institutions. There are also several German institu-

tions, including a girls' school and an orphanage outside the walls. The remaining Christian sects, Copts, Syrians, and Abyssinians, number only about 200 souls. For the Jews in Jerusalem see Jews, page 686 of the present volume.

The streets of Jerusalem at Easter present a strange spectacle from the numerous national costumes seen together. The European tourist, the Turkish nizam, the hooded Armenian, the long-haired Greek monk, are mingled with the native peasants in yellow turbans and striped mantles, with Armenian pilgrims wearing broad red sashes, Jews in Oriental costume or with the fur cap and love-locks of the Pharisee, Russians in knee boots and padded robes, and native ladies in white mantles with black face veils. The architecture of the city, Oriental, Gothic, Byzantine, or Italian, tells the same story—that Jerusalem has been for eighteen centuries a holy city in the eyes of Jew, Christian, and Moslem alike, and the religious centre of half the world. (c. R. c.)

Literature.—For the oldest period the Bible is the only source; for the city of Herod Josephus, to whom classical authors (Strabo, Tacitus) add little. The Talmudic material has been collected by Neubauer, *Géographie du Talmud*, Paris, 1868; comp. Schwarz's *Palestine* (ירושלם), 1845; Eng. transl., Philadelphia, 1850; German transl., 1852). The materials for Christian Jerusalem in patristic literature, histories, and pilgrimages are immense. The best list is Tobler's *Bibliographia Geographica Palestinæ*, Leipzig, 1867, with the supplement (1875) for 983–1000 A.D. See also A. B. McGregor's *Index of Passages bearing upon the Topography from Writings prior to the 11th century*, Glasgow, 1876. The Arabic sources have hitherto been imperfectly utilized. Of the more ancient Istakhry and Mokaddasy (988 A.D.), on whom Yāqūt and Kazwini mainly depend, deserve special notice. For Arabic works on Jerusalem see H. Khalifa, ii. 139. Recent writers have chiefly followed two very modern works, the *Une Jaldit* of Mujir ed Din (1494 A.D., see H. Kh., i. 453), of which extracts are given by Williams (vol. i., app. 2), and by Sauvarey (*Hist. de Jerusalem et d'Hebron*, 1876), and the *Rehse et Ahsed* of Kemāled Din (1470 A.D., see H. Kh., i. 148), which through an error of the translator Reynolds (London, 1886) is often ascribed to the famous Jalāl ed Din (Soyut). This book by no means deserves the authority attached to it by English writers. Results of recent research are embodied in the ordinance survey map, 1865; Zimmermann's maps, 1874, 1880; Warren's *Recovery of Jerusalem*, 1871. Of the innumerable topographical *discussions* (excluding works specially devoted to the Temple and Holy Sepulchre) may be named Beland, *Palestina*, 1714; Ohlhausen, *Zur Topographie des alten Jerusalem*, 1833; Ferguson, *Topography of Jerusalem*, 1847; Robinson, *Biblical Researches*; Thurny, *Ancient Jerusalem*, 1855; Lewin, *Siege of Jerusalem by Titus*, 1863; Williams, *The Holy City*, 2d ed., 1849; Furrer, *Wanderungen*, 1855; id., "Jerusalem" in Schenkel's *Bib. Lex.* For the history see Williams, *op. cit.*, and Bosant and Palmer, *Jerusalem*, 1871 (from consular and Arabic sources). Sothe-Böcker's *Handbook* deserves special notice.

JESI, a city in the circle and province of Ancona, Italy, is situated on a slight eminence on the left bank of the Esino, 17 miles west-south-west of Ancona, with which it is connected by rail. It is surrounded by a wall with towers. The streets, of which the Corso is the finest, are fairly good, and contain several noteworthy buildings, including a theatre and several churches. The cathedral, restored in the 18th century, is dedicated to St Septimius the martyr, who was first bishop of the see in 308. Jesi possesses a hospital and several benevolent institutions, besides a seminary, a lyceum, a communal college, and other educational establishments. It is one of the most active industrial towns of the province. Its manufactures include silk and woollen stockings, paper, cordage, leather, &c.; and it carries on trade in wine, oil, and grain. Jesi takes its title of "royal" city from having been the birth-place of the emperor Frederick II. in 1194. The population is 11,469.

Jesi represents the Roman colony and municipium *Æsina* (in Strabo, *Æsena*), which traces a traditional origin to the Pelagi. Vestiges of Roman remains render probable the opinion that, after being destroyed during the barbarian invasion of Italy, the town was removed to a new site. Jesi was a bone of contention between the Longobardi and the Byzantine exarchs, who alternately possessed it. Ultimately it fell into the hands of the Franks. During the early Middle Ages it enjoyed prosperity under Frederick II and his immediate successors; but about the beginning of the 14th century it began to have its full share of internal and external troubles. It passed into the power of the Holy See in the pontificate of Nicholas V. (1447–1455); under Napoleon it figured as a vice-prefecture, and in 1860 it was incorporated with the kingdom of Italy.

JESSE, EDWARD (1780–1868), a writer on natural history, was born 14th January 1780, at Hutton Cranswick, Yorkshire, where his father was vicar. He became clerk in one of the Government offices in 1798, and for a time was secretary to Lord Dartmouth, when president of the Board of Control, through whom he also received an office at court. In 1812 he was appointed commissioner of

hackney coaches, and not long afterwards he became deputy surveyor-general of the royal parks and palaces. On the abolition of this office he retired on a pension, and he died at Brighton 28th March 1868. The office which Mr Jesse filled in connexion with the royal parks induced him to take a considerable interest in the habits and characteristics of animals, the result of which was seen in a series of pleasant and popular books on natural history, the principal of which are *Gleanings in Natural History*, 3 vols., 1832-35; *An Angler's Rambles*, 1836; *Anecdotes of Days*, 1846; and *Lectures on Natural History*, 1863. He also edited Walton's *Complete Angler*, White's *Selborne*, and Ritchie's *Windsor Castle*, and wrote a number of handbooks to places of interest, including Windsor and Hampton Court.

JESSE, JOHN HENEAGE (1808-1874), son of Edward Jesse noticed above, was born in 1808. From his early manhood he held an office in the secretary's department of the Admiralty at Whitehall. His first contribution to literature, a poem on Mary Queen of Scots, which he dedicated to Sir Walter Scott, was published in 1829, and this was followed in 1830 by a collection of poems entitled *Tales of the Dead*. Among his other efforts in verse were a drama (*Richard III.*) and a fragmentary poem entitled *London*, dedicated to Mr Rogers the poet. None of these ventures achieved any success, but his series of historical works, which together form a continuous narrative from the reign of Richard III. to that of George III. inclusive, are written with vivacity and interest, and in their own style are a not unimportant contribution to the history of England. His *Memoirs of the Court of England during the Reign of the Stuarts* was published in 1839-40, *Memoirs of the Court of London from the Revolution of 1688 to the Death of George II.* in 1843, *George Selwyn and his Contemporaries* in 1844, *Memoirs of the Pretenders and their Adherents* in 1845, *Richard the Third and his Contemporaries* in 1861, and *Memoirs of the Life and Reign of King George the Third* in 1867. The titles of these works are sufficiently indicative of their character. They are sketches of the principal personages and of the social details of various periods in the history of England rather than complete and comprehensive historical narratives. In addition to these works, Mr Jesse wrote *Literary and Historical Memoirs of London*, 1847, and *London and its Celebrities*, 1871. His *Memoirs of Celebrated Britons* appeared in 1875. He died July 7, 1874.

JESSELMERE, a form of JĀISALMER (*q.v.*).

JESSOR, or JESSORE, a British district in the Lieutenant-governorship of Bengal, lying between 22° 25' 50" and 23° 17' N. lat., and between 88° 57' 33" and 90° 0' 13" E. long., with an area (1878) of 3658 square miles, forms the eastern portion of the presidency division. It is bounded on the N. and W. by Nadiyā district, on the S. by the Sundarbans, and on the E. by the district of Faridpur.

Jessor forms the central portion of the delta between the Hooghly and the united Ganges and Brahmaputra. It is a vast alluvial plain intersected by rivers and watercourses, which at places in the southern portion of the district spread out into large marshes. The northern part of the district is verdant, with extensive groves of date-palms; villages are numerous and large; and the people are prosperous. In the central portion the population is sparse, the only part of the tract suitable for dwellings being the high land on the banks of rivers. The principal rivers of Jessor are the Madhumatī (which forms the eastern boundary of the district), with its tributaries the Nabagangā, Chitra, and Bhairab; the Kumār, Kabadak, Kakti, Haridhar, Bhadrā, and Athārbānkā. Within the last century the rivers in the interior of Jessor have ceased to be true deltaic rivers; and, whereas the northern portion of the district formerly

lay under water for several months every year, it is now reached only by unusual inundations. The tide reaches as far north as the latitude of Jessor town.

The population of Jessor in 1872 numbered 2,075,021, of whom 1,061,126 were males and 1,023,895 females. The inhabitants of the district are all Bengalis; the better classes are Hindus, the lower orders being principally Mahomets. The Hindus number 915,413, the Mussalmān 1,151,936, and the Christians 1142. The Brāhma Samāj has a few adherents. Among the lower ranks, the fishing and boating castes deserve attention, the fisheries in the rivers and deeper swamps being very valuable, and the right to fish being a regular tenure paid for like the right to cultivate land. Jessor is noted for a colony of pure Kulin Brāhmins, who live at Lakshmipāsā, a village on the Nabagangā. These Kulin trace their origin to Rāmadān Chakrabartī, who five generations ago emigrated from Sarmangal in Bhāraganā, a great Kulin settlement. The only place with a population exceeding 5000 is Jessor town, which has 8152.

The principal staple in Jessor is rice; among other crops are barley, Indian corn, peas, mustard, jute, tobacco, potatoes, sugarcane, indigo, *pān*, dates, &c. The total cultivated area is about 1,381,500 acres, more than a million of which are said to be under rice. The estimated area covered by date-palms for the manufacture of sugar is 17,600 acres. The area under indigo is 31,533 acres. The total produce in 1872-73 was 203 tons, valued at £114,400. There are about fifty-five European factories, besides fifty worked in the interest of native proprietors under European or native management. Blights occur occasionally. The district is subject to heavy floods, which have sometimes been immediately followed by disastrous cyclones. Several inundations have taken place, causing famine.

The trade of Jessor is carried on chiefly by means of permanent markets, but there is also a considerable traffic at the numerous fairs and religious gatherings held throughout the district. The chief exports are sugar, indigo, rice, pulse, timber, honey, shells, &c.; the chief imports are salt, English goods, and cloth. The principal manufactures are date-sugar and indigo. The police-force consisted in 1871 of 590 officers and men, maintained at a cost of £13,548. In 1871 the number of Government and aided schools was 390, with 12,349 pupils. The climate does not differ from that of the other districts of Lower Bengal. April, May, and June are very trying, the average mean temperature being 88°-6 Fahr. The average rainfall is about 65 inches. Malarious diseases are very prevalent, intermittent fever being common throughout the year. Cholera breaks out every hot season.

British administration was completely established in the district in 1781, when the governor-general ordered the opening of a court at Murdī near Jessor. Before that, however, the fiscal administration of the district had been in the hands of the English, having been transferred to the East India Company with that of the rest of Bengal in 1766. The changes in jurisdiction in Jessor have been very numerous. After many transfers and rectifications, the district was in 1863 finally constituted as it at present stands. The rājās of Jessor or Chāncārā trace their origin to Bhābeswar Rāi, a soldier in the army of Khān-i-Azam, an imperial general, who deprived Rājā Pratāpāditya, the popular hero of the Sundarbans, of several fiscal divisions, and conferred them on Bhābeswar. But Manohar Rāi (1649-1705) is regarded as the principal founder of the family. The estate when he inherited it was of moderate size, but he acquired one *paraganā* after another, until, at his death, the property was by far the largest in the neighbourhood.

JESUITS. The "Company of Jesus," in its original conception, and in its avowed or ostensible objects, does not at the first glance appear as more than one of many similar communities which have grown up in the bosom of Latin Christianity. Like several of them, it is a congregation of ecclesiastics living in accordance with a definite rule, whence technically called "Clerks Regular"; like the Templars, Hospitaliers, and Teutonic Knights, military ideas have entered largely into its plans; like Benedictines, Dominicans, and Franciscans, its spiritual labours have been those of teaching the young by schools and catechizings, conducting home missions by such agencies as sermons, retreats, and the like, combating heresy with the pulpit and the pen, and converting the heathen. In each and all of these peculiarities and occupations it comes late into a field where its precursors had been busy for centuries, and it might seem to differ from them merely by a more careful selection of instruments, a more skilful organization, and a more perfect discipline.

But such a view is entirely misleading. On closer

examination the Jesuit body proves to resemble those other religious societies only in external and separable accidents, differing from them and from all others in its essential character,—and that not in degree merely, but in kind also, so as to be an institution absolutely unique in history.

In the first place, all the earlier associations of the kind, even the military orders themselves, have their origin in a desire to withdraw so far as possible from contact with the world and its concerns, to seek spiritual perfection in a retired life of contemplation and prayer, to concentrate efforts for this end chiefly within the cloister where each such group is collected, and to act only indirectly, and as it were with the mere surplus overflow of religious energy, on their more immediate neighbours around, and even then chiefly with the idea of persuading all the most devout and fervent amongst them to forsake the world in a similar fashion. Contrariwise, the Jesuit system is to withdraw religious men from precisely this sort of retirement, except as a mere temporary preparation for later activity, and to make habitual intercourse with society a prime duty, rigidly suppressing all such external regulations of dress, rule, and austerities as tend to put obstacles in the way, so leaving the members of the "Company" free to act as emissaries, agents, or missionaries in the most various places and circumstances. Next, the constitution of the elder societies was for the most part democratic. Allowing for special exceptions, the normal scheme of government was this. Each house of an order had a separate life and partial independence of its own. It elected its own superior and officers, usually by ballot, for a short term of years, it discussed its business, and its members confessed their faults, in open chapter. Each group of houses elected a provincial; the provincials, or delegates from among them, elected the general, whose authority was strictly constitutional, and limited as definitely by the rule and statutes as the rights of the youngest novice. Further, admission was seldom difficult; the noviciate rarely exceeded two years, and the novices, professed at the close of that probation, at once entered on a share in the government of the society, and became eligible for its highest offices. Unlike this method in every respect, the Jesuit polity is almost a pure despotism, guarded, no doubt, with certain checks, but even those of an oligarchical kind. The general is indeed elected by the congregation of the society; but, once appointed, it is for life, and with powers lodged in his hands, partly due to the original constitutions, and partly to special faculties and privileges conferred by various popes, which enormously exceed, as regards enactment and repeal of laws, as to restraint and dispensation, and both in kind and degree, those wielded by the heads of any other communities. He alone nominates to every office in the society (with certain significant exceptions to be named presently) and appoints the superiors of all the houses and colleges. The vow of obedience is taken directly to him, and not, as in the older orders, to the rule, as distinguished from the mere chief of the executive. The admission or dismissal of every member depends on his absolute fiat; and, by a simple provision for reports to him, he holds in his hands the threads of the entire business of the society in its most minute and distant ramifications.

Once more, the distinguishing peculiarity of the earlier communities, dating from the origin of the Benedictine rule, is their hostility to local change. The vow of *stability*, soon added to the three customary pledges of poverty, chastity, and obedience, was designed to impede, not merely itinerancy without settled abode, such as had brought discredit on those ancient monks who were styled *circumcellions*, nor even easy transition from one religious community to another, unless in search of greater austerity,

but even facility of transfer from one house to another of the very same order. Where the profession was made, there, in the absence of exceptional reasons, the life should be spent; and this rule of course tended to nationalism in the monasteries of every country, even in the great military orders, which, though accepting recruits from all quarters, yet grouped them into *tongues*. But mobility and cosmopolitanism are of the very essence of the Jesuit programme. The founder of the society has excluded the possibility of doubt on this subject, for having chosen the military term "Company," rather than "Order" or "Congregation" to describe his new institute, he explained its meaning to Paul III. as being that, whereas the ancient monastic communities were, so to speak, the infantry of the church, whose duty was to stand firmly in one place on the battlefield, the Jesuits, contrariwise, were to be the "light horse," capable of going anywhere at a moment's notice, but especially apt and designed for scouting or skirmishing. And, to carry out this view, it was one of his plans to send foreigners as superiors or officers to the Jesuit houses of each country, requiring of these envoys, however, to use invariably the language of their new place of residence, and to study it both in speaking and writing till entire mastery of it had been acquired,—thus by degrees making all the parts of his vast system mutually interchangeable, and so largely increasing the number of persons eligible to fill any given post, without reference to locality.

Further, the object of the older monastic societies was the sanctification of their individual members. In truth, community life was only a later development of the original system, as exhibited in the Thebaid, in accordance with which solitary hermits began to draw near to each other, until the collection of separate huts gradually assumed the form of a *laura* or hamlet of cells, grouped under an abbot, and with a common place of worship—a model still surviving in the Camaldolese order. Their obedience to a superior, and the observance of some kind of fixed rule, had no further intention than the improvement of the spiritual character of each person who entered such a community; and, with certain qualifications, this has continued the ideal of the older orders,—modified chiefly by the natural desire of each such body to gain influence and credit from the personal character of all its members and the efficiency of its active operations. But the founder of Jesuitism started at once with a totally different purpose. To him, from the first, the society was everything, and the individual nothing, except so far as he might prove a useful instrument for carrying out the society's objects. In a MS. collection of sayings by Loyola, whose genuineness is accepted by the Bollandists, themselves Jesuits, and by his biographer F. Genelli, he is stated to have said to his secretary, Polanco, that "in those who offered themselves he looked less to purely natural goodness than to firmness of character and ability for business, for he was of opinion that those who were not fit for public business were not adapted for filling offices in the society." He went even further than this, and laid down that even exceptional qualities and endowments in a candidate were valuable in his eyes only on the condition of their being brought into play or held in abeyance strictly at the command of a superior. On this principle, he raised obedience to a position it had never held before, even amongst monastic virtues. His letter on this subject, addressed to the Jesuits of Coimbra in 1553, is still one of the standard formularies of the society, ranking with those two other products of his pen, the *Spiritual Exercises* and the *Constitutions*; and it is evident that his views differ very seriously from the older theories on the subject, as formulated in other rules. In them the superior is head of a local family, endowed with paternal authority, no doubt as

understood by the old civil code of the Roman empire, centuries after the very memory of freedom had been lost, yet having fixed limits, alike traditional and prescribed, besides being exercised only within a limited area and for certain specified purposes. Loyola, true to his military training and instincts, clothes the general with the powers of a commander-in-chief of an army in time of war, giving him the absolute disposal of all members of the society in every place and for every purpose. Not only so, but he pushes the claim much further, requiring, besides entire outward submission to command, also the complete identification of the inferior's will with that of the superior. He lays down that this superior is to be obeyed simply as such, and as standing in the place of God, without reference to his personal wisdom, piety, or discretion; that any obedience which falls short of making the superior's will one's own in inward affection as well as in palpable effect, is lax and imperfect; that going beyond the letter of command, even in things abstractly good and praiseworthy, is disobedience; and that the "sacrifice of the intellect"—a familiar Jesuit watchword—is the third and highest grade of obedience, well-pleasing to God, when the inferior not only wills what the superior wills, but thinks what he thinks, submitting his judgment so far as it is possible for the will to influence and lead the judgment. So far-reaching and dangerous are these maxims that the *Letter on Obedience* was formally condemned, not long after Loyola's death, by the Inquisition in Spain and Portugal, and it tasked all the skill and learning of Bellarmine as its apologist, together with the whole influence of the company, to avert the ratification of the sentence at Rome.

It has, however, been alleged in defence that this very strong language must be glossed and limited by two other maxims penned by Loyola: (1) "Preserve your freedom of mind, and do not relinquish it by the authority of any person, or in any circumstances whatever"; and (2) "In all things *except sin* I ought to do the will of my superior, and not my own." But the value of these checks is seriously diminished when it is added that the former of them occurs in the introductory part of the *Spiritual Exercises*, a manual expressly designed and used for the purpose of breaking down the will of those who pass through its appointed ordeal under a director; while the latter is qualified in its turn, not only by the whole principle of probabilism, the special doctrine of the society, which can attenuate and even defend any kind of sin, but by the four following maxims, in close juxtaposition to itself in the very same document: "I ought to desire to be ruled by a superior who endeavours to subjugate my judgment or subdue my understanding"; "When it seems to me that I am commanded by my superior to do a thing against which my conscience revolts as sinful, and my superior judges otherwise, it is my duty to yield my doubts to him, unless I am otherwise constrained by evident reasons"; "If submission do not appease my conscience, I must impart my doubts to two or three persons of discretion, and abide by their decision"; "I ought not to be my own, but His who created me, and his too by whose means God governs me, yielding myself to be moulded in his hands like so much wax. . . . I ought to be like a corpse, which has neither will nor understanding, or like a small crucifix, which is turned about at the will of him that holds it, or like a staff in the hands of an old man, who uses it as may best assist or please him." And one master-stroke of Loyola's policy was to insure the permanence of this submission by barring access to all independent positions on the part of members of the society, through means of a special constitution that no Jesuit can accept a cardinal's hat, a bishopric other than missionary, an abbacy, or any similar dignity, save with permission of the general, not to

be accorded unless and until the pope has commanded its acceptance under pain of sin.

The next matter for consideration is the machinery by which the society is constituted and governed, so as to enable this principle to become a living energy, and not a mere abstract theory. The society, then, is distributed into six grades—novices, scholastics, temporal coadjutors, spiritual coadjutors, professed of the three vows, and professed of the four vows. The novice cannot become a postulant for admission to the society till fourteen years old, unless by special dispensation, and is at once classified according as his destination is the priesthood or lay brotherhood, while a third class of "indifferents" receives such as are reserved for further inquiry before a decision of this kind is made. They first undergo a strict retreat of a month in what is practically solitary confinement, during which they go through the *Spiritual Exercises*, and make a general confession of their whole previous life; after which the first noviciate, of two years' duration, begins. This is spent partly in daily study, partly in hospital work, and partly in teaching the rudiments of religious doctrine to children and the poor. They may leave or be dismissed at any time during this noviciate, but if approved are advanced into the grade of scholastics, corresponding in some degree to that of undergraduates at a university. The ordinary course for these is five years in arts, when, without discontinuing their own studies, they must pass five or six years more in teaching junior classes, not reaching the study of theology till the age of twenty-eight or thirty, when, after another year of noviciate, a further course of from four to six years is imposed, and not till this has been completed can the scholastic be ordained as a priest of the society, and enter on the grade of spiritual coadjutor, assuming that he is not confined to that of temporal coadjutor, who discharges only such functions as are open to lay-brothers, and who must be ten years in the society before being admitted to the vows. The time can be shortened at the general's pleasure, but such is the normal arrangement. Even this rank confers no share in the government, nor eligibility for the offices of the society. That is reserved for the professed, themselves subdivided into those of the three vows and of the four vows. It is these last alone, forming only a small percentage of the entire body, who constitute the real core of the society, whence its officers are all taken, and their fourth vow is one of special allegiance to the pope, promising to go in obedience to him for missionary purposes whenever and whithersoever he may order,—a pledge seriously qualified in practice, however, by the power given to the general of alone sending out or recalling any missionary. The constitutions enjoin, by a rule seldom dispensed with, that this final grade cannot be attained till the candidate has reached his forty-fifth year, which involves a probation of no fewer than thirty-one years for even such as have entered on the noviciate at the earliest legal age. These various members of the society are distributed in its noviciate houses, its colleges, its professed houses, and its mission residences. The question has long been hotly debated whether, in addition to these six avowed grades, there be not a seventh, answering in some degree to the Tertiaries of the Franciscan and Dominican orders, secretly affiliated to the society, and acting as its unsuspected emissaries in various lay positions. This class is styled in France "Jesuits of the short robe," and some evidence in support of its actual existence was alleged during the lawsuits against the company under Louis XV. The Jesuits themselves deny the existence of any such body, and are able to adduce the negative disproof that no provision for it is to be found in their constitutions. On the other hand, there are clauses therein which make the creation of such

a class perfectly feasible if thought expedient. One is the power given to the general to receive candidates secretly, and to conceal their admission, for which there is a remarkable precedent in the case of Francis Borgia, duke of Gandia, afterwards himself general of the society; the other is an even more singular clause, providing for the admission of candidates to the company by persons who are not themselves members of it. The known facts on either side are insufficient for a decisive verdict, and "Not proven" is the only impartial judgment possible. The general, who should by the statutes of the society reside permanently at Rome, holds in his hands the right of appointment, not only to the office of provincial over each of the great districts into which the houses are mapped, but to the offices of each house in particular, no shadow of electoral right or even suggestion being recognized.

The superiors and rectors of all houses and colleges in Europe must report weekly to their provincial on all matters concerning the members of the society and all outsiders with whom they may have had dealings of any sort. Those employed in district missions report at such longer intervals as the provincial may fix. The provincial, for his part, must report monthly to the general, giving him a summary of all details which have reached himself. But, as a check on him, all superiors of houses in his province are to make separate reports directly to the general once in three months, and further to communicate with him without delay every time any matter of importance occurs, irrespective of any information which the provincial may have forwarded. Nor is this all; an elaborate system of espionage and delation forms part of the recognized order of every house, and, in direct contrast to the ancient indictment and confession of faults in open conventual chapter, every inmate of a house is liable to secret accusation to its superior, while the superior himself may be similarly delated to the provincial or the general.

Nor is the general himself exempt from control on the part of the society, lest by any possibility he might prove, from dissimulation or error, unfaithful to its interests. A consultative council is imposed on him by the general congregation, consisting of six persons, whom he may neither select nor remove,—namely, four assistants, each representing a nation, an admonisher or adviser (resembling the *adlatus* of a military commander) to warn him of any faults or mistakes, and his confessor. One of these must be in constant attendance on him; and, while he is not at liberty to abdicate his office, nor to accept any dignity or office outside it without the assent of the society, he may yet be suspended or deposed by its authority. No such instance, however, has yet occurred in Jesuit history, although steps in this direction were once taken in the case of a general who had set himself against the current feeling of the society. With so widely ramifying and complex a system in full working order, controlled by the hand of one man, the Company of Jesus has been aptly defined as "a naked sword, whose hilt is at Rome, and whose point is everywhere."

There would seem at first to be an effectual external check provided, however, in the fact that, while all the officers of the society, except the council aforesaid, hold of the general, he in turn holds of the pope, and is his liegeman directly, as well as in virtue of the fourth vow, which he has taken in common with the other professed. But such is the extraordinary skill with which the relations of the society to the papacy were originally drafted by Loyola, and subsequently worked by his successors, that it has always remained organically independent, and might very conceivably break with Rome without imperilling its own existence. The general has usually stood towards the pope much as a powerful grand feudatory of the Middle Ages

did towards a weak titular lord paramount, or perhaps as the captain of a splendid host of "Free Companions" did towards a potentate with whom he chose to take temporary and precarious service; and the shrewd Roman populace have long shown their recognition of this fact by styling these two great personages severally the "White Pope" and the "Black Pope." In truth, the society has never, from the very first, obeyed the pope, whenever its will and his happened to run counter to each other. Even in the very infancy of the company, Loyola himself used supplications and arguments to the pope to dissuade him from enforcing injunctions likely to prove incompatible with the original plan, and on each occasion succeeded in carrying his point; while his immediate successors more openly resisted Paul IV. when attempting to enforce the daily recitation of the breviary on the clerks of the society, and to limit the tenure of the generalship to three years, and Pius V. when following his predecessor's example in the former respect. Sixtus V. having undertaken with a high hand the wholesale reform of the company, including the change of its name from "Society of Jesus" to "Society of Ignatius," met with strenuous opposition, and the fulfilment of Bellarmine's prophecy that he would not survive the year 1590 was looked on less as the accomplishment of a prediction than of a threat,—an impression deepened by the sudden death of his successor, Urban VII., eleven days after his election, who, as Cardinal Castagna, had been actively co-operating with Sixtus in his plans. The accuracy of a similar forecast made by Bellarmine as to Clement VIII., who was also at feud with the society, and who died before he could carry out his intended measures, confirmed popular suspicion. Urban VIII., Innocent XI., Alexander VIII., and Clement XII. vainly contended against the doctrines taught in Jesuit books and colleges, and could effect no change. Nine popes fruitlessly condemned the "Chinese rites," whereby the Jesuit missionaries had virtually assimilated Christianity to heathenism, and the practical reply of the latter was to obtain in 1700 an edict from the emperor of China, in opposition to the papal decree, declaring that there was nothing idolatrous or superstitious in the incultured usages, while in 1710 they flung Cardinal Tournon, legate of Clement XI., into the prison of the Inquisition at Macao, where he perished; and finally, they disobeyed the brief of suppression issued by Clement XIV. in 1773, which enjoined them to disperse at once, to send back all novices to their houses, and to receive no more members. It is thus clear that the society has always regarded itself as an independent power, ready indeed to co-operate with the papacy so long as their roads and interests are the same, and to avail itself to the uttermost of the many pontifical decrees in its own favour, but drawing the line far short of practical submission when their interests diverge.

So constituted, with a skilful combination of strictness and laxity, of complex organization with the minimum of friction in working, the society was admirably devised for its purpose of introducing a new power into the church and the world, and for carrying out effectively every part of its vast programme. Thus equipped, its services to Roman Catholicism have been incalculable. The Jesuits alone rolled back the tide of Protestant advance when that half of Europe which had not already shaken off its allegiance to the papacy was threatening to do so, and the whole honours of the counter-Reformation are theirs singly. They had the sagacity to see, and to admit in their correspondence with their superiors, that the Reformation, as a popular movement, was fully justified by the gross ignorance, negligence, and open vice of the Catholic clergy, whether secular or monastic; and they were shrewd enough to discern the only possible remedies. At a time when primary and even secondary education had in most places

become a mere effete and pedantic adherence to obsolete methods, they were bold enough to innovate, less in system than in materials, and, putting fresh spirit and devotion into the work, not merely taught and catechized in a new, fresh, and attractive manner, besides establishing free schools of good quality, but provided new manuals and schoolbooks for their pupils, which were an enormous advance on those they found in use, so that for nearly three centuries the Jesuits were accounted the best schoolmasters in Europe, as they were, till their forcible suppression the other day, confessedly the best in France,—besides having always conciliated the good will of their pupils by mingled firmness and gentleness as teachers. And, although their own methods have in time given way to further improvements, yet they revolutionized instruction as completely as Frederick the Great did modern warfare, and have thus acted, whether they meant it or not, as pioneers of human progress. Again, when the regular clergy had sunk into the moral and intellectual slough which is pictured for us in the writings of Erasmus and in the powerful satire *Epistolæ Obscurorum Virorum*, while there was little of a better kind visible in the lives of the parochial priesthood, the Jesuits won back respect for the clerical calling by their personal culture and the unimpeachable purity of their lives. These are qualities which they have all along carefully maintained, and probably no body of men in the world has been so free from the reproach of discreditable members, or has kept up an equally high average level of intelligence and conduct. As preachers, too, they delivered the pulpit from the bondage of an effete scholasticism, and reached at once a clearness and simplicity of treatment such as the English pulpit scarcely begins to exhibit till after the days of Tillotson; while in literature and theology they count a far larger number of respectable writers than any other religious society can boast. It is in the mission-field, however, that their achievements have been most remarkable, which might fully justify their taking as their motto—

“*Que regis in terris nostri non plene labores ?*”

Whether toiling amongst the tens of millions of Hindustan and China, labouring amongst the Hurons and Iroquois of North America, governing and civilizing the natives of Brazil and Paraguay, in the missions and “reductions,” or ministering, at the hourly risk of his life, to his coreligionists in England under Elizabeth and James I., the Jesuit appears alike devoted, indefatigable, cheerful, and worthy of hearty admiration and respect.

Nevertheless, two most startling and indisputable facts meet the student who pursues the history of this unique society. The first is the universal suspicion and hostility it has incurred,—not, as might reasonably be expected, more from those Protestants whose avowed and most successful foe it has been, nor yet from the enemies of all clericalism and religious dogma, to whom it is naturally the embodiment of all they most detest, but from every Roman Catholic state and nation in the world, with perhaps the insignificant exception of Belgium. Next is the brand of ultimate failure which has invariably been stamped on all its most promising schemes and efforts. It controlled the policy of Spain, when Spain was aiming, with good reason to hope for success, at the hegemony of Europe, and Spain came out of the struggle well-nigh the last amongst the nations. It secured the monopoly of religious teaching and influence in France under Louis XIV. and XV. only to see an atheistic revolution break out under Louis XVI. and sweep over the nation after a century of such training. It guided the action of James II., lost the crown of England for the house of Stuart, and brought about the limitation of the throne to the Protestant succession. Its Japanese and Red Indian missions have vanished without

leaving a trace behind; its labours in Hindustan did but prepare the way for the English empire there; it was swept out of its Paraguayan domains without power of defence; and, having in our own day concentrated its efforts on the maintenance of the temporal power of the popes, and raised it almost to the rank of a dogma of the Catholic faith, it has seen Rome proclaimed as the capital of united Italy, and a Piedmontese sovereign enthroned in the Quirinal. These two phenomena demand some inquiry and analysis. As regards the former of them, the hostility the Jesuits have encountered has been twofold, political and moral or religious. There has been, from a very early date in their annals, a strong conviction prevalent that the famous motto of the society, “*A.M.D.G.*” (*Ad majorem Dei gloriam*), did not adequately represent its policy and motives, that its first and last aim was its own aggrandizement in power and wealth (for Julius II. had dispensed the general from the vow of poverty, and the colleges also were allowed to hold property), and that it spared no efforts to compass this end, even to the extent of embroiling cabinets, concocting conspiracies, kindling wars, and procuring assassinations. In several of these cases, notably as regards the charges which led to their first expulsion from France and Portugal, inclusive in the latter instance of their exile from Paraguay, the Jesuits are able to make one very telling reply, pleading that motives of statecraft alone, of an unworthy kind, and the evidence of untrustworthy and disreputable agents of their enemies, were suffered to decide the matter. In other cases, as for example the assassination of Henry IV. by Ravalliac, they deny all complicity, and no sufficient proof has ever been adduced against them. But, when full allowance has been made for such rejoinders, there remain several counts of the indictment which are but too clearly made out: as, for instance, their large share, as preachers, in fanning the flames of polemical hatred against the Huguenots under the last two Valois kings, their complicity in the plots against the life of Queen Elizabeth which followed on her excommunication by Pius V.; their responsibility for kindling the Thirty Years’ War; the part they took in prompting and directing the cruelties which marked the overthrow of Protestantism in Bohemia; their decisive influence in causing the revocation of the Edict of Nantes, and the expulsion of the Huguenots from the French dominions; and their accountability for precipitating the Franco-German war of 1870. And in regard to a large number of other cases where the evidence against them is defective, it is at least an unfortunate coincidence that there is always direct proof of some Jesuit having been in communication with the actual agents engaged. So it was with the massacre of St Bartholomew, almost immediately preceded by a visit of the Jesuit general, Francis Borgia, to the French court, though there is no further evidence to connect him therewith; so with Châtel and Ravalliac, the unsuccessful and successful assassins of Henry IV.; so with Jaureguay and Balthazar Gerard, who held the like relation to William the Silent, prince of Orange; so (as is more familiarly known) with the accomplices in the Gunpowder Plot. In all these and several other instances, the precautions which would naturally, and even inevitably, be taken by skilled and wary diplomatists for their own protection are sufficient to account for the lack of direct proof against them, but it is not easy to explain the invariable presence of a Jesuit in the background, on any hypothesis which will secure the complete acquittal of the society from charges of the sort. It is sufficient to say here in illustration that the English Roman Catholics under Elizabeth, addressing the pope with regard to the severe penal laws which oppressed them, laid the whole blame of the Government’s action on the Jesuits, as having provoked.

it by their conspiracies; while the secular priests in England issued in 1601 by the pen of one of their number, William Watson (afterwards executed in 1603), a pamphlet known as *Important Considerations*, to the same effect.

The merited odium which has overtaken the Inquisition, usually officered by Dominicans, has induced the Jesuits, whose own controversial method has for the most part been different, to disclaim all connexion with that tribunal, and to represent their society as free from complicity in its acts. But, in truth, it was Ignatius Loyola himself who procured its erection in Portugal in 1545-6, and F. Nithard, one of the very few cardinals of the society, was inquisitor-general of that kingdom in 1655.

The charges against the Jesuits on moral and doctrinal grounds are not less precise, early, numerous, and weighty. Their founder himself was arrested more than once by the Inquisition, and required to give account of his belief and conduct. But Loyola, with all his powerful gifts of intellect, was entirely practical and ethical in his range, and had no turn whatever for speculation, nor desire to reason on, much less question, any of the received dogmas of his church. He was therefore acquitted on every occasion, and sagaciously applied for and obtained each time a formally attested certificate of his orthodoxy, knowing well that, in default of such documents, the fact of his arrest as a suspected heretic would be more distinctly recollected by opponents than that of his honourable dismissal from custody. His successors, however, have not been so fortunate. On doctrinal questions indeed, though their teaching on grace, especially in the form given it by Molina, one of their number, was directly Pelagian (the result of reaction from Luther's teaching, which they had combated in Germany), and condemned by several popes, yet their pertinacity in the long run carried the day, and gained a footing for their opinions which was denied to the opposite tenets of the Jansenists. But the accusations against their moral theology and their action as guides of conduct, nay, as themselves involved in many doubtful transactions, have not been so appeased. They were censured by the Sorbonne as early as 1554, chiefly at the instance of Eustache de Bellay, bishop of Paris, on grounds of which some were quite true, though others appear to have been at least exaggerations; but they can plead that no other theological faculty of the time joined in the condemnation. Melchior Cano, one of the ablest divines of the 16th century, never ceased to lift up his testimony against them, from their first beginnings till his own death in 1560, and, unmollified by the bribe of the bishopric of the Canaries, which their interest procured for him, succeeded in banishing them from the university of Salamanca. St Charles Borromeo, to whose original advocacy they owed much, and especially the exception made in their favour by the council of Trent (Sess. XXV., xvi.) from the restrictions it laid on other communities, retracted his protection, and expelled them from the colleges and churches which they occupied in his diocese and province of Milan,—a policy wherein he was followed in 1604 by his cousin and successor, the equally saintly Cardinal Frederick Borromeo. The credit of the society was, however, far more seriously damaged by the publication at Cracow in 1612 of an ingenious forgery (whose authorship has been variously ascribed to John Zmorowsky or to Cambilone and Schloss, all ex-Jesuits) entitled *Monita Secreta*, professing to be the authoritative secret instructions drawn up by the general Acquaviva and given by the superiors of the company to its various officers and members, and to have been discovered in MS. by Christian of Brunswick in the Jesuit college at Prague. It is full of suggestions for extending the influence of the Jesuits in various ways, for securing a footing in fresh places, for acquiring wealth, and so forth, all marked with

ambition, craft, and unscrupulousness. It had a wide success and popularity, passing through several editions, and, though declared a forgery by a congregation of cardinals specially appointed to examine into it, has not ceased to be reprinted and credited down to the present day. The truth seems to be that, although both caricature and libel, it was drafted by a shrewd and keen observer, who, seeing what the fathers actually did, travelled analytically backwards to find how they did it, and on what methodical system, conjecturally reconstructing the process, and probably coming very near the mark in not a few details. Later on, a formidable assault was made on their moral theology in the famous *Provincial Letters* of Blaise Pascal, eighteen in number, issued under the pen-name of Louis de Montalte, from January 1656 to March 1657. Their wit, irony, eloquence, and finished style have kept them alive as one of the great French classics,—a destiny more fortunate than that of two kindred works by Antoine Arnauld, his collaborator in the *Provincial Letters*, namely, *Théologie Morale des Jésuites*, consisting of extracts from writings of members of the society, and *Morale Pratique des Jésuites*, made up of narratives exhibiting the manner in which they carried out their own maxims in their personal action. The reply on behalf of the society to Pascal's charges of lax morality, apart from mere general denials (such as that embodied in F. Ravignan's name for the *Provinciales*, "Le Dictionnaire de la Calomnie"), is broadly as follows. (1) Ignatius Loyola himself, the founder of the society, had a special aversion from untruthfulness in all its forms, from quibbling, equivocation, or even studied obscurity of language, and it would be contrary to the spirit of conformity with his example and institutions for his followers to think and act otherwise. (2) Several of the cases cited by Pascal are mere abstract hypotheses, many of them now obsolete, argued on simply as matter of intellectual exercise, but having no practical bearing whatever. (3) Even such as do belong to the sphere of actual life are of the nature of counsel to spiritual physicians, how to deal with exceptional maladies, and were never intended to fix the standard of moral obligation for the general public. (4) The theory that they were intended for this latter purpose, and do represent the normal teaching of the Jesuit body, becomes more untenable in exact proportion as this immorality is insisted on, because it is matter of notoriety that the Jesuits themselves have been singularly free from personal, as distinguished from corporate, evil repute, and no one pretends that the large numbers of lay-folk whom they have educated or influenced exhibit any great moral inferiority to their neighbours. The third of these replies is the most cogent as regards Pascal, but the real weakness of his attack lies in that nervous dread of appeal to first principles and their logical results which has been the besetting snare of Gallikanism. Afraid to deal with the fact that the society was on the whole what its founder meant it to be, and was merely carrying out his programme, because that admission would have involved challenging Loyola's position as a canonized saint, and the action of the Holy See in approving his institute, Pascal was obliged to go on the historically untenable ground that the Jesuits of his day had degenerated from their original standard; and thus he was not at liberty to go down to that principle which underlies the whole theory of probabilism, namely, the substitution of external authority for the voice of conscience. Hence the ultimate failure of his brilliant attack. The same error of complaining against integral parts of the original system as though they were departures from its spirit marks the treatise of the Jesuit Mariana on certain faults in the government of the society, which was published at Bordeaux soon after his death, in Spanish, French, Latin,

and Italian, from a MS. taken from him when he was in prison. The evils he specifies are the spy system (which he declares to be carried so far that, if the general's archives at Rome should be searched, not one Jesuit's character would be found to escape), the monopoly of the higher offices in the hands of a small clique, the narrow range of study, and the absence of encouragement and recompense for the best men of the society. But any fair examination of the constitutions will show that all these belong to the original scheme of government, and should have been challenged on that ground, if at all. Yet, on the broad issue, Pascal's censures have in the main been justified by the subsequent teaching of the society, for the lax casuistry which he held up to ridicule has been formally reproduced in the most modern and popular Jesuit text-book on the subject, that of F. Gury, while the works of Liguori and Scavini, though not of direct Jesuit origin, are yet interpenetrated with the same opinions. And the result of dispassionate examination of these and kindred works—always bearing in mind that no Jesuit writings can be published without special licence from the general, after careful scrutiny and review—is that the three principles of probabilism, of mental reservation, and of justification of means by ends, which collectively make up what educated men intend by the term "Jesuitry," are recognized maxims of the society. As the last of these three is at once the most odious in itself and the charge which is most anxiously repelled, it is well to cite three leading Jesuit theologians in proof. Busembaum, whose *Medulla Theologiae* has been more than fifty times printed, and lately by the Propaganda itself, lays down the maxim in the following terms: "Cum finis est licitus, etiam media sunt licita," and, "Cui licitus est finis, etiam licent media." Layman, similarly, in his *Theologia Moralis*, "Cui concessus est finis, concessa etiam sunt media ad finem ordinata;" and Wengemann, in his *Synopsis Theologiae Moralis*, yet more tersely, "Finis determinat probitatem actus." In point of fact, many rules of conduct based on these three principles have gradually percolated, as might have been expected, into popular catechisms, and so have weakened the plea that we are dealing only with technical manuals for a professional class; while the plausible defence from the fair average honesty and morality of the lay-folk taught by a clergy which uses these manuals, amounts simply to a confession that the ordinary secular conscience is a safer guide in morals than a Jesuit casuist, since the more nearly the code deducible from his text-books is conformed to the more widely must the pupil diverge from all accredited ethics.

Two causes have been at work to produce the universal failure of the great company in all its plans and efforts. And first stands its lack of powerful intellects. Nothing can be wider from the truth than the popular conception of the ordinary Jesuits as a being of almost superhuman abilities and universal knowledge. The company is without doubt a *corps d'élite*, and an average member of it is of choicer quality than the average member of any equally large body, besides being disciplined by a far more perfect drill. But it takes great men to carry out great plans, and of great men the company has been markedly barren from almost the first. Apart from its mighty founder, and his early colleague Francis Xavier, there are absolutely none who stand in the very first rank. They have had, no doubt, able administrators, like Acquaviva; methodical and lucid compilers, like the Bollandists and Cornelius a Lapide; learned and plausible controversialists, like Bellarmine; eloquent preachers, as Bourdaloue, Segneri, and Viennys; distinguished mathematicians, like Le Sou, Jacquier, and more lately Secchi; but even their one boldest and most original thinker, Denis Petau, has produced no permanent influence

over the current of human thought. They have had no Aquinas, no Anselm, no Bacon, no Richelieu. Men whom they trained and who broke loose from their teaching, Pascal, Descartes, Voltaire, have powerfully affected the philosophical and religious beliefs of great masses of mankind, but respectable mediocrity is the brand on the long list of Jesuit names in the catalogues of Alegambe and De Backer. This result is due chiefly to the destructive process of scooping out the will of the Jesuit novice, to replace it with that of his superior (as a watchmaker might fit a new movement into a case), and thereby annihilating in all instances those subtle qualities of individuality and originality which are essential to genius. Men of the highest stamp will either refuse to submit to the process, or will come forth from the mill with their finest qualities pulverized and useless. Nor is this all. The *Ratio Studiorum*, as devised by Acquaviva, and still followed in the colleges of the society, lays down rules which are incompatible with all breadth and progress in the higher forms of education. True to the anti-speculative and traditional side of Loyola's mind, it prescribes that even where religious topics are not in question, the teacher is not to permit any novel opinions or discussions to be mooted; nor to cite himself, or allow others to cite, the opinion of an author not of known repute; nor to teach or suffer to be taught anything contrary to the prevalent opinions of acknowledged doctors current in the schools. Obsolete and false opinions are not to be mentioned at all, even for refutation, nor are objections to received teaching to be dwelt on at any length. The professor of Biblical literature is always to support and defend the Vulgate reading, and to cite the Hebrew and Greek only when they can at least be reconciled therewith; while all versions except the LXX. (which is to be spoken of respectfully) are to be passed over entirely, save when they help to confirm the Vulgate text. In philosophy, Aristotle is to be always followed, and Aquinas generally, care being taken to speak respectfully of him even when abandoning his opinion. It is not wonderful that, under such a method of training, highly cultivated commonplace should be the inevitable average result, and that in proportion as Jesuit power has become dominant in Latin Christendom, the same doom of intellectual sterility, and consequent loss of influence with the higher and thoughtful classes, has spread from the part to the whole. The second cause which has blighted the efforts of the company is the lesson, too faithfully learnt and practised, of making its corporate interests the first object at all times and in all places. The most brilliant exception to this rule is found in some of the foreign missions of the society, and notably in that of St Francis Xavier. But Xavier quitted Europe in 1541, before the new society had hardened into its final mould, and never returned. His work, so far as we can gather from contemporary accounts, was not done on the true Jesuit lines, though the company has reaped all its credit; and it is even possible that had he succeeded Loyola as general of the Jesuits the institute might have been seriously and healthfully modified. It would almost seem that careful selection was made of the men of greatest piety and enthusiasm, such as Anchieta, Beraza, and Brébeuf, whose unworldliness made them less apt for the diplomatic intrigues of the society in Europe, to break new ground in the various foreign missions, where their successes would throw lustre on the society, and their scruples need never come into play. But such men are rare, and as they died off, their places had to be filled with more sophisticated and ordinary characters, whose one aim was to increase the power and resources of the society. Hence the condescension to heathen rites in Hindustan and China. The first successes of the Indian mission were entirely amongst the lowest class; but when Robert de Nobili, to win the

Brahmans, adopted their insignia and mode of life in 1605—a step sanctioned by Gregory XV. in 1623—the fathers who followed his example pushed the new caste-feeling so far as absolutely to refuse the ministrations and sacraments of religion to the pariahs, lest the Brahman converts should take offence,—an attempt which was reported to Rome by Norbert, a Capuchin, and by the bishop of Rosalia, and was vainly censured in the pontifical briefs of Innocent X. in 1645, Clement IX. in 1669, Clement XII. in 1734 and 1739, and Benedict XIV. in 1745. The Chinese rites, assailed with equal unsuccess by one pope after another, were not finally put down until 1744, by a bull of Benedict XIV. For Japan, where their side of the story is that best known, we have a remarkable letter, printed by Wadding, addressed to Paul V. by Soletto, a Franciscan missionary, who was martyred in 1624, in which he complains to the pope that the Jesuits had systematically postponed the spiritual welfare of the native Christians to their own convenience and advantage, while, as regards the test of martyrdom, no such result had followed on their teaching, but only on that of the other orders who had undertaken missionary work in Japan. Again, even in Paraguay, the most promising of all Jesuit undertakings, the evidence shows that the fathers, though civilizing the Guarani population just sufficiently to make them useful and docile servants, happier, no doubt, than they were before or after, stopped short there, and employed them simply in raising produce to be traded with for the interests of the society, in accordance with a privilege conferred on them by Gregory XIII., licensing them to engage in commerce.

These examples are sufficient to explain the final collapse of so many promising efforts. The individual Jesuit might be, and often was, a hero, saint, and martyr, but the system of which he was a part, and which he was obliged to administer, is fundamentally unsound, and in contravention of inevitable laws of nature, so that his noblest toils were foredoomed to failure, save in so far as they tended to ennoble and perfect himself, and offered a model for others to imitate.

The influence of the society since its revival in Latin Christendom has not been beneficial. It presents the seeming paradox of the strictest and most irreproachable body, amongst the Roman clergy doing nothing to raise the general standard of clerical morals; of that which is collectively the best educated order setting itself to popularize merely emotional and material cults, to the practical neglect and disparagement of more spiritual agencies; of the most intellectual religious teachers deliberately evincing the understanding, and endeavouring to substitute mechanical submission to a word of command for intelligent and spontaneous assent to reasonable argument. And yet in all this they are but carrying out the fatal principles of the original institute. True to the teaching of that remarkable panegyric on the society, the *Imago Primi Seculi Societatis Jesu* (probably written by John Tollenarius in 1640), they have identified the church with their own society, and have considered only what mode of action would make it more easily governed in the same spirit. It is thus for the advantage of such a scheme that laymen should reason as little as possible on questions of theology, that the fathers of the company should hold an acknowledged position of moral and intellectual superiority to the ordinary secular clergy, that all the threads of ecclesiastical authority should be gathered up into one hand, and that one hand in the stronger grasp of the society—a policy modelled exactly on the lines of the concordat of Napoleon I. with Pius VII. Hence the long preparation and elaborate intrigues which issued in the Vatican decrees of papal infallibility and immediate jurisdiction in all dioceses, the ultimate issues of which are still hidden in futurity.

HISTORY.

Such being in outline the constitution and character of the Company of Jesus, it remains to summarize its historical career. Don Inigo de Loyola, a nobleman of Guipuzcoa, brave and accomplished, but unversed in letters, was severely wounded at the siege of Pamplona in 1521, when he was thirty years of age. Sent to his father's castle by his chivalrous captors, he was induced by the reading of some pious books, intended to divert the tedium of illness, to devote himself to a religious life. Quitting his home, he betook himself first to Montserrat and thence, in the garb of a pilgrim, to Manresa, a small town near Barcelona, whence, after serving for a time in the hospital, he withdrew to a cavern close at hand, where, amidst the practice of various austerities, he made the first draft of his famous *Spiritual Exercises*, a work which, often replete with formulae of his society. Thence he proceeded by way of Barcelona to sail for Italy, and, after visiting Rome and Venice, he made a pilgrimage to Jerusalem, intending if possible to establish a missionary society there for the conversion of the Mahometans. Compelled to withdraw by the provincial of the Franciscans, who feared a collision with the Turkish authorities, Loyola returned to Spain, and at thirty-three years of age attended school at Barcelona to acquire the rudiments of Latin, and during ten years there between his studies and such missionary work as was possible for him. He then removed in 1526 to the newly founded university of Alcalá, where he first began to gather round him a little band of fellow-workers, holding religious conferences amongst the students, and giving private instruction besides to various townsfolk. This conduct drew on him the suspicions of the Inquisition, but after a short imprisonment he was released, and migrated to Salamanca, whither two of his friends had preceded him. Here he was again thrown into prison on suspicion of heresy, and formed the plan of going to Paris on recovering his liberty, as a place where he could have more freedom of action, superior teaching, and a greater likelihood of finding able recruits in so central and populous a city for the society he was preparing to found. He reached Paris in 1528, and entered at the college of St Barbara in the university. Not until his sixth year of residence did he attempt the regular organization of the most promising of the young men whom he drew around him. It was in July 1534 that he opened his plans to them, for starting a missionary society to work in the Holy Land, and the actual vows binding the new companions to one another, and to the sort of life they contemplated, or to direct service of the pope, should that prove impracticable, were taken in the crypt of Notre Dame de Montmartre on August 15, 1534, by Ignatius Loyola himself; Peter Faber or Le Fèvre, a Savoyard, Francis Xavier, Diego Laynez, Alfonso Salmeron, Nicolas Alfonso de Bobadilla, Spaniards; and Simon Rodriguez, a Portuguese. With his usual practical foresight, Loyola postponed the execution of their scheme till January 25, 1537, and provided for its possible modification or abandonment. Three more disciples specially joined the infant society, Jean Codure, Claude le Joy, and Paschase Brouet. In March 1535 Loyola quitted Paris, committing his society to Faber, the eldest, and betook himself to Spain, where he remained a few months, and then proceeded to Venice, whence he wrote to summon his companions to join him. They left Paris on November 15, 1536, and reached Venice on January 6, 1537, where their leader had already gained three fresh recruits, Ioseph and the two brothers D'Eguia. Remaining in Venice himself for prudential reasons, he sent all the others to Rome as a solist from Paul III. leave to go as missionaries to Jerusalem. They were aided in their application by Pedro Ortiz, the emperor's envoy, and readily obtained the desired permission, with further licence to be ordained priests by any bishop, on being duly qualified.

Returning to Venice, they were ordained on St John Baptist's Day, 1537, along with Loyola himself, by Vincenzo (or Antonio) Nigamanti, bishop of Arba. A war which broke out between Turkey and Venice made the intended journey to Palestine impracticable; and accordingly Loyola, Faber, and Laynez betook themselves to Rome, while the others dispersed themselves through the chief university towns of North Italy, and began their work as home missionary preachers; and it was immediately before they separated on this occasion, at Vienna in November 1537, that Loyola announced his intention that their fellowship should henceforward be known as the "Company of Jesus," and that, abandoning their original plan of a purely Oriental mission, they should offer themselves to the pope as a special militia. It may be here remarked that the more popular name "Jesuits" seems to have been first used by Calvin, and it appears also in the register of the parliament of Paris as early as 1552, while the enemies of the society in Spain actually spoke of its members as "Inigistas," after the name of its founder.

On their arrival at Rome, the three Jesuits were favourably received by Paul III., who at once appointed Faber to the chair of Biblical exegesis, and Laynez to that of scholastic theology, in the college of Sapienza. But they encountered much opposition, and were even charged with heresy, nay, when this accusation had been disposed of, there still were difficulties in the way of starting any

new order. Despite the approval of Contarini, and the goodwill of the pope himself (who is said to have exclaimed, on perusing Loyola's papers, "The finger of God is here"), there was a strong and general feeling that the monastic system had broken down utterly, and could not be wisely developed further. Cardinal Guldooni, one of a committee of three appointed to examine the draft constitutions, was known to advocate the abolition of all existing orders save four, which were to be remodelled and put under strict control. And it was that very year, 1538, that a committee of cardinals, consisting of Reginaldo Polo, Contarini, Sadoleto, Caraffa (afterwards Paul IV.), Fregoso, Aleander, and Badia, had just reported to the pope that the conventual orders were such a scandal to Christendom that they should be all abolished—"abolendos putandos omnes." Not only so, but, when greater strictness of rule and of enclosure seemed the most needed reforms in communities which had become too secular in tone, the proposal of Loyola to make it a first principle that the members of his new institute should mix freely with the world, and be as little marked off as possible externally from secular life and usages, ran counter to all tradition and prejudice, save that Caraffa's then recent order of Theatines, from which Loyola copied some details, had taken some steps in the same direction.

Loyola and his companions, however, had little doubt of ultimate success, and so bound themselves, on April 15, 1539, to obey any superior chosen from amongst their body, and agreed on May 17 to accept of other rules, the most important of which was the vow of special allegiance to the pope for mission purposes, to be taken by all members of the society. But Guldooni, on a careful study of the papers, changed his mind,—partly, it is supposed, because of the strong interest in the new scheme exhibited by the king of Portugal, who instructed his ambassador to press it on the pope, and to ask Loyola himself for some priests of his society for mission work in Portugal and its Indian possessions, and accordingly Xavier and Rodriguez were sent to the king in March 1540. And on September 27, 1540, the bull *Regimini militantis ecclesie* was published, confirming the new order, but limiting its members to sixty, a restriction which was removed by a later bull in March 1543. In the Latin translation of the original draft constitutions, approved by the pope, the word *compensa* was represented by *societas*, though *colours* or some such military term would have more exactly reproduced the founder's idea, and thus the Jesuit body is known indifferently as "company" or "society," while the title "Order" is never officially given to it. This title was finally settled by Gregory XIV. in a bull of June 28, 1591.

On April 7, 1541, Loyola was unanimously chosen superior. His refusal of this post was overruled, so he entered on his new office on April 13, and on April 15 the newly constituted society took its formal corporate vows as a religious order in the church of St. Paul-without-the-Walls. The general entered on his duties by holding public catechisms in St. Martin in Strada for eight and forty days, a precedent followed over and over by his successors in office. Scarcely was the society launched when its members dispersed in various directions to their new tasks. Salmeron and Brouet were sent, clothed with the powers of papal legates, on a secret mission to Ireland, to encourage the native clergy and people in resistance to the religious changes introduced by Henry VIII.; Bobadilla went to Naples; Faber, first to the diet of Worms, and then to Spain; Laynez and Le Jay to Germany, while their general busied himself in founding the convent of St. Martha at Rome for female penitents, and that of St. Catherine for unprotected young women, as also in perfecting the original draft of the constitutions, a task he did not finish till 1550. Success crowned these first efforts, and the earliest college of the society was founded at Coimbra in 1542 by King John III. of Portugal, who secured the appointment of Simon Rodriguez as its rector. It was designated as a training-school to feed the Indian mission, of which Francis Xavier had already taken the oversight, while a seminary at Goa was the second institution founded out of Rome in connexion with the society. In Spain, national pride in the founder aided their cause almost as much as royal patronage in Portugal, and the new house of the society after Goa was opened at Gandia under the protection of its duke, Francis Borgia; in Germany they were eagerly welcomed as the only persons able to meet the Lutherans on equal terms; and only in France, of the countries still belonging to the Roman communion, was their advance checked, owing to political distrust of their Spanish origin, together with the hostility of the Sorbonne and the bishop of Paris. However, after many difficulties, they succeeded in getting a footing through the help of Duprat, bishop of Clermont, who founded a college for them in 1545 in the town of Billon, besides making over to them his house at Paris, the Hôtel de Clermont, which became the nucleus of the afterwards famous college of Louis-le-Grand, while a formal legalization was granted to them by the states-general at Poissy in 1561.

In Rome, Paul III.'s favour did not lessen. He bestowed on them the church of St. Andrea, where now Cardinal Alessandro Farnese's stately erection, the Gesù, stands, and conferred on them at the same time the more valuable privilege of altering their own statutes,

besides two others procured in 1548, which Loyola had still more at heart, as touching the very essence of his institute, namely, exemption from ecclesiastical offices and dignities, and from the task of acting as directors and confessors to convents of nuns. The former of these measures effectually stopped any drain of the best members away from the society, and limited their hopes within its bounds, by putting them more fully at the general's disposal, especially as it was provided that the final vows could not be annulled, and that only the joint action of the general and the pope could dismiss a professed member from the society. The regulation as to convents seems due partly to a desire to avoid the worry and expenditure of time involved in the discharge of such offices, and partly to a conviction that penitents of the kind would be of no effectual use to the society; whereas Loyola, against the wishes of several of his companions, laid much stress on the duty of accepting the post of confessor to kings, queens, and women of high rank, when opportunity presented itself. And the year 1548 is notable in the annals of the society as that in which it embarked on its great educational career, especially by the annexation of free day-schools to all its colleges.

The council of Trent did much to increase the reputation of the new society, for the pope chose three of its members, Laynez, Faber, and Salmeron, to act as his theologians in that assembly, and they had no little influence in framing its dogmatic definitions and decrees. In 1548 the company received a valuable recruit in the person of Francis Borgia, duke of Gandia, afterwards third general, while two important events marked 1550,—the foundation of the Collegio Romano, and a fresh confirmation of the society by pope Julius III. The German college, for the children of poor nobles, was founded in 1552, and in the same year Loyola firmly settled the discipline of the society by putting down with promptness and severity some attempts at independent action on the part of Rodriguez at Coimbra, while 1553 saw the despatch of a mission to Abyssinia, and the first quarrel of the society with the pope, who thought that the Spanish Jesuits were taking part with the emperor against the Holy See, but was reconciled by the good offices of Ferdinand, king of the Romans. Paul IV. (whose election at first alarmed the Jesuits, for they had found him not very friendly as Cardinal Caraffa) proved as favourable to them as his predecessors; and, when Ignatius Loyola died in 1566 under his pontificate, the society already counted forty-five professed fathers and two thousand auxiliary members, distributed over twelve provinces, with more than a hundred colleges and houses. After two years' interregnum, Laynez, who had acted as rector in the vacancy, was elected general in 1568, and was successful in a struggle with the pope, who desired to enforce the recitation of the breviary on the society, and to limit the tenure of the generalship to a term of three years, but could effect neither object. Laynez also succeeded in increasing further the already enormous powers of the general by adding these four clauses to the constitutions:—that the general alone can make contracts binding the society; that he can authoritatively gloss and interpret the rules and laws, can enact new or repeal old laws, and may have prison for the incarceration of refractory members. He took a leading part in the colloquy of Poissy in 1561 between the Catholics and Huguenots, and obtained, as already said, a legal footing from the states-general for colleges of the society in France. He died in 1564, leaving the society increased to eighteen provinces, with a hundred and thirty colleges, and was succeeded by Francis Borgia. It was during his generalship that the greatest favour yet vouchsafed the company was bestowed by Pius V., who not only confirmed by bull all former privileges, and extended to it further every privilege that had been or might afterwards be granted to any order with vows of poverty, but also decreed that these letters should at no time be capable of being revoked, limited, or derogated from by the Holy See, nor be included within any revocation of similar or dissimilar privileges, but be for ever excepted therefrom. It was a trifling set-off to such a grant that the pope in 1567 again enjoined the fathers to recite the canonical hours in choir, and to admit only the professed to priest's orders, especially as Gregory XIII. rescinded both these injunctions in 1573; and indeed, as regards the hours, all that Pius V. was able to obtain was the nominal concession that the breviary should be recited in the professed houses only, and that not of necessity by more than two persons at a time. Eberhard Mercurian, a Fleming, succeeded Borgia in 1572 (being forced on the company by the pope, in preference to Polanco, Loyola's secretary and then vicar-general, who was rejected partly as a Spaniard, and still more because he was a "New Christian" of Jewish origin, and therefore objected to in Spain itself), and was in turn followed by Claudio Acquaviva, an able and strong-willed man, who sat from 1581 to 1615, a time almost exactly coinciding with the title of the great and successful counter-Reformation movement, chiefly due to the Jesuits, which had begun under Borgia. It was, however, during his generalship that the company's evil reputation began to eclipse its good report, that they first had the pope their avowed enemy, and that they were driven from England (whither they had come chiefly from the seminary founded at Douay by Cardinal Allen in 1566),

once in 1581, and again in 1601, as conspirators against the life of Queen Elizabeth, and later again for their share in the Gunpowder Plot; from France as accomplices in the attempt of Châtel to assassinate Henry IV.; and from Antwerp as having resisted the pacification of Ghent. It is true that the edict of the parliament of Paris in 1594, which banished them from France, was revoked in 1603, by desire of Henry IV., who permitted them to return under conditions; and thus fact has been much relied on by Jesuit writers in proof of their innocence of all complicity in Châtel's plot. But as Sully has recorded, Henry declared his only motive to be the expediency of not driving them into a corner, and so inducing them to murder him through despair or revenge, and that his only hope of tranquillity lay in appeasing them, his conduct does not tell much in their favour.

It was also during Acquaviva's generalship that Philip II. of Spain complained bitterly of the company to Pope Sixtus V., and encouraged him in those plans of reform which were cut short by his death in 1590, and also that the long-protracted discussions on grace, wherein the Dominicans contended against the Jesuits, were carried on at Rome, with little practical result, by the Congregation *De Auxiliis*, which began to sit in 1593, and continued till 1607. He saw too the expulsion of the Jesuits from Venice in 1606 for siding with Paul V. when he placed the republic under an interdict, but did not live to see their recall, which took place at the intercession of Louis XIV. in 1657. But the concessions made to the company by Gregory XIV., successor of Sixtus V., during his short reign of twelve months, almost seemed to compensate for all these troubles; for he not only confirmed all existing privileges, but conferred also that of being able to expel members of the society without any form of trial, or even documentary procedure, besides denouncing excommunication against every one save the pope or his legates who directly or indirectly infringed the constitutions of the society, or attempted to bring about any change therein.

Under Vitelleschi, Acquaviva's successor, the first centenary of the society was held on September 25, 1589, the hundredth anniversary of the verbal approbation given to the draft constitutions by Paul III., and there were then thirty-six provinces, with eight hundred houses, containing fifteen thousand Jesuits. It was in the following year that the great controversy which raged for a century in the Latin Church broke out by the posthumous publication of the *Augustinus* of Cornelius Jansen, bishop of Ypres, in which the Jesuits took the leading part, and finally secured the victory for their teaching throughout the Roman obedience. It was in this same year 1640 that the great mark of distinction was conferred on Olivarez, prime minister of Philip IV. of Spain, they powerfully aided the revolution which placed the duke of Braganza on the throne of Portugal, and their services were rewarded with a practical control of ecclesiastical and almost of civil affairs in that kingdom, which lasted for more than a hundred years.

The society also gained ground steadily in France, for, though held in check during Richelieu's life, and little more favoured by Mazarin, yet from the moment Louis XIV. assumed the reins of government, their star was in the ascendant, and Jesuit confessors, the most celebrated of whom were La Chaise and Letellier, guided the policy of the king, not hesitating to take his side in his quarrel with the Holy See, which nearly resulted in a schism, nor to sign the Gallican articles. How their hostility to the Huguenots forced on the revocation of the Edict of Nantes in 1685, and their war against Jansenism did not cease till the very walls of Port Royal were demolished in 1710, even to the abbey church itself, and the bodies of the holy great mark of distinction was conferred on Olivarez, prime minister of Philip IV. of Spain, they powerfully aided the revolution which placed the duke of Braganza on the throne of Portugal, and their services were rewarded with a practical control of ecclesiastical and almost of civil affairs in that kingdom, which lasted for more than a hundred years.

But, while this gaining power in one direction, the company was losing it in others. The Japanese mission had vanished in blood by 1661, and, though many Jesuit fathers and their converts died bravely as martyrs for the faith, yet it is impossible to acquit them of a large share in the causes of that overthrow. And it was about this same period that the grave scandal of the Chinese and Malabar rites, already referred to, began to attract attention in Europe, and to make thinking men ask seriously whether the Jesuit missionaries taught anything which could be fairly called Christianity at all. When it is remembered, too, that they decided in a council at Lima that it was inexpedient to impose any act of Christian devotion except baptism on their South American converts, without the greatest precautions, on the ground of intellectual difficulties, it is not wonderful that this doubt was not satisfactorily cleared up, notably in face of the charges brought against the society by Bernar-

di Acquaviva saw the gradual secularization of tone by the flocking in of recruits of rank and wealth, desirous to share in the glories and influence of the company, but not well adapted to increase them, and too readily admitted on merely temporal grounds, while the old strict discipline was relaxed, as the professed fathers gradually encroached on the general's authority, till they went the length, in 1661, of appointing a vice-general with powers which practically superseded those of the general, Goswin Nickel, whom they did not think it expedient to depose formally. And, though the political weight of the company continued to increase in the cabinets of Europe, yet it was being steadily weakened internally. They abandoned, too, the system of free education, which had won them so much influence and honour; by attaching themselves exclusively to the interests of courts, they lost favour with the middle and lower classes; and, above all, their monopoly of power in the colleges in France, with the fatal use they had made of it, drew down the bitterest hostility upon them. It was indeed to their credit that the Encyclopedists attacked them as the foremost representatives of Christianity, but they are accountable in no small degree for the unfavourable opinion of the nature and merits of Christianity itself which their opponents entertained. But that part of the policy of the company which proved most fatal to it, and served as the pretext of the attacks before which it fell, was its activity, wealth, and importance as a great trading firm, with branches and houses scattered over the richest, most powerful countries in the world. Its founder, with a wise instinct, had forbidden the accumulation of wealth; its own constitutions, as revised in the eighty-fourth decree of the sixth general congregation, had forbidden all pursuits of a commercial nature, as also had various popes, rescinding the decree of Gregory XIII.; but nevertheless, the trade went on unceasingly. The first mutterings of the storm which was soon to break were heard in a severe brief issued in 1741 by Benedict XIV., the most learned and able of the later popes, wherein he denounced the Jesuits as "disobedient, contumacious, crafty, and reprobate persons," and enacted many stringent regulations for their better government; and this was followed up by two bulls, *Ex quo singulari* in 1742, and *Omnium sollicitudinem* in 1744, striking at their continued insubordination in the matter of the Chinese rites, which, however, did not save them from an edict of banishment from China itself in 1753, and the last of them disappeared thence in 1774.

The first serious attack came from a country where they had been long dominant. In 1753 Spain and Portugal exchanged certain American provinces with each other, which involved a transfer of sovereign rights over Paraguay, but it was provided that the populations should severally migrate also, that the subjects of each crown might remain the same as before. The inhabitants of this 'reductions,' whom the Jesuits had trained in the use of European arms and discipline, rose in revolt, and attacked the troops and authorities. Their previous docility, and their entire submission to the Jesuit missionaries, left no doubt possible as to the source of their rebellion, though direct proof was, as usual, lacking, and the matter was not soon forgotten. In 1757 Carrillo, marquis of Pombal, prime minister of Joseph I. of Portugal, dismissed the three Jesuit chaplains of the king, and named three secular priests in their stead. He next complained to Benedict XIV. that the trading operations of the society hampered the commercial prosperity of the nation, and asked for remedial measures. The pope granted a visitation of the society, and committed it to Cardinal Saldanha, a close intimate of Pombal's. He issued a severe decree against the Jesuits, and ordered the confiscation of all their movable property. But at this juncture Benedict XIV. died, and was succeeded, much as had happened on several previous occasions, by a pope strongly in favour of the Jesuits, Cardinal Rezzonco, who took the title of Clement XIII. Pombal, finding that no help was to be expected from this quarter, adopted other means. The king was fled at and wounded on returning from an assassination with his mistress, the marchioness of Tavora, September 8, 1758. The duke of Aveiro, the marquis of Tavora, and other persons of high rank were tried and executed for conspiracy, while some of the Jesuits, who had typically been in communion with them, were charged, on evidence whose value there are no certain means of testing, but which seems very doubtful, with complicity in the attempted assassination. Pombal charged the whole society with its guilt, and, unwilling to await the dubious issue of an application he had made to the pope for licence to try them in the civil courts, where they were exempt, issued a decree on September 1, 1759, ordering their immediate deportation from Portugal and all its dependencies, and their suppression by the bishops in the schools and universities. Those in Portugal were at once shipped to Italy, and such as were in the colonies expelled speedily after. In June, Madame de Pompadour was their enemy,—it is said, because they endeavoured to make her break off her connexion with Louis XV., and refused her absolution on any other terms; but the immediate cause of their ruin was the bankruptcy of F. Lavallete, the Jesuit administrator of Martinique, a daring speculator, who failed for 2,400,000 francs, and ruined some French commercial houses of note. Ricci, then general of the Jesuits, repudiated the debt,

alleging lack of authority on Laval's part to pledge the credit of the society, and was sued by the creditors. Losing his cause, he appealed to the parliament of Paris, and it, to decide the issue raised by Rice, required the constitutions of the Jesuits to be produced in evidence, and affirmed the judgment of the courts below. But the publicity given to a document scarcely known full then (indeed the first authentic edition of the *Constitutions* is that of Prague in 1757) raised the utmost indignation against the company. A royal commission, appointed by the Duke of Choiseul to examine the constitutions, convoked a private assembly of fifty-one archbishops and bishops under the presidency of Cardinal de Luynes, all of whom except six voted that the unlimited authority of the general was incompatible with the laws of France, and that the appointment of a resident vicar, subject to those laws, was the only solution of the question fair on all sides. Rice replied with the historical answer, "Sunt ut sunt, aut non sunt"; and after some further delay, during which much interest was exerted in their favour, the Jesuits were suppressed by an edict in November 1764, but suffered to remain on the footing of secular priests, a grace withdrawn in 1767, when they were expelled from the kingdom. In the very same year, Charles III. of Spain, a monarch known for personal devoutness, convinced, on evidence not now forthcoming, that the Jesuits were plotting against his authority, prepared, through his minister D'Aranda, a decree suppressing the society in every part of his dominions. Secular distinctions were sent to every Spanish colony, to be opened on the same day, April 3, 1767, when the measure was to take effect in Spain itself, and the expulsion was relentlessly carried out, nearly six thousand priests being deported from Spain alone, and sent to the Italian coast, whence, however, they were repelled by the orders of the pope and Ricci himself, finding a refuge at Corte in Corsica, after some months' suffering in overcrowded vessels at sea. The general's object may probably have been to accentuate the harshness with which the fathers had been treated, and so to increase public sympathy, but the actual result of his policy was blame for the cruelty with which he enhanced their misfortunes, for the poverty of Corsica made even a bare subsistence scarcely procurable for them there. The Bourbon courts of Naples and Parma followed the example of France and Spain, and Clement XIII. retorted with a bull launched at the weakest adversary, and declaring the rank and title of the duke of Parma forfeit. The Bourbon sovereigns threatened to make war on the pope in return (France, indeed, seizing on the county of Avignon), and a joint note demanding a retraction, and the abolition of the society, was presented by the French ambassador at Rome on December 10, 1768, in the name of France, Spain, and the Two Sicilies. The pope, a man of eighty-two, died of apoplexy, brought on by the shock, early in 1769. Cardinal Lorenzo Ganganelli, a Franciscan, was chosen to succeed him, and took the name of Clement XIV. He endeavoured to avert the decision forced upon him, but, as Portugal joined the Bourbon league, and Maria Theresia with her son the emperor Joseph II. ceased to protect the Jesuits, their remaining only the petty kingdom of Saluzzo in their favour, though the fact of Choiseul in France raised the hopes of the society for a time. The pope began with some preliminary measures, permitting first the renewal of lawsuits against the society, which had been suspended by papal authority, and which, indeed, had in no case been ever successful at Rome. He then closed the Collegio Romano, on the plea of its insolvency, seized on the houses at Frascati and Tivoli, and broke up the establishments in Bologna and the Legations at large. Finally, on July 21, 1773, the famous brief *Dominus ac Redemptor* appeared, suppressing the Society of Jesus. This remarkable document opens by citing a long series of precedents for the suppression of religious orders by the Holy See, amongst which occurs the ill-famed instance of the Templars. It then briefly sketches the objects and history of the Jesuits themselves. It speaks of their delinquency of their own constitution, expressly revived by Paul V., forbidding them to meddle in politics; of the great ruin to souls caused by their quarrels with local ordinaries and the other religious orders, their conformity to heathen usages in the East, and the disturbances, resulting in persecutions of the church, which they had stirred up even in Catholic countries, so that several popes had been obliged to punish them. Seeing then that the Catholic sovereigns had been forced to expel them, that many bishops and other eminent persons demanded their extinction, and that the society had ceased to fulfil the intention of its institute, the pope declares it necessary for the peace of the church that it should be suppressed, extinguished, abolished, and abrogated for ever, with all its rites, houses, colleges, schools, and hospitals; transfers all the authority of its general or officers to the local ordinaries; forbids the reception of any more novices, directing that such as were actually in probation should be dismissed; and declaring that profession in the society should not serve as a title to holy orders. Priests of the society are given the option of either joining other orders or remaining as secular clergy, under obedience to the ordinaries, who are empowered to grant or withhold from them licences to hear confessions. Such of the fathers as are engaged in the work of education are permitted to continue, on condition of abstaining from lax and question-

able doctrines, apt to cause strife and trouble. The question of missions is reserved, and the relaxations granted to the society in such matters as fasting, reciting the hours, and reading heretical books, are withdrawn, while the brief ends with clauses carefully drawn to bar any legal exceptions that might be taken against its full validity and obligation. It has been necessary to cite these heads of the brief, because the apologists of the society allege that no motive influenced the pope save the desire of peace at any price, and that he did not believe in the culpability of the fathers. The categorical charges made in the document, and that in the most solemn fashion, rebut this plea. The pope followed up this brief by appointing a congregation of cardinals to take possession of the temporalities of the society, and armed it with summary powers against all who should attempt to retain or conceal any of the property. He also threw Lorenzo Ricci, the general, into prison in the castle of St. Angelo, where he died in 1775, under the pontificate of Pius VI., who, though not unfavourable to the company, and owing his own advancement to it, dared not release him, probably because his continued imprisonment was made a condition by the powers who enjoyed a right of veto in papal elections. In September 1774 Clement XIV. died after much suffering, and the question has been hotly debated ever since whether poison administered by the Jesuits was the cause of his death. It is impossible to decide the doubt, as the opinions and evidence on each side are equally balanced. On the one hand, Salicetti, the pope's physician, denied that the body showed signs of poisoning, and Tanucci, Neapolitan ambassador at Rome, who had a large share in procuring the brief of suppression, entirely acquits the Jesuits, while F. Theiner, no friend to the company, does the like. On the other hand, Scipio de Ricci, bishop of Pistoia, nephew and heir of the unfortunate general, distinctly charges the Jesuits with the crime, as also does Cardinal de Bernis; and the report by the Spanish minister to the court of Madrid, printed by De Potter in his *Vie et Mémoires de Séipon de Ricci*, vol. iii. pp. 151-74, contains the noteworthy fact that the date of the pope's death was predicted beforehand, notably in a statement made by the vicar-general of Padua to the secretary of the congregation for Jesuit affairs, that several members of the company, believing him to be one of their friends, told him that the pope would die before the end of September.

At the date of this suppression, the company had 41 provinces and 22,589 members, of whom 11,295 were priests. Far from submitting to the papal brief, the Jesuits, after some hesitation, attempted at direct resistance, withdrew into the territories of the non-Roman-Catholic sovereigns of Russia and Prussia, Frederick II. and Catherine II., both of them frothkeepers, who became their active friends and protectors; and the fathers alleged as a principle, in so far as their theology is concerned, that no papal bull is binding in a state whose sovereign has not approved and authorized its publication and execution. Russia formed the headquarters of the company; and two forged briefs were speedily circulated, being dated June 9 and June 19, 1774, denying their establishment in Russia, and implying the repeal of the brief of suppression. But these are contradicted by the tenor of five genuine briefs, all issued in September of that year to the archbishop of Gnesen, and making certain assurances to the Jesuits, on condition of their complete obedience to the injunctions already laid on them. They also pleaded a verbal approbation by Pius VI., technically known as an *Oratioem esse vocis*, but no proof of either its existence or its validity is forthcoming.

Their defeat by three Poles successively as generals, taking, however, only the title of vicars, till on March 7, 1801, Pius VII. granted them liberty to reconstitute themselves in North Russia, and permitted Karen, then vicar, to exercise full authority as general. On July 80, 1804, a similar brief restored the Jesuits in the Two Sicilies, at the express desire of Ferdinand IV., the pope thus anticipating the further action of 1814, when, by the brief *Sollicitudo omnium Ecclesiarum*, he revoked the action of Clement XIV., and formally restored the society to corporate legal existence, yet not only omitted any censure of his predecessor's conduct, but all mention of the Jesuits from the heavy charges in the brief *Dominus ac Redemptor*. In France, even after their expulsion in 1765, they had maintained a precarious footing in the country under the partial disguise and names of "Fathers of the Faith," or "Clerks of the Sacred Heart," but were obliged by Napoleon I. to retire in 1804. They reappeared under their true name in 1814, and obtained formal licence in 1822, but became the objects of so much hostility that Charles X. deprived them by ordinance of the right of instruction, and obliged all applicants for licences as teachers to make oath that they did not belong to any community unrecognized by the laws. They were dispersed again by the revolution of July 1830, but soon reappeared, and, though put to much inconvenience during the latter years of Louis Philippe's reign, notably in 1845, maintained their footing, recovered the right to teach freely after the revolution of 1848, and gradually became the leading educational and ecclesiastical power in France, notably under the second empire, till they were once more expelled

by the Ferry laws of 1880, though they have been quietly returning since the execution of those measures. In Spain they came back with Ferdinand VII., but were expelled at the constitutional rising in 1820, returning in 1828, when the duke of Angoulême's army replaced Ferdinand on his throne; they were driven out once more by Espartero in 1835, and have had no legal position since. In Portugal, ranging themselves on the side of Don Miguel, they fell with his cause, and were exiled in 1834. Russia, which had been their warmest patron, drove them from St Petersburg and Moscow in 1813, and from the whole empire in 1820, mainly on the plea of attempted proselytizing in the imperial army. Holland drove them out in 1818, and, by giving them thus a valid excuse for aiding the Belgian revolution of 1830, secured them the strong position they have ever since held in Belgium. They were expelled from Switzerland in 1847-48 for the part they had taken in exciting the war of the Sonderbund. In South Germany, inclusive of Austria and Bavaria, their annals since their restoration have been uneventful; but in North Germany, owing to the footing Frederick II had given them in Prussia, they became very powerful, especially in the Rhine provinces, and, gradually moulding the younger generation of clergy after the close of the War of Liberation, succeeded in spreading Ultramontane views amongst them, and so leading up to the difficulties with the civil Government which issued in the Falk laws, and their own expulsion by decree of the German parliament, June 19, 1872. In Great Britain, whither they began to struggle over during the revolutionary troubles at the close of the last century, and where, practically unaffected by the clause directed against them in the Emancipation Act of 1829, their chief settlement has been at Stonyhurst in Lancashire, an estate conferred on them by Mr Weld in 1795, they have been unmoled; but there has been little affinity to the order in the British temperament, and the English province has consequently never risen to numerical or intellectual importance in the society. In Rome itself, its progress after the restoration was at first slow, and it was not till the reign of Leo XII. (1829-30) that it recovered its place as the chief educational body there. It advanced steadily under Gregory XVI., and, though it was at first shunned by Pius IX., it secured his entire confidence after his return from Gnets in 1849, and obtained from him a special brief erecting the staff of its literary journal, the *Civiltà Cattolica*, into a perpetual college under the general of the Jesuits, for the purpose of teaching and propagating the faith in its pages. How, with this pope's support throughout his long reign, and the gradual falling of nearly all the sees of Latin Christendom with bishops of their own election, they contrived to stamp out the last remains of independence everywhere, and to crown the Ultramontane triumph with the Vatican decrees, is matter of familiar knowledge.

The society has been ruled by twenty-two generals and four vicars from its foundation to the present day; and the most notable fact to

signalize with reference to them is that, of all the various nationalities represented in the company, France, its original cradle, has never given it a head, while Spain, Italy, Holland, Belgium, Germany, and Poland were all represented. The numbers of the society at present are not accurately known, but are estimated at about 6000 in all parts of the world.

The generals of the Jesuits have been as follows:—

1. Inigo de Loyola (Spanish).....	1541-1556
2. Diego Laynez (Spanish).....	1558-1565
3. Francisco Borgia (Spanish).....	1565-1572
4. Eberhard Mercator (Belgian).....	1573-1580
5. Claudio Acquaviva (Neapolitan).....	1581-1615
6. Matteo Vilescio (Roman).....	1615-1645
7. Vincenzo Caraffa (Neapolitan).....	1645-1649
8. Francesco Piccolomini (Florentine).....	1649-1651
9. Alessandro Gottofredi (Roman).....	1651-1652
10. Goswin Nickel (German).....	1652-1664
11. Giovanni Paolo Oliva (Genoese) vice-general and conductor, 1661; general.....	1664-1681
12. Charles von Noyelle (Belgian).....	1682-1686
13. Tiso Gonzalez (Spanish).....	1687-1705
14. Michele Angelo Lambertini (Modenese).....	1706-1780
15. Franz Ratz (Bohemian).....	1780-1750
16. Ignazio Visconti (Milanese).....	1751-1755
17. Alessandro Centronio (Genoese).....	1755-1757
18. Lorenzo Ricci (Florentine).....	1758-1775
a. Stanislaus Czerniewicz (Pole), vicar-general.....	1782-1785
b. Gabriel Lenkiewicz (Pole).....	1785-1798
c. Francis Xavier Karw (Pole), general in Russia, 7th March 1801.....	1799-1802
d. Gabriel Gruber (German).....	1802-1805
19. Thaddeus Brzozowski (Pole).....	1805-1820
20. Aloisio Fortis (Venetian).....	1820-1829
21. Johannes Roothaan (Dutchman).....	1829-1853
22. Peter Johannes Beckx (Belgian).....	1853

The bibliography of Jesuitism is of enormous extent, and it is impracticable to give more than a few of the most important works. They are as follows:—*Institutum Societatis Jesu*, 7 vols. Argentan, 1830-38. Orléans, *Statut Societatis Jesu*, Antwerp, 1820. *Disputa Prima Sacra Societatis Jesu*, Antwerp, 1619; Nuremberg, 1614. *Teatro de San Ignacio de Loyola*, 9 vols. fol. Madrid, 1616-1704; Genoa, 1617. *Life of St Ignatius of Loyola*, London, 1872. Baeke, *Bibliographie des Écrivains de la Compagnie de Jésus*, 7 vols. Paris, 1864-65; Grützmacher, *Historie der Jesuiten*, 2 vols. Paris, 1858-60. Stewart, *Notes, Ignatius Loyola and the Early Years*, London, 1871. Wolff, *Alteingeschichte der Jesuiten*, 4 vols. Zurich, 1788-93; *Palaeography of the Society of Jesus in the New World*, and *The Jesuits in North America*, Boston, 1868; *Lettres Diffamées et Contre-diffamées, écrites des Missions Étrangères, avec les Années de la Propagation de la Foi*, 4 vols. Lyons, 1810-15; Saint-Ilmer, *Histoire de la Compagnie des Jésuites en 1771*, Paris, 1841; *Revue de la Compagnie des Jésuites*, 9 vols. Berlin, 1838; and Günwirth, *The Jesuits, their Constitution and Teaching*, London, 1876. (R. F. L.)

JESUS CHRIST

THE Christian religion, besides its natural and spiritual elements, has also an historical element. It believes that, in accordance with a Divine purpose, prophesied at the very dawn of human life, God was manifest in the flesh in the man Christ Jesus. The actual life of Jesus on earth is but the central part of a scheme which, in the belief of Christians, extends through all the ages. Our present object is merely to furnish a brief sketch of that life as it appears in the full light of history, without entering into the numberless collateral questions which it offers for consideration, a task which in these limits is obviously impossible.

1. The word Jesus is the form assumed in Latin by the Greek *Iesous*, which is the transliterated form of the Hebrew *Yehoshua*, *Jeshua*, or *Joshua*, meaning "Jehovah is salvation." In one or other of its forms the name is found in many passages of the Old Testament. It was not, however, borne by any person who rose to historic eminence between the days of Joshua the son of Nun and the high priest Joshua who was the colleague of Zerubbabel at the return from the exile. The prominent position held by Joshua in the later prophetic books seems to have made the name popular. We find frequent traces of it after the exile.¹ During the Hellenizing period, which excited so deep an indignation among patriotic Jews, many of the

bearers of the name preferred to adopt the purely Greek analogous Jason,² and the name occurs in this form in the New Testament also.³ Later on it became one of the commonest Jewish names which we find in the New Testament,⁴ and again and again in Josephus.⁵ There is some reason for believing that the name of Bar Abbas was also "Jesus," although it may have disappeared from the chief manuscripts, partly from feelings of reverence, partly from the mistaken fancy of Origen that we find no sinner among all those who had borne the name.⁶ But the name, though common, was meant to be deeply significant of the work for which Jesus was born into the world—namely, to save His people from their sins; and for this reason, in the account of the Annunciation, as given by St Luke (i. 31), His mother is expressly bidden to call her babe by this name.⁷

¹ 1 Macc. viii. 17, xii. 10; 2 Macc. ii. 19, iv. 7; Jos., *Ant.*, xii. 10. 6. The Greek Jason was connected with *Idqan*, and the Greek fathers by a play on words—of which traces may be found even in the New Testament (Acts ii. 84, x. 38)—connect the name Jason with the same root (*Basch*, *Denn. Zwang*, iv.).

² Acts xviii. 5; Rom. xvi. 21.

³ Acts xxi. 6, xviii. 5, xviii. 7; Rom. xvi. 21; Col. iv. 11.

⁴ Jos., *Ant.*, xiv. 9, 2, xvii. 13, i. xx. 9, 1; *J. J.*, iii. 9, 7, iv. 8, 9, vi. 5; *Id.*, 22.

⁵ In MS. S. the reading is said to be found in "exceedingly ancient MSS." It is now chiefly found in some cursive MSS., and the Armenian and Syriac versions. See Origin on Matt. xvii. 16.

⁷ In Matt. i. 21 the same command is given to Joseph. For the

¹ Jos., *Ant.* xii. 5, i. and 10, 6, xv. 8; i.; Euseb., *prot.* i. 27, &c.

On the other hand, the word Christ was not originally a name but a title.¹ In the Gospels we scarcely ever read of Christ, but always of "the Christ."² It was only after the resurrection that the title gradually passed into a name, and "Jesus Christ," or later still "Christ Jesus," becomes one designation. The Greek word means "anointed," and is a translation of the Hebrew "Messiah." The coming Deliverer for whom the Jews had yearned for so many centuries was spoken of as the "anointed one," with special reference to the prophecies of Isaiah (lxi. 1) and Daniel (ix. 24-26), which again referred backward to the language of the Psalms (ii. 2, xx. 6, xlv. 7). The anointing of Jesus was the special outpouring of the Holy Spirit upon Him, not only throughout His life (Acts x. 38), but specially at His baptism (John i. 32). Unction was the recognized mode of consecrating any one to the offices of priest (Ex. xxix. 29; Lev. iv. 3) and king (1 Sam. x. 1, xiv. 6); and prophets were supposed to be anointed by God's grace for the fulfilment of their task (Isa. lxi. 1). The Messiah combined in His office the threefold dignity. He was a prophet to reveal (John vi. 14; Matt. xiii. 57; Luke xiii. 33, xiv. 19), a king to reign and to judge (Luke xxiii. 2; Acts xvii. 7; 1 Cor. xv. 24; Rev. xv. 3), and a high priest to offer up the sacrifice of Himself (Heb. ii. 17 and *passim*).

Since these, however, were distinctively Jewish conceptions, it was natural that they should be but little understood by the Greeks and Romans. The word "anointed" conveyed to them no sacred conceptions, and it was restamped (*surfrappé*) by them into accordance with their own notions. They fancied that the real name of the founder of the new religion must be *Chrestus* or "excellent,"³ and they constantly spoke of the Christians as "Christians." Suetonius says that the Jews were expelled from Rome by Claudius because they were raising seditions at the constant instigation of "Chrestus"; and he cared so little to inform himself on the subject that he made no distinction between Jews and Christians, and seems to have imagined that "Chrestus" was some leader of sedition then living at Rome.⁴ On the other hand the Christians in no wise objected to the mistaken designation. "If you call us Christians," said Tertullian, "you bear witness to the name of our master; if you call us 'Christians,' you testify to the blamelessness of our lives."⁵

II. The designation of "the Christ" given to Jesus shows that His followers saw in Him the long-promised Messiah of Judaism; and the rapidity with which the title developed into a name proves the strength and permanence

of this conviction. And this much at least is conceded by all, that Jesus more than fulfilled the conditions for which the Jews had hoped in the Deliverer of whom so many prophets had spoken, and that He fulfilled them in a manner transcendently wider, deeper, and more permanent than even the prophets had fully foreseen. Even the most advanced sceptic cannot deny that by His life and teaching He has altered the entire current of human history, and raised the standard of human morality. He was, says Renan, "the individual who made the species take the greatest step towards the divine."⁶ But as His life was passed and His work accomplished, not in a corner,⁷ but on the open stage and under the full light of a civilized epoch, it becomes a matter of great importance to estimate the value of the sources from which our knowledge of His life is derived. Those sources are (1) heathen, (2) Jewish, and (3) Christian.

1. The knowledge derivable from heathen sources, if much smaller than we could have desired, or *a priori* expected, is not smaller than is fully accounted for in the simple and unsophisticated narratives preserved for us by the evangelists and apostles. They show us that Christianity began from the most humble origin, and was regarded by the whole non-Christian world—alike Jewish and pagan—with unconcealed hatred, largely mingled with a contempt which ultimately passed into terror and exasperation. They faithfully record for us the obscure position, the extreme poverty, the persecuted lives, the unlearned training of the apostles, and the disdain to which they were on all sides subjected. The silence of contemporary Gentile and Jewish writers, which would be otherwise inexplicable, finds its undesigned explanation in the New Testament itself, which never attempts to conceal the contemptuous indignation of the Jewish aristocracy, and the lordly indifference of the higher Gentile authorities.

Accordingly, from heathen writers we do not learn a single *new* fact respecting Jesus Christ, while yet all that they do tell us, even when expressed in language of calumny and abhorrence, proves the historical reality of the facts which the Gospels record. If it be true that Napoleon once asked Herder whether Jesus ever lived at all, such a passing phase of incredulity is so perfectly unreasonable that it has long been abandoned even by the most destructive critics. Whether there ever existed any authentic census tables of Quirinius, or any official report of Pilate to the emperor Tiberius or not,⁸ Tacitus tells us with perfect accuracy that the founder of Christianity had been put to death in the reign of Tiberius by the procurator Pontius Pilate, and that his religion, which Tacitus calls a "deadly superstition," "though crushed for a time, burst forth again, not only throughout Judæa, in which it sprung up, but even in Rome, the common reservoir for all the streams of wickedness and infamy." He further tells us that Nero diverted from himself the odium of the burning of Rome by charging the crime upon the Christians; and, though he implies that their fate was not undeserved because of their universal misanthropy, he yet honestly admits that they were not guilty of this crime of incendiarism, on pretence of which they were subjected to the most awful forms of martyrdom.⁹ It is clear that Tacitus, in common with all his contemporaries, confounded the Christians with the Jews, only regarding them as being Jews whose belief was more than usually abject. How little information could be expected from this eminent historian appears from the credulity with which he accepted

significance of the name see Eodius. xlv. 1, where it is said of Joshua that, "according to his name, he was made great for the saving of the elect of God."

¹ "Non proprium nomen est, sed nomenclatio potestatis et regni," Lactantius, *Div. Inst.*, iv. 7.

² The only exceptions are Matt. i. 1, 18, Mark i. 1, John i. 17 (which are all in the headings and prefaces), and John xvi. 3, where we find "Jesus Christ." The only other passages in which the article is omitted before "Christ" in the Gospels are Mark iv. 41, Luke ii. 11, xiii. 2, John ii. 22. Thus Matt. ii. 4 is "where the Christ should be born"; Matt. xi. 2 is "John hearing in prison the works of the Christ," i.e., Messianic works; and Matt. xxi. 42 is "what think ye of the Messiah?"

³ There is a possible allusion to the similar sound of the two words in 1 Pet. ii. 8, *ὅτι ἡμετέροις ἐσὶ κήποις*.

⁴ The Romans did not fully learn to discriminate Jews from Christians, and to recognize the latter as members of an entirely distinct religion, until the savage attacks upon Christians by the Jewish false Messiah Barabbas, in the reign of Hadrian, 132 A.D.

⁵ *Χριστιανὸν γὰρ εἶνα κατηγοροῦμεθα*, τὸ δὲ χριστὸν πεποιθεμένον ὁ βλαδὺς, Just. Mart., *Apol.*, i. 4; *Ἀβελὰς ἐξ Ἰσραὴλ πεποιθεμένος χριστοῦ ἐκ ἐλπί καὶ λέγοντας*, Clem. Alex., *Strom.*, ii. 4, § 18. *Christiani vero . . . de unctione deducti, sed et cum perperam Christianos pronuntiavit a vobis (nam nec nomen certa est notitia penes vos) de suavitete et benignitate compositum est.* Tert., *Adv. Gentes*, ii., comp. Lactantius, *Div. Inst.*, iv. 7, 5; Jerome on Gal. v. 22.

⁶ *Vie de Jésus*, p. 457.

⁷ Acts xxvi. 26.

⁸ A writing called "the Acts of Pilate" existed in the 2d century (Justin, *Apol.*, i. 35), and long continued to be used in heathen schools to warn boys against the behalf of the Christians (Euseb., *II. E.*, i. 9, ix. 5).

⁹ *Theol. Ann.*, — 84.

the most foolish legends and calumnies about the origin and early history even of the Jews.¹ His contemporary Sætonius evidently held the same opinions. He seems to regard Nero as a public benefactor because he punished the Christians, "a class of men of a strange and pestilent superstition."² In his life of Claudius, as we have already seen, he ignorantly confuses Christ with some Chrestus whom he supposes to have been at that time living at Rome.³ From the younger Pliny, who wrote to the emperor Trajan for advice how to deal with Christians,⁴ we learn the valuable fact that they lived lives confessedly innocent, since he was unable to establish against them any crime beyond that of the belief which, like his contemporaries, he regarded as a perverse and extravagant superstition. We learn also from this celebrated letter that nothing could shake the allegiance of Christians to Christ, and that they were accustomed to meet early in the morning to celebrate Him as God with hymns of praise. Later in the 2d century the scoffer Lucian, in his *Death of Peregrinus*, and his *Philopseudes*, spoke with bitter sneers both of Christ and Christians. He alludes to the fact of the crucifixion of Christ, to His miracles, to the mutual love and help which prevailed among His followers, and their belief in Him as a divine person. Passing over the asserted allusions to Christ by Numenius,⁵ to His parables in Galerius, and to the earthquake at the crucifixion in Philogon,⁶ we come to the "True Word" of Celsus the Platonist, towards the close of the second century. We only know this by the quotations and refutation of Origen, but it furnishes us with indisputable testimony that in his day the facts of the Gospels from first to last were current in the exact form in which we now possess them (see Celsus). Thus, from the scanty notices of heathens even, we can derive a confirmation of the main external facts in the life of Christ:—His miracles, His parables, His crucifixion, His claim to divine honour, the devotion, innocence, heroic constancy, and mutual affection of His followers, and the progressive victories won by His religion in despite of overwhelming opposition alike physical and intellectual.

3. From Jewish writers we can glean similar confirmation of the gospel story. Philo indeed is silent. The legends preserved by Eusebius⁷—that Philo had met St Peter in Rome during his mission to the emperor Caius, and that in his book on the contemplative life he is describing not the life of the Essenes and Therapeutæ, but those of the Christian church in Alexandria founded by St Mark⁸—are valueless. It is extremely probable that Philo had scarcely heard either of Christ or of the Christians.⁹ He died after 40 A.D., but at that period Christianity had hardly emerged into the recognition claimed by prominent historical phenomena. The writings of Philo are valuable, not for any light which they throw on the gospel histories, but for the evidence which they afford of prevalent modes of thought and phraseology, in which some even of the apostles shared. When, however, we turn to Josephus, we find in his writings, as now extant, no less than three allusions to events in the gospel history. It cannot be decided with certainty whether two of these passages are genuine as they now stand, but modern opinion tends to the view that in each of the actual allusions to Jesus there is a genuine basis with later Christian interpolations. The passage in which

he speaks of the preaching and execution of John the Baptist is not disputed,¹⁰ and it is very important as showing that Josephus must have been perfectly well acquainted with the facts of Christ's life, and that he has passed them over, in his usual unscrupulous way, with a reticence due only to dislike or perplexity. For in speaking of St John's preaching he deliberately, and it must be feared dishonestly, excludes the Messianic element from which it derived its main power and significance. In another passage he mentions with strong disapproval the judicial murder by the younger Annas of James the Just, "the brother of Jesus, called the Christ."¹¹ The passage was early tampered with by Christian interpolators who wished to make it a more emphatic testimony in favour of Christ, but in its present form its genuineness is undisputed.¹² Respecting the third passage, in which Josephus speaks directly of Jesus, the only question is whether it be partly or entirely spurious. Placing in brackets the words which are undoubtedly interpolated, it runs as follows:—

At this time appeared a certain¹³ Jesus, a wise man [if indeed He may be called a man, for He was a worker of miracles, a teacher of such men as receive the truth with joy], and He drew to himself many Jews [and many also of the Greeks. This was the Christ]. And when at the instigation of our chief men Pilate condemned Him to the cross, those who had first loved Him did not fall away. [For He appeared to them alive again on the third day, according as the holy prophets had declared this and countless other marvels of Him.] To this day the sect of Christians, called after Him, still exists.¹⁴

That Josephus wrote the whole passage as it now stands no sane critic can believe. Vespasian, not Jesus, was the Messiah of the "ambiguous oracle" of that apostate Jew.¹⁵ There are, however, two reasons which are alone sufficient to prove that the whole passage is spurious,—one that it was unknown to Origen and the earlier fathers, the other that its place in the text is uncertain. It is now found after the historian's notices of Pilate, but the remarks of Eusebius show that in his time it was found before them.¹⁶ We must conclude then that Josephus preserved a politic silence respecting Christ and the Christians, confining himself to remote allusions; and this was quite possible, because he was writing mainly for Greeks and Romans who were profoundly ignorant of the whole subject. That Josephus knew a great deal more than he chose to say is evident. There is reason to suspect that his account of his own juvenile precocity before the leading teachers of his nation is borrowed from the Gospels,¹⁷ and that his account of his shipwreck on the journey to Rome is not uncoloured by the facts of St Paul's shipwreck about that very time.¹⁸ But the most striking indication of his hostile reticence is found in the chapter of his *Antiquities* which follows the supposed allusion to Jesus.²¹ It there breaks his narrative in the most arbitrary manner to drag in a disgusting story of a trick played by the priests of Isis on a Roman lady; and no one who is acquainted with the Jewish calumnies about the incarnation can doubt that in this story we have an oblique and malignant anticipation of the falsehood which ultimately took form in the Talmud and the anti-Christian writings of the later Jews.

From other Jewish sources not a single fact about Jesus can be gleaned. In the unexpurgated editions of the

¹ Tac., *Hist.*, v. 3, 4.

¹⁹ *Vit.*, 2. ²⁰ *Vit.*, 3.

²¹ *Ant.*, xviii. 8, 4.

Talmud there are about twenty allusions to Christ and the Christians characterized by intense hatred. He is usually spoken of indirectly as "that man," "the Nazarene," "the fool," "Absalom," "the hung," "the son of Stada," "the son of Pandera." Many allusions to Him are veiled in cryptographs of which the key is in the possession of but few. All the grossest fictions respecting him—that He was a seducer (*mesith*) who had learned magic in Egypt, and had been excommunicated by Rabbi Joshua ben Perachia in the reign of Alexander Jannæus (nearly a century before His birth!), and that He was crucified at Lydda, because no one, during forty days, came forward to give any evidence in His favour—are collected in a miserable Jewish tract called the *Toldoth Jeschu*, which may be consigned to oblivion, because even the Jews now regard it with contempt and shame.¹ It is, however, remarkable that from these intensely embittered Jewish sources we derive an absolute confirmation of Christ's stay in Egypt, of His Davidic descent,² of His miracles, of His disciples, of His excommunication by the Sanhedrin, of His crucifixion on the evening before the Passover, and even of His innocence, —for not a single crime but that of working miracles by magic, and claiming divine honour, is, even in these sources, laid to His charge. And thus even from pagan and Jewish enemies we derive all that we want and all that we could expect in the recognition of the historic personality of Christ, and of the chief facts in His outward life.

3. If we had nothing to help us but these allusions, the two great facts of Christianity and Christendom would be an inexplicable enigma. In the Christian sources of information all becomes intelligible. Of these we may dismiss for practical purposes all but the New Testament. From the fathers we derive surprisingly little. A few sayings—of which some are very dubious,³ and of which the most valuable are only variations of those in the Gospels—and one or two highly uncertain incidents,⁴ are all that we can glean from them. The Apocryphal Gospels help us still less. They are for the most part heavy fictions, the inventions of an indiscriminate curiosity, often grossly heretical, abounding in coarsely-conceived and even pernicious miracles, and dwelling chiefly on imaginary details of the nativity, the infancy, or the last scenes.⁵ Their chief value is to set forth by contrast the immeasurable superiority of the canonical Gospels, by showing us what these also might have been if they had been the products of human invention. But it is not the Gospels alone on which we have to depend. We have four works of which the authenticity has never even been assailed by any serious writer, namely, St Paul's four epistles to the Galatians, Romans, and Corinthians. These may truly be regarded as a fifth Gospel, of which the testimony is all the more valuable because it is undesigned and incidental. It is also earlier than that of any Gospel, and is the testimony of one whose personality stands forth with absolute clearness in the light of history. Further than this, it is the

testimony of a man of commanding intellect, and of the highest Jewish culture, who, after the death of Christ, was converted from the most bitter hostility to the most intense devotion, and who bears his witness within twenty-five years of the events respecting which he speaks. And yet, if we had the epistles of St Paul alone, we could find a contemporary testimony to almost every single fact of primary importance in the life of Christ,—His birth of the seed of David, His poverty, His Messianicship, His moral teaching, His proclamation of the kingdom of God, His calling of the apostles, His supernatural power, His divine claims, His betrayal, His founding of the Last Supper, His passion, crucifixion, burial, resurrection, and repeated appearances.⁶ If we add the testimony of the other epistles, we have further testimonies to almost every fact of importance in the Gospels, as we have also in the catholic epistles and in the Revelation of St John.

It is, however, from the Gospels that our fullest light is derived. They are not, and do not profess to be, full biographies written for the gratification of curiosity, but they preserve for us all that is necessary to explain the origin of Christianity in the life of its Founder. In the first three Gospels, called Synoptic, we have sketches of the life and teaching of Christ of which the latest was probably written within forty years of the crucifixion. No one has ever denied that the representation of Christ in these three Gospels is essentially the same. The view of Him presented in the Fourth Gospel, which was not published till towards the close of the 1st century, is more subjective. It is the spiritual Gospel, the Gospel for the church, and even those critics who deny its Johannean authorship admit its value as a very ancient document written by a Jewish Christian of extraordinary genius who had access to the most valuable sources of contemporary information.

III. Since, then, it may be regarded as a truth for which the close investigations of historical criticism have only secured more universal admission that the life of Jesus was a life of which the main outlines are historically certain, we must now glance at its chronology and duration.

It must be admitted that we cannot demonstrate the exact year of the nativity, but critics of all schools are verging more and more towards the acceptance of 4 B.C. as the probable year of Christ's birth. Our present era was fixed (525 A.D.) by a learned Sythian, Dionysius Exiguus, who was an abbot at Rome, and died about 550; but it is now admitted to be erroneous by at least four years. Many methods have been adopted to arrive at the true date; but all attempts to fix it by the enrolment of Quirinius, the order of the Jewish courses of priests, the consulships mentioned by Tertullian, and the extremely remarkable astronomical conjunction of Mars, Jupiter, and Saturn in Pisces in the spring of A.U.C. 748,⁷ have led to nothing but highly dubious results. We are left with two data which furnish us with an approximation to the accurate date. One of these is the death of Herod the Great. Josephus tells us that he died thirty-seven years after he had been declared king by the Romans.⁸ Now this took place A.U.C. 714, and therefore—by the Jewish mode of reckoning the year from Nisan to Nisan, and counting fractional parts of a year as a whole year—he must have died between 4 B.C. and 3 B.C. Further, we know that there was an eclipse of the moon on March 12, 4 B.C., on which night Herod ordered some Jewish rabbis to be burnt

¹ See Grätz, iii. 243; Jost, *Gesch. des Judenth.*, i. 405, 414; Wagners, *Die Ihesu Satana* (where it is published with a translation); Schottgen, *Hor. Heb.*, i. 607.

² Sanheir, 43, 1. See Derombong, *L'Hist. de la Palestine*, p. 849; Farrar, *Life of Christ*, Exc. ii (vol. ii. p. 475).

³ These are collected in Fabricius, *Cod. Apoc.*, i. 322 sq.; Hoffmann, *Leben Jesu nach d. Apokryphen*, 317–329; Westcott, *Introduction to the Gospels*, Append. C; and Farrar, *Life of Christ*, ii. 499.

⁴ E.g., that the nativity took place in a cave; that a fire was kindled in Jordan at the time of Christ's baptism; that the vilest sinners were chosen as apostles; that there was a statue at Pannasa of the woman with the issue of blood, &c.

⁵ They are collected by Fabricius, *Cod. Apoc. N. T.*, 1743; Thilo, *Cod. Apoc. N. T.*, 1832; and Tischendorf, *Ev. Apocryph.*, 1853. They have been excellently translated by Mr B. Harris Cooper (*The Apocryphal Gospels*), and Hoffmann has written the life of Jesus as represented in these late and worthless forgeries (*Das Leben Jesu nach d. Apokryphen*, 1851).

⁶ See Rom. i. 3, 4, v. 12, viii. 2, 3, 32, ix. 5, xv. 8; Gal. ii. 7, iii. 13, iv. 4, v. 21; 1 Cor. vi. 18, vii. 10, xi. 25, xv. *passim*; 2 Cor. iii. 17, iv. 4, xii. 12, xiii. 4, &c. See Stanley's *Corinthians*, pp. 580–589.

⁷ As calculated by Kepler. According to more recent investigations it occurred in A.U.C. 747.

⁸ *Ant.*, xvii. 8, 1.

for urging their pupils to destroy his golden eagle,¹ and that he was dead before the passover which took place on April 12, 4 B.C. Christ must therefore have been born before February, 4 B.C. Again, St Luke tells us that John the Baptist began to preach in the fifteenth year of Tiberius, and as the reign of Tiberius was usually reckoned in the provinces from the date of his association with Augustus in the empire, this gives us A.D. c. 780 for the baptism of John, at which period Jesus was about thirty years old.² As to the day and month of the nativity it is certain that they can never be recovered; they were absolutely unknown to the early fathers, and there is scarcely one month in the year which has not been fixed upon as probable by modern critics.³ The date now observed—December 25—cannot be traced further back than the middle of the 4th century, but was adopted by St Jerome, St Augustine, Orosius, and Sulpicius Severus, and in the East by St Chrysostom and St Gregory of Nyssa.⁴ If 4 B.C. be accepted as the date for the nativity, which has most probability in its favour, the question of the date of the crucifixion depends mainly on that of the duration of the ministry. Now on this point the data of the evangelists have been disturbed by a prevalent early tradition that Christ's public ministry only lasted one year, and by another tradition that Jesus did not die till the age of fifty. The first of these notions is a mistaken inference drawn by Clement of Alexandria,⁵ Origen, and other fathers, as also by the Valentines, from Luke iv. 15; and it was by no means universal even in early days, for Irenæus⁶ says that Christ taught for three years. The other notion was a mistaken inference from John viii. 57. That both views are mistakes appears from the positive testimony of St Luke that Jesus was about thirty years old when he began His ministry, and from the clear indications given by St John (ii. 13, vi. 4, xi. 55) that there were at least three passovers during the public ministry. On other grounds it is probable that there was one passover during the ministry which our Lord did not attend; and if so, we see the grounds for the ancient tradition that His public preaching lasted upwards of three years, and that Jesus died at the age of thirty-three.⁷ He died during the reign of Tiberius, the procuratorship of Pontius Pilate, the tetrachate of Antipas, and the high priesthood of Joseph Caiaphas. Now Tiberius died on March 16, 37 A.D., and Pilate ceased to be procurator before, and Caiaphas to be high priest immediately after, the passover of 36 A.D.; the date therefore cannot be later than 35 A.D. We may set aside dubious considerations derived from the allusion to an eclipse and earthquake by the pagan historian Phlegon, and may regard it as highly probable that the crucifixion took place at the passover of March 30 A.D.⁸

IV. The circumstances of the nativity are only related by St Matthew and St Luke, and by each of them in a manner so absolutely independent that facts known to the one may

have been unknown to the other. There is no difficulty in reconciling their fragmentary intimations if we suppose that Nazareth was the native place of Joseph and Mary, and that there the coming nativity was announced to the Virgin, but that the exigencies of the enrolment undertaken by Quirinus for imperial purposes required Joseph to register his name at Bethlehem, the native town of David, from whom both he and, probably, his espoused wife were descended.¹⁰

Assuming that there was an enrolment of Quirinus in 4 B.C., the difficulties which have been raised about the registration taking place at the home of the family and not at the place of residence are *a priori* objections which have but little weight against testimony. The Jews clung to their genealogies and tribal relations, and in consequence of the settled habits of Oriental life most families would be naturally resident at their native place. The incompleteness with the danger of exciting tumults by needlessly forcing the Roman methods of registration on a reluctant people. The smallness of Palestine, and the regular custom of attending a yearly passover, would tend to minimize any inconvenience; and, if the attendance of Mary was not obligatory (which is uncertain), nothing is more natural than that at such a time of trial and danger she should have accompanied the only person who could protect her. Those who charge St Luke with a gross chronological error in antedating by ten years the registration of Quirinus should remember that in every other instance in which his statements have been challenged on grounds open to historic decision his accuracy has been triumphantly vindicated.¹¹ And since the celebrated treatise of A. W. Zumpt (*Das Geburtsjahr Christi*, 1869) it has been all but demonstrated that Quirinus—although the fact is not distinctly mentioned by any ancient author—as twice legate of Syria, viz. A.D. 760–783 and again A.D. 780–795. Neither the sources nor the attacks of critics have in the slightest degree shaken this probability; and, since Justin Martyr appeals to the census table of Quirinus, and Tertullian to those of Sentius Saturninus,¹² there is no critical unlikelihood in the conjecture that the censuses may have been ordered by Sentius Saturninus, begun by Publ. Sulpicius Quirinus during his first term of office as legate of Syria, and completed during his second.

V. It is not of course our object to narrate or even to touch upon all the events and teachings which occupy the four Gospels, but only to glance at their general bearing. The life of Jesus naturally falls into five epochs:—(1) the infancy and childhood; (2) the youth and early manhood; (3) the public ministry, including (4) the closing scenes and crucifixion, and (5) the resurrection and ascension. These epochs are well marked in the Gospels.

1. The two who alone preserve for us any details of the infancy and childhood are St Matthew and St Luke, and they relate four events. Of these the circumcision and the presentation in the temple present no difficulties. The circumcision, at which the name was always publicly given, took place on the eighth day after the birth, and was performed in the presence of the nearest friends. It illustrated the truths that Christ was "born under the law" which he came "not to destroy but to fulfil." Thirty-three days after the circumcision was the purification in the temple, and St Luke tells us how the aged Simeon and Anna welcomed the infant Saviour with words of prophecy. The third event, the visit of the Magi, is known as the Epiphany or manifestation of Christ to the Gentiles.

It rests on the sole authority of St Matthew, but there is no feature in his account which is out of keeping with known events and possibilities. The Magi, Persian or Chaldean astrologers, were a class extremely common at that epoch, and under different names are repeatedly mentioned by the contemporary historians and satirists.¹³ That they were accustomed to wander to various countries, and to interest themselves in horoscopes, we know from the story of Diogenes Laertius that a Syrian magus had foretold his

death to Socrates,¹ and from Seneca's statement that magi, "who then chanced to be at Athens," had visited the tomb of Plato and offered incense to him as to a divine being.² That they should have been deeply interested in any sidereal phenomenon is in accordance with what we know of their studies, and that a sidereal phenomenon of the rarest kind,³ and one which by the recognized rules of astrology was of stupendous significance, actually did occur at this very epoch we know by the independent and, so to speak, accidental investigations of the great Kepler.⁴ The conjunction of planets which occurred on December 17, 1613, was followed the next year by the appearance of a new evanescent star of the first magnitude in the foot of Ophiuchus, which first attracted the notice of Kepler's pupil Brumowski, and continued to shine for a whole year. Such a phenomenon may have some bearing on the "star of the wise men," although taken alone it will not minutely correspond with the language of St. Matthew.⁵ But that such an astrological event would naturally turn the thoughts of these Chaldeans to some great birth, and that its occurrence in the sign of the zodiac which astrology connected with the fortunes of Judaea should turn their inquiries thitherward, is again in accordance with the tension of Messianic expectations in those days, which especially affected the East, but which has left deep traces even on the pages of Roman writers.⁶ Again, the answer of the Jewish rabbis to these inquiries is in exact accordance with their own anticipations.

The sequel of the story—Herod's jealousy and the massacre of the innocents—has been mainly doubted because it is not mentioned in Josephus. But there must have been hundreds of events of that day of which the Jewish historian has taken no notice, though they were far more sanguinary than the murder of a handful of infants in a little village. The act corresponds to the jealousy and cruelty which were the master passions of the Idumean usurper, and, if Josephus here follows Nicolaus of Damascus, we may be quite sure that he would not have mentioned a fact so damaging to the character of his patron. There are, however, two allusions in Josephus, which, if they do not specifically indicate this event, yet may well allude to it, or at least show how consonant it was with Herod's impulses.⁷ Further, Macrobius speaks of "the boys under two years of age (comp. Matt. ii. 16) whom Herod ordered to be slain in Syria," and, although he confuses this with the sentence upon Herod's sons, of whom Antipater was executed within five days of Herod's death, his words may well point to the murder of the children of Bethlehem.⁸ Thus, while this event is not recognizable in other histories, it meets with unexpected confirmations of its possibility from many quarters. That Joseph should have fled with Mary and the child into Egypt was exactly what would have been done by every Jew similarly circumstanced. Three days' journey, as far as the Wady Rhinocolura, would have placed the fugitives beyond the reach of Herod's jurisdiction.

The sojourn of the holy family in Egypt was probably very short, nor indeed would there have been any temptation to stay a day longer than was necessary. Joseph's first intention was to return to Bethlehem when the news that Herod the Great was dead seemed to open the prospect of happier times. But when he was met on the way by the intelligence that Judaea had fallen by his father's

will to the share of the cruel Archelaus⁹ he was afraid to establish himself so near to the palace of that jealous tyrant, and "retired" (*ἀνεχώρησε*) to the mountain seclusion of remote and despised Nazareth. How deep was the impression which these events had made on the memory of the people, and how little likely it was that a contemporary evangelist could fall into a mistake about them, is shown by the fact, which has only recently been noticed, that fully thirty years afterwards Jesus made the events which happened at the succession of Archelaus even in minute particulars the groundwork of a striking parable.¹⁰

2. At Nazareth He was, even as a mere matter of history, was to influence for ever the entire development of human civilization grew up in extreme seclusion. A single anecdote and two or three incidental expressions comprise every glimpse of Him which we can obtain. We learn that "He was subject to His parents"¹¹ at Nazareth; that "He grew and waxed strong in spirit, filled with wisdom, and the grace of God was upon Him,"¹² that "He gradually advanced (*προέκορτε*) in wisdom and stature, and in favour with God and man."¹³ We further learn that He was not subjected to the training of any of the rabbinic schools. He had never learned that complicated system of oral tradition which was known by the Jews as "letters."¹⁴ It is doubtful whether the schools which afterwards became common existed at this early period in country villages. Schools for infants are said to have been first founded by the son of Gamaliel, but possibly by this time the custom had begun of employing the scribes and lower officers of the synagogue (*chazzanim*) to teach the boys of each village. We can trace proofs that Jesus was wonderfully familiar with the sights and sounds of nature, as well as with the habits of men of all classes, for He drew His illustrations in abundance from both sources. It is also certain that He knew both Greek and Aramaic, which were at that time universally spoken throughout Palestine; and there are slight indications that He was acquainted with Latin and with Hebrew, though the latter had now become a dead and learned language. We also find that He was acquainted with the then by no means common art of writing. It is certain that in His home He must, like other Jewish children, have learned first the Shema' (Deut. vi. 4), then the Hallel (Psalms cxv. to cxviii.), and then the Scriptures generally, to all parts of which, and especially to the Psalms and prophetic books, He constantly referred. The certainty that He never passed through the ordinary training of the learned classes nullifies the suggestion that any part of His wisdom was borrowed from such writers as Philo and such rabbis as Hillel and Shammai. His methods and His whole moral conception differ fundamentally from those of the Alexandrian philosopher and the Jerusalem Pharisees. His teachers, humanly speaking, were the books of God,—the books of Scripture, of nature, and of life,—and the voice of God within His soul.

At the age of twelve a Jewish boy was held to have finished the elementary stages of his education, and became a "son of the law." At this age He was presented by His father in the synagogue, began to wear the phylacteries, learnt a trade for His own support, and "advanced," as the Jews phrased it, from the study of the Scriptures to

⁹ St. Matthew uses the word *Βαριλῆαι*, and Archelaus, having been saluted "king" by the army, actually did wear that title for a short time after his father's death (Jos., *Ant.*, xvi. 1, § 1; *Ant.*, xvi. 9, § 2) until Augustus ordered him to be called only "ethnarch."

¹⁰ The "parable of the pounds," Luke xix. 11-27. St. Luke does not himself allude to the fact that this parable is a veiled sketch of what had happened to the ethnarch thirty years before, and that the circumstance may well have been recalled to the memory alike of the Speaker and the hearers by the vicinity of the splendid palace which Archelaus had built at Jericho (see Jos., *Ant.*, xvi. 13, §§ 1, 2).

that of the oral law. At this age Joseph and Mary took Jesus for the first time to Jerusalem, and there occurred the memorable incident of the temporary loss of Him by His mother and Joseph, and their discovery of Him in the Temple seated among the doctors, "both hearing, and asking them questions." His answer to the astonished inquiry "Why dost thou treat us thus?" was, "Why is it that ye looked for me?" "Did ye not know that I must be in my Father's house?"¹ These are His first recorded words, and their beauty and simplicity give them such a stamp of truthfulness as no art could imitate. They are the first gleam of that character and personality which has transcended anything of which the world has had any experience during all the former or subsequent ages. The evangelists record no further particulars of these early years.

Of the remaining life of Jesus during the period between this visit to Jerusalem and His baptism one word alone remains to us. It is in the question, "Is not this the carpenter?"² in Mark. vi. 3. It shows us that these eighteen years of youth and opening manhood were spent, not only in the obscurity of a despised provincial village, but also in the manual toils of a humble trade.³ It shows us that Jesus worked with His hands for His own support, and that of His mother and brethren. The fact is so entirely unlike anything which we should *a priori* have expected in the life of Him whom Christians adore as the Son of God and the Saviour of the world, that we once more see the faithfulness of the narrators, who do not attempt to break by unauthorized inventions the deep silence of those long unknown years in which He consecrated the common lot of toil and poverty, and thereby showed the inherent dignity of manhood and the intrinsic sacredness of human life.

3. Before entering on the third epoch of the life of Jesus,—the baptism and public ministry,—we must pause for a moment to touch on the political and religious aspect of the world during the brief period of His Messianic activity.

Politically the world was passing through a bad epoch. Rome under the emperors, as she attained the zenith of her apparent power and splendour, sank almost to the nadir of her real degradation. The genius of Julius Caesar, the astute policy of Augustus, could not delay the ever-deepening degeneracy which revealed itself in its worst colours in the reign of Tiberius. The condition of the Roman world during the later years of Tiberius, when he was hiding at Capræ, the infamies of his sanguinary lust, was that condition of terror and despair which Tacitus has portrayed with such unequalled power. The words in which he describes the characteristics of a somewhat later period apply also to this; it was "rich in disasters, terrible in battles, rent by seditions, savage even in its peace."⁴ The murder of princes, the outbreaks of rebellion and civil war, the prevalence of alarming rumours, the decimation of the noblest families by means of spies and informers, the conflagrations of temples and cities, the oppression of provinces by the greed and cruelty of legates and procurators, the horrible degradation of private morals, the awful tragedies of impurity and bloodshed which were enacted in various courts, the multiplications of banishments, even the terror of famines, storms, and earthquakes, combined to render

the early years of the Christian era a period of gloom and anguish throughout large portions of the Roman empire. Judæa was the scene of special miseries, because it groined under the ruthless and hypocritical tyranny of Idumean usurpers.

Meanwhile the religious condition of the world and of the nation was no less unsatisfactory. Throughout the Roman empire the belief in the popular mythology had died away, and, while a few of the noblest spirits took refuge in the hard and despairing dogmas of Stoicism, the mass of the people was plunged in practical atheism or abject superstition. Such religion as there was among the people usually took the form of Egyptian and Phrygian worship, which were often connected with the vilest immorality. In Judæa the dominant religion consisted in scrupulous devotion to the petty external ordinances of the oral law.

Thus at the epoch of Christ's birth the heathen world had sunk into practical atheism, and the Jewish world was deeply corroded by formalism and hypocrisy. In the heathen world religion had almost ceased to exist; in the Jewish world it was tainted at its source.

It was no doubt due to the darkness of the religious and political horizon, and to the sense of despair and weariness which was prevalent in the hearts alike of Jews and Gentiles, that the Messianic hope, fostered by generations of prophets, gained a powerful hold on the hearts of all sincere Israelites, and even found its expression in secular literature. Virgil, Tacitus, and Suetonius, no less than Josephus, show that the thoughts of the civilized world were turned to the East in expectation of some great deliverer. But the character of their hope was utterly mistaken. Overlooking the prophetic passages which told of a suffering Messiah, a servant of Jehovah, who should bear the sorrows of His people, the Jews were anticipating the advent of some temporal sovereign who would rule their enemies with a rod of iron, and dash them in pieces like a potter's vessel, while He raised Israel to the summit of earthly prosperity and luxury.⁵ The Messiah, the son of David, was to be a conquering warrior, which accounts for the grossly unspiritual conceptions which induced one party to represent Herod as the promised Messiah, and which enabled Josephus to pretend that he found a fulfilment of the Messianic prophecies in the elevation to the empire of Vespasian, the bourgeois soldier who had crushed his country under the iron heel of the Roman legions.

At this time of extreme trouble and expectation the Baptist began his preaching. It was confessedly preparatory. The coming of the Messiah was always declared to depend on the "righteousness" of the nation, that is—in ordinary Jewish phraseology—their rigid observance of the Mosaic law. But John saw that what was needful was morality, not legalism, and his cry "Repent ye, for the kingdom of heaven is at hand," was explained to each of the great classes which applied to him for advice by practical directions as to their daily duties. John created an intense though transitory impression by his dress and appearance, which recalled the memory of ancient prophets, and specially of Elijah, and still more by the burning sincerity and reality of a style of teaching which presented so strong a contrast to the ordinary teaching of the scribes. He adopted the rigid seclusion and asceticism of the Essenes, and his language rang with denunciations clothed in the imagery of the desert. Refusing all the titles which the people wished to force upon him, he described himself as "a voice of one crying in the wilderness," and announced the coming of one greater than himself, who would found

¹ Luke i. 49. This and not "about my Father's business" is the correct rendering of *ἐν τοῦ πατρὸς οἴκῳ*, as has been conclusively proved in an unpublished paper of Dr Field. See the present writer's *St Luke* (in *Cambr. Bibl. for schools*) ad loc.

² This is the true reading, though a false feeling of reverence and a wrong dogmatic bias have led the copyists of the later MSS. to alter it into "the son of the carpenter."

³ Justin, *C. Tryph.*, 88, says that He specially made "ploughs and yokes."

⁴ Tac., *Hist.*, i. 2.

⁵ See Bartolucci, *Bibl. Rabbin.*, i. 511–514; Lightfoot, *Hor. Heb.*, p. 552; Buxtorf, *Synag. Jud.*, p. 52.

the kingdom which he only announced. The submission to the simple rite of baptism, a rite already familiar to the Jews in the admission of proselytes, was the only sign of the acceptance of his mission which he required; and the multitudes were so deeply moved by his preaching that they thronged to be baptized of him in Jordan, confessing their sins. It was in order to receive this baptism, and to ratify the mission of the great forerunner, that Jesus left the deep provincial seclusion in which He had hitherto lived. The stainless personality of his Kinsman overawed the bold and mighty spirit of the desert preacher. He shrunk from baptizing one in whom he at once recognized that "royalty of inward happiness," and purity of sinless life, which he could not himself claim. Jesus, however, though He had no sins to confess, bade John to baptize Him, "for thus it becometh us," He said, "to fulfil all righteousness." He received the baptism, as a representative of the people whom He came to save, as a beautiful symbol of moral purification, and as the fit inauguration of a ministry which came not to destroy the law but to fulfil. And during the baptism John saw the overshadowing radiance and heard the voice from heaven which revealed to him that the promised Messiah had now come, and that this Messiah was the Son of God.

After this great crisis, which finally closed the private period of the life of Jesus, He was "driven" by the spirit into the wilderness for His mysterious temptation. The details of what occurred could of course only have been derived from what He Himself made known to His apostles. What is clear is that in that region of Quarantania, in the desert of Jericho, He was divinely strengthened for this mission by victoriously wrestling with every suggestion of the powers of evil which could have altered the character of His work. Although this was not His only temptation, it was evidently the most deadly. The first temptation appealed subtly and powerfully to the exhaustion of His physical nature; the second to spiritual pride, as it would have been manifested by an unwarranted challenge of the providence of God; the third to unhalloved personal ambition. In the two greatest temptations of His life—in the wilderness and at Gethsemane—He was tempted both positively and negatively,—positively by allurements to a lower line of action, and negatively by the seductive pleas which would have drawn Him aside from the path of suffering. But He won the perfect victory because temptation never passed into even the thought of sin, but was so wrestled with and overcome that it made no determining impression upon His heart.²

After this victory over the power of evil, Jesus returned to the fords of Jordan. It will not of course be possible or needful to dwell on the narratives of His ministry in all their details; but, since these narratives are confessedly fragmentary, we shall endeavour to furnish from the four Gospels in rapid outline a sketch of the general events of His ministry before touching upon its eternal significance. The events described in the Gospels are often grouped together by subjective considerations, and it was the evident object of St John to dwell preponderantly on the Judean ministry, and on those discourses which brought out the deeper and more mysterious side of the being of Christ, while the Synoptists chiefly describe the work in Galilee, and preserve what may be called the more exoteric discourses. The combination of these disintegrated records into one harmonious and consecutive whole is a task which can never be accomplished with absolute certainty; but it is possible, without a single arbitrary conjecture, to construct a continuous narrative which shall simply follow the indication of our authorities without doing violence to them

in any instance. In this scheme the ministry of Christ falls into the following epochs:—(1) the early scenes, narrated by St John alone, until the beginning of the public preaching in Galilee; (2) the Galilean ministry till the murder of the Baptist; (3) the period of decided opposition; (4) the period of flight and peril until the final farewell to Galilee; (5) from the great journey to Jerusalem till the retirement to Ephraim, (6) from this retirement to the Passover; (7) the last supper, passion, trial, and crucifixion; (8) the re-urrection and ascension.

(1) The scenes of the first period are related by St John with a beauty and simplicity which can only be called idyllic. He tells us how the Baptist, on the banks of the Jordan, saw Jesus pass by, and exclaimed, in language of deep significance, "Behold the Lamb of God, that taketh away the sin of the world!" Whether the prominent thought in the Baptist's mind was the paschal lamb, or the lamb of morning and evening sacrifice, or the lamb which Isaiah and Jeremiah had used as an emblem of patient and suffering innocence, it is clear that in the spirit of prophecy he saw in Jesus one who was predestined to a life of sorrows which should be for the salvation of the world. The next day the Baptist repeated the same emphatic testimony in the presence of two Galilean youths, St Andrew and St John, who were so deeply impressed by it that they followed Jesus, saw Him in the place where He was then dwelling, and became His first disciples. Andrew then brought to Jesus his brother Simon, who also recognized in Him the promised Messiah. Three days afterwards Jesus called Philip, another young fisherman of Galilee, who in his turn brought to Jesus his friend Nathanael, the guileless Israelite who is known in the Gospels as Bartholomew, or the son of Tholmai. Accompanied by these pure and warmhearted young men, and also by His mother, Jesus was a guest at the simple wedding feast of Cana in Galilee, at which He first displayed His possession of supernatural power by turning the water into wine. Then, after a brief stay at Capernaum, He went to the Passover at Jerusalem. His first visit to the temple as a recognized teacher was signalized by an authoritative Messianic act. He cleansed the temple of its mean and desecrating traffic, although neither priests nor Pharisees nor the Roman authorities had ever taken a step in that direction. When His right to act thus was challenged, He answered in mysterious words, of which the meaning was not thoroughly understood till long afterwards, "Destroy this temple, and in three days I will raise it up"—speaking of the spiritual temple of His body.³ The words created so deep an impression that after being distorted both in form and meaning they formed one of the chief charges against Him at His trial. Even at this early phase of His work Jesus touched the heart and won the secret allegiance of Nicodemus, with whom He held at night the memorable discourse on the new birth. But He was met from the first by such signs of opposition that He went with His disciples into Judaea, and there allowed them to baptize. The work of the Baptist was not yet over, and until it was, Jesus both permitted the disciples to adopt the symbol of purification which had been used by His forerunner, and Himself similarly preached "Repent, for the kingdom of heaven is at hand." Some Jew⁴ raised a discussion with the disciples of John about purification, and they in their perplexity and jealousy applied to their great master with the complaint that his ministry was being eclipsed by that of Him whom he had baptized beyond Jordan. John, with noble self-suppression, pointed out that he must

¹ Luke iv. 13; John vii. 4; Heb. i. 10, 18, iv. 15.

² See Ullmann, *Sinlessness of Jesus* (Eng. tr.), pp. 30, 140.

³ John ii. 19. That "the Jews," as St John calls the opponents of Christ, were not so entirely ignorant of His meaning as they chose to appear results from Matt. xxvii. 63.

⁴ *Μετὰ τὸν βαπτισμὸν* is the true reading in John iii. 25.

thenceforth decrease; and shortly after this time he was thrown into prison by Herod Antipas. In consequence of this event Jesus withdrew into Galilee. He chose the route through Samaria, and it was to a poor frail woman by Jacob's well that He seems first to have distinctly revealed His Messiahship. His acceptance of the invitation of the Samaritans to stay a few days with them was a rebuke to the spirit of fanatical hatred and exclusiveness, which in that day so filled the minds of His countrymen that they regarded any intercourse with Samaritans as involving pollution.

(2) Although Jesus was aware that a prophet is often least known in his own country and among his own kindred, He made His way, preaching as He went in various synagogues, direct to Nazareth.¹ There, in the synagogue, He read aloud part of Isaiah lxi, and amid deep silence applied it to Himself. But He had not proceeded far when the spell of His divine teaching was broken by the pride and ignorance of the Nazarenes, who began to murmur among themselves about His humble birth and occupation, and to demand that He should do some deed of power among them. It was on His reminding them that Elijah and Elisha had wrought their miracles of healing upon strangers that they rose in fury, and dragged Him to the brow of the hill on which their city was built. Something, however, in the majesty of His bearing seems to have created in their minds a supernatural awe, so that, as on later occasions, He was able "to pass through the midst of them, and go on His way." To the place of His birth He seems never to have returned.

From this time His home, so far as He could in any sense be said to have a home, was at the bright little city of Capernaum on the shores of the Sea of Galilee, to which, perhaps in consequence of the churlishness of the Nazarenes, His mother and brethren also migrated. At this point begins the period of His brightest activity, the year which was in a pre-eminent sense "the acceptable year of the Lord." The scene of that ministry was mainly the beautiful and populous plain of Gennesaret through which passed "the way of the sea," the great caravan road which led to Damascus. It was the manufacturing district of Palestine, thronged by men of all nationalities, and therefore pre-eminently suited for the proclamation of the kingdom. At the same time it was a scene of infinite charm, and the opportunities of sailing from place to place, and of earning a livelihood, which were afforded by the inland lake, rendered it specially appropriate. On the way to Capernaum Jesus healed by His word the son of the courtier of Herod,² who in consequence believed with his whole house. Much of the brief story of the Gospels is made up of the records of single days which stood out with marked prominence. One such day was the first Sabbath at Capernaum. Christ began with a sermon in the synagogue, during which He wrought one of His great exorcisms on a raving demoniac who was present in the audience. Retiring to the house of Peter, He healed Peter's mother-in-law of a fever, and at sunset, when the Sabbath ended, wrought many cures upon a multitude of sufferers. The fame of this day rang even to Syria, and, finding that even temporary seclusion was now impossible, Jesus went from village to village preaching the kingdom of God.³ It was at this time that He preached to the multitude from Peter's boat, and after the miraculous draught of fishes called Andrew, Peter, and the sons of Zebedee to a closer and

more unremitting discipleship. Matthew the publican was the next to "leave all" and follow Christ. The choice of the full number of twelve to be apostles took place just before the sermon on the mount, and nothing can more decisively show the wisdom and insight of Jesus than the fact that among the twelve were characters so opposite as a zealot and a publican. Judas, the "man of Kerioth," was probably the only Judean in the little band of Galileans. The great discourse known as the Sermon on the Mount was delivered primarily to the disciples, but was intended also for the multitude. The hill by the Galilean lake⁴ was the Sinai of the new dispensation, but it was a mount not of terrors but of beatitudes. The sermon first sketched the character of the citizens of the new kingdom both absolutely and relatively.⁵ It proceeded to sketch the new law in contrast, both general and special, with the old.⁷ The last great section of it was occupied with the characteristics of the new life—its devotion, its duties, and its dangers.⁸ It ended with the contrast between doers and mere hearers.⁹ The grandeur, originality, independence, and authoritative tone of the sermon, with its vivid illustrations and divine idealism, produced a very deep and wide impression. The inauguration of the doctrine was followed by deeds of mercy and power. From this time He was constantly surrounded by thronging multitudes, and was constantly appealed to for miracles of compassion. We are told in quick succession of the healing of a leper by a touch, of the centurion's servant by a word, and the raising from the dead of the widow's son at Nain; and so incessant was His activity that His mother and His brethren began to be alarmed. Soon after the miracle at Nain He received the deputation from John the Baptist, then in his gloomy prison at Machærus, to ask whether He were indeed the Messiah. He bade the messengers take back no other answer than the works which they had witnessed or heard, and pre-eminent among them was the preaching the gospel to the poor. It was after their departure that He pronounced the unequalled eulogy on John as the greatest of the prophets, while yet "the least in the kingdom of heaven" was, in spiritual privileges, greater than He. It was in this discourse that He contrasted the glad and natural geniality of His own example—as one who came "eating and drinking"—with the asceticism and gloom of the Baptist. He never refused the invitations even of the Pharisees, and it was at the banquet of a Pharisee named Simon that He accepted the pathetic devotion of the "woman that was a sinner" (whom Christian tradition persistently identifies with Mary of Magdala), and rebuked the haughty and untender formalism of His host. His life during this period, as He wandered about Gennesaret and its vicinity, preaching to rejoicing crowds, was a life of poverty, toil, and simplicity, but it was also a life of exalted joy from the rapturous gratitude of the people and the faith which enabled Him to work many deeds of mercy among them. Of one episode of the period many details are preserved. After one of the missionary tours in Galilee, Jesus, finding Himself surrounded by a vast throng, began for the first time to preach to them in those parables which were the most characteristic form of His subsequent teaching, and which had the additional advantage of testing the moral and spiritual qualities of His hearers. He began with the parable of the sower, and this method of instruction naturally stimulated to such an extent the eagerness of His hearers that He was kept teaching till evening came. A second ill-judged attempt of His mother and brethren to control His proceedings probably combined with the sense of deep weariness

¹ Luke iv. 15.

² Not improbably Chuza, Herod's steward, whose wife Joanna was one of the "ministering women."

³ Three such circuits in Galilee are faintly traceable; but it is not possible to mark their separate incidents.

⁴ They were probably first cousins of Jesus, for it seems probable from Mark xv. 40, John xix. 25, that Salome the wife of Zebedee was a sister of the Virgin Mary.

ness to create a desire for brief rest and retirement, and He urged His disciples to a hasty departure to the lonelier eastern shores of the lake. During the sail of about 6 miles there rose one of the violent sudden storms to which the Sea of Galilee is specially liable. He was sleeping on the leather cushion of the steersman the deep sleep of fatigue, which not even the waves now dashing into the boat could disturb. The disciples woke Him in wild alarm, and the calm majesty with which He hushed the storm made an indelible impression on their minds. No sooner had they landed on the other side than they were met by a naked and raving maniac, whose dwelling was in the tombs which are still visible on the neighbouring hillsides. Jesus healed him, and (as we are told in a narrative which evidently touches on things entirely beyond our cognizance) suffered the demons to enter into a herd of swine hard by, which immediately rushed violently over a steep place into the sea. The semi-heathen inhabitants of the district, alarmed by His presence, and vexed at the loss of their swine, entreated Him to depart out of their coasts. He granted their evil petition, but left the healed demoniac to lead them to a better frame of mind. The people on the other side recognized the sail of His returning vessel, and were waiting in multitudes to meet Him. While preaching to them in a house at Capernaum, the friends of a paralytic, who had been unable to get near Him for the press, let down the sick man through the roof in front of Him, and He healed him, exciting some murmurs from the Scribes, who had already begun to watch Him with suspicion, by first using the formula "Thy sins are forgiven thee." From the house He adjourned to the shore, and after another brief time of teaching there went to the farewell feast which Matthew gave to the "publicans and sinners" who had been his friends. The Pharisees, afraid as yet to find fault with Him directly, asked the disciples in great displeasure why their Master ate with publicans and sinners, whose very touch they regarded as a pollution. The answer of Jesus was given in the memorable quotation, to which He more than once referred, "Go ye and learn what that meaneth, I will have mercy and not sacrifice."¹ He answered the inquiry of St John's disciples about fasting by pointing out to them that the glad initiation of the marriage feast of the kingdom of heaven was no time for fasting;² and that the embodiment of a new spirit in old form was like putting new wine in worn skins, or a new patch on an old garment. It seems to have been immediately after the banquet that He received the heartrending appeal of Jairus that He would come and heal his little daughter. On the way He healed the woman with the issue who secretly touched the fringe of His garment.³ By the time He reached the house of Jairus the little maid was dead, and His three most chosen disciples—Peter, James, and John—were alone admitted with the father and mother to witness this second instance in which He recalled the dead to life.

It was probably at this point of the ministry that there occurred the visit to that unnamed feast at Jerusalem,⁴ which was almost certainly the Feast of Purim. Perhaps with a view to this absence from Galilee He sent out the twelve, two and two, to preach and perform works of mercy in His name, sending them "like lambs among wolves," and bidding them set the example of the most absolute contentment and simplicity. During His visit to Jerusalem,

where—as we learn from St John, whose facts are incidentally confirmed by allusions in the Synoptists—He had many friends and followers, He healed the impotent man at the Pool of Bethesda, and excited the bitter enmity of the Jews by deliberately ignoring the exaggerated minutiae of the traditional law which made them regard it as a heinous crime to carry even the smallest burden on the Sabbath. The simple command to the healed man to take up the mat on which he lay and walk aroused the Jews to fury; and from that incident, as St John expressly tells us, the overt persecution of Jesus began.⁵ He seems to have been summoned before some committee of the Sanhedrin, but on this occasion they did not dare to punish His violation of their traditions, and on the contrary had to listen in unavailing wrath, not only to His irresistible defence of what He had done on the Sabbath, but to Divine claims which they declared to be blasphemy. They did not dare to touch Him, knowing His power with the people, but from that day the leading authorities of Jerusalem seem to have determined on His death, and their hostility was so bitter and persistent that He left Jerusalem without waiting for the approaching Passover.

(3) It was from this moment that the period of determined opposition began. Hitherto the local Pharisees and Scribes of Galilee might disapprove and murmur, but they had not dared to set themselves in distinct and public antagonism against Him. They were now encouraged to do so by the fact that the leading authorities of the capital had repudiated His claims. The high priests and Pharisees even sent some of their number to act as spies upon His words and actions, and see how they might contrive occasions for His ruin. He returned to Galilee with the full knowledge that His human day was beginning to fade into evening, and that the sentence of violent death hung over Him. It was at this solemn time that the murder of John thrilled men's hearts with horror. Jesus retired with the disciples to a desert plain near the town at the northern end of the lake known as Bethsaida Julias, which was in the dominion of the milder Philip, and beyond the jurisdiction of the blood-stained Antipas. Even to this retirement, however, the multitude followed Him, and here it was that, moved with deep compassion, He fed the five thousand with five barley loaves and two small fishes. Then urging the departure of His disciples by boat to Capernaum, He dismissed the multitude in the gathering dusk, and at last fled from thence⁶ to the top of a neighbouring hill where He spent the night in prayer. During the night a terrible storm arose, and He came to His disciples walking upon the sea, and rescued St Peter as with a half faith he endeavoured to meet Him on the water. The next day at Capernaum He uttered that memorable discourse about Himself as the bread of life, and the necessity of "eating the flesh of the Son of Man and drinking His blood," which was expressly designed to dissipate idle chilastic and material delusions, and to test the sincerity of a spiritual faith. The discourse created deep discontent, and from that time many forsook Him. He even foresaw that one of His chosen apostles was "a devil"; but Peter spoke the conviction of the rest in the noble words, "Lord, to whom shall we go? Thou hast the words of eternal life."

But henceforth opposition became more marked and more fearless. It had already been stirred up in the hearts of all Jewish formalists by His claiming to forgive sins, by His disapproval of asceticism, by His intercourse with publicans and sinners. It gathered force from His consistent depreciation of the petty traditional superstitions which had degraded the Sabbath from a delight and a blessing into a mere fetich of servitude. When the incident at Bethesda had attracted the notice of the Sanhedrin, the

¹ Hos. vi. 6.

² His reference to the days "when the bridegroom should be taken away from them" (*ἀναρπάξῃ*) is one of those early intimations of His death of which one hint had already been given in the night discourse to Nicodemus (John vi. 16).

³ An interesting indication that he observed even the minute particulars of the Mosaic law (Numb. xv. 37-40; Deut. xxii. 12).

⁶ N (Vulg.) *φεύγει*, John vi. 22.

Pharisaic spies from Jerusalem especially watched His Sabbath proceedings. Again and again their hatred was kindled on this point. Now they indignantly challenged the conduct of the hungry disciples for plucking ears of corn and rubbing them in their hands on the Sabbath day; on another occasion they attacked Him for healing on the Sabbath day the man with the withered hand, and later on for healing the bowed woman, and the blind man at Jerusalem. On each of these occasions He exposed with irresistible demonstration their inconsistency and hypocrisy, but thereby only deepened their anger against Him. On other occasions He came into violent collision with their whole system of traditional ceremonialism by pouring contempt on their superfluous and meaningless ablutions, by showing how comparatively meaningless was their scrupulosity about clean and unclean meats, and generally by denouncing the spirit which had led them to place the cumbersome pettinesses of their oral law above the word of God and the inmost spirit of all true religion. The rage of His Pharisaic opponents culminated on one day of open and final rupture between Himself and the spies of the Sanhedrin. Finding Him standing in silent prayer, the disciples had asked Him to teach them to pray, and in reply He had taught them "the Lord's prayer," and told them, in such accents as man had never heard before, about the fatherhood of God, and the consequent efficacy of prayer. Shortly afterwards He had wrought one of His most marvellous cures upon a poor wretch who was at once blind, dumb, and mad. The Pharisees felt bound to check the astonished admiration which this act had once more excited, and with impotent and stupid malignity had tried to teach their followers that He cast out devils by Beelzebub the prince of the devils. This blasphemous folly had drawn down upon their heads words of rebuke more intense and stern than they had ever heard. Such words, addressed to men accustomed to unbounded admiration as infallible teachers, aroused them to the deadliest hostility, and they soon found a weapon of annoyances and injury by demanding on every possible occasion that "sign from heaven" which Jesus always refused to give. Their exacerbation seems to have alarmed His mother and brethren into the third of their ill-timed interferences, which Jesus had once more to check by declaring that the day had now come on which human relationships were as nothing compared to the spiritual. The time for the mid-day meal had now arrived, and Jesus accepted, though it seems to have been given in no good spirit, the invitation of a Pharisee to break bread in his house. On entering He at once sat down at table, since it was but a brief and trivial meal, perhaps of bread and fruits, and the multitude were waiting outside to hear the word of God. Instantly He recognized that He was alone in the midst of enemies, and, moved to deep indignation by their hypocrisy and baseness, He delivered a terrible denunciation of the whole system and religion of the legalists and Pharisees. The feast broke up in confusion, and the guests began to surround Jesus with vehement, taunting, and threatening demonstrations.¹ Passing from amongst them He found the multitude actually treading on each other in their haste and eagerness, and perhaps it was to their presence that He owed His safety. He preached to them a sermon, characterized throughout by the deep emotions by which His spirit had been agitated, of which the main topic was the awful peril of hypocrisy and greed; and then—as though some solemn agony had passed over His spirit—He warned them of the signs of the times, and of the awful consequences of rejecting His teaching.

(4) With that day of conflict ended the second and darker stage of His work in Galilee. The remainder of His life

was mainly passed in flight, in peril, and in concealment, only broken by brief occasional appearances in Galilee and Jerusalem. He departed from Capernaum, and went into the heathen region of Tyre and Sidon. But few particulars of this period are recorded. Somewhere in those regions He tested the strong faith of the Syro-Phœnician woman, and healed her demoniac daughter. From Tyre and Sidon He wandered southwards again, keeping mainly to the eastward and less inhabited region, only now and then healing a sufferer, but gradually attracting crowds once more. Somewhere on the Pæraean side of the lake He fed the four thousand. After this period of wandering and absence He once more sailed to Magdala, but was met immediately by the ominous conjunction of Herodians and Pharisees with their hostile demand for a sign. Turning away from them, He uttered His last sad farewell and prophecy to the cities in which He had laboured, and once more journeyed northwards. During this journey they came near to Cæsarea Philippi, and, after standing in silent prayer, He asked His disciples "Whom do men say that I the Son of man am?" The sorrowful confession had to be made that, though they recognized Him as a prophet, they had not recognized Him as the Messiah. Then came the momentous question, which was to test how much of His task was accomplished in the hearts of those apostles whose training had now for some time been His principal work, "But whom say ye that I am?" Then it was that Peter won the immortal glory of giving that which has thenceforth been the answer of all the Christian world, "Thou art the Christ, the son of the living God." That answer is the inauguration, in human convictions, of Christianity and of Christendom; and it was rewarded by the promise of the power of the keys, and the power to bind and loose, and the foundation of the Christian church upon a rock. Whatever may be the difficulties of the passage, we see that Jesus meant to confer on His church the teaching power of which the key was the symbol, the power of legislative action indicated by binding and loosing, and the prophetic insight on which depended the ability to absolve in God's name. But to obviate all delusions He at once revealed to them the dark abyss of suffering down which He had first to tread; and, as though to prove how little claim His words gave to sacerdotal usurpations, He proceeded to rebuke in the sternest words the presumption of Peter, who ventured to set aside His predictions as to His coming sufferings and death. It was six days after this that He took the three most chosen apostles with Him up the snowy slopes of Hermon, where they witnessed the transfiguration, as though to strengthen their faith in the dark hours to come. On descending the hill, He healed the demoniac boy whom the apostles had vainly tried to help, and built on this exorcism the lesson of faith which He was never weary of inculcating on His followers. Having now reached the northern limit of the Holy Land, He turned His footsteps southwards by the most secluded paths, omitting no opportunity to train the apostles, now teaching them humility by the example of a little child, and now warning them by significant parables of the need of self-sacrifice and of the spirit of forgiveness.

(5) At the ensuing Feast of Tabernacles we find Him once more at Jerusalem, where He appeared suddenly in the temple. St John records His teachings, drawn from the various incidents of the feast, and also the divided opinions of the people, and the almost unanimous opposition of the ruling classes. This visit to the Holy City was marked by the incident of the woman taken in adultery, in which He showed such sovereign wisdom and tenderness, and by the Sabbatarian disputes which arose from the healing of the blind man. On one occasion Jesus had to leave the temple amid a burst of fury in which the Jews threatened

¹ Luke xi, 53.

to stone Him, and when He left Jerusalem it was under the direct ban of excommunication. Under these circumstances He returned for one more brief visit to Galilee. The news which He received of the murder of some Galileans in the temple by Pilate, and of Herod's designs against His safety, show how surrounded by perils was His human life. But He now calmly ended His work in Galilee by the mission of seventy disciples to prepare for His great last journey southwards. His words of farewell to the cities which had rejected Him were full of sadness and solemnity, as He started from the land which had refused His mission to the city in which He was to be crucified.

We now enter on the last great phase of His work, the incidents of His final journey and the close of His ministry. First He was refused shelter by the rude villagers of Engannin, and had to change his route. Next came the healing of the ten lepers, of whom but one showed gratitude, and he was a Samaritan. The Sabbath healings of the bowed woman and of the man with the dropsy are the two chief miracles of the journey, during which He also delivered many most memorable discourses, and some of His divinest parables—such as those of the good Samaritan and the prodigal son. So we trace His steps to the house of Martha and Mary at Bethany, and to Jerusalem, which He visited at the Feast of the Dedication. His appearance in the temple was always the signal for the fiercest opposition of Sadducees and Pharisees, who watched with jealousy and hatred the eagerness of the multitude to hear Him. After serious conflicts He retired to the other Bethany, beyond Jordan. Among the few recorded incidents of His stay in Perea are the attempts to entangle Him with Herod and the Jewish schools by questions about divorce, the beautiful scene of blessing the little children, and the discourse about riches on the occasion of the test which He applied to the rich young ruler who "made the great refusal." The death of Lazarus summoned Him to Bethany, and the most signal miracle which He there wrought by raising Lazarus from the dead excited such notice that the Sanhedrim now met under the presidency of Caiaphas, and came to the deliberate conclusion that they must put Him to death, lest the populace should raise tumults on His behalf which might precipitate the final intervention of Rome in the affairs of their nation. But, as His time was not yet come, Jesus avoided the peril of public arrest or private assassination by retiring to an obscure village called Ephraim, on the edge of the wilderness.

(6) He did not leave Ephraim till He could join the great caravan of Galilean pilgrims with whom He could proceed in safety to His last passover. His apostles, both from His own warnings and from the visible grandeur of His transfiguration of self-sacrifice, were well aware that a crisis of His career had now arrived; and nothing can show more clearly the mistaken character of their Messianic hopes than the fact that, though He now distinctly told them the crowning horror that He should be crucified, the sons of Zebedee came with their mother Salome to beg for places at His right hand and His left in His kingdom. Jesus made their ambitious request a theme for rich and solemn teachings on the beatitude of suffering for the cause of God and man. As they approached Jericho, accompanied by excited multitudes, He healed the blind Bartimæus, and in Jericho He excited the murmurs of the crowd by accepting the hospitality of the publican Zacchæus. On the road between Jericho and Bethany He delivered the parable of the pounds. He arrived at Bethany probably on Friday, Nisan 8, A. V. C. 783 (March 31, 30 A. D.), six days before the passover, and before the sunset had begun the Sabbath hours. The Sabbath was spent in quiet. In the evening Martha and Mary gave him a banquet in the house of Simon the leper, at which Mary, in her devotion and

gratitude, broke the alabaster of precious ointment over His head and feet, and so awoke the deadly aversion of Judas that he seems on that very evening to have communed with the Jewish priests for the paltry blood-money of thirty pieces of silver (less than £1) for which he was willing to betray Him. On the morning of Palm Sunday Jesus made His triumphant entry into Jerusalem amid the palm-waving throngs, who shouted "Hosanna to the son of David," and at the point of the road where the city first bursts upon the view He paused to weep over it and prophesy its doom. After once more cleansing the temple, and protecting from the anger of the priests and Pharisees the children who still shouted Hosanna, He spoke to Philip about the Greeks (probably from Edessa) who wished to see Him, and, strengthened by a voice from heaven, spent the rest of the day in teaching. At evening He retired for safety with the twelve outside the city walls in the direction of Bethany. On the Monday morning, as He went to Jerusalem, He pronounced the symbolic doom upon the fig-tree which had only leaves. On entering the temple He was met by a formidable deputation of priests, scribes, and rabbis, who demanded "by what authority He was acting,"—a question which He declined to answer until they proved their right to ask it, by giving a definite opinion respecting the baptism of John. Their confession of inability to do this was so marked a proof of their incompetence to claim the function of religious teachers, that He refused to meet their challenge. The day may be called "a day of parables," for during His teaching He spoke the parables of the two sons, the rebellious husbandmen, the builders and the corner stone, and the marriage of the king's son. These parables were so obviously aimed at the hypocrisy, malevolence, and presumption of the Jewish authorities that fear alone restrained them from immediately seizing Him. At evening He again retired from the city. The next day, the Tuesday in Passion week, may be called the day of temptations, for it was marked by three deliberate attempts to undermine His authority by involving Him in some difficulty either with the rulers or the people. In the morning walk to Jerusalem He taught to His disciples a lesson of faith from the withered fig-tree. In the temple He was first met by the plot of the Herodians and Pharisees to embroil Him either with the Romans or the populace by a question as to the lawfulness of paying tribute, then by a piece of poor casuistry on the part of the Sadducees concerning the resurrection, then by the question of a Scribe as to the great commandment of the law. In each instance the divine and ready wisdom of His answers not only entirely defeated the stratagems of the Sanhedrists, but showed His immeasurable superiority to them in knowledge and insight. Then, to prove how easily He might have turned the tables on them, had He desired their humiliation, He exposed their complete ignorance respecting the very subject on which they claimed the fullest knowledge by reducing them to a confession of their inability to explain why David in the spirit had given the name of Lord to the Messiah who was to be his son. And then, knowing that the time had come when their degradation of religion into a mere tyranny and semblance should be set forth, He delivered the terrible denunciation which, with its eightfold "Woe unto you, Scribes and Pharisees, hypocrites," was intended to leave them utterly inexcusable. The Jewish authorities felt that this was a final rupture, that they must now, at all costs, bring about His immediate death.

Before He left the temple for ever He taught the lesson of true charity as illustrated by the widow's mite, and then went and sat on the green slopes of the Mount of Olives. There He pronounced to His disciples that great eschatological discourse which was suggested by their admiration of the temple buildings, destined so soon to sink in blood

and ashes. In the cool of evening they walked to Bethany, perhaps at the very time that Judas was arranging with the priests the final details of His betrayal and arrest. The Wednesday was spent in deep retirement at Bethany, and not a single word or incident is recorded on that day. On the Thursday morning He woke never to sleep again.

(7) On the evening of Thursday Jesus went with His disciples to Jerusalem to keep that quasi-pascal feast at which He instituted the sacrament of the Eucharist. Even then the apostles had jealousies about precedence, and it was to cure them of their fatal tendency to selfish pride and ambition that He washed the disciples' feet. During the supper He first indicated to John, and through him to Peter, that He knew who the traitor was. He clearly told them that this was the last meal which He should eat with them, and bade them henceforth "eat bread and drink wine" in sacramental memory of Him. It was after Judas had gone forth into the night that He began those last discourses preserved for us by St John alone, which are so "rarely mixed of sadness and joys, and studded with mysteries as with emeralds." There is a matchless beauty and tenderness in the records of His gentle words of warning and help to Peter, Thomas, Philip, and Jude, and of that familiar intercourse with his dearest followers, whose sinking spirits He sustained by the promise of the Comforter. Then they sang a hymn, probably the Psalm known to the Jews as the Great Hallel, and in the darkness walked to the olive garden of Gethsemane, where Jesus passed through His hour of mysterious agony and passion, while even His most beloved apostles could not watch with Him. Then torches suddenly flashed upon the night as the traitor, accompanied by priests and their servants, and Levites of the temple guard, and Roman soldiers, made their way across the valley of the Kidron to the slope of Olivet on which the garden lay. There Judas betrayed Him with a kiss; and, in spite of the supernatural awe which His presence inspired even into His enemies, He resigned Himself into their hands, rebuked the rash blow of Peter, and by one last act of mercy healed the slight wound of Malchus. "Then all His disciples forsook Him and fled."

(a) He was taken first to the astute and aged Annas, who was regarded as high priest *de jure*, though not *de facto*. From this time forward it was the priestly party—the Sadducees, not the Pharisees—who were almost exclusively responsible for His death. On His refusal to plead before this disorderly midnight tribunal, He was struck on the mouth; and, failing to extort anything from Him, Annas sent Him bound across the courtyard to his son-in-law Caiaphas, the *de facto* high priest.

(β) It was still night, and here took place the second irregular and illegal trial, before His worst enemies among the priests and Sadducees. The false witnesses who endeavoured to convict Him of having threatened to destroy the temple failed, and He preserved unbroken silence until Caiaphas adjured Him by the living God to tell them whether He was the Messiah, the Son of God. In answer to this appeal He said "I am," and told them that they should see His return hereafter in the clouds. Then Caiaphas rent his robes with the cry of blasphemy, and this committee of the Sanhedrin declared Him "guilty of death."

(γ) After this second examination Jesus was remanded to the guardroom until break of day, before which time the whole Sanhedrin could not meet. As He was led past the brazier in the courtyard, His one glance broke into penitence the heart of His backsliding apostle, who had just denied Him with oaths. As He waited, He was insulted by the coarse derision and brutal violence of the priestly menials. When the Sanhedrin met, they once more entirely failed to fix any charge upon Him, until He renewed in their presence His claim to be the Son of God. He was

then formally condemned to death, and underwent a second derision at the hands of the assembled elders. It was after this condemnation that remorse seized the dark soul of Judas. He flung down the blood-money before his tempters, and with an agonized confession of guilt rushed out to his terrible suicide.

At this period the Jews had lost all legal right to put any one to death, and they were further anxious to avoid personal responsibility, and danger of vengeance from the followers of Jesus, by handing Him over for execution to the Roman procurator. Accordingly they led Him bound to Pilate in imposing procession. They were, however, mistaken in supposing that Pilate would crucify Jesus at their bare word without seeing whether He was guilty; and, as they could not enter the Herodian palace, in which the Gentile ruler lived, without pollution, which would have prevented them from partaking in the passover that evening, Pilate went out to them. In every line of the brief colloquy which ensued we trace the haughty contempt of the Roman, and the burning hatred of the Jews. Failing to arrive at any definite charge, Pilate questioned Jesus alone inside the pretorium, and after a brief examination came out to the Jews with the declaration of complete acquittal.

In the wild clamour which ensued he caught the word Galilee, and, understanding that Jesus had chiefly taught in Galilee, eagerly seized the opportunity of getting rid of the matter by sending Him to Herod. But before Herod as before Pilate Jesus retained His majestic silence, and, unable to condemn Him, Herod contented himself with arraying Him in a white festive robe, setting Him at nought with his myrmidons, and sending Him back with a second practical acquittal to the procurator.

Then, in three stages, began the third and most agonizing phase of the public trial. Pilate, seated on his bema upon the marble pavement, declared that, as His innocence was now certain, He would merely scourge and dismiss Him. It was a disgraceful proposal, due partly to His desire to save the life of one whom he saw to be innocent, but dictated by fear of a new riot. Further than this, the warning of his wife, and the awful majesty of the sufferer, had created a strong presentiment in Pilate's mind. But his actions were practically controlled by the past guilt which made him tremble at the thought of the complaints which Jews, Samaritans, and Galileans could alike prefer against him. He did not therefore venture to refuse the cry of the mob—hounded on as they were by the priests and Sanhedrists—for the passover boon of having a prisoner liberated to them; and he vainly tried to induce them to ask for the liberation of Jesus. They demanded the rebel and murderer Bar Abbas, and began to shout for the crucifixion of Jesus. Bar Abbas was set free, and Jesus underwent the horrible Roman scourging, which was followed by the ruthless mockery of the soldiers, who arrayed Him in an old crimson robe and placed a crown of thorns on His head, and a reed in his hand as a sceptre, and so paid Him mock homage as a king of the Jews.

When He came forth after this hour of agony, Pilate made one more appeal to their compassion in the words "Behold the man!" and on hearing that He claimed to be "a Son of God"—for since the charge of treason had broken down, the priests now substituted for it a charge of blasphemy—he became still more alarmed, and once more questioned Jesus in a private interview. For some time Jesus would not speak. When He did, it was to say that He regarded Pilate as less guilty than the Jews. As Pilate led Him forth, and saw Him stand before that shameful yelling multitude in His majesty of solemn woe, he broke forth into the involuntary exclamation, "Behold your King!" That word raised among the multitude some

very ominous allusions to Caesar, and Pilate, after publicly washing his hands, in token that he was innocent of this death, pronounced the fatal order for His crucifixion.

Jesus was then clad in His own garments and led forth with two robbers to be crucified. As He was unable to bear the weight of His cross, Simon of Cyrene was impressed for that service. On His way Jesus gently consoled the weeping daughters of Jerusalem, and, when they reached the fatal spot of Golgotha, He refused the stupefying potion which was offered to Him, and prayed for His murderers even as they drove the nails through His hands. Pilate managed to insult the Jews by putting over the cross the title "The King of the Jews," in three languages, which thus in the presence of the vast passover multitude testified to the truth. On the cross Jesus hung for three hours in agony. The soldiers parted His garments, and cast lots for His seamless robe. The mob, the priests, even the crucified malefactors, joined in taunting Him. But He answered not. After His prayer for His murderers He only spoke to promise paradise to the penitent robber; to assign His mother to the care of the beloved disciple; to quote in the lowest depth of His agony the first words of the 22d Psalm; to give vent to the sole expression of physical anguish which He uttered, "I thirst"; to commend His spirit into His Father's hands; and lastly, in the one victorious word *Τετέλεσται*, "it is finished," to end His work on earth. The bearing of Jesus on the cross, together with the circumstances which accompanied the crucifixion—the darkness, earthquake, and rending of the temple veil—produced a deep impression even on the mind of the heathen centurion. They so powerfully affected the multitude that they returned to Jerusalem wailing and beating on their breasts, at once with a feeling of guilt and a presentiment of future retribution.

(8) At evening the soldiers despatched the two crucified robbers by breaking their legs, in order that their bodies might be removed before the passover. But they found Jesus already dead, and the certainty of His death was assured by one of the soldiers driving his spear into the region of the heart, whence came out blood and water. As very little time was left before the sunset marked the beginning of the Sabbath, and rendered labour impossible, the body of Jesus was hastily buried by Nicodemus and by Joseph of Arimathea, who had obtained the requisite permission. They wrapped it in fine linen and spices, and laid it in the rockhewn garden-grave of Joseph, rolling a great stone to the aperture, which was further guarded by soldiers sent by the Jews to prevent its removal for purposes of fraud. This was on Friday evening. Very early on the morning of Sunday, while it was yet dark, the two Marys were met at the sepulchre by a vision of angels which announced His resurrection. Of that resurrection, in spite of their original doubts and misgivings, the whole body of the disciples became unalterably convinced, and on their unalterable conviction, and the subsequent witness of history to the blessed truth of their doctrines, has rested in great measure the belief of the Christian church. Uniting the contemporary testimony of St Paul, who must have been in personal communication with many of the five hundred witnesses to whose evidence he appeals, with those of the Gospels, we find ten recorded appearances—(1) to Mary Magdalene (John xx. 17); (2) to other women (Matt. xxviii. 9, 10); (3) to Peter (Luke xxiv. 34; 1 Cor. xv. 5); (4) to the two disciples on their way to Emmaus (Luke xxiv. 13-32); (5) to the ten apostles. All these appearances occurred on the first Easter day. On the following Sunday Jesus appeared (6) to the eleven apostles, Thomas having been absent on the previous occasion. He further appeared (7) to seven apostles by the Sea of Galilee (John xxi. 1-24);

(8) to more than five hundred at once on a mountain in Galilee; (9) to James (1 Cor. xv. 3, 8); and (10) at the ascension. These appearances continued for forty days. On the last occasion Jesus led His disciples towards Bethany, gave them His last command, blessed them, and as He blessed them passed away, and "a cloud received Him out of their sight."

VI. Such, in briefest outline, are the main recorded events of the life of Jesus Christ on earth. It only remains to say a few words concerning His person and His work, regarded here in their historical rather than in their theological aspect.

As regards His person, Christians who accept the New Testament as the record of inspired teaching, and who believe it to be evidenced, not only by inward and supernatural revelation, but also by the subsequent history of the church and the world, believe that Jesus Christ was (in the words of what is probably a very ancient Christian hymn quoted by St Paul) the only begotten Son of God, "manifest in the flesh, justified by the Spirit, seen of angels, preached unto the Gentiles, believed on in the world, received up into glory";¹ and as a part of this belief they hold that, just as Adam the first man was not born but created, so the second Adam, who came to redeem our nature, was not born by ordinary generation but was "incarnate by the Holy Ghost of the Virgin Mary." But even those who do not accept this faith see in Jesus a unique and sinless personality, one with whom no other human being can even distantly be compared, either in His character, His teaching, or the results which He accomplished by His brief ministry. He taught but for three years, and not continuously even during them. He accepted the most ordinary customs of the teachers of His day. He wore no broad phylacteries like the Pharisees; He was not emaciated with asceticism like the Essenes; He preached the kingdom of God, not, as John had done, between the gloomy precipices of the wilderness, but from the homely platform of the synagogue, to give the Midrash when the Torah had been read.² He appeared before the people, not in the hairy mantle of a prophet, but "in the ordinary dress of a Jewish man, at the four ends of which the customary tassels were not wanting."³ He came "eating and drinking"; He had no human learning; His rank was but that of a village carpenter; He checked all political excitement; He directed that respect should be paid to all the recognized rulers, whether heathen or Jewish, and even to the religious teachers of the nation; He was obedient to the Mosaic law; His followers were "unlearned and ignorant men" chosen from the humblest of the people. Yet He has, as a simple matter of fact, altered the whole current of the stream of history; He closed all the history of the past, and inaugurated all the history of the future, and all the most brilliant and civilized nations of the world worship Him as God. Kant testifies to His ideal perfection.⁴ Hegel saw in Him the union of the human and the divine. Even the most advanced of sceptics do Him homage. Spinoza spoke of Him as the truest symbol of heavenly wisdom. The beauty and grandeur of His life overawed even the flippant soul of Voltaire.⁵ "Between Him and whoever else in the world," said Napoleon I. at St Helena, "there is no possible term of comparison."⁶ "If the life and death of Socrates are

those of a sage," said Rousseau, "the life and death of Jesus are those of a God."¹ "He is," says Strauss, "the highest object we can possibly imagine with respect to religion, the Being without whose presence in the mind perfect piety is impossible."² "The Christ of the Gospels," says Renan, "is the most beautiful incarnation of God in the most beautiful of forms. His beauty is eternal; His reign will never end."³ John Stuart Mill spoke of Him as "a man charged with a special, express, and unique commission from God to lead mankind to truth and virtue."⁴

The transcendent power of His personality, which is betokened in such expressions as those quoted above, is due, not only to His devotion and self-sacrifice, but to His absolute sinlessness. This constitutes the unique character of His individuality. He alone of mankind has claimed to be sinless, and has had the claim granted by unanimous consent both in His lifetime and in subsequent ages. He alone among men has never even been assailed by the breath of moral calumny, and never even in His most sacred utterances and prayers betrayed the faintest consciousness of any evil as present in His soul. He therefore alone has furnished mankind with a perfect ideal; and, though no saint has ever even distantly attained to the perfectness of that ideal, yet those who have done so in greatest measure have always said that they have done so solely by the aid of His grace, and the imitation of His example.

Nor was His teaching less unique than His personality. It was marked by a tone of sovereign authority; "Ye have heard that it was said—but I say unto you." In this it was the very opposite to the teaching of His own day and of centuries afterwards, which relied exclusively upon precedent. It was also marked by absolute originality. The test of its originality is the world's acceptance of it as specifically His. Isolated fragments of it may be compared with truths uttered by others; but it stands alone in its breadth and in its power, in its absence of narrow exclusiveness and scholastic system and abstract speculation. It was fresh, simple, natural, abounding in illustrations at once the most beautiful and the most intelligible, drawn from all the common sights and sounds of nature, and all the daily incidents and objects of social and domestic life. It flowed forth without reserve to all and on every fitting occasion,—on the road, on the hillside, on the lake, or by the lonely well, or at the banquet whether of the Pharisee or the publican. Expressed in the form of parables, it has seized the imagination of mankind with a force and tenacity which is not distantly approached even by the sacred writers, and even when not directly parabolic it was so full of picturesque and directness that there is not one recorded sentence of it which has not been treasured up in the memory of mankind. His utterances not only rival and surpass all that preceded and all that has followed them, but "they complement all beginnings." Sometimes they consist of short suggestive sayings (gnomes), full of depth, yet free from all affectation or obscurity,⁵ which make even what is most mysterious and spiritual humanly perceptible, throwing over it the glamour both of poetry and of a long-lingering presentiment, and incessantly enticing man towards something yet higher. There is never in them a lurking fallacy nor a superfluous word, but all is "vivacity, nature, intelligibility, directly enlightening grace," intended only to convince and to save. And while such was the incompar-

able form of His teaching, its force was even more remarkable. It is all centred in the two great truths of the Fatherhood of God and the brotherhood of man; from the former springs every truth of theology, from the latter every application of morals. Judaism had sunk into a religion of hatreds; the one message of Jesus was love. In this He differs even from John the Baptist and the prophets. "Their emblem is the storms, His the sun."

Once more,—as regards the work of Jesus, the Christian believer contemplates it in that aspect in which it is presented by St Paul as a work of atonement, the redemption of a guilty race;⁶ but even apart from this the mere historical student must admit that Christ elevated both the individual and the race as none have ever done before or since. His doctrine purified the world from the loathly degradation of lust and luxury into which society had fallen. By convincing men of the inherent dignity of manhood, He added to the value of human life. He made holiness a common possession. Heathen morality had reached its loftiest point in the Stoic philosophy; but Stoicism was scornful, ineffectual, despairing, and Christ gave a moral system infinitely more perfect, more hopeful, and more tender to all mankind. To Him is alone due the Christian significance of such words as charity, humility, and humanity. He first taught the sacredness of the body as a temple of the Holy Ghost. He has inspired the aims of the noblest culture, while at the same time He has restored the souls of men, and made the care of the moral and spiritual being the supreme end of life. The gradual emancipation of the world from the tyrannies of sensuality, cruelty, and serfdom has been won step after step from His principles. The supremacy of the spiritual, the solidarity of nations, the universality of God's love, the essential equality of all men in His sight, are but a few of the great and fruitful conceptions which have sprung directly from His teaching, and which still have an unexhausted force, to bring about, in ever-increasing measure, the amelioration of the world.

VII. It only remains to touch on the growth and progress of Christian doctrine relative to the Person of Christ. It would have been impossible for the Christian world to have drawn from the teaching of the apostles and evangelists any other conclusion respecting Jesus than that He was more than man,—that He was "God manifest in the flesh." The Gospels spoke of His incarnation, His sinlessness, His miraculous power, His claims for loftier than would have been possible to any man, His fearless conjunction of His own name with that of the Eternal Creator. Altho the Gospels and the Epistles testify to His pre-existence (John i. 15, vi. 52, viii. 58), His eternal existence (1 Pet. i. 18-20; Phil. ii. 6, 7; Rev. i. 11), His part in the creation of the world (Heb. i. 11), His miracles of power; and they speak of Him in terms incompatible with simple humanity.⁷ It is indisputable that no Christian, who accepted as divine revelations the writings of St John and of St Paul, could possibly suppose that the Saviour, in whom he was taught to trust, and into whose name he was baptized, was a mere human being like himself. And yet, that Jesus was perfectly human, as well as divine, they could not for a single moment doubt. He was born of a woman. He grew like other children. He suffered hunger, and thirst, and weariness, and pain, and wounds, and death. He had flesh and bones like all other men, and passed through the stages of life as others do. And His soul was a human soul no less than His body was a human body, for He increased gradually in wisdom no less than in stature; and felt sorrow and sympathy, and was subject to temptation, and was liable to the common emotions of our mortal nature.

With these facts the earliest teachers of the church were content. When they had asserted that Christ was both human and divine, "born and unborn, God in flesh, life in death, born of Mary and born of God" (Iren., *Ep. ad Ephes.*, 7), they entered into no speculations respecting the mode and definition of that union of natures. But such reticence soon became impossible. The doctrine of a God-man was openly asserted or secretly undermined by twofold

forms of heresy—partly by Jewish Ebionites, partly by Gentile Docetæ. The Ebionites, the Nazarenes, the followers of Artemon, the Alogi, and many sects allied to them in their main principle, denied the true divinity of Christ. In the opposite direction many of the Gnostic sects entirely explained away His humanity, either with the Basilidians supposing that He only became divine at His baptism, or holding with the Valentinians that Mary was only the channel by which He entered the world. To both these conflicting fancies the orthodox fathers opposed the simple statement of St John that "the Logos became flesh." But, as was natural, their opinions were as yet vague and even in some instances erroneous. Thus Justin Martyr thought that in Christ the Logos took the place of the human intelligence (*Apol. mem.*, ch. x.). Clement of Alexandria thought that the human needs and sufferings were only apparent, or by way of "accommodation" (*Ædæ.*, i. 5, p. 112, *Seron.*, vi. 3, p. 775, ed. Syll.). Origen had clearer views, and was the first to use the term God-man (*ἡσέθωπος*), as well as to guard against the double error of excluding the Logos from Christ, or of confounding the Logos with the existence of the human Christ (*Hom. in Ezek.* vii. 8, *C. Cels.*, iii. 20). It is, however, important to observe that the existence of technical errors of theology in the modes of expressing this doctrine adopted by the Ante-Nicene fathers was freely admitted, and was not regarded as formal heresy. Their individual insight was not sufficient to enable them to arrive at those careful scholastic distinctions to which the Church was only guided by the collective wisdom of ecumenical councils after periods of long and painful conflict. The remarks of St Jerome on the real orthodoxy of the early fathers are both charitable and explicit. "It may be," he says, "that they erred in simplicity, and that they wrote in another sense, or that their writings were gradually corrupted by unskillful transcribers; and, certainly, before Arius like 'the destruction that wasteth at noonday' was born in Alexandria, they made statements incautiously which are open to the misinterpretations of the perverse." We find a remarkable illustration of the extent to which the terminology was as yet unsettled in the fact that the council at Antioch which condemned Paul of Samosata in 269 also condemned the expression *homoiouios* ("consubstantial"), which a century afterwards became the very watchword of Nicene orthodoxy.¹

By the 3d century the Ebionizing heresies were practically dead, but the Docetæ were still flourishing in various forms. Two sects had arisen; one was that of the Patripassians, who so completely obliterated all real distinction between the first and second person of the Trinity as to lay themselves open to the charge of teaching that the Supreme Father had been crucified. Thus Praxeas taught that the same God is at once the Father and Son. Noetus of Smyrna, who banished from Ephesus, taught these notions at Rome, and even the Popes Zephyrinus and Callistus seem to have been inured with them. Sabellius, a presbyter of Ptolemais, elaborated these opinions into a system in which Father, Son, and Holy Spirit were only three modes of manifestation, three names, three aspects of the divine nature, revealing itself under the different forms (Greg Nyss, *Orat. c. Arrian. et Sabell.*). The Monarchians, on the other hand, in their equal anxiety to avoid all danger of Dithisism and Trithisism, admitted the supernatural birth of Christ, but only saw in Him the holiest of the prophets; these views were expounded at Rome by Theodotus of Byzantium, who was consequently expelled from the church by Pope Victor. The heresies of Paul of Samosata, the vain and brilliant patriarch of Antioch, seem to have originated in an unhappy attempt to reconcile the views of these Monarchian sects by teaching that not the whole divine nature was manifested in Christ, but only one single divine power. He thus distinguished between the Logos and the human Son of God. He was banished and died in obscurity, but the sect, which was generally called Patripassian in the West and Sabellian in the East, continued to linger on for a time.

All these controversies were but preludes to the great struggle of the church against Arianism. Hiltherto she had condemned the Noëtians and Sabellians for denying the hypostasis of the Son as distinct from the Father, and the Theodotians and Ebionites for denying His divinity. Arius, a presbyter of Alexandria, admitted both the divine and the human nature of Christ, but by making Him subordinate to God denied His divinity in its highest sense. He was led to this error by the reaction against Sabellianism, and he ranked the Son among created beings, saying that "there was (a time) when He was not." Arius was deposed and excommunicated by a council at Alexandria, but since many bishops, and among them the distinguished Eusebius of Cæsarea, and Eusebius of Nicomedia, interceded in his favour, the dispute assumed such wide proportions that Constantine was compelled to intervene by summoning in 325 the first ecumenical council of Nice. By this council the doctrine of Arius was condemned, and it was declared to be a matter of the Catholic faith that the Son was not only of like essence (*homoiousios*) but of the same essence (*homoousios*) with the Father. It was long, however, before the voice of controversy was silenced.

Many bishops still continued to be on the one hand Arius or Semi-Arian, while on the other hand men of great power and enlightenment, like Marcellus of Ancyra and Photinus of Sirmium, shied back into dangerous affinity to Sabellianism. It was in consequence of a similar reaction that Apollinaris, bishop of Laodicea, in the desire to maintain the glory of Christ, fell into a new heresy and revived an old error, by arguing that in Jesus the Logos supplied the place of the reasonable soul. It is obvious that such a view undermined the doctrine of the example and atonement of Christ, and it was condemned in 381 at the council of Constantinople.

The next great controversy arose from the refusal of Nestorius, patriarch of Constantinople, to apply to the Virgin Mary the term *Theotokos* or mother of God. In his endeavour to avoid the extremes which had already been condemned, he spoke of the union of the two natures in Christ as a connexion (*συνδεσις*) or indwelling (*ἐνσκήσις*), but denied that there was any communication of attributes (*κοινωνία διακρίσεων*). He maintained, in fact, a mechanical rather than a supernatural union of the two natures. He was condemned in the council of Ephesus, 431, and died in exile, but the schools of Edessa and Nisibis still maintained the Nestorian doctrine, which has continued in the East even till the present day.

The last great controversy on the two natures was raised by Eutyches, archimandrite of Constantinople, who confounded together the two natures which Nestorius had separated, thus inaugurating what is known as the Monophysite heresy, which was condemned in the council of Chalcedon, 451. It is needless to explain the obscure heresies of Theopaschites, Pthartelaites, Aphthartodocetæ, or to do more than name the views of the Monothelites, who strove to put an end to controversy by maintaining that though there were two natures in Christ there was only one will. The main results at which the church arrived cannot be better summed up than they are in an admirable passage of Hooker (*Ædæ. Pol.*, v. 64, 10): "There are but four things which concern to make complete the whole state of our Lord Jesus Christ. His deity, His manhood, the conjunction of both, and the distinction of the one from the other being joined in one. Four principal heresies there are which have in those things withstood the truth: Arians by bending themselves against the deity of Christ; Apollinarians by naming and misinterpreting that which belongeth to His human nature; Nestorians by rendering Christ asunder and dividing Him into two persons; the followers of Eutyches by confounding in Him person those natures which they could distinguish. Against these there have been four most ancient general councils: the council of Nice to define against Arians; against Apollinarians the council of Constantinople; the council of Ephesus against Nestorians; against Eutychians the Chalcedon council. In four words ἀρεῖς, τελέως, ἀδιαφύκτος, ἀσυγχύτως, truly, perfectly, indivisibly, distinctly—the first applied to His being God, the second to His being man, the third to His being of both One, and the fourth to His still continuing of that one Both—we may fully, by way of abridgement, comprise whatever antiquity hath at large handled either in declaration of Christian belief, or in refutation of the fore-said heresies." The result of those centuries of controversy was enshrined in the so-called Nicene creed—"the holy symbol declared at Nice, established at Constantinople, strengthened at Ephesus, sealed at Chalcedon."

When the church had thus rigidly defined the limits of Catholic orthodoxy, the decisions of the four ecumenical councils were accepted, and no further controversies arose on these subjects for about 800 years. The disputes between the Western and the Eastern, and the speculations of the Schoolmen generally as regards this subject, turned rather on the proofs or illustrations of the doctrine of the Trinity than on theories respecting the two natures of Christ. There are remarks and illustrations not only in the Schoolmen but even in the Reformers which might be regarded as questionable, but none of them were intended to diverge from the Catholic verity. Passing over the crude system of Servetus, we hear of Unitarian communities in Poland as early as 1563. In 1544 Lælius Socinus had been obliged to leave Italy because his opinions were known to be unfavourable to the divinity of Christ. On his death at Zurich in 1622 his nephew Faustus Socinus openly taught the opinions which he had learnt from his uncle's papers, and acquired a considerable following in Poland. The exoteric methods of Socinianism were so weak, and its rupture with Christian history so absolute, that the special views of the Socini—which was that Christ, though miraculously born, was only the highest of men, and was deified after His death as a reward for His virtues—have had an indirect rather than a direct influence. In 1611 three men were burnt in England for denying the doctrine of the Trinity, but in the middle of the 17th century we find John Biddle recognized as a leader of the Unitarians, and the spread of Unitarian doctrines led Bull to write his celebrated *Defensio Fidei Nicænæ* in 1635. The first Unitarian church in England was founded in 1773 by Lindsay. The writings of Spinoza and of the English deists—Herbert, Toland, Shaftesbury, Chubb, Bolingbroke—helped largely to weaken the orthodox faith. But in later periods it has been rather undermined than denied.

¹ Mansi, i. 1001; Euseb., *J. E.*, vii. 27-30; Epihan., *Æræ.*, lxx. 1.

mentioned by Solinus; but it was certainly used there in pre-Roman times. Barrows of the Bronze Age have yielded beads, buttons, rings, armlets, and other personal ornaments of jet. The early supply was probably obtained from the Yorkshire coast, near Whitby—a locality which still yields the finest varieties. The Whitby jet occurs in isolated masses, of irregular shape, but frequently more or less lenticular, imbedded in bituminous shales near the base of the Upper Lias. The particular horizon of the jet-rock is known to geologists as the zone of *Ammonites serpentinus*. Opinion is divided as to the exact nature and origin of the jet: some regard it as a variety of lignite, others as a kind of cannel coal, and others again as a hardened form of bitumen. There is little doubt that the jet has in all cases resulted from the decay of organic matter. Microscopic sections of jet frequently reveal a ligneous structure, in most cases of coniferous type. It has been suggested that masses of wood brought down by a river have drifted out to sea, where, becoming water-logged, they have sunk and have gradually been covered with a deposit of fine black mud, beneath which the decay has slowly proceeded. Possibly bituminous matter may have been distilled from this decaying vegetation, and deposited between the layers of shale in its neighbourhood. Drops of liquid bitumen are frequently found in the fossils of the jet-rock, and inflammable gas, derived from the bituminous shales, is not uncommon in the jet-mines. Moreover, scales of fish and other fossils of the jet-rock are frequently converted into jet, the bituminous matter having replaced the original tissues. When jet is heated, it betrays its bituminous character by burning with a dense pungent smoke, which was formerly reputed to possess powerful medicinal virtues. At present the material is used only for trivial ornaments, principally for mourning jewellery. To obtain jet, the shale is systematically mined not only at its outcrop in the cliffs but in the inland dales of the Cleveland district. It is now rare to find washed jet upon the sea-shore, but formerly a considerable quantity was thus obtained. The best hard jet is exceedingly tough, and may be readily carved or turned on the lathe, while its compact texture allows it to receive a high polish. The final polish is given by means of rouges, which produces a beautiful velvety surface. The softer kinds, not capable of being freely worked, are known as bastard jet. From the estuarine beds of the Lower Oolites of Yorkshire, a soft jet is obtained; but, though occasionally used for ornamental purposes, it is far inferior to the true Whitby jet. Spanish jet has been largely imported into Whitby, but is deficient in hardness and lustre. Cannel coal from Scotland is occasionally used in the place of jet; and it is not uncommon for brooches to be made of a carving of Whitby jet set in a plain polished rim of either Spanish jet or cannel.

For descriptions of jet and jet-working see *The Yorkshire Lias*, by Ralph Tate and J. P. Blake, 1876; and a paper on *Whitby Jet*, by J. A. Bower, in *Jour. Soc. Arts*, December 19, 1873.

JEW, THE WANDERING. The legend of a Jew doomed to wander until the day of judgment, for an insult offered to Christ, is first mentioned by Roger of Wendover in the Chronicle completed by Matthew Paris, who received the story from an Armenian bishop, who visited England in the year 1228. As told in Matthew's *Historia Major*, the legend runs that the wanderer's name was Cartaphilus, that he was doorkeeper of Pilate's palace, and that as Jesus was led out to be crucified he struck him on the neck, saying, "Go, Jesus, go on faster; why dost thou linger?" Jesus replied, "I go, but thou shalt remain waiting till I return." The Armenian bishop, if his French servant and interpreter is to be trusted, said that this wanderer had dined with him shortly before his leaving home, and that he was now a penitent man and had

been baptized by Ananias, who also baptized Paul, under the name of Joseph. At the time of the crucifixion he was thirty years of age; whenever he reaches the age of one hundred he becomes faint, and when he becomes conscious again he is as young as when his doom was pronounced. He never smiles, refuses all gifts, and narrates many ancient events to those who come from far and near to listen. On the same authority rests the somewhat later account by Philippe de Mousket in his *Chronique rimée*. The English chronicler states that the bishop's statement was in reply to a question whether he had seen or heard of one Joseph, said to have been present at the crucifixion to be preserved in the world as a witness of that event. It would appear, therefore, that there was already in existence a legend of an undying Jew, although nothing was intimated of his insult to Christ. The idea of wandering did not enter into the legend until a later period, when persons pretending to be the undying Jew appeared in various parts of Europe. Near the middle of the 16th century the legend appears in Germany, brought there by a man who professed to be the "Ewige Jude" himself. He appeared at Hamburg, in 1547, giving his name as Ahasuerus, and stating that he had been a shoemaker in Jerusalem who would not suffer Christ to rest at his door when fainting under the weight of the cross. He struck Jesus, and bade him move on. Jesus said, "I will stand here and rest, but thou shalt go on until the last day." This story, however, also rests upon the authority of an irresponsible reporter. It is attributed to Dr Paulus von Eizen, bishop of Schleswig, whose long conversations with Ahasuerus are given, in a work by one Chrysostomus Duduleus Westphalus,—probably a pseudonym. This was published some years after the death of Paulus von Eizen, which occurred in 1598, and its aim is to make the story as sensational as possible as a "warning." This earliest known book on the legend, published at Leipzig, 1602, professes to be derived from a previous one:—*Strange Report of a Jew born at Jerusalem, who pretends he was present at the crucifixion of Christ, newly printed at Leyden*. Other small works appeared somewhat later, as at "Augsburg, 1619," and elsewhere, and were continued throughout the 17th century, these containing rumours of the Jew's appearance in Hamburg, Dantzic, Naumburg, Lübeck, Brussels, Moscow, and Madrid. Rudolph Botorescu, parliamentary advocate of Paris (*Comm. histor.*, 1604), mentions contentiously the rumours of the appearance of this Jew in Germany, Spain, and Italy, and the popular credulity. The most important account of any of these monomaniacs or pretenders is that given of one in Paris (1644) by *The Turkish Spy* (book iii., letter i.). "One day I had the curiosity to discourse with him in several languages; and I found him master of all those I could speak. I conversed with him five or six hours together in Arabic." "The common people are ready to adore him; and the very fear of the multitude restrains the magistrates from offering any violence to this impostor." From a letter of Madame de Mazarin to Madame de Bouillon, it appears that an individual appeared in England in the beginning of the 18th century professing to have been an officer of rank in Jerusalem who for an insult given to Jesus was doomed to live and wander. It is said that the universities sent professors to cross-examine him, and that many were satisfied of the truth of his story. Several pretenders of the kind appeared in England in the last century. Brand remembered to have seen one going about the streets of Newcastle muttering "Poor John alone." It is difficult, however, to discover whether in all these cases the rôle of the Wandering Jew was assumed or was added to aged beggars by popular credulity.

The names given to these wanderers are various. Cartaphilus is probably *καρτα φιλος*, the "much beloved."

in allusion to St John, who was believed to "tarry" until the coming of Christ. Joseph was perhaps caught from the legend of Joseph of Arimathea, who was said to have wandered into Britain in the year 63, when his flowering staff indicated the spot where Glastonbury abbey should be built. *The Turkish Spy* in Paris gives his name as Michob Adar; Libavius (*Praxis Alchymia*) as Butadæus. In Brussels he was called Isaac Laquedem, a name believed by Grässe to be the French *la* combined with *kedem*, Heb. for "aforetime." Mr Karl Blind has suggested that his name in Germany, Ahasuerus, may have been formed out of a corruption of As-Vidar, "god Vidar,"—the Teutonic deity who was to survive the destruction of the world and conquer the wolf Fenris by thrusting his foot covered with an enormous shoe down the monster's throat (*Gentleman's Magazine*, July 1880). This ingenious suggestion would account for the transformation of the wanderer between 1328, when the Armenian bishop described him as Pilate's doorkeeper, and 1547, when he claims to have been a shoemaker. For a long time there were kept at Bern and also at Ulm enormous pairs of shoes said to have been left by the Wandering Jew on his visits to those places.

The legend of the Wandering Jew seems clearly related to a class of myths, found in every part of the world, in which certain saints or heroes are represented as having never died. Many of these myths,—as those of King Arthur, Charlemagne, Barbarossa, Tell,—are no doubt ethnically connected; but the corresponding myths found among the Incas, and among various American tribes, may lead us to seek for a common root of them all in human nature,—in the unwillingness of men to believe that their heroes can be really dead. In a primitive race, which had not yet conceived the idea of alimistic immortality, the notion of a continued existence in happy isles, valleys, or grottoes, would naturally arise. The earliest instance of this earthly immortality would appear to be that of the Persian Yima, king of the Golden Age, who, in the Zend-Avesta, "gathers around him men and animals in flocks, and fills the earth with them, and after the evils of winter had come over his territories leads a select number of the beings of the good creation to a secluded spot, where they enjoy uninterrupted happiness" (Haug's *Essays*, &c., p. 277). In a corresponding phase of development the Semitic races ascribed a similar terrestrial immortality to Enoch, Elijah, and some others. The Arabs have very particular accounts of the secret abodes of these; and there are indications that in Eastern folklore Moses was believed to be sleeping in his unknown sepulchre.

By the action of religious dualism on this belief there arose evil counterparts of the immortal heroes, who instead of dwelling in blissful retreats were doomed to wander without finding even the repose of the grave. Of this class Cain was the most conspicuous, and the Bedouin still feels his presence in the feverish desert-winds (Cain-winds), as the Picardy peasant says of a destructive gale, *C'est le juif errant qui passe*. Esau, Ishmael, and others have been evil wanderers in the superstitions of various localities; but there is one tradition of high antiquity which would appear to have especially prepared the way for our legend. It is related by G. Weil (*The Bible, the Koran, and the Talmud*, p. 127) that, according to this tradition, the golden calf was made by Al Samiri. Moses was about to put this man to death when Allah declared he should be banished. "Ever since that time he (Samiri) roams like a wild beast throughout the world; every one shuns him, and purifies the ground on which his feet have stood; and he himself, whenever he approaches men, exclaims, Touch me not!" There also arose a belief that this monster dwelt with his progeny on a rocky island in the Arabian

Gulf, from which emanated the plague (Sale, *Koran*, xx.).

These traditions were inherited by the folklore of Christendom. The mantle of Enoch and Elijah, and other saintly sleepers, fell upon the seven supposed to be slumbering in a cave near Ephesus, near to the slumbering St John, belief in whose earthly immortality is mentioned in the New Testament (John xxi. 23). On the other hand, the mantle of Cain and other evil wanderers would seem to have fallen on Nero, who for some time after his death was believed by friend and foe to be still living. At a later period, after Rome had been Christianized, the idea of a perpetual enemy of the Messiah was temporarily detached from any one man and personified as Antichrist,—a restless invisible spirit appointed by the adversary to resist the rival kingdom. This more abstract conception was prolific of evil wanderers. When, in course of the diffusion of Christianity throughout Europe, its missionaries came in contact with popular beliefs in deities which in many cases had been developed from traditional heroes and warriors,—such as Odin, Valdemar, Vidar,—these imaginary potentates were degraded into phantoms, demons; the brand of Cain was set on their names by solemn anathema, and thenceforth all regions of space had their doomed wanderers,—the Wild Huntsman in the air, the Flying Dutchman on the sea, and various forest-phantoms like the Gros Veneur of Fontainebleau and Diedrich of Bern on the earth. The Jewish race, however, was the one race which did not yield to Christianity; its special identification with Antichrist was therefore inevitable. Many superstitions affecting them had long been accumulating. There was a belief that the seven whistlers—plovers or sometimes wild geese—were Jews that had been transformed because they had assisted in the crucifixion of Christ, and to see or hear those birds was regarded as ominous of disaster. The Witch Sabbaths were so called because the Jews were supposed to assemble at them. Their wealth was believed to be obtained from Satan. There was also a belief that they carried about plagues. This idea may partly have been derived from the tradition of Samiri and his island, already mentioned, but possibly derived some confirmation from the actual results of crowding the Jews into the confined and neglected quarters of cities, in disregard of sanitary laws. From innumerable sources like these gathered the cloud of fanaticism which sent its thunderbolts upon the Jewish people. The legend of the Wandering Jew, when it was pieced together, represented precisely the popular belief that this race, having betrayed its supernatural mission, had received a supernatural doom. The legendary figure was invested with the fatal associations of most of the demons which Christianity had degraded. He passed in the storm, presided at orgies, diffused diseases, instigated revolutions, burned cities. He was not only associated with European demons but with those of the Jewish race also. There was a wild fable about Judas,—that he had fulfilled a fearful dream of his mother before his birth, living, despite her throwing him into the sea, to "kill his father and sell his God,"—which reappears in our legend. Judas was said to have become page to Pilate, as Cartaphilus was his doorkeeper. Death refused to touch Judas until his doom had been fulfilled, as it spared the Wandering Jew. In the familiar legend of the discovery of the True Cross, the Jew who, after torture, points out its place of concealment to Helena is named Judas; and M. Magnin has plausibly suggested that the story of the Wandering Jew grew up in connexion with the True Cross legend. As Cain was a prototype of Judas, so was Judas of such doomed wanderers as Malchus in Italy and Ahasuerus in Germany. M. Gaston Paris believes the legend of

Malchus to be the earlier. He was said to have struck Jesus with an iron bar, and to have been condemned to walk until judgment-day around a subterranean column, against which he often dashed his head in the vain hope of death.

The respect shown by peasants to persons pretending to be the Wandering Jew was such as might have been expected for Cain with a mark upon his brow defending him from the hand of man. Such a mark was indeed supposed to be on the Wandering Jew's forehead. Xenola says it was a red cross concealed by a black bandage, on which account the Inquisition vainly tried to find him. While persecuting actual Jews, the peasantry had some compassion for this imaginary one, and in some parts of Germany two harrows were sometimes left in the field, set up together with teeth downward, it being believed that so the wanderer might obtain a night's rest.

The Wandering Jew has been a favourite subject of poetry and romance. Goethe (*Dichtung und Wahrheit*, xv.) has given the scheme of a dramatic poem on the theme which he had contemplated. It has been followed by C. F. D. Schubart, *Der ewige Jude*, 1787; A. W. Schlegel, *Warnung*, 1811; Aloys Schreiber, *Der ewige Jude*, 1837; W. Müller, *Wanderbilder*, 1836; Edgar Quinet, *Ahasuerus*, 1838; Chausso, *Neuer Ahasuer*, 1855; P. Hautrel, *Ahasuerus*, 1838; Julius Moser, *Ahasuer*, 1833; Ludwig Köhler, *Der neue Ahasuer*, 1841; Nicolas Lennau, *Ahasuer*, 1843; H. C. Andersen, *Ahasuerus*, 1847; E. Grenier, *La mort du Juif-Errant*, 1857; Dönniger (1831) and Wordsworth have written lyrical poems on the subject. Shelley evokes the Wandering Jew six times, notably in his *Queen Mab*. In 1812 a comedy based on the legend by Cinguez was performed in Paris. Klingemann's tragedy *Ahasuerus* (1827) was successful as a play. Eugene Sue's romance (1844), which stimulated popular interest in the legend, has also been often acted. Several German novels have been founded on the legend, the most important being those of Franz Horn, Th. Oelckers, and F. Laun. In England, where the legend had been made familiar by the ballad in *Perry's Reliques*, there was acted at Drury Lane, in 1797, a comedy by Andrew Franklin, entitled *The Wandering Jew*, or *Love's Misadventure*. George Croly's novel *Salathiel* is on this subject. See Dr J. G. Th. Grasse, *Die Sage vom Zwergen Juden, Jüdische antike Welt*, ss. Dresd and Leipzig, 1844; Herzog's *Real-Encyclopädie*, Friedrich Hildig, *Die Sage vom "Ewigen Juden," ihre praktische Wandlung vom Fortbildung*, Berlin, 1874; C. Scheibel, *La légende du Juif-Errant*, Paris, 1877; Gaston Paris, *Le Juif-Errant*, Paris, 1880. (M. D. C.)

JEWEL, or **JEWELL**, JOHN (1522–1571), bishop of Salisbury, was born May 24th 1522, at Berry Narbor, near Ilfracombe, Devonshire. At the age of thirteen he entered Merton College, Oxford, where he had for tutor John Parkhurst, afterwards bishop of Norwich, from whom his mind received a bias towards Protestantism. Becoming tutor in Corpus Christi College in 1539, he in his turn took the opportunity of inculcating Protestant principles on his pupils; and in 1540 he received an allowance from a private fund instituted for the benefit of indigent scholars who publicly professed the doctrines of the Reformed faith. After the accession of Mary in 1553 he was expelled by the fellows from the college on account of his opinions, and in a moment of weakness he was induced to sign his adherence to a form of doctrine essentially Romanistic. He, however, speedily repented of his momentary faithlessness to his convictions, and in order to escape the penalties of martyrdom he fled in 1555 to Frankfort, where he publicly abjured his former recantation. On the death of Mary he returned to England. He was one of the learned Protestant doctors appointed to dispute before Elizabeth at Westminster with a like number of Catholics. In the beginning of 1560 he was created bishop of Salisbury, and in the same year he published, with the sanction of the queen and bishops, his *Apologia Ecclesie Anglicane*, which was in fact an argument against the decision of the pope to exclude the Reformers from the council of Trent, convoked to be held in December of that year. The work, as was to be expected, excited very great

attention at the time; it was condemned at the meeting of the council, who appointed two divines to reply to its arguments. It was translated into English by Anna, wife of Sir Nicholas Bacon, and Elizabeth ordered that a copy of it should be chained in every parish church in England. Its chief English opponent was Thomas Harding, who in 1565 published a *Confutation of the Apology*, to which Jewel replied in 1567 by the *Defence of the Apology*. The general argument of Jewel is that unity or predominance of opinion is not a test of truth, and, although he denied that Rome had the support of the fathers, he rested his general case on the fact that the foundation on which the Church of England was built was not that of the fathers but of the apostles and Jesus Christ. His views were strongly anti-sacramentarian, as he held that the Lord's Supper had nothing more than a commemorative use. Jewel died suddenly at Monkton Farleigh, a small village in his diocese, September 22, 1571.

Jovannis Juellii vita et opera, T. Hurni, edo autore, was published at London in 1678. The *Apology*, translated with notes and life by Isaacson, appeared in 1828, and the other biographies of Jewel are one by Le Bas in the Theological Library, 1835, and a short sketch published by the Society for the Promotion of Christian Knowledge, 1856. His works, which are mostly controversial, were collected by Dr R. W. Jelf, and published in 8 vols. at Oxford, 1848.

JEWELLERY (*Latin, gaudium*; French, *jouel, joyau*). Plates. Personal ornaments appear to have been among the very XI, XII first objects on which the invention and ingenuity of man were exercised; and there is no record of any people so rude as not to employ some kind of personal decoration. Natural objects, such as small shells, dried berries, small perforated stones, feathers of variegated colours, were combined by stringing or tying together to ornament the head, neck, arms, and legs, the fingers, and even the toes, whilst the cartilages of the nose and ears were frequently perforated for the more ready suspension of suitable ornaments.

Amongst modern Oriental nations we find almost every kind of personal decoration, from the simple caste mark on the forehead of the Hindu to the gorgeous examples of beaten gold and silver work of the various cities and provinces of India. Nor are such decorations mere ornaments without use or meaning. The hook with its corresponding perforation or eye, the clasp, the buckle, the button, grew step by step into a special ornament, according to the rank, means, taste, and wants of the wearer, or became an evidence of the dignity of office. That these ornaments were considered to have some representative purpose even after death is abundantly proved; for it is in truth to the tombs of the various ancient peoples that we must look for evidence of the early existence of the jeweller's art.

That the Assyrians used personal decorations of a very distinct character, and possibly made of precious materials, is proved by the bas reliefs. In the British Museum we have a representation of Samsi Vul IV, king of Assyria (825 a.c.). He wears a cross (Plate XI, fig. 1) very similar to the Maltese cross of modern times. The still more ancient Egyptian jewellery is distinctly brought before us by the objects themselves, placed with the embalmed bodies of the former wearers in sarcophagi, only to be opened in our own time. The most remarkable collection of Egyptian art in this direction is to be found in the jewellery taken from the coffin of Queen Aah-hotep, discovered by M. Mariette in the entrance to the valley of the Tombs of the Kings in 1859, and now preserved in the Bâlik museum. In these objects we find the same ingenuity and perfect mastery of the materials as characterize the monumental work of the Egyptians. Hammered work, incised and chased work, the evidence of soldering, the combination of layers of gold plates, together with coloured stones, are all there,—the handicraft being complete in every respect.

A diadem of gold and enamel, found at the back of the head of the mummy of the queen (fig. 2), was fixed in the back hair, showing the cartouche in front. The box holding this cartouche has on the upper surface the titles of the king, "the son of the sun, Aahmes, living for ever and ever," in gold on a ground of lapis lazuli, with a chequered ornament in blue and red pastes, and a sphinx couchant on each side. A necklace of the order or decoration of the Fly (fig. 3) is entirely of gold, having a hook and loop to fasten it round the neck. A small porcelain cylinder (fig. 4) is ornamented with interlaced lotus flowers in intaglio, having a ring for suspension, and fig. 5 is a gold drop, inlaid with turquoise or blue paste, in the shape of a fig. A gold chain (fig. 7) is formed of wires closely plaited and very flexible, the ends terminating in the heads of water fowl, and having small rings to secure the collar behind. To the centre is suspended by a small ring a scarabæus of solid gold inlaid with lapis lazuli. These scarabæi were in constant use in Egyptian ornaments, and were worn in rings by the military caste. We have an example of a bracelet, similar to those in modern use (fig. 6), and worn by all persons of rank. It is formed of two pieces joined by a hinge, and is decorated with figures in repoussé with a ground inlaid with lapis lazuli. A signet ring (fig. 8) has a square revolving bezel on which are four serpents interlaced.

The discoveries of Dr Schliemann at Mycenæ and at Hissarlik, the assumed site of ancient Troy, supply further illustrations of ancient jewellery and gold work. In extent and in the wonderful character of the design and workmanship, the relics found at Mycenæ present the most perfect examples, although some of the objects brought from the "burnt city" at Hissarlik give evidence of singular skill and ingenuity in the methods of combining the various portions of an ornament and finesse in working the gold. From Mycenæ the objects ranged over most of the personal ornaments still in use: necklaces with gold beads and pendants, butterflies (fig. 16), cuttlefish (fig. 10), single and concentric circles, rosettes, and leafage, with perforations for attachment to clothing, crosses (fig. 9), and stars formed of combined crosses, with crosses in the centre forming spikes,—all elaborately ornamented in detail. The spiral forms an incessant decoration from its facile production and repetition by means of twisted gold wire. Grasshoppers or tree crickets in gold repoussé suspended by chains and probably used for the decoration of the hair, and a griffin (fig. 17), having the upper part of the body of an eagle and the lower parts of a lion, with wings decorated with spirals, are among the more remarkable examples of perforated ornaments for attachment to the clothing. There are also perforated ornaments belonging to necklaces, with intaglio engravings of such subjects as Hercules and the Nemean lion, and a duel of two warriors, possibly Hector and Achilles, one of whom stabs his antagonist in the throat. Another has a representation of a lion, very archaic in treatment, the style resembling that of the fore part of the lion found on the statue of Sardinia, attributed to Croesus, 560 B.C. There are also pinheads and brooches formed of two stags lying down (fig. 15), the bodies and necks crossing each other, and the horns meeting symmetrically above the heads, forming a finial. The heads of these ornaments were of gold, with silver blades or pointed pins inserted for use. The bodies of the two stags rest on fronds of the date-palm growing out of the stem which receives the pin. Another remarkable series is composed of figures of women with doves (fig. 20). Some have one dove resting on the head; others have three doves, one on the head and the others resting on arms. The arms in both instances are extended to the elbow, the hands being

placed on the breasts. These ornaments are also perforated, and were evidently sewed on the dresses, although there is some evidence that an example with three doves has been fastened with a pin.

Mention must be made of an extraordinary diadem found upon the head of one of the bodies discovered in the same tomb with many objects similar to those noticed above. It is 25 inches in length, covered with shield-like or rosette ornaments in repoussé, the relief being very low but perfectly distinct, and further ornamented by thirty-six large leaves of repoussé gold attached to it. As an example of design and perfection of detail, another smaller diadem found in another tomb may be noted (fig. 11). It is of gold plate, so thick as to require no "piping" at the back to sustain it; but in general the repoussé examples have a piping of copper wire. Diadems of similar form are found on statues of Aphrodite, and also on statuettes of Hercules in ivory, in the Assyrian collection at the British Museum. Fig. 13 represents a remarkably elegant pendant ornament, the design being of an exceptionally beautiful character. A cross of thin gold work formed of four leaves (fig. 18), a finial-like ornament (fig. 19), and the head of a pin or brooch evidently suggested by a butterfly (fig. 14), are all characteristic of the gold work of Mycenæ.

The gold ornaments found at Hissarlik, in what Dr Schliemann calls the "Treasury of Priam," partake in most instances of the same characteristics as those found in the sepulchres at Mycenæ. There are necklaces, brooches, bracelets (fig. 29), hair-pins (fig. 23), earrings (figs. 21, 22, 25, 26, 27, 28), with and without pendants, beads, and twisted wire drops. The majority of these are ornamented with spirals of twisted wire, or small rosettes, with fragments of stones in the centres. The twisted wire ornaments were evidently portions of necklaces. A circular plaque decorated with a rosette (fig. 30) is very similar to those found at Mycenæ, and a conventionalized eagle (fig. 31) is characteristic of much of the detail found at that place as well as at Hissarlik. They were all of pure gold, and the wire must have been drawn through a plate of harder metal—probably bronze. The principal ornaments differing from those found at Mycenæ are diadems or head fillets of pure hammered gold (fig. 24) cut into thin plates, attached to rings by double gold wires, and fastened together at the back with thin twisted wire. To these pendants (of which those at the two ends are nearly three times the length of those forming the central portions) are attached small figures, probably of idols. It has been assumed that these were worn across the forehead by women, the long pendants falling on each side of the face. If, however, the position on which they were found was formerly part of a temple instead of a palace, it may be suggested that they were used as veils for the priests when giving forth the oracles from the shrine.

Jewellery and gold work of a very similar character has been found at Cyprus within the last few years by Major Cesnola. The rings (Plate XII. figs. 5 and 6) have a great resemblance to the Greek, whilst the beetle, which is of green stone set in gold (fig. 6), has a very Egyptian-like appearance. The great similarity in design and workmanship between these Eastern examples and the gold jewellery and personal ornaments found in Peru and Mexico (figs. 1, 2, 3, 4) is not a little remarkable. These, however, are more rude in design, though equally good in workmanship.

Greek, Etruscan, and Roman ornaments partake of very similar characteristics. Of course there is variety in design and sometimes in treatment, but it does not rise to any special individuality. Fretwork is a distinguishing feature of all, together with the wave ornament, the

guilloche, and the occasional use of the human figure. The workmanship is often of a character which modern gold workers can only rival with their best skill, and can never surpass. The pendant oblong ornament for containing a scroll (Plate XI. fig. 34) is an example of this, as also the Italo-Greek earring (fig. 32). The earring (fig. 36) is an exquisite illustration of Greek skill in the introduction of the human figure; the rosette for concealing the hook and the winged ornament at the back of the Cupid are beautifully wrought. The other earrings (figs. 33, 35, 37) are all characteristic. The Etruscan examples are of the same character. The pendant (fig. 40), the rosette (fig. 38), and the plaque of gold (fig. 39) repeat some of the forms found at Mycenæ, with possibly a little more classic grace of detail and refinement of workmanship. The brooch (fig. 41) is perhaps the most characteristic example of purely classic design, essentially Greek in its principal details, whilst the workmanship is all that can be desired.

The granulation of surfaces practised by the Etruscans was long a puzzle and a problem to the modern jeweller, until Signor Castellani of Rome discovered gold workers in the Abruzzi to whom the method had descended through many generations, and, by inducing some of these men to go to Naples, revived the art, of which he contributed examples to the London Exhibition of 1872, successfully applied to modern designs.

The Merovingian jewellery of the 5th century, the Anglo-Saxon of a later date, and the Celtic as leading to the Gothic or mediæval, have each distinguishing features. In the first two the characteristics are thin plates of gold, decorated with thin slabs of garnet, set in walls of gold soldered vertically like the lines of cloisonné enamel, with the addition of very decorative details of filigree work, beading, and twisted gold. In Plate XII. figs. 9 and 13 we have examples of Anglo-Saxon fibulae, the first being decorated with a species of cloisonné, in which garnets are inserted, whilst the other is in hammered work in relief. A pendant (fig. 8) is also set with garnets. The buckles (figs. 10, 11, 12) are remarkably characteristic examples, and very elegant in design. A girdle ornament in gold, set with garnets (fig. 14), is an example of Carolingian design of a high class. The Celtic ornaments are of hammered work, adapted to uses now comparatively unknown, but display another style of workmanship,—details in repoussé, fillings in with amber, rock crystal with a smooth rounded surface cut *en cabochon*, with the addition of vitreous pastes. The minute filigree and plaited work, in combination with niello and enamel, communicate to the ornaments of this class found in Ireland and Scotland an unmistakable Oriental spirit alike in design and workmanship.

In figs. 15 and 17 are illustrations of two brooches. The first is 13th century; the latter is probably 12th century, and is set with paste, amber, and blue. The brooch in the form of a figure of St Christopher bearing the infant Saviour, and supported by his staff (fig. 16), is of silver gilt. Chaucer mentions such a brooch as worn by the yeoman:—"A Crystofre on his brest of silvyr schene."

Rings are the chief specimens now seen of mediæval jewellery from the 10th to the 13th century. They are generally massive and simple. Through the 16th century a variety of changes arose; in the traditions and designs of the *Cinquecento* we have plenty of evidence that the workmen used their own designs, and the results culminated in the triumphs of Albert Dürer, Benvenuto Cellini, and Hans Holbein. The goldsmiths of the Italian republics must have produced works of surpassing excellence in workmanship, and reaching the highest point in design as applied to handicrafts of any kind. The use of enamels,

precious stones, niello work, and engraving, in combination with skilful execution of the human figure and animal life, produced effects which modern art in this direction is not likely to approach, still less to rival.

In Plate XII. illustrations are given of various characteristic specimens of the Renaissance, and later forms of jewellery. A crystal cross set in enamelled gold (fig. 18) is German work of the 16th century. The pendant reliquary (fig. 19), enamelled and jewelled, is of 16th century Italian work, and so probably is the jewel (fig. 20) of gold set with diamonds and rubies.

The Darnley or Lenox jewel (fig. 21), now in the possession of the Queen, was made about 1576-7 for Lady Margaret Douglas, countess of Lenox, the mother of Henry Darnley. It is a pendant golden heart set with a heart-shaped sapphire, richly jewelled and enamelled with emblematic figures and devices. It also has Scottish mottoes around and within it. The earring (fig. 22) of gold, enamelled, hung with small pearls, is an example of 17th century Russian work, and another (fig. 23) is Italian of the same period, being of gold and filigree with enamel, also with pendant pearls. A Spanish earring, of 18th century work (fig. 24), is a combination of ribbon, cord, and filigree in gold; and another (fig. 25) is Flemish, of probably the same period; it is of gold open work set with diamonds in projecting collets. The old French-Normandy pendant cross and locket (fig. 26) presents a characteristic example of peasant jewellery; it is of branched open work set with bosses and ridged ornaments of crystal. The earring (fig. 27) is French of 17th century, also of gold open work set with crystals. A small pendant locket (fig. 28) is of rock crystal, with the cross of Santiago in gold and translucent crimson enamel; it is 16th or 17th century Spanish work. A pretty earring of gold open scroll work (fig. 29), set with minute diamonds and three pendant pearls, is Portuguese of 17th century, and another earring (fig. 30) of gold circular open work, set also with minute diamonds, is Portuguese work of 18th century. These examples fairly illustrate the general features of the most characteristic jewellery of the dates quoted.

During the 17th and 18th centuries we see only a mechanical kind of excellence, the results of the mere tradition of the workshop,—the lingering of the power which when wisely directed had done so much and so well, but now simply living on traditional forms, often combined in a most incongruous fashion. Gorgeous effects were aimed at by massing the gold, and introducing stones elaborately cut in themselves, or clustered in groups. Thus diamonds were clustered in rosettes and bouquets; rubies, pearls, emeralds, and other coloured special stones were brought together for little other purpose than to get them into a given space in conjunction with a certain quantity of gold. The question was not of design in its relation to use as personal decoration, but of the value which could be got into a given space to produce the most striking effect.

The traditions of Oriental design as they had come down through the various periods quoted, were comparatively lost in the wretched results of the *rococo* of Louis XIV. and the inanities of what modern revivalists of the Anglo-Dutch call "Queen Anne." In the London Exhibition of 1851, the extravagances of modern jewellery had to stand a comparison with the Oriental examples contributed from India. Since then we have learnt more about these works, and have been compelled to acknowledge, in spite of what is sometimes called inferiority of workmanship, how completely the Oriental jeweller understood his work, and with what singular simplicity of method he carried it out. The combinations are always

harmonious, the result aimed at always achieved; and, if in attempting to work to European ideas the jeweller failed, this was rather the fault of the forms he had to follow, than due to any want of skill in making the most of a subject in which half the thought and the intended use were foreign to his experience.

A collection of peasant jewellery got together by Castellani for the Paris Exhibition of 1867, and now in the South Kensington Museum, illustrates in an admirable manner the traditional jewellery and personal ornaments of a wide range of peoples in Europe. This collection, and the additions made to it since its acquisition by the nation, show the forms in which these objects existed over several generations among the peasantry of France (chiefly Normandy), Spain, Portugal, Holland, Denmark, Germany, and Switzerland, and also show how the forms popular in one country are followed and adopted in another, almost invariably because of their perfect adaptation to the purpose for which they were designed.

So far we have gone over the progress and results of the jeweller's art in the past. We have now to speak of the production of jewellery as a modern art industry, in which large numbers of men and women are employed in the larger cities of Europe, but which also has its special localities in which it flourishes, and out of which an important national commerce arises.

Nearly all the great capitals of Europe produce jewellery, but Paris, Vienna, London, and Birmingham are the most important centres. An illustration of methods and processes and the various kinds of jewellery produced at the present day in the manufacture as carried on in London and Birmingham will be sufficient for all practical purposes, and as giving an insight into the technique and artistic manipulation of this branch of art industry; but, by way of contrast, it may be interesting to give in the first place a description of the native working jeweller of Hindustan. Travelling very much after the fashion of a tinkler in England, his "budget" contains tools, materials, fire pots, and all the requisites of his handicraft. The gold to be used is generally supplied by the patron or employer, and is frequently in gold coin, which the travelling jeweller undertakes to convert into the ornaments required. He squats down in the corner of a courtyard, or under cover of a veranda, lights his fire, cuts up the gold pieces entrusted to him, hammers, cuts, shapes, drills, solders with the blow-pipe, files, scrapes, and burnishes until he has produced the desired effect. If he has stones to set or coloured enamels to introduce, he never seems to make a mistake; his instinct for harmony of colour, like that of his brother craftsman the weaver, is as unerring as that of the bird in the construction of its nest. Whether the materials are common or rich and rare, he invariably does the very best possible with them, according to native ideas of beauty in design and combination. It is only when he is interfered with by European dictation that he ever vulgarizes his art or makes a mistake. The result may appear rude in its finish, but the design and the thought are invariably right. We thus see how a trade in the working of which the "plant" is so simple and wants are so readily met could spread itself, as in years past it did at Clerkenwell and at Birmingham, before gigantic factories were invented for producing everything under the sun.

It is impossible to find any date at which the systematic production of jewellery was introduced into England. Probably the Clerkenwell trade dates its origin from the revocation of the Edict of Nantes, as the skilled artisans in the jewellery, clock and watch, and trinket trades appear to have been descendants of the emigrant Huguenots, as the Spitalfields weavers were. The Birmingham trade

would appear to have had its origin in the skill to which the workers in fine steel had attained towards the middle and end of last century, a branch of industry which collapsed after the French Revolution.

Modern jewellery may be classified under three heads:

—(1) objects in which gems and stones form the principal portions, and in which the gold work is really only a means for carrying out the design by fixing the gems or stones in the position arranged by the designer, the gold being visible only as a "setting"; (2) when gold work plays an important part in the development of the design, being itself ornamented by engraving or enamelling or both, the stones and gems being arranged in subordination to the gold work in such positions as to give a decorative effect to the whole; (3) when gold or other metal is alone used, the design being wrought out by hammering in repoussé, casting, engraving, or chasing, or the surfaces left absolutely plain but polished and highly finished.

Of course the most ancient and primitive methods are those wholly dependent upon the craft of the workman; but gradually various ingenious processes were invented, by which greater accuracy in the portions to be repeated in a design could be produced with certainty and economy: hence the various methods of stamping used in the production of hand-made jewellery, which are in themselves as much mechanical in relation to the end in view as if the whole object were stamped out at a blow, twisted into its proper position as regards the detail, or the various stamped portions fitted into each other for the mechanical completion of the work. It is therefore rather difficult to draw an absolute line between hand-made and machine-made jewellery, except in extreme cases of hand-made, when everything is worked, so to speak, from the solid, or of machine-made, when the hand has only to give the ornament a few touches of a tool, or fit the parts together if of more than one piece.

The best and most costly hand-made jewellery produced in England, whether as regards gold work, gems, enamelling, or engraving, is made in London, and chiefly at Clerkenwell. A design is first made on paper, or drawn and coloured, and when needful with separate enlargement of details, everything in short to make the drawing thoroughly intelligible to the working jeweller. According to the nature and purpose of the design, he cuts out, hammers, files, and brings into shape the constructive portions of the work as a basis. Upon this, as each detail is wrought out, he solders, or fixes by rivets, &c., the ornamentation necessary to the effect. The human figure, representations of animal life, leaves, fruit, &c., are modelled in wax, moulded, and cast in gold, to be chased up and finished. As the hammering goes on the metal becomes brittle and hard, and then it is passed through the fire to anneal or soften it, in fact to restore the particles of gold to their original position. In the case of elaborate examples of repoussé, after the general forms are beaten up, the interior is filled with a resinous compound, pitch mixed with fire-brick dust; and this, forming a solid but pliable body underneath the metal, allows of the finished details being wrought out on the front of the design, and being finally completed by chasing. When stones are to be set, or when they form the principal portions of the design, the gold has to be wrought by hand so as to receive them in little cup-like orifices, these walls of gold enclosing the stone and allowing the edges to be bent over to secure it. Setting is never effected by cement in well-made jewellery. Machine-made settings have in recent years been made, but these are simply cheap imitations of the true hand-made setting. Even strips of gold have been used, serrated at the edges to allow of being easily bent over, for the retention of the stones, true or false.

Great skill and experience are necessary in the proper setting of stones and gems of high value, in order to bring out the greatest amount of brilliancy and colour, and the angle at which a diamond (say) shall be set, in order that the light shall penetrate at the proper point to bring out the "spark" or "flash," is a subject of grave consideration to the setter. Stones set in a haphazard, slovenly manner, however brilliant in themselves, will look commonplace by the side of skillfully set gems of much less fine quality and water. Enamelling has of late years largely taken the place of "paste" or false stones. This may be divided into two kinds—*champlevé* and *cloisonné*. In *champlevé* the enamelling substance is applied to the surface of the gold as ornamental details, and is "fired" in a muffle or furnace under the eye of the enameller. Here the metallic oxides play an important part in imparting variety of colour, as in the case of the "strass" of which "paste" or false stones are made. *Cloisonné* enamelling is effected by walls of gold wire being fastened to the surface to be decorated, upon which surface the design has been already drawn in outline. Within these walls or "cloisons" the various-coloured enamels are placed, and the whole fixed together by firing until the surface is more than filled up. The surface is levelled by grinding down with pumice stone, and then polished. One kind of *champlevé* closely approaches in its character to *cloisonné*. It is when the gold is thick enough to allow of portions to be cut away by the graver, and in these incised parts the coloured enamels are fused as in the manner of the true *cloisonné*.

Enamelled subjects or paintings, portraits, landscapes, animals' heads, &c., are sometimes used as a setting for pins, brooches, pendants, bracelets, &c. These are of course true *champlevé*; and formerly very able artists, such as Bono, Essex, and others, were employed in the production of costly works of this kind.

Engraving is a simple process in itself, and diversity of effect can be produced by skillful manipulation. An interesting variety in the effect of a single ornament is often produced by the combination of coloured gold of various tints. This colouring is a chemical process of great delicacy, and requires much skill and experience in the manipulation, according to the quality of the gold and the amount of silver alloy in it. Of general colouring it may be said that the object aimed at is to enhance the appearance of the gold by removing the particles of alloy on the surface, and thus allowing the pure gold only to remain visible to the eye.

The application of machinery to the economical production of certain classes of jewellery, not necessarily imitations, but as much "real gold" work, to use a trade phrase, as the best hand-made, has been on the increase for many years. Nearly every kind of gold chain now made is manufactured by machinery, and nothing like the beauty of design or perfection of workmanship could be obtained by hand at, probably, any cost. The question therefore in relation to chains is not the mode of manufacture, but the quality of the metal. Eighteen carat gold is of course always affected by those who wear chains, but this is only gold in the proportion of 18 to 24, pure gold being represented by 24. The gold coin of the realm is 22 carat; that is, it contains one-twelfth of alloy to harden it to stand wear and tear. Thus 18 carat gold has one-fourth of alloy, and so on with lower qualities down to 12, which is in reality only gold by courtesy.

The application of machinery to the production of personal ornaments in gold and silver can only be economically and successfully carried on when there is a large demand for similar objects, that is to say, objects of precisely the same design and decoration throughout. In

hand-made jewellery, so-called, mechanical appliances are only used to economize time and reduce the necessity for the handicraftsman doing that which can be done as well, perhaps better, by some simple mechanical method applied under the hand. In machine-made jewellery everything is stereotyped, so to speak, and the only work required for the hand is to fit the parts together,—in some instances scarcely that. A design is made, and from it steel dies are sunk for stamping out as rapidly as possible from a plate of rolled metal the portion represented by each die. It is in these steel dies that the skill of the artist die-sinker is manifested. Brooches, earrings, pinheads, bracelets, lockets, pendants, &c., are struck out by the gross. This is more especially the case in silver and in plated work,—that is, imitation jewellery,—the base of which is an alloy, afterwards gilt by the electro-plating process. With these ornaments imitation stones in paste and glass, pearls, &c., are used as setting, and it is remarkable that of late years some of the best designs, the most simple, appropriate, and artistic, have appeared in imitation jewellery. It is only just to those engaged in this manufacture to state distinctly that their work is never sold wholesale for anything else than what it is. The worker in gold only makes gold, or real jewellery, and he only makes of a quality well known to his customers. The producer of silver work only manufactures silver ornaments, and so on throughout the whole class of plated goods. It is the unprincipled retailer who, taking advantage of the ignorance of the buyer, sells for gold that which is in reality an imitation, and which he bought as such.

Space will not permit of any notice of various kinds of personal ornaments coming under the head of jewellery, such as the elegantly designed hand-made pearl ornaments, Whitby jet, coral, &c., nor can we allude to the methods adopted in the workshops where gold and silver alone are used to economize the metal that would be wasted without proper precautions. Even the minute quantities of the material which adheres to the hands of the workman are washed off before he leaves the premises, carried into a proper receptacle, and recovered by chemical agency.

The special localities of the jewellery trade proper, in England, are Clerkenwell and Pentonville in London, and Birmingham. In Clerkenwell an inquiry made some years ago showed that from 1600 to 2000 persons were employed in the trades connected with the production of jewellery and personal ornaments. In Birmingham at least 8000 were thus occupied, chiefly in production of what may be considered as purely mechanical work. Among the higher class of jewellers in Birmingham some of the best work sold in the London shops is produced, the mechanical means employed being so ingenious, and the handicraft power so skillfully applied in fitting, setting, and finishing, as to leave little or nothing to desire, when compared with hand-made work of the same class. (G. W.)

JEWS, MODERN. An outline of the mediæval history of the Jews is given in the article ISRAEL. The modern history of the race in its political and intellectual emancipation begins with Moses Mendelssohn, who flourished at Berlin in the latter part of the 18th century. The persecutions of the Middle Ages had produced their natural effect. Cut off from their fellow-citizens, excluded by oppressive laws from all trades except that of peddling in old clothes and even from buying certain classes of these, specially taxed, confined to Ghettoes and Judengassen, strictly prohibited from entering some towns, limited in numbers in others, forbidden to marry except under restrictions designed to check the growth of the Jewish population, disabled from employing Christian servants or being members of trade guilds, the Jews seemed by their abject condition to deserve the evils which were its cause.

There were always, it is true, exceptions to the general degradation of the race. The exiles from the Spanish peninsula (who in western Europe were found chiefly in Amsterdam, Bordeaux, Paris, and London, and also in Hamburg and Copenhagen) were in many cases persons of distinguished culture and intelligence, having been enabled, while protected by their disguise of Christianity, to live a life more worthy of freemen than was that of their oppressed and pillaged brethren in the north. In Germany itself Frederick William, the great elector of Brandenburg (1640 to 1688), was indebted for zealous service to Gompertz and Solomon Elias. Beckman of Frankfurt-on-the-Oder obtained permission in 1696 to print the Talmud. In Austria Wolf Schlesinger was personally exempted from the decree which banished the Jews from Vienna in the time of Leopold I. The Oppenheimers had sufficient influence in Austria to prevent the publication there of Eisenmenger's libels on their race; the Arnsteins, Sinzheimer, and other families earned the favour of Maria Theresa, and were decorated with titles of nobility. But the general condition of the multitude was shown by the excommunication of Spinoza at Amsterdam, by the rise of the Chasidim and of Frank, and the marvellous history of Sabbatai Zebi. The German Jews grew distrustful of their knowledge of their own religion, and instructed their children by the aid of long-tingletted rabbis from Poland, who overspread the country, inculcating contempt for all except the too subtle dialectics of their peculiar school of disputation. Led by these blind guides, the German Jews continued to speak their own jargon of Hebrew and German, to correspond and even endorse their commercial bills in Hebrew characters, and abandoned the hopeless attempt to enter into the general life of their country. Fortunately the hereditary desire of learning still survived, though the selection of subjects for study helped to isolate them from their happier neighbours. Moses Mendelssohn (1729-1786), who did so much to induce the Jews to become at one with the spirit of the age, and the Christians to tolerate them, was at three years old taught by his father, a professional copyist of Hebrew religious manuscripts, to repeat the wise sayings of the Talmud. Later on he found in the rabbi Frankel, of his native town of Dessau in Anhalt, a capable and enlightened teacher. When Fränkel was promoted, the young Mendelssohn followed him, at the age of fourteen, to Berlin. In Prussia the condition of the Jews had been comparatively favoured. Forty or fifty respectable families fleeing from persecutions in Austria had been admitted to Berlin towards the end of the 17th century. The colony increased, and was specially patronized in his own grotesque and tyrannical fashion by the half-mad sovereign Frederick William I. Frederick the Great held the maxim that "to oppress the Jews never brought prosperity to any Government," but his "general privilege," issued in 1760, while it abolished some old restrictions, was only a halting step in advance. It divided the Jews into two classes,—the hereditarily and the personally tolerated. In the first were those who were actually engaged in commerce or who occupied some office in connexion with the synagogue. Their right of abode extended to merely one child of the family. Those who were personally tolerated were men who had means of independent subsistence, though not engaged in commerce, and their right did not descend to their children. The right to residence for a second child of each family of hereditary inhabitants was purchased by the Jews for 70,000 thalers. The restrictions imposed by Frederick on marriage were severe; poor Jews could not marry at all. No Jew was permitted to own land in fee or to possess more than forty houses. Their business was confined to trade in money or goods. Frederick the Great,

penetrated as he was by the sentiments of Voltaire, yet struck out Mendelssohn's name when it was put forward for election into the Berlin Academy. Mendelssohn was with difficulty admitted into Berlin when he presented himself at its gates as a poor boy, having no friend but his teacher Frankel. He went into a silk manufacturer's house as teacher to the children, and became a clerk and afterwards a partner in the firm. He formed a warm friendship with Lessing, and inspired the drama of *Nathan the Wise*, in which the Jew was for the first time in modern literature represented in a benevolent light. He translated the Pentateuch into German, and issued his translation in Hebrew characters, added to it a commentary in Hebrew (incorporating the rational as distinguished from the Agadistic interpretations of former Hebrew commentators), partly by himself and partly by others, whom he associated with himself, and by this and other works introduced the Jews to modern culture. At the same time he gained a distinguished place in the world of letters by the pure and exalted tone, and the charming style, of his *Philosophical Dialogues*, his *Phädo*, or the *Immortality of the Soul*, and other works, which showed him to be at the height of the philosophy of that time. He remained warmly attached in feeling and practice to the synagogue, and was requested by the chief rabbi of Berlin, Hirschel Levin, who for a brief period had been chief rabbi in London, to prepare the German digest of the ritual laws of the Jews, which was ordered by Frederick the Great. Every visitor to Berlin, Jew or Gentile, sought to make his acquaintance at a kind of *salon* which he held in the afternoons. By the great majority of the orthodox Jews the writings of Mendelssohn were received with delight, and it was only by exception (as in Hamburg, Prague, Fürth, and Poland) that they were fiercely denounced as rationalistic in tendency. The times were favourable to the development to which he led the way. The ideas of the great writers who preceded the French Revolution were teaching the abolition of privilege and of religious persecution. Although neither Voltaire nor Bayle wrote in a kindly spirit of the degraded Hebrew race, the general tendency of their teaching was in the direction of toleration, and so it happened that, just at the moment when the Jews were become more than ever willing and ready to enter into the national life of Germany, the country was being prepared to receive them. The civil restrictions were only gradually abolished; painful revivals of hatred recurred from time to time, but henceforth the name of Jew grew year by year to mean less a distinction of nationality, and became more exclusively a denomination referring merely to ancestry and religious belief.

Among the friends and disciples of Mendelssohn who continued his work were Wessely (the father of modern Hebrew study), David Friedlander (founder of the Jews' Free School in Berlin), Joel Löwe (professor at the Jewish Wilhelmshule in Breslau), Hertz Homberg (tutor in the house of Moses Mendelssohn, and inspector of German schools of the Jews in Galun), Aaron Wolfsohn (teacher at Breslau), Baruch Landau (writer on physics), Marcus Hiorz (Mendelssohn's family doctor, whose more famous wife, afterwards converted to Christianity, received at her house a brilliant society, the two Humboldts, Count Bernstorff, Gentz, and Börne), Isaac Euchel (translator of the Jewish prayer-book), Lazarus Ben-Zvi (who was specially concerned with education). All these and others contributed to the Hebrew periodical *Massef* ("The Gatherer"), published at Königsberg and Berlin, 1783-1790; Breslau, 1794-1797; Berlin, Altona, Dessau, 1809-1811. The activity of the literary period which followed appears from the long list of rabbinical reprints, some with valuable notes, or translations, issued immediately before the close of the 18th century from the Jews' Free School printing-press at Berlin, under the direction of Isaac Sataw.

From minimizing differences in religion some were led to give up their distinctive religion altogether, and adopt a nominal, sometimes a real, Christianity, and thus the famous names of Heine, Börne, Edward Gans the jurist, Rahel, the younger Mendelssohn the composer, and Neander

the historian pass out of the scope of this article. These celebrated persons belong rather to the general history of German culture than to that of the race from which they sprang. Among the general body of the Jews, the removal of political restrictions and a closer communion with modern thought worked noticeable, though less radical, changes. The old system of preaching in the synagogue was revived, and led to the excision of some of the interminable prayers and sacred poems which the piety of preceding ages had accumulated in embarrassing profusion. After the establishment of the consistory in the (French) kingdom of Westphalia, German lectures were held in Cassel, Dessau, Berlin, Hamburg, &c.; and now there is scarcely anywhere an important Jewish community without a preacher. Organs were introduced into some synagogues. The alterations brought about disputes in several communities and even secessions, as at Hamburg in 1819. In Prussia the Government, acting on the principles urged in Mendelssohn's time by his friend Dohm, but vigorously combated by the Jewish philosopher, gave the sanction of state authority to the resolutions of the orthodox. The private synagogue founded in Berlin by Israel Jakobsohn, after the breaking up of the Westphalian consistory, on principles similar to those of the reformed Hamburg Temple, was closed, and suffered the same fate when reopened as a public synagogue in 1817 and again in 1823. Even choirs and sermons were prohibited as un-Jewish innovations. Such regulations tended to disgust many educated persons who might otherwise have continued to remain attached to the faith of their fathers. They felt themselves isolated in the midst of their less advanced brethren, and were tempted to identify themselves even in religion with their more cultured Christian associates. Besides, a change of faith offered an escape from humiliating legal restrictions, and opened the way to more dignified careers than those permitted to the conforming Jews. The smaller German states appointed rabbis who were more or less state officials. When the Government restrictions were removed, considerable divergences manifested themselves, which the assemblies of rabbis and synods, beginning in 1844, and continued from time to time to the present day, did little to heal. There now exist in most German towns an orthodox and a reform congregation, which differ in their mode of conducting public service, in the prominence given to the belief in the Messiah and the return to the Holy Land, and in their greater or less adherence to the laws of the Sabbath, and laws concerning diet, &c. One reformed congregation in Berlin keeps the Sabbath on the first day of the week.

More remarkable examples of sectarian dissent were the movements known by the names of Sabbatai Zeli, of Frank, and of the Chasidim. Sabbatai's career had Turkey for its theatre, but the influence of his strange pretensions was felt in Poland and Germany, as well as throughout the East. Sabbatai Zeli was born at Smyrna in 1626. He announced himself the Messiah in Jerusalem, named his brothers kings of Judah and Israel, took the title for himself of king of the kings of the earth. Miracles were related of him; from Poland, Hamburg, and Amsterdam treasures poured into his court; in the Levant young men and maidens prophesied before him; the Persian Jews refused to till the fields. "We shall pay no more tribute," they said, "our Messiah is come." The pretender, more than many unhappy people were ready to sacrifice to their deliverer from unendurable evils, afterwards embraced Mahometanism to escape death from the Porte. Some of his followers went over with him to Islam; others treated his conversion as forced, and still proclaimed themselves Jews and his disciples. Their faith was nearer to immortality than their Messiah, and he was still believed in and his return expected after his death. Out of the wrecks of the Sabbataic party Jacob Frank formed in Podolia the Zoharites, whose Hillel was the Cabbalistic work called *Zohar*. Persecuted by the orthodox, he put himself under the protection of the bishop of Kamnietz, and burnt the Talmud in public. When his protector died he migrated with hundreds of followers, and afterwards lived in royal state at Vienna, Brtinn, and Offenbach, ending by becoming a Roman Catholic. He died in 1781, and his sect perished with him. Very different was the fate of the Chasidim ("the pious"),

who preceded Frank and have survived him. They also swear by the *Zohar*, and revere as their founder Israel Bani Shem ("possessor of the wonder-working name"), or Baht, who flourished at Miedzibor in Podolia in 1740. Baht pretended to be the promised child foretold by the prophet Elijah, and named by him Israel before his birth. A long sojourn in solitary places, much fasting and physical torment, the tortures of rolling in thorns in summer and of bathing in half-frozen rivers at midnight in the winter, gave this prophet the faculty of seeing visions, the power to heal diseases, and to release souls held captive in the bodies of brutes. Like the older Kabbalists he treated the Talmud with contempt; he exhorted his followers not to lead a gloomy ascetic life, but praised gaiety and enjoyment as tending to a career agreeable to God. Joyful religious worship was to be induced by drinking, jumping, clapping of hands, making noises and screaming, to which were added abstinences according to the fashion of the Essenes of old, and the wearing of a peculiar dress. Amongst his followers many found out how to derive advantage from the superstition and ignorance of the masses. Doh Beer (Bernsh) of Muzicz seldom showed himself but to his disciples, and had reports of his wondrous works spread by them; many sick and lame went to him for cure; offerings of money came in and supplied the Zaidik with means to lead a princely life. The Chasidim still flourish in Russia and Jerusalem, and the Zaidikim (or "righteous") and Rebbeis, as their leaders are called, live in magnificence upon the contributions of the most ignorant of the people.

While this and cognate heresies were driven back into the over-crowded Jewish communities of Russia and Poland from which they came, in Germany Talmudic studies were pursued with undiminished zeal, though carried on in gradually narrowing circles, and largely owing to the knowledge of the Talmud being a qualification for appointments in large congregations. Gradually the Talmud, which had been once the common pabulum of all education, passed out of the knowledge of the laity, and was abandoned almost entirely to candidates for the rabbinate. In the earlier part of this period, the rabbis received their education at the Yeshiboth ("sessions" of academies devoted to the Talmud, the *Shulchan Aruch*, and their commentators). As the spirit kindled by Mendelssohn penetrated the various sections of the Jews, it was felt that this mode of instruction would not suffice, and institutions were founded, not confined exclusively to these studies, but embracing the whole domain of Hebrew theology, philosophy, and history. Jonas Fränkel in 1854 established the Judeo-theological seminary at Breslau, an institution which has provided Germany and Austria as well as England and the United States with many rabbis. Its first director was Zacharias Fränkel (1801-1875), predecessor of Graetz in editing the *Monatschrift*, and author of works on the Septuagint, the Mishna, and the Talmud of Jerusalem. Of later date are the high school for the study of Judaism, founded in 1872, and the "seminary for rabbis for orthodox Judaism," under Dr Hildesheimer, established at Berlin in 1877. Israel Jakobsohn, president of the Westphalian consistory (1768-1823), did good service in improving teaching. He founded in Seesen (Brunswick) an educational and normal institution, bearing his name, for Jews and Christians, which still flourishes. A similar college was instituted by his brother-in-law Isaac Samson, and directed by S. M. Ehrenberg, amongst whose pupils were Jost and Zanz. Schools of a more elementary character were the Berlin Free School, already referred to, and others. In Dessau, Moses Mendelssohn's birthplace, the free school fostered by the duke, and called after him *Franzschule*, flourished under David Fränkel (1779-1865), editor of the journal *Sulamit*; in Frankfurt-on-the-Main was the Philanthropin, now converted into a technical school. In almost all Jewish communities we now find institutions teaching religion. After a first and unsuccessful attempt, Dr Moritz Veit founded a normal school, which existed under Zanz in Berlin from 1840 to 1852, and was revived by Dr Veit and the famous preacher and author Dr M. Sachs. Similar schools were founded in other places—Hanover, Münster, Düsseldorf, Cassel,—with more or less success. The union

for the culture and science of Judaism (1823) and the Kulturverein had a brief existence. Instead of receiving support and thanks, the chief workers were regarded as heretics.

The modern historical study of Judaism was inaugurated by Rapoport and Zunz. Solomon Juda (Löb) Rapoport, sprung from an old family boasting many learned Talmudists, was born in Lemberg in 1790, and was rabbi at Tarnopol and in Prague, where he died in 1867. His published essays in various periodicals or in the form of prefaces are largely biographical, and display a great range of reading and power of combining distant references. Of his projected Talmudic encyclopedia but one part appeared, and his scheme for a biographical series under the title of *Men of Renown* remained unrealized, except some fragments. Nachman Krochmal (1780-1840) was not less learned than Rapoport, and perhaps surpassed him in philosophical acuteness.¹

Of greater importance and influence were the writings of the patriarch of living Jewish scholars, Leopold Zunz, especially his epoch-making work *Die Gottesdienstlichen Vorträge der Juden* (Berlin, 1832).² Among other historical writers may be named Isaac Marcus Jost (1793-1860), teacher in the Jewish normal school at Frankfort, editor of a valuable edition of the Mishna with a German translation (1832-34), and author of several important histories of Judaism and its sects, A. GEIGER (*q.v.*), and H. Graetz of Breslau, who has composed the most comprehensive history of the Israelites that has yet appeared. To the names of these scholars may be added FRANK the lexicographer (*q.v.*), M. Steinschneider the bibliographer, Herzheimer the translator of the Bible (*Pent.*, 1841; *Proph.* and *Hagi.*, 1841-48), and Herzfeld the historian (*Gesch. d. J. Jids.*, 1847). In modern German-Jewish literature Philippon of Bonn and Lehmann of Mainz are leading representatives in journalism of reform and orthodoxy. German Jews have also distinguished themselves in general public life, claiming such names as Lasker in politics, Auerbach in literature, Rubenstein and Joseph in music, Traube in medicine, Lazarus in psychology. Especially famous have been the Jewish linguists, pre-eminent among whom are T. Benfey of Göttingen (1809-1881), the most original of modern comparative philologists and the greatest Sanskrit scholar of our days, and the admirable Greek scholar and critic Jacob Bernays of Bonn (1824-1881).

Within the last year or two the success of the Hebrew race in commerce and the professions has led in Germany to a singular revival of old-world prejudices. A series of leagues of "Germans" were formed against the "Semites." Stocker, a "Christian Socialist," and count preacher to the emperor, gave importance to the movement by placing himself at its head. His weapon is social ostracism: meetings are held at which the Jews are loudly denounced; and members of the "German" leagues vow to have no commerce with the hated race. Occasionally the two parties came to blows, some Jewish houses were wrecked, and a synagogue at Neu-Stettin burnt. At this point the Government interfered.

The universal admission of the Jews to public posts only dates from the establishment of the empire. In the German states the spiritual emancipation of the Jews was not immediately followed by political emancipation. They were freed in Germany by the French law as a result of the conquests of Napoleon, but lost their civil equality when the French retired, to regain it bit by bit in succeeding years.

The Leibzoll, the odious tax imposed upon a Jew as often as he crossed the boundary of a city or petty state, even if he went in and out twenty times in the day, was

removed in Prussia in 1790, and in other German states in 1803. In 1812 the royal edict declared all Jews in Prussia to be citizens, and gave them equal rights and privileges with their Christian fellow countrymen. They fought in the war of liberation, but after its success there was a reaction, and the new privileges (more particularly free admission to academic posts) were in part withdrawn. The Jews who had been promoted to the rank of officers during the war had to quit military service to escape the degradation of losing their commissions. The national parliament, which met at Frankfurt in 1848, adopted resolutions in favour of the removal of religious disabilities. The Prussian constitution of 1850 declared that the enjoyment of civil rights was independent of religious confession. The legislation with which the empire was inaugurated in 1871 at length gave political and civil equality to the Jews throughout Germany.

The number of the Jews in the German empire is now 520,575, or 1 per cent. of the whole population (census of 1875). The Gemeindebund, or union of congregations for some religious and charitable purposes, has recently been established at Leipzig. The Jews are engaged in all the occupations which other citizens pursue in Germany. While they show a marked predilection for and success in commerce and the learned professions, a few are farmers and sailors. Being subject to the ordinary military laws, they serve in the army, and many Jews hold commissions in those regiments in which noble descent is not a necessary qualification.

While the spiritual awakening of the Jews was essentially a German movement, having its centre in Prussia, the most powerful impulse to their political liberation came from France. The Jews had been banished from France by Charles VI., but a few had returned. Some Portuguese fugitives had taken up their residence at Bordeaux and Bayonne. Others had settled at Arignon under papal protection, and at Carpentras there was a congregation with a liturgy in some respects peculiar. To Paris the Jews began to return in 1550, but held the privilege of domicile by a precarious tenure till Percy, the founder of the institution for deaf mutes, obtained in 1776 formal confirmation of the leave given to the Portuguese Jews to reside in the capital. There were already several hundred German Jews resident in an unlawful way, and protected chiefly through the influence of a German Jew named Calmer, who had been naturalized for services to the Government. The conquest of Alsace had added largely to the Jewish subjects of France. In 1780 the Alsatian Jews presented to the king a petition complaining of the seigniorial dues exacted of them, of the restrictions on their trade, and the efforts of the priests to convert their children. The complaint was not without effect. The capitation tax was abolished in 1784, projects of enfranchisement began to be broached, and a commission was appointed for the revision of the laws about the Jews, but its work was interrupted by the Revolution. The Jews addressed themselves with better hopes to the national assembly, and those of Paris distinguished themselves by demanding the withdrawal of the authority of the synagogue over its members. In 1790 the French Jews united in sending into the assembly a petition demanding their admission to full and equal rights with other citizens. This requisition at first met with some serious opposition even among the advocates of universal liberty; the ancient prejudice against this people had not been entirely eradicated. But the exertions and influence of Mirabeau and Rabaut St Etienne prevailed. In 1790 the Portuguese Jews, and in 1791 the whole Hebrew population of France, were admitted to complete rights of citizenship. The constitution of 1795 confirmed the declarations of the assembly.

¹ His fragmentary works were collected by Zunz, under the title *Moré Naboche ha-seman*, 1851.

² A collected edition of Zunz's scattered essays was commenced by the "Zunztum" in honour of his eightieth birthday, 1874.

The gratitude of the Jews was shown by their patriotic devotion in the wars of the Revolution.

One of the most remarkable events in modern Jewish history was the convocation of the Sanhedrin (Synagogue) by Napoleon. It was preceded by the session of a general assembly of one hundred and eleven delegates, held in Paris in 1806 under the presidency of Abraham Furtado, merchant, author, and scientific agriculturist, the delegate of the Portuguese congregation in the port of the Gironde. To this assembly twelve questions were submitted by the emperor, and its principal answers were afterwards confirmed and formulated in nine propositions of law by a Sanhedrin formally elected by the synagogues in France and Italy. The Sanhedrin commenced its sittings on February 3, 1807, under the presidency of Rabbi David Süssheim of Strasburg, with a Piedmontese rabbi as first, and an ex-legislator of Italy as second assessor. The forms of the old Sanhedrin were observed as far as possible; the responses are couched in the form of statutes binding the constituents of the Sanhedrin, and these decisions have usually been treated with much respect even by communities which sent no delegates, while the Jews of Frankfurt and Holland formally accepted them.

The following are the nine decrees:—(1) polygamy is forbidden, according to a decree of the synod of Worms in 1050; (2) divorce is allowed to the Jews; and so far as it is confirmatory of a legal divorce pronounced by the authority of the civil law of the land in which they live; (3) no Jew may perform the ceremony of marriage unless civil formalities have been fulfilled,—intermarriages with Christians are valid civilly, and, although they cannot be solemnized with any religious celebration, they involve the parties to them in no ban; (4) the Jews of France recognize in the fullest sense the French people as their brethren; (5) acts of justice and civility are to be performed towards all mankind who recognize the Creator, irrespective of their religion; (6) Jews born in France and treated by its laws as citizens consider it their native country,—they are bound to obey the laws of the land; Jews are dispensed from ceremonial observances during service in the army; (7) the Sanhedrin exhorts the Jews to train their children to laborious lives in useful and liberal arts, to acquire landed property as a means of becoming more firmly attached to their fatherland, to renounce occupations which render men odious and contemptible in the eyes of their fellow-citizens, and to do all in their power to acquire their neighbours' esteem and good will; (8) interest is not allowed to be taken when money is lent for the support of a family, but interest is permitted when money is lent for commercial purposes, if the lender runs any risk, and if the legal rate is not exceeded; (9) the above declarations concerning interest, and the texts of the Holy Scripture on the same subject, apply between Jews and fellow-citizens in precisely the same way as between Jews and Jews. Usury is altogether forbidden. At the close of the Sanhedrin, the emperor established the consistorial organization which in its main features still exists in France. Every two thousand Jews were to form a synagogue and a consistory consisting of one chief rabbi, and two rabbis with three laymen householders belonging to the capital town of the consistory. Bankrupts and usurers were excluded from the consistory, which was to watch over the conduct of the rabbis, to maintain order in the synagogues, and to admonish the Jews of the district to follow handicrafts and obey the laws of the conscription. The central consistory, sitting at Paris, had power to appoint and depose the rabbis. The rabbis were to publish the decrees of the Sanhedrin, to preach obedience to the laws, and to pray in the synagogues for the imperial house. Many Hebrew hymns of praise were composed in honour of the despot who had framed this organization, although at the same time the emperor issued a decree which made considerable concessions to the popular prejudices against the Jews in Alsace and eastern France generally, forbade the Jews to change their dwellings or enter into occupation without special permission, framed stringent precautions against usury, and exempted the Alsace Jews from the right to provide substitutes for military service. The laws of 1814, 1819, and 1823 made some beneficial changes in the position of the Israelites, and in 1829 Charles X. established at Metz a central school for the instruction of candidates for the rabbinate. It was subsequently removed to Paris. In 1831 the Government definitively decided, in accordance with the ideas of Napoleon, that the rabbis should be state functionaries. From that year they have been paid by the state. In 1833 the French Government suspended relations with a Swiss canton which had denied equal rights to a French subject on the ground that he was a Jew.

In France the absence of political restrictions has been unfavourable to the separate development of Judaism. The ministers Crémieux (1796-1879), Fould, and Goudchaux, the archaeologists and philologists Jules Oppert and Halévy and the Darmesteters, the composer Meyerbeer, and many others, are well-known names in the general history of their country. Many Israelites have occupied high civil and military posts. Other Israelites by race have become

indistinguishable by religious practice from the main body of the citizens; and the principal contributions in France to Hebrew literature have been from writers born in Germany, like Munk (1802-1887) and Derenbourg, like Samuel Cohen and Franck.

Before the year 1860, an outbreak against the Jews in Russia, the accusations at Damascus, the Mortara abduction case in Italy, and about this time the sufferings of the Jews in Morocco, had vividly excited the sympathies of the Jews in western Europe; they had joined together to make contributions of money for relief of distress at Königsberg and in the Holy Land, and had even made representations to the Governments of the various countries in which they resided in order to bring political means to bear to alleviate the fate of their unfortunate co-religionists. An English Jew, Sir Moses Montefiore, took the lead in these efforts. But there was no regular provision for prompt and concerted action in defence of outlying and oppressed communities of Jews till, in 1860, an organization was established in Paris which was destined to exert a permanent watchfulness over the oppressions practised in the less civilized countries upon Jews, as well as to improve the backward communities of Hebrews by education. This was the Alliance Israélite Universelle, which on January 1, 1881, had 24,000 subscribers in all parts of the world, though Israelites are by no means unanimous in supporting it.

The connexion between the local committees and the central body is not very intimate, but a correspondence is constantly kept up, and subscriptions for public objects flow from one to the other according to their respective wants and wealth. The Alliance and similar societies of a more strictly national character which exist in London and Vienna made representations at the Berlin conference in 1878, and helped to procure some alleviations of the state of the Jews in Roumania and Servia. The exertions of the same bodies had previously arrested, by making them known to Europe, the atrocities practised upon the Roumanian Jews in 1872. Similar action was brought to bear at the Madrid conference in 1880 in favour of the Jews in Morocco. Another part of the work of the Alliance is to maintain or assist schools for boys and girls in North Africa and in the Turkish empire, &c. In this task it co-operates with the Anglo-Jewish association formed for similar objects in England, the Board of Deputies in London, and the Alliance in Vienna. The Alliance has also an organization for apprenticing Jewish children to useful trades in eleven Eastern towns. Other Jewish public institutions at Paris are the rabbinical seminary under chief rabbi Wogno, schools and an industrial school for girls, the hospital founded by the late Baron James de Rothschild, the orphanage established by the late Baron Salomon de Rothschild, the ladies' committee and house of refuge, a central committee for Jerusalem schools, the society of Talmudical studies, and many burial and mutual aid societies. At Lyons and Marseilles there are similar institutions.

The distinction between reform and orthodox congregations, which has been noticed in Germany, and reappears elsewhere, is not found in France. The older distinction between the Spanish and Portuguese Jews (Sephardim) on the one hand, and the Polish and German Jews (Ashkenazim) on the other, is, however, still made. They have different synagogues, in which a somewhat different ritual and a different pronunciation of Hebrew are employed. No doctrinal distinction, however, exists between the two divisions, and they now freely intermarry and associate with each other, although at their first meeting in France and England, about a century ago, and for some time later, the rich and polished émigrés from the south refused to mix with their uncultured northern brethren. The Jews of German rite are now much more numerous and wealthy in western Europe than the Sephardim.

The number of Jews in France in 1880 was about 60,000, of whom 34,000 were in the consistorial circumscription of Paris, 8500 in that of Nancy, 2200 in Lyons, 4000 in Bordeaux, 2200 in Bayonne, 4000 in Marseilles. The Jewish population in France (including northern Italy, and Troves, Mainz, Coblenz, &c.) in 1808 was 77,000; it had risen to 158,984 (without including Italy or Troves and its sister cities) when the census of 1869 was taken, but fell to 49,439 in the census of 1872, owing to the loss of Alsace

Lorraine, the part of France in which the most numerous Jewish population existed. The Jewish inhabitants of the Pays circumscription were in 1808 only 3555 in number, about a tenth of their number in 1850. Two Jewish newspapers are published in the French language at Paris, and one at Avignon. The Jewish population of Algeria in 1880 was (according to the *Annuaire Israélite*) 72,800, of whom 52,000 were in the consular circumscription of Oran. These figures show a large increase in the population in recent years. M. Crémieux by a stroke of the pen obliged the Israelites in Algeria to become French citizens, a step that had previously involved certain formalities which their conservative feeling resisted. The measure, however, led to an outbreak of the Arabs. In Versailles exhortations were made to cancel it, and its operation was suspended, but finally the decree was sustained, and the Jews, who form the class among the native population most fitted for civilization, retain the franchise.

England. The Jews were readmitted into England by Cromwell on the application of Manasseh ben Israel; and the Spanish and Portuguese Jews from Amsterdam took a lease of ground for a burying-place at Stepney in February 1657. The first recorded interment was in 1658. The city of London, which was afterwards to aid so powerfully in the emancipation of the Jews, petitioned the council in the first years of the restoration to remove the competing Jewish merchants, but, this and other petitions being unsuccessful, a synagogue was built and the cophold of the cemetery was acquired, although up to fifty years ago doubt was sometimes expressed whether Israelites even if born in the country could hold land in England. The right of Jewish charities to hold land was clearly established by an Act passed in 1846. The Jews were too few in number to be visited with special disabilities, but suffered from the general operation of the Tests Acts, which excluded them from political, civil, and municipal offices, from the bar, &c., and could be invoked to prevent them from voting at parliamentary elections. Jacob Abendana and David Nieto are rabbinical writers who flourished in England in the 17th and early in the 18th centuries. In 1735 Sarmento, a mathematician, was (like Gompertz and others after him) made a Fellow of the Royal Society. Emanuel Mendes da Costa was secretary and librarian of the society a few years later (died 1769). Sir Solomon Medina financed the commissariat in the duke of Marlborough's campaigns. But the Sephardic immigration is best known by the converts to Christianity whom it supplied, as Isaac Disraeli, and his son Lord Beaconsfield (who was baptized at the age of twelve), David Ricardo, the Lopes family, and others. Conversion to Christianity was encouraged by a statute of Anne (repealed in 1846), which compelled Jewish parents to make an allowance to their children who embraced the dominant faith. German Jews began to immigrate in large numbers after the accession of the house of Hanover. English statesmen soon perceived what important contributions the business ability of the Jews was capable of rendering to the wealth of the country in which they settled, but the enlightened appreciation of the governing class was long in making its way among the electors. In 1753 Mr Pelham passed his Jewish Naturalization Act, which was repealed the next year owing to popular clamour, "No more Jews, no wooden shoes," becoming as influential a refrain as Lillibulero. This premature emancipation supplied an argument which afterwards assisted to retard the political liberation of the Jews. The Jews were excepted from the benefit of the Irish Naturalization Act in 1783; the exception was abolished in 1846; in that year also the obsolete statute De Judaismo, which prescribed a special dress for Jews, &c., was formally repealed. It had been disregarded ever since the return of the Jews under Cromwell. The Reform Act of 1832 gave the right of voting for members of parliament in all constituencies to Jews who possessed the property or other qualification required. Mr Robert Grant, M.P. for Inverness, in 1830 proposed to admit Jewish members to the House of Commons, Mr Haskisson having pre-

viously presented a petition asking for this concession. The bill was carried on the first reading by eighteen votes, but lost on the second by sixty-three. The Board of Deputies had been appointed in 1760 to watch over the interests of the "Portuguese nation" as the Sephardic Jews called themselves in England and France; it was shortly afterwards joined by delegates of the German congregation, and now represents the orthodox congregations in the principal towns of the United Kingdom. Through this board the House of Commons was frequently petitioned in the next thirty years to grant political equality to the Jews, and the claim was supported by eminent statesmen, notably by Macaulay and by Lord Russell, the latter of whom brought in an annual bill on the subject. Baron Lionel de Rothschild was elected five times by the city of London before he was allowed to vote, and was eleven years a member of the House of Commons without taking the oath. Alderman Salomons was returned for Greenwich in 1851, and took his seat, spoke, and voted, having in repeating the oath omitted the words "on the true faith of a Christian." He was fined £500 by the court of exchequer, and was obliged to retire from parliament. The enabling bills had been passed year after year in the House of Commons, but as often rejected by the Lords, until in 1858 a compromise was effected, and Jews were permitted by the joint operation of an Act of Parliament and a resolution of the House of Commons to omit on taking the oath required of a member of the Lower House the words to which they conscientiously objected. In 1866 and 1868 Acts were passed which prescribed an oath in a form unobjectionable to Jews to be used in the Houses of Lords and Commons alike, but no Jew by religion has yet been raised to the peerage. Remarkable legislative provisions in favour of the Jews are the exceptions by which they have enjoyed since 1870 under the Factories Acts the right to labour on Sunday in certain factories if they rest on their own Sabbath. Till 1828 only twelve Jewish brokers were permitted to carry on business in the city of London, and the patent was purchased for large sums when vacancies occurred. No Jew could open a shop in the city till 1832, because that permission was only accorded to freemen. Even baptized Jews were not admitted to the freedom of the city between 1785 and 1828. The first Jewish sheriff of London, Sir D. Salomons, was unable to take the oaths till a special Act was passed by Lord Campbell in 1835, and, although he was followed two years later by another Jewish sheriff, Sir Moses Montefiore, it was not until ten years after his election as alderman that Lord Lyndhurst's Act (1845) enabled him to perform the duties of that office. Among the names of Jews in England distinguished in science and literature are the mathematician Sylvester, the Sanskrit scholar Goldstickler, and the Orientalists Zolner and Deutsch. The first Jewish barrister (Sir F. Goldsmid) was called to the bar in 1833.

The Jews Free School in London is probably the largest and most efficient elementary school in England. Two Jewish newspapers are published in London. The Jewish community in England maintains many charitable and other public institutions. The most important are the boards of guardians in London and Manchester, which are chiefly occupied in the relief of penniless emigrants from Russian Poland. Dr Benisch, the late editor of the *Jewish Chronicle*, founded in 1871 the Anglo-Jewish association to co-operate with the Alliance Israélite de Paris, which has been already described. The association has nearly 3000 members, chiefly in England and the colonies, but also at Alexandria and Tangiers. The Jews' college in London and the Arts college at Portsea are designed for the training of ministers and teachers. Three societies for the promotion of Hebrew literature have been formed. The only one which still exists is the Society of Hebrew Literature, to which Christian scholars have contributed equally with the Jewish students of the same subject. The principal religious movement has been the formation of the West London congregation of British Jews, a body of dissenters, who have simplified the ritual, only keep one day of the festivals, and do not acknowledge the spiritual ascendancy of the chief rabbi.

They succeeded in 1840. Congregations at Manchester and Bradford worship with the same rites. The Sephardim and Ashkenazim still differ in liturgy and in pronunciation of Hebrew. The principal London synagogues of the latter body were tolerated by private Act of Parliament in 1870 under the name of the United Synagogue, which now consists of ten London congregations. Its liturgy was modified in the direction of Great Britain in 1860. Forty provincial orthodox synagogues are recognized by the Board of Deputies, which under the Marriage Acts certifies the secretaries of orthodox synagogues entitled to register marriages.

The Jewish population of Great Britain is estimated (in the absence of a census by religions) to be 62,000, of whom 40,000 are reckoned to be in London. There were 453 Jews in Ireland at the census of 1881.

In the British colonies Jews are numerous and their congregations flourishing. There are nearly 2000 Jews in Gibraltar, who carry on an active commerce with their brethren in Morocco, sending Manchester and Sheffield goods, and receiving corn, hides, and other produce. Their settlement dates from the British occupation in 1704, which allowed the unhappy Spanish refugees in Morocco to return to a corner of Spain. Jews have been law-officers, ministers, members of the legislatures, and magistrates in the Australasian colonies, Cape Colony, the West Indies, &c. In Victoria there were 3571 Jews in 1870, and a Jewish newspaper is published at Melbourne; in West Australia there were 62 only in 1870, in Tasmania they formed only 0.23 per cent. of the total population of 93,338.

A remarkable settlement exists in Bombay under the name of the Beni Israel. They are 5000 in number, and are for the most part artisans, some of them soldiers. They support a school to which the Anglo-Jewish association in London and Manchester contributes. The Beni Israel have a tradition that they were shipwrecked on that coast more than one thousand years ago. They have always strictly observed the Sabbath, refraining from cooking their food or doing any other work on that day. They do not eat unclean fish or flesh; they observe the great feasts, and have a Jewish type of penitence. The Beni Israel are found not only in Bombay itself but in other towns on the coast not beneath the direct rule of the British Government. They relate that David Rabahia, a Jew either of Baghdad or Cochim, came to that part of India about nine hundred years ago, and, having discovered that the Beni Israel were observing the Jewish code, was convinced of their Jewish origin, and established a Hebrew school. Before his death he gave a written order to two of his scholars to succeed him as religious ministers. This order has been retained to this day by their descendants. These ministers are called *kahes*, and are considered superior to the ordinary religious ministers who receive payment for officiating in the synagogues. They are in some respects like high priests and civil heads of the community, and in the outlying villages ecclesiastical and civil matters are investigated and settled by them with the aid of a council. With these *kahes* may be compared the *cohenim* (priests) in the Western Jewish communities, who are reputed to be descendants of Aaron, and enjoy the prerogative of blessing the people, and a certain precedence in synagogue, to the exclusion of ministers who are not of the same lineage. In Bombay judicial and other civil functions for the Beni Israel are performed by a person called *Nassi* or head, aided by a council. The Beni Israel have been settled in Bombay itself for upwards of one hundred and fifty years. Their first synagogue was built in 1796 by Samuel Ezekiel, a native commandant in the British army sent against Tippono Selah. The Sephardic daily prayer-book, Dr Hermann Adler's sermons, and some other works have been translated by the Beni Israel into Marathi. Some of them know Hebrew, although Marathi is their ordinary language, and their knowledge of Hebrew is probably rather due to frequent intercommunication with the Jews of Baghdad and Europe than to independent tradition. The Beni Israel rarely intermarry with the ordinary Jews. They have a literature in Marathi. They tie a golden belt ("manny") with black glass beads round the bride's neck during marriage to show that the bride is a married woman; when she is stripped of it she is considered a widow. They say that they adopted the title of Beni Israel because that of Jehudim or Jews was hateful to the Mussulmans. The Baghdad and Cochim Jews attend their synagogues and eat with them, and *vise versa*. They have among them a class of Beni Israel whom they designate *Kala Israel* or Black Israel. Between them and the white Beni Israel no intermarriages are ever solemnized. They are descendants of Beni Israel by heathen wives, or are proselytes or their descendants. They have separate burying-grounds.

The Jews of Cochim, found in that British port of the Madras presidency and elsewhere on the Malabar coast, have the tradition that they arrived at Cochin in 1482, in the sixty-eighth year of the Christian era, and received a written charter from the native ruler, and that when the Portuguese came they suffered oppression and removed to Cochim, where the rajah granted them places to build their synagogues and houses. They again suffered from the Portuguese, but the Dutch conquest in 1692 gave them protection. At Cochim there are black and white Jews. The white Jews consider

themselves as immigrants from Palestine. The black Jews are regarded as proselytes and emancipated slaves of the white Jews. The black and white do not intermarry with each other, and the black Jews do not observe all the ceremonies of the law.

The history and condition of the Jews in three important Austria, countries and their colonies having been somewhat fully sketched, a shorter account of their situation elsewhere will be sufficient. The Austrian Jews participated in all the intellectual movements of their brethren in Germany. Their chief writers are Komper (the brilliant author of *Tales of the Ghetto*), Frankel the poet, G. Wolf, historian, Mosenthal, dramatist, Dukes, Kaysersling, Mannheim, Jelinek, Gudemann, Kaufmann, Letteris. The chief training establishment for rabbis is the Budapest seminary established with the proceeds of the fine imposed upon the Jews for participation in the insurrection in 1848. Austria was long notorious for ill-treatment of the Jews, but Joseph II. made in 1783 a new departure in his policy towards this class of his subjects. He abolished the *Leibnoll*, night-wards, passport regulations, and gave the Jews permission to learn trades, art, science, and, under certain restrictions, agriculture. The doors of the universities and academies were opened to them. He founded Jewish elementary and normal schools, and also compelled the adults to learn the language of the country. In spite of these reforms, considerable restrictions were still imposed upon the Jews with regard to right of residence, &c., and the successors of the philosophic emperor, Leopold II. and Francis I., restored many of the most humiliating regulations. The Jews in Austria remained during the greater part of the present century subject to special restrictions. To remove from provinces to provinces they required the permission of the central Government. In many parts of the empire they were not allowed to rent or purchase lands beyond their own dwellings. The Magyar nobles, however, employed them largely as bailiffs, gave them great freedom of tenure, and actually fought under their lead as military officers in the struggle for independence. After 1848 the Jewish condition was reduced except in Vienna; but, as many Jews had taken part in the revolutionary movement in Hungary, a heavy exaction was imposed upon them after its suppression. The reforms inaugurated by the constitution of 1860 for Austria and in 1861 for the rest of the empire, and completed in 1868, at length gave the Austrian Jews the freedom which they now enjoy, which makes them influential and respected in Vienna and the other great towns, and even in the backward provinces of Galicia a striking contrast to their less favoured brethren in the Russian Empire. The contrast of Russia and Poland is shown by their rolls, set in the legislatures. The Israelitish Alliance was founded in Vienna in 1872. The number of the Jews in the empire of Austria-Hungary is 1,372,338, or more than 8 per cent. of the total population. Of the total number, 520,200 are found in Austria (including 675,433, or more than a tenth of the total population in Galicia), and 552,133 in Hungary.

In Italy, while Venice and Leghorn sheltered large and comparatively flourishing colonies, the Roman Jews had long an unenviable pre-eminence in suffering. Till 1847 they were not permitted to leave the Ghetto, and their conversion was sought by most oppressive means. It was in the papal states after this date that the young Mortara, secretly baptized by his nurse, was torn from his parents, and trained to be a monk. The kingdom of Italy brought freedom and political equality to the Jews. The most celebrated of recent Jewish scholars in Italy was S. D. Luzzatto (1800-1886). The rabbinical college at Padua, founded by J. S. Reggio of Gorz (1764-1855), fell with the Austrian domination in 1856. The number of Jews in Italy was in 1876 estimated to be 159,000, of whom 5000 were in Rome, 2800 in Modena, 8000 in Venice, 2000 in Sulzy, 7888 in Leghorn, 2500 in Turin, 2000 in Padua.

The census of 1870 gave 2582 as the number of the Jews in Greece. They enjoy perfect freedom of worship, and live on terms of friendship and equality with their neighbours in the kingdom of Greece, although at Alexandria, Smyrna, and other towns of the Levant, quarrels sometimes occur between the two races.

The liberal institutions established during the last few years in Spain.

Spain have permitted the Jews to return to a country in which their ancestors enjoyed a glorious period of literary and scientific activity. In 1881 the Spanish representative at Constantinople was authorized to assure some distressed Jews who had fled to Turkey to escape the persecutions of Russia that the Government of Spain would welcome them to that country, in which, he added, all Jews could now settle. At Seville Jewish worship is regularly held, and most khalles according to Jewish rites can be bought. At Madrid a congregation assembles on the most solemn fast in a private house.

Since the commencement of this century foreign Jews of Portugal, Portuguese origin from Gibraltar and elsewhere have immigrated into Portugal and been permitted to solemnize religious services there. There are three synagogues at Lisbon and one in Oporto. On the Day of Atonement, unknown persons from a distance in the interior have been observed to join these congregations; they were members of Jewish families who had secretly preserved their religion and the tradition of their origin during the whole time of the exclusion of

the Jews from Portugal. In 1821 the cortes abolished the Inquisition, and resolved that all rights and privileges which had been accorded to the Jews by former sovereigns should be renewed, and that all Jews who dwelt in any part of the world might settle in Portugal. About 1000 Jews reside in this country.

Holland. In Holland, which was long the refuge of the Jews, and was the cradle of a flourishing Jewish literature, the Israelite immigrants were not entirely without restrictions, although Mendelssohn pointed to Amsterdam as a commercial paradise where all men were allowed free interchange of commodities. The 50,000 Jews of Holland, 20,000 of whom resided in Amsterdam, were first admitted to political equality in 1796, and the closer union with France which followed completed the work of liberation. At first this gift was not willingly received by the leaders of the Jewish community. They enjoyed great power over individuals, could levy large fines upon those members of the congregation who incurred their displeasure, and feared that the new duty of serving as soldiers and the new right of filling all the employments of the state would alienate their flocks. The Portuguese (or Sephardic) Jews, who were regarded as the aristocracy of their race, were especially conservative, and ultimately the discussions about emancipation led to the secession of the nectering party under the name of 'Adas Jeshurun. The number of Jews in Holland is now 68,000, to whom 665 may be added for Larenbourg.

Belgium. In Belgium there are about 2000 Jews, who enjoy freedom and state subjection for their worship as in France.

Switzerland. In Switzerland the Jews were long treated with great severity, and the French domination brought them only temporary relief. It was only in 1874 that full religious equality was conceded to the Swiss Jews. Their number is now 6396.

Denmark. In Denmark the number of Jews does not exceed 4500. Since 1814 they have been eligible as magistrates.

Sweden. The archives of the Sephardic synagogue in London contain a curious printed invitation from the king of Sweden, sent in the year 1746, in which wealthy Jews are invited to Sweden, while the poor are warned that their residence will be unwelcome. The London Jews declined this calculating hospitality. There are now 1836 Jews in Sweden, and an insignificant number in Norway.

Russia. In Russia the Jews are more numerous and more harshly treated than in any other country in the world. From Russia proper the Jews were long and still are excluded, but the conquests of the Miscellaneous brought them face to face with large numbers of Israelites who, driven out of Germany by persecution, had taken refuge in Poland under the name of *Goyim* the Great. The half Hebrew half German patois (*Judeisch-Deutsch*) which Jews still speak in Russia and Roumania preserves this part of their history. A literature exists in this language; journals are printed in it with Hebrew characters; theatrical representations are given in it, and two companies in London lately played dramas in it, in which the main point of the action was the misery of the religious Jew, who is dragged away from the study of his favourite Talmudical books to serve in the army, where he can hope, as a Jew, for no promotion. The flourishing factories, agriculture, and commerce of the Polish and Lithuanian Jews were wrecked by the intolerance of the successors of Casimir, and Russian oppression completed the ruin. The Jews are still confined to a few over-populated provinces, and loaded with special taxes and restrictions. Under Alexander II. the condition of the Jews was in some respects improved, and the permission accorded for three Jews to settle at each railway station has enabled a few to escape from the old overcrowded settlements and find a new sphere for their commercial activity. They are still, however, largely at the mercy of the official class, and popular risings against them have been repeatedly permitted or encouraged. They are excluded from many vocations, or practise them only by the connivance of bribed officials. For some purposes they are still subject to the jurisdiction of the rabbis. Harkavy, Pinsker, Mandelstamm, Rollman, and Levinson are among their most learned writers; Baron Ginzburg is at the head of a society for spreading culture among the masses. In spite of their disabilities, there are among the Russian Jews enterprising contractors, skilled doctors, and successful lawyers. The number of Jews in European Russia was returned for 1876 as 2,612,179. In Russia in Asia they are estimated to number 25,000. For the KARAITES in Russia see that article.

Moldavia and Bessarabia. At the beginning of the present century the Jews were found in Moldavia everywhere keeping the village inns and forming the centres for the commerce of their districts. Engaged in this occupation, or travelling through the country to buy or advance money upon the crops, and to sell foreign merchandise, were Jews, sons of whom had come from Poland or Russia, while the families of others resident chiefly at Bucharest, had been in the country from time immemorial. They also exercised many handicrafts. They were glaziers, locksmiths, tinsmen, tailors, &c. The metal roofs and pinnacles of churches were all the work of Jews. In the great towns of Moldavia, and also in the Wallachian city of Bucharest, there were established wealthy communities belonging to both divisions of the modern Jews, Ashkenazim and Sephardim. Of the

Sephardim or Spanish Jews it is known beyond a doubt that they settled in the country many centuries ago. They belonged to the families driven from Spain by the Inquisition. The principal bankers of Roumania are Jews. Their children have been in the habit of attending the same schools as the wealthy native families, and the parents held a good position in society. In Jassy, the principal city of Moldavia, 30,000 or 40,000 out of the 80,000 individuals are Jews. In 1804 the practice of the neighbouring states began to creep into Roumania. In that year an ordinance of Prince Mourousi of Moldavia deprived the Jews of the right to hold farms except when attached to village inns. Since that time there have been a series of laws and edicts limiting the freedom of the Jews to hold land and engage in various professions and trades; the Jews have also had much to suffer from popular outbreaks, and even the treaty of Berlin, which abolished all discrimination on grounds of religion, has been interpreted by the Roumanian Government as not applying to the Jews, who are regarded as foreigners, and only naturalized in small numbers and by special acts of the legislature. There are 200,000 Jews in Roumania, and perhaps two or three thousand may have been admitted to naturalization.

In Servia there are 2000 Jews. They have suffered from occasional orders of expulsion from the country districts, but on the whole their condition is comparatively favoured, and they are believed to be on the eve of being admitted, if not already admitted, to political rights.

The Jews in European Turkey before the war which ended with Turkey, the treaty of 1878 were estimated to number 72,000 (in Adrianople 1500, Shumla 1500, Walida 1200, Varna 800, Tatar Bazarlik 1050, Dardanelles 2000, Philippopolis 2200, Ruschuk 2000, &c.). There are some thousands in eastern Roumelia, and others in Bulgaria, who have been very fairly treated by the authorities of the new principality, having grants for their schools, &c. The exertions of Dr Alkanut of Salonica have provided the community of that town (25,000 to 30,000 persons) with excellent means of education. Here is published the *Yekok*, a Spanish newspaper in Hebrew characters, which recalls the fact that thus, like so many of the Jewish communities on the shores of the Mediterranean, sprung from exiles from Spain. The Jewish population of Constantinople consists of about 30,000 souls. Most of the Jews are Sephardim. Two thousand follow the German rite, and are principally to be found in Galata. The Jews in Constantinople are chiefly engaged in traffic. They are governed by a *calim-begam* appointed by themselves, and salaried by the Government. There are forty-two synagogues in the city. Besides the schools of the Alliance, there are 1287 pupils in the wretched Talmud Torah schools. There are also three infant schools. The number of Jews in Asiatic Turkey is stated to be from 100,000 to 130,000. The Smyrna Jews number 25,000. In Baghdad, where there are 30,000 Jews, and where the wealthy family of Sassoon first became known, there are twenty-one synagogues. Pilgrimages are made to the tombs of Ezra, Ezekiel, Joshua the priest, and Shickli Isaac. There are 500 families in Adina, 400 in Bagdad, 250 in Cossak, 130 in Pergamos, 516 in Cune in Ceylan, 200 in Ceylan, 1200 in Beyroot, 2000 in Damascus, 10,000 in Aleppo. Outbreaks of religious hatred between the Greeks and the Jews, and even between the Mahometans and the Jews, have occasionally occurred at Smyrna, Rhodes, &c. The Jews on each occasion have been accused of using Christian blood at the passover. The falsity of this charge was publicly established in 1840, owing to the efforts of Sir Moses Montefiore, who journeyed to the East, accompanied by Crémieux and Munk, to vindicate the innocence of those of his co-religionists who had been put to death, and to liberate those who were imprisoned. The sultan then issued, at the request of Sir Moses Montefiore, a firman declaring the innocence of the Jews, and their title to the equal protection. They now suffer under no disabilities, and are admissible to office.

There are 15,000 Jews in Jerusalem (forming half the population), Palestine whose chief occupation is to study the Talmud. To maintain them this in this hallowed incidence their brethren throughout the world send annual contributions (*halukot*) amounting to about £20,000 a year, or five-sevenths of the total revenue of Palestine. The rabbis who administer these large funds, and also wield the trumpet weapon of excommunication (*herem*), have set their faces against worldly education, regarding Jerusalem as the one great rabbinical college of the world, where the contributors of the *halukot* fulfil the sacred duty of studying the law by proxy. Both Ashkenazim and Sephardim (whose leaders, more liberal than the Ashkenazim, permit Arabic to be taught), both Chasidim and Karaites, are represented here; the Sephardim dress as Orientals; the Russians and Poles wear their long silk or cloth gowns and fur caps, the Germans the quaint cut coat and flannel waistcoat of the early part of this century. All cultivate the long love-locks brought down in front of the ears in obedience to Lev. xix. 27. Boys often marry at fifteen, girls at thirteen. There are two weekly Hebrew newspapers. The synagogues are very numerous; around them cluster the Talmud schools. There are three hospitals for Jews, one of which is maintained by a Christian mission, numerous almshouses, of which the Juda Touro house is the principal, and several endowed schools.

JEWS HARP, or **JEW'S TRUMP** (Fr. *Trompe*), a small musical instrument, known for centuries all over Europe, and consisting of a metal frame with two branches, between which a slender tongue of steel, fastened at one end, and free at the other, is made to vibrate by twitching with the finger, while the frame is held between the teeth. The English name "Jew's trumpet," seems to be merely a corruption of the French words *jeu* and *trompe*. Prefixed to the Rev. Patriek Macdonald's *Collection of Highland Airs* (1781) is a dissertation by the Rev. Walter Young, in which he states that the natives of the island of St Kilda, "being great lovers of dancing, have a number of reels, which are either sung, or played on the Jew's harp or trumpet, their only musical instrument" (p. 11). In the Himalaya journals one of the travellers mentions that he procured a Jew's harp from Tibet. At the commencement of the present century this instrument was improved, and several Jew's harps were combined, it being thus possible by using several instruments in different keys to obtain a complete scale. Eulenstein, a native of Württemberg, made a sensation in London in 1827 by playing on no less than sixteen Jew's harps. No. 30 of the *Leipzig Musical Gazette* (1816) contains an account of the compound Jew's harp, with pieces of music suited for it.

JEYPORE, or **JÁIPUR**, a native state in Rájputána, under the political superintendence of the Rájputána agency and the Government of India, lies between 25° 41' and 28° 27' N. lat. and between 74° 55' and 77° 15' E. long. It is bounded on the N. by Bikaner, Loháru Hájjar, and Patiká; on the E. by Alwar, Bharatpur, and Karáuli; on the S. by Gwalior, Bundi, Tonk, and Údaipur; on the W. by Kishangarh, Jodhpur, and Bikaner. Its area is 14,465 square miles. The country is tolerably level and open, although its surface is diversified by groups and ranges of hills and by isolated peaks. The centre of the state is an elevated triangular table-land from 1400 to 1900 feet above sea-level, whose eastern limit is formed by ranges running north and south. On the north and west it is bounded by a broken chain of hills, an offshoot from the Aravalli mountains, which forms the apex of the triangle. To the east, beyond the hills, the country becomes gradually more open as it spreads out towards the alluvial flats of the Jumna. On the north-west stretches the sandy and desert tract of Shaikhawati (or the country of the Shaikhawati clan). The general drainage of Jeypore from the central table-land is to the east and south-east, though a few streams follow the slope to the north-west. Those flowing south are the Banás and the Bangangá, the tributary of the Jumna, and their tributaries, the Amanisháh, Bándi, Moril, Dánd, and Khari. The Sabi and Káčli flow north. In the south of the state, water is everywhere found at a depth varying from a few feet to 30 or 40 feet; but in Shaikhawati water is always at a great depth, averaging from 80 to 100 feet. The soil is generally sandy. The hills are more or less covered with jungle trees, of no value except for fuel. The hill ranges are said to consist in the north chiefly of granite, and in the south and east of sandstones, mixed sometimes with white and black marble, and occasionally with mica. Copper ore and cobalt are found. Salt is largely manufactured and exported from the Sambhar Lake, the average yearly turn-out amounting to nearly 40,000 tons.

In Shaikhawati there is generally but one crop in the year, consisting chiefly of *bajra*, *mung*, and *moth*. In the north, besides these, a little wheat and barley are grown. Towards the south and east, as the soil becomes richer and firmer, *jowá*, Indian corn, cotton, *ráh*, wheat, barley, gram, sugar-cane, opium, tobacco, *dál*, and linseed are extensively grown. Since 1868 the state has spent £5000 annually on irrigation.

In the absence of a census the population has been roughly estimated at about 1½ millions for the whole territory, with the following proportions of the various classes.—Rájputs, $\frac{1}{4}$; Hindús, $\frac{1}{4}$; Mahometans, $\frac{1}{4}$; Jains $\frac{1}{4}$. The most notable feature in the commerce of the state is the large banking and exchange business carried on at the capital and in the large towns. The chief manufactures are marble sculpture, enamel work done on gold, woollen cloths and fabrics. Education has made great progress in the state. Jeypore city is the site of a college, with a daily attendance (1876) of 800 students; also of a school for the sons of thakurs and higher officials, and a Sanskrit college and industrial school. In the district there are 23 elementary schools, wholly supported by the state, and 879 indigenous schools, with an aggregate attendance of nearly 8000. The coins minted at Jeypore are distinguished from those of other independent states by the *ghar* or spigot on the reverse. The Rájputána State Railway on the metre gauge runs from Agra to Jeypore city, and thence to Ajmir and Nussersáhib. The military force of the state consists of 824 artillerymen, 4450 cavalry, and 15,868 infantry. The number of forts is 38, with an aggregate of 220 guns of all calibres. Some £700,000 from the revenues of the state are alienated in *jágirs* and religion grants, but the available receipts are about £275,000. The climate is dry and healthy. The average temperature, taken from a record of five years, is 81° Fahr. The average rainfall is 26½ inches.

The maharájá of Jeypore belongs to the Kachhwha tribe of Rájputs, and claims descent from Rama, king of Ayodhya in Oudh. Jeypore state was founded in 987 by Dhola Rao, who, along with his Kachhwhas, is said to have absorbed or driven out the petty chiefs. On the ruination of the Mahometans, Jeypore state had very soon to succumb to them, and the Jeypore house furnished some of their most distinguished generals. Among them were Mán Singh, who fought in Orissa and Assam; Jái Singh, commonly known by his imperial title of Mírzá Rájá, whose name appears in all the wars of Aurangzeb in the Deccan; and Jái Singh II., the famous mathematician and astronomer, and the founder of Jeypore city. Towards the end of the 18th century the Jáis of Bharatpur annexed a portion of the state. The chief of Alwar reduced the territory of Jeypore. By the end of the century the state was in great confusion, distracted by internal broils, and impoverished by the exactions of the Marhattás. The disputes between the chiefs of Jeypore and Jodhpur had brought both states to the verge of ruin, and Anir Khán, with the Pindhárís, was exhausting the country. Ráya Hyat in 1818 the protection of the British was extended to Jeypore, and an annual tribute fixed. In 1836, on the accession of the maharájá, then two years old, there was a serious disturbance in the city, after which the British Government took measures to insist upon order, and to reform administration as well as to support its effective action; and the state has become gradually well governed and prosperous. When the mutiny broke out in 1857, the maharájá assisted the British in every way that lay in his power.

JEYPORE, or **JÁIPUR**, capital of the state of the same name, is situated in 26° 55' N. lat. and 75° 59' E. long., on the Rájputána State Railway and the Agra and Ajmer trunk road. It is the largest town and the chief commercial centre of Rájputána, and in many respects the finest of modern Hindu cities. The city, which takes its name (Jáinagar or Jáipur) from the famous Maharájá Síwái Jái Singh II., by whom it was founded in 1728, stands on a small plain surrounded on all sides except the south by rugged hills, the summits of which are at all important points crowned with forts. At the end of the ridge, overhanging the city on the north-west, is the chief defensive work, the *Nahargarh*, or "Tiger Fort," the rock face of which is so scarped as to be inaccessible on the south or city side. Jeypore is remarkable for the regularity and wideness of its streets, and the architectural beauty of the mosques, temples, and private residences which adorn them. From east to west the town is a little over 2 miles in length, with a breadth of about $\frac{1}{4}$ miles. The main streets are paved, and the city is lighted by gas. The houses of the nobility and the citizens are in the suburbs, while the maharájá's palace with its pleasure-grounds occupies the centre of the town. In Jeypore there are as many as seven banking firms, whose aggregate annual business amounts to about £2,500,000, and which possess a capital of upwards of £3,000,000 sterling. Besides these, there are several minor houses, whose collective business may be estimated at £500,000 a year. Exchange and banking form the greater portion of the business of

the place. The city is well provided with hospitals, dispensaries, alms-houses, and schools. One of the most interesting antiquities of the state is the Hindu observatory in the capital, erected by the founder of the city.¹ The population in 1870 was 137,847.

JEZREEL (יֶזְרְעֵל), the well-known capital of the Israelite monarchy under Ahab. Its site has never been lost, and the present village *Zer'in* retains the name radically unchanged. In Greek the name appears under the form *Ἐρζαραία* (*Stradela* in the *Itiner. Hieros.*), and to the crusaders the place was known as *Parvum Gernum*. The modern village stands at the north extremity of a long ledge terminating in steep cliffs forming part of the chain of Mount Gilboa, east of the plain of Esdraelon. The top of the swell is 500 feet above the broad northern valley; the knoll on which the stone village is built is bare and rocky; the buildings are apparently modern, but numerous ancient cisterns and scattered sarcophagi, lying on the hill side, mark the antiquity of the site. The view over the plains from Beisan on the east to Carmel on the west, and from the Samaritan hills on the south to the mountains of Galilee on the north, is fine and extensive. No vineyards now exist, but rock-cut wine presses occur east of the village, perhaps marking the site of Naboth's vineyard (1 Kings xxi. 1). The fountain mentioned in the Bible (1 Sam. xxix. 1) is very probably the fine spring 'Ain el Meiyeth north of the village, a shallow pool of good water full of small fish, rising between black basalt boulders. A very large spring, 'Ain Jaldit or Jaldit (Yâkût, iii. 760), exists in the valley of Jezreel (Josh. xvii. 16) north of the hill. A second city called Jezreel existed in the tribe of Judah, somewhere near Hebron (Josh. xv. 56).

JHĀLĀWAR, a state in Rājputāna, under the political superintendence of the Rājputāna agency and the Government of India, mainly consisting of two separate areas. The larger is bounded on the N. by the state of Kotah; on the E. by Sindhiā's territory and a detached district of the Tonk state; on the S. by the petty state of Rājgarh, a detached district of the Dewas state, and the state of Jaon; and on the W. by detached tracts belonging to Sindhiā and Holkar. This portion lies between 23° 48' and 24° 48' N. lat., and between 75° 55' and 77° E. long. The lesser detached area is bounded on the N., E., and S. by the Gwalior state, and on the W. by Kotah, and lies between 25° 5' and 25° 25' N. lat., and 76° 55' and 77° 25' E. long. The main portion of Jhālāwar is situated on a raised plateau. The northern, eastern, and part of the southern portions are very hilly, and intersected by numerous streams. The hills are for the most part covered with timber and grass, and frequently enclose lakes. The rest of this tract is a rich undulating plain, dotted with evergreen trees. The soil generally is very rich, consisting in great part of dark clayey mould, which produces valuable crops. Of the many streams running through the territory, the most important are—the Parwan, with its tributary the Newāj; the Kālī Sind, with its tributary the Ad; and the Chūhota Kālī Sind. The population in 1875 was 226,000, of whom the majority were Hindus. The area of the whole state is 2500 square miles.

In Jhālāwar all the ordinary Indian grains are cultivated, and in the southern districts opium is extensively grown. In the rest of the state wheat and opium are the chief crops, except in Shāhābād,

where *bajra* is chiefly produced. Irrigation is principally carried on by means of wells. Near Jhālā Patān, the capital, there is a large artificial lake, from which water is drawn by a channel 2 miles long. In 1876, 507,418 acres, or barely two-fifths of the total area, were cultivated. The total revenue for 1876 was £174,719. The police number 100 horse and 2000 foot. Education is at present very backward in the state. In the districts the village priest teaches the young people. In the capital and cantonment there are schools in which Hindi, Urdu, and English are taught. The only metalled roads in the state are in the cantonment. All other roads are simply cart tracks, which in the rains are useless for wheel traffic. Opium is exported; the imports are English cloths and grain. The chief towns are Jhālā Patān and the chhānoti or cantonment, Shāhābād, and Kailwara. The climate resembles that of Central India, and is generally healthy. In the hot weather the thermometer ranges during the day from 85° to 88° Fahr. The temperature during the rains is cool and pleasant, and in the cold weather it is occasionally frosty.

The ruling family of Jhālāwar belongs to the Jhālā clan of Rājputes, and their ancestors were petty chiefs of Halwad in the district of Jhālāwar, in Kāthiāwar. About 1709 one of the younger sons of the head of the clan left his country with his son to try his fortunes at Delhi. At Kotah he left his son Madan Singh, who soon got into great favour with the mahārājā, and got from him an important post, which became hereditary. On the death of one of the Kotah rājās, the country was left to the charge of Jhālā Singh, a descendant of Madan Singh. From that time Jhālā Singh was the real ruler of Kotah. He brought it to a wonderful state of prosperity, and under his administration, which lasted over forty-five years, the Kotah territory was respected by all parties. In 1838 it was resolved, with the consent of the chief of Kotah, to dismember the state, and to create the new principality of Jhālāwar as a separate position for the descendants of Jhālā Singh. The districts then severed from Kotah were considered to represent one-third (£120,000) of the income of Kotah; by treaty they acknowledged the supremacy of the British, and agreed to pay an annual tribute of £8000. Madan Singh received the title of mahārājā rājā, and was placed on the same footing as the other chiefs in Rājputāna. The present mahārājā rājā of Jhālāwar has a force of 20 field and 75 other guns, 150 artillerymen, 426 cavalry, and 4600 infantry.

JHANG, a British district in the Lieutenant-governorship of the Punjab, India, between 30° 35' and 33° 4' N. lat., and between 71° 39' and 73° 38' E. long., with an area of 5712 square miles. It forms the northern district of the Mūltān division, and is bounded on the N. by Shāhpur and Gujranwala, on the W. by Derā Ismā'īl Khān, and on the S.E. by Montgomery. It comprises an irregular triangle, artificially constituted for administrative purposes from portions of three separate tracts. Its eastern half embraces a large part of the high dorsal bridge in the Rechna Doāb; thence it stretches across the Chenab into the wedge of land between that stream and the Jhelum, whose waters unite a few miles below the town of Jhang; while westward again the boundary runs beyond the joint river, far into the heart of the Sind Sāgar Doāb. The Ravi also bounds the district for a few miles along its southern edge. So artificial a tract can hardly be said to possess any common natural features of its own. Along the banks of the river strips of comparatively fertile lowland support a dense population.

At the census of 1868 the population was 345,027 (193,624 males and 151,403 females). The Mahomedans numbered 270,819; Hindus, 57,297; Sikhs, 2994; and "others" 16,917. Only three towns contain a population exceeding 5000—Jhang, 9124; Maghāniā, 10,525; and Chindot, 11,477. The area under cultivation in 1873 amounted to 241,325 acres, out of an assessed total of 3,650,867 acres. No crops can anywhere be grown without irrigation. Wheat, barley, gram, *sarras*, *chāna*, *joār*, maize, and cotton form the staples of the district. Grain is imported. Country cloth is manufactured at Jhang and Maghāniā, and bought up by the Poverda merchants of Afghanistan. Manufactures of gold and silver lace also exist. The principal road from Mūltān to Wazīrābād passes through the chief towns in the district. A bridge of boats is in course of construction (1875) across the united stream of the Jhelum and the Chenab. Both rivers are navigable. The total revenue for 1873 was £49,302. The police force in 1872 numbered 503 men. In 1873 there were 32 Government and 123 native schools, with a joint roll of 3696 pupils. The district bears a good reputation for healthiness. Small-pox and fever form the most prevalent diseases. The average rainfall for the seven years ending 1872-73 was 10 inches. There are seven charitable dispensaries.

¹ On the summit of a range of hills, about a mile and a half east of Jyoyore town, is a sacred shrine called the "Gūta," where there is a temple devoted to "Surya," or the Sun-god. Below the platform a spring issues, which pours over the rock by a fall of 70 feet into the valley below. The water of this spring is considered peculiarly sacred by the Brāhmins.

The district of Jhang possesses unusual historical interest from the presence within its borders of the mums which crown the rocky eminences of Sanglana Tila. This site has been identified with the Sūkala of the Brāhmins, the Sāgal of Buddhism, and the Sanga of Alexander's historians. In modern times the history of Jhang centres in the famous family of Sials, who exercised an extensive sway over a large tract between Shāhpur and Multān, with little dependence on the imperial court at Delhi, until their family fell before the all-absorbing power of Rājput descent, whose ancestor, Rāi Shaukar of Dīnagar, emigrated only in the 13th century from the Gangetic Doab to Jampur. In the beginning of the present century the mahājāti Rājput Sials invaded Jhang, and captured the Sial chieftain's territories. He recovered a small portion afterwards, which he was allowed to retain on payment of a yearly tribute. In 1847, after the establishment of the British agency at Lahore, the district came under the charge of the British Government, and in 1848 Jemāl Khān, the Sial leader, rendered important services against the rebel chiefs, for which he received a pension. During the mutiny of 1857 the Sial leader again proved his loyalty by serving in person on the British side. His pension was afterwards increased, and he obtained the title of Khān Bahādur, with a small jagir for life.

JHANG, a municipal town in the above district. The sister town of Maghāniā, containing the civil station for the district, lies 3 miles south of Jhang, and has a population of 10,535 persons. They form together a single municipality, and may be regarded as practically one town, situated in 31° 10' 16" N. lat., and 72° 21' 45" E. long., about 3½ miles to the west of the present bed of the Chenāb. Jhang itself lies on the lowland, a little apart from the regular lines of trade, and since the removal of the Government offices to Maghāniā, has yielded its commerce and importance to its younger rival. Founded by Māl Khān, a Sial chieftain, in 1462, it long formed the capital of a native Mahometan state. The population of Jhang proper in 1865 was 9124, comprising 4568 Hindus, 4244 Mahometans, 129 Sikhs, 12 Christians, and 171 "others." Population of the united towns, 19,649.

JHĀNSI, a British district in the Lieutenant-governorship of the North-Western Provinces, India, between 25° 3' 45" and 25° 48' 45" N. lat., and between 78° 21' 15" and 79° 27' 30" E. long. It forms the central district in the division of the same name, and is bounded on the N. by the Gwalior and Santhar states, on the E. by the river Dhasān, on the S. by the district of Lalitpur and the Orchha state, and on the W. by the Datia, Gwalior, and Khandia Dānā states. Jhānsi forms a portion of the hill country of Bundelkhānd, sloping down from the outliers of the Vinḍhyān range on the south to the tributaries of the Jumna on the north. The extreme south is composed of parallel rows of long and narrow-ridged hills. Through the intervening valleys the rivers of the district flow down impetuously over ledges of granite or quartz. North of the hilly region, the rocky granite chains gradually lose themselves in clusters of smaller hills. The northern portion consists of the level plain of Bundelkhānd, distinguished for its deep black soil, known as *mār*, and admirably adapted for the cultivation of cotton. The district is intersected or bounded by three principal rivers—the Pahli, Betwa, and Dhasān. There are many minor streams, most of which are feeders of the Dhasān. The district is much cut up, and portions of it are insulated by the surrounding native states.

The census of 1872, taken over an area of 1567 square miles, returned a population of 817,896, of whom (exclusive of non-Asiatics) 167,519 were males and 150,216 females. As regards religion, 805,151 were Hindus, while only 12,417 were Mahometans. Five towns have a population exceeding 5000—Mhow, 15,068, Rāmpur, 8320; Gīrsārū, 5897; Barwa Sāgar, 5556; and Bhāndar, 5141. Jhānsi, in the nature of its soil, the character of its people, the poor

means of irrigation, and the want of good communication, is worse off than any other district in the North-Western Provinces, except Lalitpur. Out of a total area of 1,002,734 acres, only 428,348 acres are under cultivation. The principal crops are *jowā*, *bajra*, cotton, *lūt* or oilseed, *kodan* (a kind of pulse), wheat, grain, and barley. The most important product is the *al* dye, procured from the root of the *Azoreadic carthagen*, which is only dug up every third year. The *Azoreadic kām* grass has proved as great a pest here as elsewhere in Bundelkhānd. Jhānsi is specially exposed to lightdews, droughts, floods, hailstorms, epidemics, and their natural consequences—famine. It is considered that famine may be feared on an average every five years. The district imports grain, and in return exports the *al* dye and cotton. The 110 schools in 1870 taught 2385 pupils at a cost of £1247. The climate is hot and very dry, but not unhealthy. The mean annual temperature for 1871 was 51·7 Fahr. The average rainfall for the ten years ending 1870 was 81 inches. The population are habitually underfed, and consequently succumb readily to slight diseases.

Nothing is known with certainty as to the history of this district before the period of Chandel rule, about the 11th century of our era. To this epoch must be referred the artificial reservoirs and architectural remains of the hilly region. The Chandels were succeeded by their servants the Khānās, who built the fort of Kānūr, lying just outside the British lines. About the 14th century the Bundelas poured down upon the plains, and gradually spread themselves over the whole region which now bears their name. The Mahometan *savabādh* were constantly making incursions into the Bundela country; and in 1732 Chhatarsāl, the Bundela chieftain, called in the aid of the Marhattās. They came to his assistance with their accustomed promptitude, and were rewarded, on the *rājā*'s death in 1734, by one-third of his dominions. Their general formed the city of Jhānsi, and peopled it with rāhātārīs from Orchha state. In 1806 the British protection was promised to the Marhattā viceroy, and in 1814 the *peishwā* ceded to the East India Company his rights over Bundelkhānd. In 1858 Gangadhar Rāo died childless, and his territories lapsed to the British. The Jhānsi state and the Jālām and Chanderī districts were then formed into a superintendency. The widow of the late *rājā* considered herself aggrieved because she was not allowed to adopt an heir, and because the slaughter of cattle was permitted in the Jhānsi territory. Reports were spread which excited the prejudices of the Hindus. The events of 1857 accordingly found Jhānsi ripe for mutiny. In June a few men of the 13th native infantry seized the fort containing the treasure and magazine, and massacred the European officers of the garrison. Everywhere the usual anarchic quarrels rose among the rebels, and the country was plundered mercilessly. The *rājā* put herself at the head of the rebels, and died bravely in battle. It was not till November 1858, after a series of sharp contests with various *guerrilla* leaders, that the work of reorganization was fairly set on foot. Since that time Jhānsi has remained a British district, and famines and floods alone have disturbed the prosperous course of civil administration.

JHANSI, a city and fort in Gwalior state, North-Western Provinces, India, in 25° 27' 30" N. lat. and 78° 27' E. long. A stone fort crowns a neighbouring rock, and commands the town, as well as the British outpost, Jhānsi Naohād, which adjoins the city. It lapsed to the British in 1853, and during the mutiny was the scene of insurrection and massacre. In 1861 the town, fort, and surrounding territory beyond the Pahli were handed over to Gwalior state. The administrative headquarters of Jhānsi district is Jhānsi Naohād, which had a population in 1872 of 536 persons. The estimated population of Jhānsi proper is 30,000.

JHELMUM, or JHELAM, a district in the Lieutenant-governorship of the Punjab, India, between 32° 26' and 33° 15' N. lat., and between 71° 51' and 73° 50' E. long., bounded on the N. by Rāwāl Pindī district, E. by the Jhelum river, S. by Shāhpur district, and W. by Jammu district. It forms the south-eastern portion of a rugged Hīmalāyan spur, extending between the Indus and Jhelum to the borders of the Sind Sāgar Doāb. Its scenery is very picturesque, although not of so wild a character as the mountain region of Rāwāl Pindī to the north, and is lighted up in places by smiling patches of cultivated valley. The backbone of the district is formed by the Salt Range, a treble line of parallel hills running in three long forks from east to west throughout its whole breadth. The range rises in bold and striking precipices, broken by gorges,

¹ The division of Jhānsi is under a commissioner in the North-Western Provinces, and comprises the three districts of Jhānsi, Jālām, and Lalitpur, which contain a large portion of the tract known as Bundelkhānd. The area in 1872 was 5087 square miles, the population 824,943.

clothed with green brushwood and traversed by trickling streams, at first pure and fresh, but soon impregnated with the saline matter over which they pass. Between the line of hills lies a picturesque table-land, in which the beautiful little lake of Kallar Kahar nestles amongst the minor ridges. North of the Salt Range, the country extends upwards in an elevated plateau, diversified by countless ravines and fissures, until it loses itself in the tangled masses of the Rāwal Pindī mountains. In this rugged tract cultivation is rare and difficult, the soil being choked with saline matter. At the foot of the Salt Hills, however, lies a small strip of level soil, lying along the banks of the Jhelum, and thickly dotted with prosperous villages. The drainage of the district is determined by a low central watershed running north and south at right angles to the Salt Range. The waters of the western portion find their way into the Sohan, and finally into the Indus; those of the opposite slope collect themselves into small torrents, and empty themselves into the Jhelum.

The census of 1883 returned the population of Jhelum district at 500,988, inhabiting 118,010 houses, and spread over an area of 3910 square miles. The Mahometans numbered 434,167; Hindus, 49,111; Sikhs, 13,865, and "others," 3855. Five towns contained in 1883 a population exceeding 6000.—Pind Dādan Khān, 16,740; Chakwal, 6767; Taidgang, 6767; Lwā, 5286; and Jhelum, 5148. Of a total area of 2,622,200 acres, but 769,845 acres are under cultivation, and only 258,326 acres more are returned as capable of tillage. The staple crops are wheat and *bajra*. Trade is chiefly concentrated in the towns of Pind Dādan Khān. The exports are salt, silk and cotton goods, brass and copper wares, the imports, English piece goods and metals, and woollen fabrics from Kashmir and from Central Asia via Peshāwar. Salt is procured in immense quantities from the central hills of the Salt Range, the net revenue from this source in 1871-72 amounted to £262,198. The total revenue in 1873-74, excluding salt, was £70,390, of which £50,766 was derived from the land tax. The police force consisted in 1873 of 527 men. For fiscal and administrative purposes the district is subdivided into 4 *talukās* and 10 *parganas*, containing 989 estates, and owned by 49,860 proprietors.

The history of the district dates back from the semi-mythical period of the *Mahābhārata*. Hindu tradition represents the Salt Range as the refuge of the five Pāndava brethren during the period of their exile, and every saintly spot in its scenery is connected with some legend of the national heroes. Modern research has fixed the site of the conflict between Alexander and Poros as within Jhelum district, although the exact point at which the Macedonian king effected the passage of the Jhelum (or Hydaspes) is disputed. After this event, we have little information with regard to the condition of the district until the Mahometan conquest brought back literature and history to Upper India. The Janyālis and Jats, who now hold the Salt Range and its northern plateau respectively, appear to have been the earliest inhabitants. The Ghakkars seem to represent an early wave of conquest from the east, and they still inhabit the whole eastern slope of the district; while the Awāns, who now cluster in the western plain, are apparently later invaders from the opposite quarter. The Ghakkars were the dominant race at the period of the first Mahometan incursions, and long continued to retain their independence. During the flourishing period of the Moghul dynasty, the Ghakkār chieftains were among the most prosperous and loyal vassals of the house of Bābur; but after the collapse of the Delhi empire Jhelum fell, like its neighbours, under the sway of the Sikhs. In 1768 Gajpur Singh defeated the last independent Ghakkār prince, and reduced the wild mountaineers to subjection. His son succeeded to his dominions, until 1810, when he fell before the irresistible power of Ranjit Singh. In 1849 the district passed, with the rest of the Sikh territories, into the hands of the British. Ranjit Singh, however, had so thoroughly subjugated the wild mountain tribes that little difficulty was experienced in reducing it to working order, and the subsequent history of Jhelum has been purely fiscal and administrative.

JHELUM, the headquarters of the above district, situated on the north bank of the Jhelum river, in 32° 55' 26" N. lat. and 73° 46' 36" E. long. The town is quite of modern origin, and in 1868 contained a population of 5148, viz., Mahometans, 2831; Hindus, 1588; Sikhs, 442; Christians, 3; and "others," 14. The civil lines and cantonments for a regiment of native infantry lie about a mile north of the town, which is noted for boat building.

JHIND, or JIND, a native state in the Punjab, India, consisting of three or four isolated tracts to the east of the Sutlej. The area is 1236 square miles, and the estimated population 311,000. The principality was founded in 1763 by a Sikh of the Sidhu Jāt tribe, and the chief was recognized as *rājā* by the Moghul emperor in 1768. The family have always been loyal supporters of the British Government. On the overthrow of the Marhattā power in northern India in 1804-5, the Jhind *rājā* was among the foremost to tender his allegiance to Lord Lake, who confirmed him in the possession of the estates he had held under the Moghul emperors and the Marhattās. After the Sutlej campaign a further grant of land was awarded the chief in recognition of his services. In 1857 Rājā Swarūp Singh of Jhind was the first to march against the mutineers at Delhi. His troops acted as the vanguard of the army, and he himself remained in the British camp until the reconquest of the city, a portion of his soldiers aiding in the assault. For these services he received a grant of additional territory, yielding £11,681 per annum. The *rājā* enjoys an estimated revenue of between £60,000 and £70,000, and maintains a force of 10 guns, 73 artillerymen, 200 cavalry, and 1600 infantry. No tribute is paid by the state, but a contingent of twenty-five horsemen is furnished to the British Government.

JIDDAH, or JUDDAH, also written Jeddah, Djiddah, or Djeddah, a town of Arabia, on the eastern coast of the Red Sea, in 21° 28' N. lat. and 39° 17' E. long, is of importance mainly as the principal landing-place of the pilgrims to Mecca. Its distance from that city is estimated at 44 or 46 miles. Built on a slight eminence, with a purple background of distant hills, Jiddah as seen from the sea presents an attractive aspect. The white tower-like houses, fancifully enriched with balconies, cornices, and lattices of rich-toned woodwork, shine out from an environment of grey sand and blue-green sea with startling effect. The town extends along the beach for about a mile, and is surrounded by a high wall of modern date and in bad repair, with towers at intervals. At the northern end of the sea-face stand the prison and other public buildings, and at the southern end a small fort no longer available for the defence of the harbour. There are three landward gates, the Mecca gate to the east, through which all caravans pass, and where toll is levied on the transit of camels, the Medina gate to the north, and the Yemen gate to the south. In front of the Mecca gate is a rambling suburb, with shops, coffeehouses, and an open market-place. Before the Medina gate are the Turkish barracks, and beyond them the great holy place of Jiddah, the singular tomb of "our mother Eve," surrounded by the principal cemetery.

The tomb is a walled enclosure said to represent the dimensions of the body, about two hundred paces long and 15 feet broad. At the head a small erection where gifts are deposited, and rather more than half-way down a whitewashed dome encloses a small dark chapel within which is the black stone known as *Isṭarrah*, the navel. The grave of Eve is mentioned by Edrisi, but except the black stone nothing bears any aspect of antiquity. Further details in Burton's *Pilgrimage*, vol. ii. p. 293, and a view in Mrs Burton's *A. E. I.*

Beyond the immediate suburbs the country as far as the foot of the hill is desert, with scanty pasturage and a few villages of Arab huts. The inhabitants (Harb, Hutaym, Zobeid) are engaged in camel transport, slave hunting, and mother of pearl fishery.

The town itself, which consists of four quarters, is well built, with a good bazaar and many lofty and spacious houses, built of the madrepore rock of the district. The best dwellings are near the Medina gate; the mosques are not remarkable, and the streets are narrow and in part very filthy. The wretched huts which formerly occupied part

¹ The form Juddah has the authority of Yāqūt, but is not now used.

of the enceinte have been almost entirely removed since the frightful outbreak of cholera among the pilgrims in 1864-65, and the lowest strata of the population now occupy a village without the walls. The sanitary condition of Jiddah still, however, leaves much to be desired, especially in the pilgrim season. The chief defect is the scanty water supply derived from cisterns and wells outside the town. A conduit from the hills has been projected, and would yield a copious stream of excellent water, but the scheme is opposed by the owners of the cisterns, who drive a lucrative trade, a camel-load of water (16 skins of about 7 pints each) costing as much as sixteenpence, or after protracted drought much more. The permanent population of Jiddah is very variously estimated. Mr Beyts (*Consular Reports*, 1875) places it at 30,000, including 2000 Indian settlers, 100 Greeks, Syrians, and Maltese, and 25 Franks; but the Dutch consul in 1879 allows a total of 15,000 only. The native population is of very mixed blood.

Jiddah is said to have been founded by Persian merchants in the caliphate of Othman, but its great commercial prosperity dates from the beginning of the 15th century, when it became the centre of trade between Egypt and India. Down to the time of Burckhardt the Suez ships went no farther than Jiddah, where they were met by Indian vessels. The introduction of steamers in the Red Sea has deprived Jiddah of its place as an emporium not only for Indian goods but for the products of the Red Sea, which formerly were collected here, but are now largely exported direct by steamer from Hodeida, Suakin, and other ports, though coffee from Yemen and gums from the African coast still pass in considerable quantities through the hands of the Jiddah merchants. The chief exports apart from these are mother of pearl (fished by slave divers) and hides. The chief local manufactures are a coarse cotton fabric, embroideries in gold and silver, lacquer work, beads in black coral, and the like. Boat-building is carried on with great skill. The baggasas of from 50 to 60 tons are built of East Indian wood, and are excellent sailers. The imports of Jiddah are considerable, as the town supplies the interior not only with manufactured goods but with grain and other provisions. See full details of the trade in a valuable paper by the Dutch consul, Mr Kruyt, in *Tijdsch. v. h. Aardr. Genootschap* (Amsterdam, 1880, No. 5). The total exports and imports for 1879 are valued at £2,204,030. In the same year the port was visited by 241 steamships (213,295 tons) and 1156 sailing vessels (55,932 tons). The harbour is not convenient of access, but the roadstead when entered is well protected by coral reefs.

The introduction of steam traffic, while fatal to other local interests, has given a great impulse to the pilgrim trade, which is now regarded as the annual harvest of Jiddah. The pilgrim steamers are usually chartered by European merchants in conjunction with native capitalists and persons of religious influence. The average number of pilgrims annually landed at the port is not much short of 40,000. For 1879 Mr Kruyt enumerates 7995 Turks, 2286 from the Barbary states, 3459 Egyptians, 8787 Malaysians and Javanese, 10,894 Indians, 3506 Persians, 3300 Arabs from Yemen, the Sûdan, and other places.

In the early years of the present century Jiddah resisted with success repeated attacks of the Wahhâbites, and remained in the hands of the grand shérif when he had lost the rest of the Hijâz. It was governed by Egypt during the Arabian wars of Mehmet Ali, but since 1840 has been again occupied by the Turks. There is a Turkish caim-macam under the wâly of the Hijâz and a Turkish cadi, but the shérif through his resident agent exercises an authority practically superior to that of these officials. In 1858 the attempts of England to suppress the slave

trade and a supposed insult to the Ottoman flag led to a plot to murder all the Christians in town, which was executed with fatal success (15th June), the English consul Page and the French consul Éveillard being among the victims. This outrage was followed by the bombardment of the town by the English man-of-war "Cyclops," and the authorities were compelled publicly to execute the Turkish governor and two leading citizens involved in the plot.

For further details see, in addition to the works already cited, Niebuhr's *Voyage*; Burckhardt's *Travels in Arabia*, vol. 1, London, 1829; Von Maltzan's *Reise nach Sudarabien*, Brunswick, 1873. See also Ritter, *Erkunde von Arabien*, 1847; Zelmé, *Arabien und die Araber*, Halle, 1875.

JILOLO, GULO, or DJILOLO (properly Jailolo or Djailolo, and in the native tongue *Halmahera* or *Halemahera*, i.e., the mother or great land), is one of the larger islands of the East Indian archipelago, forming part administratively of the Dutch residency of Ternate. The equator cuts across the southern peninsula, the most northerly point of the island lying in 2° 18' N. lat., and the southern extremity in 0° 52' S. A large proportion of Jilolo is practically *terra incognita*, though information has somewhat accumulated since Wallace complained in 1856 of the smallness of our knowledge in regard to it. The area is stated at 6410 square miles; the extreme irregularity of the outline, however, renders the estimate a peculiarly precarious one. Jilolo may be said to consist of four peninsulas so arranged as to enclose three great bays (Kaon, Bitjoli, Weda), all opening towards the east,—the northern peninsula being connected with the others by an isthmus only 5 miles wide. On the western side of the isthmus lies another bay, that of Dodinga, in the mouth of which are situated the two islands Ternate and Tidore, whose political celebrity so far exceeds that of their larger neighbour Jilolo. To the north-east of the northern peninsula we have the considerable island of Morotai, and to the west of the southern peninsula the far more important island of Batchian. The northern peninsula is full of mountain chains, which give clear evidence of former volcanic activity; and at least one of the summits, Tolo or Gunong Api (3000 feet), was not quite extinct in the 16th century according to Valentijn's report. At present the crater, as described by Bernstein, is 200 feet deep, and contains a small lake. Gunong Tabblo is higher than Tolo, and Gunong Mamuya has a similar altitude. In the south of the peninsula lies a lake, Talaga Lamo (the Talagalina of Bernstein's account), about 4 or 5 miles long. The principal village is Galola, situated on a bay of the same name on the east coast, in a well-cultivated plain which extends southward and inland. The three remaining peninsulas, which have been less explored, seem to be hardly so mountainous. The whole island is clothed with a prolific vegetation, some of the more important features of which will be found described in Teymann's paper in the Report of the Botanic Garden at Buitenzorg. Rice is grown by the natives, but the sago tree is of far greater importance to them.

The people of Jilolo are for the most part pagans, living in a very backward state of civilization. Attempts to Christianize them have been made with but small success by the missionaries of the Utrecht Society, who have their chief stations at Sralonora and Dokolano, near Lake Talaga Lamo (see *Berichten der Utrechtsche Zendgenootschap*, 1860). M. Adhile Raffray gives the following description of the Halmaherians in *Tour du Monde*, 1879, where photographs of a number of the natives will be found. "They are as unlike the Malays as we are, excelling them in tallness of stature and elegance of shape, and being perfectly distinguished by their oval face, with a fairly high and open brow, their aquiline nose, and their horizontally placed eyes. Their beards are sometimes thick; their limbs are muscular; the colour of their skins is cinnamon brown. Spears of iron-wood, abundantly barbed, and small bows and bamboo arrows free from

in a determined and even autocratic manner, the haughty and turbulent Castilian nobility and the jealous intriguing Flemish councillors of Charles combined to render his position peculiarly difficult; while the evils consequent upon the unlimited demands of Charles for money threw much undesired odium upon the regent. In violation of the laws, Jimenes acceded to Charles's desire to be proclaimed king; he secured the person of Charles's younger brother Ferdinand; he fixed the seat of the cortes at Madrid; and he established a standing army by drilling the citizens of the great towns. Immediately on Ferdinand's death, Adrian, dean of Louvain, afterwards pope, produced a commission from Charles appointing him regent. Jimenes admitted him to a nominal equality, but took care that neither he nor the subsequent commissioners of Charles ever had any real share of the power. In September 1517 Charles landed in the province of Asturias, and Jimenes hastened to meet him. On the way, however, he fell ill, not without a suspicion of poison. While thus feeble, he received a letter from Charles coldly thanking him for his services, and giving him leave to retire to his diocese. A few hours after this virtual dismissal, which some, however, say the cardinal never saw, Francisco Jimenes died at Roa, November 8, 1517.

Jimenes was a bold and determined statesman. Sternly and inflexibly, with a confidence that became at times overbearing, he carried through what he had decided to be right, with as little regard for the convenience of others as for his own. In the midst of a corrupt clergy his morals were irreproachable. He was liberal to all, and founded and maintained very many benevolent institutions in his diocese. His whole time was devoted either to the state or to religion; his only recreation was in theological or scholastic discussion. Perhaps one of the most noteworthy points about the cardinal is the advanced period of life at which he entered upon the stage where he was to play such leading parts. Whether his abrupt change from the secular to the regular clergy was the fervid outcome of religious enthusiasm or the far-seeing move of a wily schemer has been disputed; but the constant austerity of his life, his unvarying superiority to small personal aims, are arguments for the former alternative that are not to be met by merely pointing to the actual honours and power he at last attained.

His services to learning and literature have yet to be noted. In 1500 was founded, and in 1508 was opened the university of Alcalá de Henares, which, fostered by Cardinal Jimenes, at whose sole expense it was raised, attained a great pitch of outward magnificence and internal worth. At one time 7000 students met within its walls. In 1536 the university was removed to Madrid, and the costly buildings were left vacant. In the hopes of supplanting the romances generally found in the hands of the young, Jimenes caused to be published religious treatises by himself and others. He revived also the Mozarabic liturgy, and endowed a chapel at Toledo, in which it was to be used. But his most famous literary service was the printing at Alcalá (in Latin *Complutum*) of the Complutensian Polyglot, the first edition of the Christian Scriptures in the original text.¹

¹ In this work, on which he is said to have expended half a million of ducats, the cardinal was aided by the celebrated Stunfos (D. Lopez de Zuñiga), the Greek scholar Nuñez de Guzman (Pneumatus), the Hebraist Vergara, and the humanist Nebrija, by a Cretan Greek Demetrius Decas, and by three Jewish converts, of whom Zamora edited the Targum to the Pentateuch. The other Targums are not included. In the Old Testament Jerome's version stands between the Greek and Hebrew. The synagogue and the Eastern Church, as the preface expresses it, are set like the thieves on this side and on that, with Jesus (that is, the Roman Church) in the midst. The text occupies five volumes, and a sixth contains a Hebrew lexicon, &c. The work commenced in 1502. The New Testament was finished in January 1514, and the whole in April 1517. It was dedicated to Leo X.,

The work by Alvaro Gomez de Castro, *De Rebus Gestis Francisci Ximenis* (folio, 1659, Alcalá), is the quarry whence have come the materials for biographies of Jimenes—in Spanish by Robles (1804) and Quintanilla (1633); in French by Bander (1835), Marsollier (1834), Flecher (1834), and Richard (1704); in German by Heide (1844, translated into English by Canon Dalton, 1860) and Havemann (1848); and in English by Barrett (1818). See also Prescott's *Ferdinand and Isabella: The Two Great World Monarchs*, May 1841; and *Mém. de l'Acad. d'hist. de Madrid*, vol. iv.

JOACHIM. See ZHITOMIR.

JOACHIM (c. 1145–1202), abbot of Floris, has a place of considerable prominence in the category of those mystics who, like St Hildegard or the abbess Elizabeth, on behalf of a sounder morality protested in prophetic denunciation against the many and gross abuses connected with the ecclesiasticism which prevailed in Europe towards the close of the 12th century. The few details of his life that can be given are neither very precise nor quite trustworthy; but it appears that he was born about 1145 at a village in the neighbourhood of Cosenza, and that when a youth he had attended the Sicilian court; afterwards he made a pilgrimage to Palestine, and, having (whether previously or subsequently to his return is not stated) become a monk, he ultimately attained to the dignity of abbot of the monastery of Corace in Calabria (onwards from 1178). Here his studies in prophecy and apocalyptic brought him into great repute, and successive popes—Lucius III., Urban III., and Clement III.—manifested an interest in them. The last-named especially, in the first year of his pontificate (1188), urged Joachim to the completion of his commentary on the Apocalypse and also of his *Concordia utriusque Testamenti*. Soon afterwards the abbot, accompanied by a friend named Raincrinus, leaving Corace in search of a more solitary life, set up among the lonely hills of Sylæ near Cosenza a new establishment, named "Sancti Joannis in Flori," for which he drew up a new and stringent rule, afterwards sanctioned (in 1196) by Celestine III. From this cloister ultimately sprang a whole congregation, —the so-called "Ordo Florentinus." The only work published during his lifetime was the *Concordia*; which had been duly submitted to the judgment of the Holy See; and before his death (which occurred between September 1201 and June 1202) he left in writing a memorandum with reference to his other compositions,—the *Epistola in Apocalypsin*, the *Psalterium decem chororum*, *Contra Judeos*, and *Contra cathol. fidei universarios*,—intimating his desire and intention that those should also be subject to the same censorship.

The study of apocalyptic prophecy had resulted in the construction of an elaborate scheme of the past and future course of the divine kingdom which is as interesting as it is curious. It distinguished three stages or ages of the world corresponding to the three persons of the Trinity, the three conditions of married persons, clergy, and monks, the three periods of the Old Testament, the New Testament, and the final dispensation. The advent of the last of these periods, that of the Holy Spirit, the "spiritual intelligence," proceeding from the Old and New Testaments, he regarded as imminent. It was to be the period of perfect freedom from the letter, of monastic contemplation, atonement, and jubilation, and of the widest possible diffusion of the gospel (even to the Jews); but it was to be preceded by fearful judgments, in which Antichrist should become manifest. He regarded the Church of Rome as having been typified by the kingdom of Judah, while the Eastern Church corresponded to that of Israel. The way in which he worked out this analogy gave him scope for pointing out the manifold errors and corruptions into which he believed the Church of the West to have fallen, yet in no spirit of hostility to that organization as such. His eschatology found great currency and much acceptance amongst the stricter members of the Franciscan order,—the "Zelatores" as they were called,—and gradually gave rise to a cognate literature more manifestly opposed to Rome and whose permission to publish was so tardy that the book did not come before the public till 1523. The MSS. on which the Holwer text was based are still at Madrid; the history of those used for the New Testament has long been a problem, but the story that they were sold to a fireworks maker appears to be a fable. See Delitzsch's unfinished studies on the subject (London, 1872, and Leipzig, 1878).

even to ecclesiasticism of any kind. Among this class of compositions the greatest historical importance belongs to the *Liber introductorius in Evangelium aeternum*, now no longer extant, except in some excerpts. The work was censured as heretical by the university of Paris, and the order for its destruction was obtained from Alexander IV. in 1255; this, however, only stimulated the public interest in the books of Joachim himself, which now began to be circulated and read more widely than ever. That interest died a natural death, however, when the year 1260, which Joachim had fixed as the time of the end, had come and gone, leaving the old and evil world practically unchanged.

JOACHIMSTHAL (Boh., *Jáchymov*), a mining town of Bohemia, in the circle of Eger, is favourably situated in a valley on the southern slopes of the Erzgebirge, about 10 miles north of Carlsbad, and 3 miles from the Saxon frontier, at an elevation of 2000 feet above the level of the sea, 50° 23' N. lat., 12° 54' E. long. It is the seat of a circuit court and board of mines, and has two commercial schools and establishments for teaching lace-making and straw-plaiting. The inhabitants are chiefly employed in mining, and in the manufacture of white and red lead, vermilion, cobalt, snail, uranium yellow, bismuth, and nickel; also of thread, lace, basket-work, cutlery, paper, and cigars. The town owes its celebrity to the silver, lead, tin, and iron mines in its vicinity. During the 16th century the silver mines reached a very high point of productiveness, but since that period the yield has considerably declined. Population in 1870, 6586.

In places of the present town of Joachimsthal, which dates from the year 1518, there stood formerly the village of Comnadgrün. This was ruled by the kings of Bohemia to the counts of Schlick, from whom it passed by feudal tenure to the knights of Haslau. It is from the silver guldengroschen, first coined in 1518 by order of Count Schlick, and afterwards known as Joachimsthaler, that the German term *thaler* is derived. In 1547, during the Sualkald war, the town was besieged by William Thurnishirn, general of John Frederick, elector of Saxony, but the siege was soon raised. In 1570 certain special privileges and additional lands were granted to Joachimsthal by the emperor Rudolph II. The last emigration of Protestants from the neighbourhood to Saxony took place in 1603. Three-fourths of the town was destroyed by fire on the 31st March 1878. The large church of St Joachim, which was also burned, was rebuilt and restored in 1876. In the neighbourhood are the ruins of the castle of Frauenstein.

JOAN, the name given to a female pope, now regarded as a fictitious personage, who under the title of John VII. or VIII. was said, according to the most general accounts, to have occupied the papal chair between the pontificates of Leo IV. and Benedict III., although various other dates are given. Tradition represents her as of English descent, but born in Ingelheim or Mainz. By some her original name is given as Gilberta, by others as Agnes. She was credited with having fallen in love with a young Benedictine monk, and with having on that account assumed the male monastic habit and lived for some time in the monastery of Fulda. Her lover, it is affirmed, died while they were pursuing their studies together at Athens, and after his death she went to Rome, where, according to the most approved version of the story, she became a very successful professor. So high indeed became her reputation for piety and learning that the cardinals with one consent elected the supposed young monk the successor of Pope Leo IV. In this position she comported herself so as entirely to justify their choice until the catastrophe of giving birth to a male child during a procession to the Lateran palace suddenly and irrevocably blasted her reputation. She is said either to have died in childbirth or to have been stoned to death.

The story of the pontificate of Joan was received as fact from the 15th to the 16th century, but it has been discarded by later researches. The circumstantial evidence around which it clung, and which may have aided in suggesting it, was the observance of

a circuit by the papal processions so as to avoid passing through a certain street (a statue at one time standing in that street, said to represent a woman and child, with a monumental stone near it having a peculiar inscription), and the use of a pierced seat at the enthronement of the popes. Of these facts other and more credible explanations have, however, been given, although there is no sufficient evidence to demonstrate beyond dispute the manner in which the story originated. According to Dr Döllinger, who gives an elaborate analysis of the story in *Die Pöpst-Pöbeln, des Mittelalters*, Munich, 1863, the tradition finds no support in the original text either of Marianns Scotus, Siegbert of Gemblours, or Otto of Freysingen. She is first mentioned by Stephen de Bourbon, who died in 1261, and who took his information probably from the chronicle of the Dominican Jean de Mailly, no copy of which is now known to be in existence. The story is not found in any of the original manuscripts of Martinus Polus, and according to Döllinger was interpolated in that chronicle some time between 1278 and 1312. He attributes the propagation of the myth chiefly to its insertion in Martinus Polus, from which it was copied into the *Mores Temporum*, a chronicle founded on Martinus, and its real originators he supposes to have been the Dominicans and Minorites, who had a grudge against the papacy on account of the persecutions they were experiencing at the hands of Benedict VIII. So rapidly did the tradition spread that in 1400 a list of the popes was placed in the cathedral of Siena along with the other popes, having the inscription "John VIII., a woman from England." The statue occupied this position till the beginning of the 17th century.

See the work of Döllinger above mentioned, which has been translated into English both in England and in America, and the authorities therein referred to.

JOAN or **ARC**, or more properly Joanneta Darc, afterwards known in France as Jeanne d'Arc,¹ the Maid of Orleans, was born about 1411, the daughter of Jacques Darc, peasant proprietor of Domremy, a small village partly in Champagne and partly in Lorraine, and of his wife Isabeau de Vouthon, who from having made a pilgrimage to Rome had received the usual surname of Romée. Joan never learned to read or write, and received her sole religious instruction from her mother, who taught her to recite the Pater Noster, Ave Maria, and Credo. In her childhood she was noted for her abounding physical energy; but her vivacity, so far from being tainted by any coarse or unfeminine trait, was the direct outcome of intense mental activity and an abnormally sensitive nervous temperament. Towards her parents her conduct was uniformly exemplary, and the charm of her unselfish kindness made her the special favourite of many in the village. In all household work she was specially proficient, her skill in the use of the needle not being excelled by that of any matron even of Rouen. As she grew to womanhood she became inclined to silence, and spent much of her time in solitude and prayer. All advances made by the young men of her acquaintance with the view of winning her attention or favour she decisively repelled; and, while active in the performance of her usual round of duties, and apparently finding her mode of life quite pleasant and congenial, inwardly she was engrossed with thoughts reaching far beyond the circle of her daily concerns.

At this time, through the alliance and support of Philip of Burgundy, the English had extended their conquest over the whole of France north of the Loire as well as Guienne; and, while the infant Henry VI. of England had in 1422 been proclaimed king of France at his father's grave at St Denis, Charles the dauphin, devoted only to present ease and pleasure, was almost passively contemplating the slow dismemberment of his kingdom by internal confusion and misery, and by the progressive encroachments of the English rule. The fact that the hard straits to which the kingdom was reduced were greatly owing to the conduct of Isabella, the dauphin's mother, who disinherited her son

¹ In the Act of ennoblement the name is spelt Dey, due probably to the peculiar current pronunciation. It has been disputed whether the name was written originally d'Arc or Darc. It is beyond doubt that the father of Joan was not of noble origin, but Boutellier suggests that at that period the apostrophe did not indicate nobility.

in favour of Henry V. of England, the husband of her daughter Catherine, supplied an opportunity for the fulfilment of the ancient prophecy of the enchanter Merlin, that the calamities which should fall upon France through the depravity of a woman would be removed by the instrumentality of a chaste virgin. To the imagination of the time there was, moreover, nothing strange in such a mode of deliverance, for it was no uncommon occurrence for damsels to accompany their lovers to the wars, and, disguised as pages, to share to some extent in their dangers and adventures. In the country of Joan the tradition was current that this virgin should come out of the forest of Domremy, where Joan was accustomed in her childhood to tend her father's sheep. How it therefore became fixed in her mind that she was the destined deliverer of her country there is little difficulty in understanding. She possessed a nature strongly sympathetic, and it was kindled to ardent patriotism by the sad condition of her country; her imagination was so overpoweringly vivid that it frequently deceived her reason; and her consciousness of endowments which could find no proper scope for their activity within her narrow sphere must have confirmed if they did not originate her prognostications that she was appointed to some high destiny. Gradually her whole attention became so engrossed with her country's wrongs that all her waking hours were one continued and prolonged prayer for its deliverance. The result was that, owing to a peculiarity in her nervous constitution, her own thoughts and hopes seemed to take audible voice, and returned to her as assurances and commands spoken to her by the saints. At last, when in 1428 Orleans, the key to the south of France, was invested by the English under the earl of Salisbury, the voices became so peremptory and urgent as to overcome all pretexts for delay on account of previous discouragements and rebuffs. Notwithstanding the strong remonstrances of her parents, who viewed her resolve with poignant grief and dismay, she now renewed with increased determination her efforts to win from Robert de Baudricourt, governor of Vaucouleurs, an introduction to the dauphin Charles. In all her subsequent acts she professed to be guided by the voices of the saints, who had set before her the twofold task of relieving Orleans and crowning the young dauphin at Rheims. By persistent importunity, the effect of which was increased by the simplicity of her demeanour and her calm assurance of success, she at last prevailed on the governor to grant her request; and in February 1429, accompanied by two knights, she set out on her perilous journey to the court of the dauphin at Chinon. At first Charles refused to see her, but the rising tide of popular feeling in her favour induced his advisers to persuade him after three days to grant her an interview. Of the divinity of her commission she is said to have persuaded him by discovering him though disguised in the crowd of his courtiers, and by assuring him regarding his secret doubts as to his legitimacy. Accordingly, after a commission of doctors had reported that they had found in her nothing of evil or contrary to the Catholic faith, and a council of matrons had reported on her chastity and virginity, she was permitted to set forth with an army of 4000 or 5000 men designed for the relief of Orleans. At the head of the army she rode clothed in a coat of mail, armed with an ancient sword which she had divined to be hidden near the altar of St Catherine de Fierbois, and carrying a white standard of her own design embroidered with lilies and having on the one side the image of God seated on the clouds and holding the world in his hand, and on the other a representation of the annunciation. Joan was of medium height, stoutly built, but finely proportioned; and her frame was capable of enduring great fatigue. Notwithstanding

subsequent traditions, she does not appear to have been strikingly handsome. Conventional beauty of the highest type could not be expected in one accustomed to her mode of life, but the most authentic testimonies represent her as less comely than many in her own station. Her features were, moreover, expressive rather of rustic honesty and innocence than of mental power, although she is said to have possessed grand melancholy eyes which, probably on account of the high and noble purpose which animated them, exercised an indescribable charm.¹ Her voice was powerful, but at the same time of great sweetness, and her manner possessed a fine natural dignity and grace, which, while it repelled familiarity, softened and subdued even the rudest of the soldiers. Nominally she had been entrusted with the command of the army, but in reality it was under the direction of experienced generals; and it cannot be pretended that the victories accomplished in consequence of her co-operation were the result of brilliant military genius. Indeed, the blind obstinacy with which in the face of overwhelming odds she refused to acknowledge defeat placed it beyond doubt that she was unable to estimate the elements of success in battle, and was actuated throughout by a fatalistic persuasion that victory was inevitable if she persevered unflinchingly in her efforts to obtain it. At the same time she possessed a shrewd and penetrating judgment both as to men and things, and the manner in which she conducted herself amid the varied difficulties of her career indicated extraordinary force of character and high and noble prudence. What, however, she chiefly supplied to the French cause was concentrated energy and resolution. Above all, she inspired the soldiery with a fanatic enthusiasm armed with the sanctions and ennobled by the influences of religion; and she overawed the enemy by the superstitious fear that she was in league with supernatural powers.

By a remarkable stroke of good luck Joan succeeded in entering Orleans on the 29th April 1429, and through the vigorous and unremitting attacks of the French the English gradually became so discouraged that on the 8th of May they raised the siege. By the capture of Jargeau and Beaugency, followed by the great victory of Patay, where Talbot was taken prisoner, the English were driven beyond the Loire. With some difficulty the king was then persuaded to set out towards Rheims, which he entered with an army of 12,000 men on July 16th, Troyes having on the way been taken by assault at the sole instigation of the Maid. On the following day, holding the sacred banner, she stood next to Charles at his coronation in the cathedral. After an endeavour to detach Burgundy from the English cause, the king at last agreed to attempt the capture of Paris, but on account of the disastrous result of an attack made on the 8th September, in which Joan was wounded, he resolved, notwithstanding her passionate remonstrance, to withdraw from the city, and disbanded his troops. Joan went into Normandy to assist the duke of Alençon, but in December returned to the court, and on the 29th she and her family were ennobled with the surname of du Lis. Unconsoled by such honours, she rode away from the court in March, to assist in the defence of Compiègne against the duke of Burgundy; and on the 24th May she led an unsuccessful sortie against the besiegers, when on account of her determination to fight to the last she was surrounded and taken prisoner. Charles, partly perhaps on account of his natural indolence, partly on account of the intrigues at the court, made no effort to effect her ransom, and never showed any sign of interest in her fate. Probably he had found her so difficult to

¹ On the personal appearance of the Maid, see especially E. de Bouteiller, *Notes Iconographiques sur Jeanne d'Arc*, 1879, containing engravings of the most authentic statues.

manage and control that he as well as his generals regarded her presence with the army as more embarrassing than helpful; and doubtless her capture dissipated the halo of supernatural power that had surrounded her. By means of negotiations instigated and prosecuted with great perseverance by the university of Paris and the Inquisition, and through the persistent scheming of Pierre Cauchon, the ejected bishop of Beauvais, she was sold in November by Luxembourg and Burgundy to the English, who on January 3, 1431, at the instance of the university of Paris, delivered her over to the Inquisition for trial. After a public examination, begun on the 9th January and lasting six days, and another conducted in the prison, she was, on the 20th March, publicly accused as a heretic and sorcerer, and, being in the end found guilty, she made her submission at the scaffold on the 24th May, and received pardon. She was still, however, the prisoner of the English, and, having been induced by those who had her in charge to resume her male clothes, she was on this account judged to have relapsed, was sentenced to death, and burned at the stake on the streets of Rouen, May 30, 1431. The sentence was revoked by the pope on the 7th July 1456, and since then it has been the custom of Catholic writers to uphold the reality of her divine inspiration. In 1436 an impostor appeared, professing to be Joan of Arc escaped from the flames, who succeeding in inducing many people to believe in her statement, but afterwards confessed her imposture.

There is no doubt that Joan herself believed in her supernatural guidance, and her judges, notwithstanding all their efforts, were unable to bring to light the smallest semblance of a sign of conscious dishonesty on her part. At the same time the nobility of her purpose was unstained by the faintest symptom of selfish regard to her own fame and glorification. Indeed the greatness of her career did not consist in her military achievements, but in her pure, true, and ardent character, which made her a pathetic victim to the mean and grovelling aims of those in whose cause she fought with such simple sincerity of faith, and to the cruelties of a superstitious age.

Literature.—All previous works on Joan of Arc were deprived of a great part of their critical value by the publication, in 5 vols., 1841-49, of the *Procès de condamnation et de réhabilitation de Jeanne d'Arc*, edited by J. Quicherat. The record of the *Procès de condamnation* consisted originally of the official notes of the trial, afterwards edited in Latin by P. Cauchon, and bears internal marks of general truthfulness. The original French muniments do not exist except in a fragment which has been reproduced by M. Vallet de Virville in his French translation of the Latin version, published in 1867. A French translation of the *Procès de condamnation et Procès de réhabilitation* by E. O'Reilly appeared in 1868. The 4th vol. of Quicherat is occupied with old chronicles and histories, the principal of which are those of *Perceval de Cagny*, a retainer of the duke of Alençon, never before published; *Jaques le Bouvier* (Bern), dated from 1432-1411 first published in 1658 as part of a history of Charles VI, and the remainder 1411-1444, in the collection of Denis Godefroy, 1601; *Jean Chartier*, only contemporaneous from 1437, before which it borrows chiefly from the *Chronique de la Pucelle* and Le Bouvier, what it does not borrow being utterly untrustworthy, published 1476-77, 1493, 1514, 1517-18, by Denis Godefroy, 1661, and Vallet de Virville, with notes, 1858; *Journal du Siège d'Orléans*, founded on the chronicles of Henri and Jean Chartier, with a few other documents, published 1576, 1606, 1611, 1619, 1621, and reprinted with notes by Jacob in 1855; *la Geste des nobles Français, or Chronique de Commines*, which closes with 1429, but some years afterwards was completed by a nephew of Commines to the siege of Paris so as to form the *Chronique de la Pucelle*, published by Denis Godefroy, 1681, by M. Petitot, 1825, in vol. viii of *Mémoires relatifs à l'histoire de France*, and with notes by Vallet de Virville, 1859; *Chronique d'Enguerrand de Monstrelet*, first published about 1500 and very frequently afterwards, French translation by Thomas Johnes, 1840, the best and best French edition, that of L. Douet d'Aren, 6 vols., 1857-62. The principal other contemporary authorities are Basin's *Histoire des Règles de Charles VII. et de Louis XI.*, first published in a complete form by Quicherat, with notes and life, 4 vols., 1855-1858; the *Chronique Normande* of Pierre Cochon, the part referring to Joan published along with *Chronique de la Pucelle* by Vallet de Virville, 1869, the

whole by De Robillard de Beaupre, 1870; *Chronique de Robert Blondel*, first published by Vallet de Virville, 1869; *Chronique de Jean Racault, or Chronique anonyme de Charles VII.*, first published by Vallet de Virville, 1858; *Arrest d'Histoire chronologique*, by Denis Godefroy, 1661, *Le mystère du Siège d'Orléans*, in verse, published from a manuscript in the Vatican in *Collection de Documents inédits sur l'Histoire de France*, 1862; a Latin poem by Valentin Vassinus, 1501; an anonymous Latin poem, manuscript 5870 of the Imperial Library of Paris; a poem by Christine de Pisan, 1429, printed in 1865; Martial Auregre, *Les Feuille du roy Charles*, in verse, 1505—one hundred copies of the portion relating to Joan of Arc printed at Orléans, 1866, of which one copy is in the British Museum.

The earliest life by other than contemporaries is that in Latin by Jean Hordal, 1612. Edmond Richer, who had procured the original documents of the *Procès*, finished a life of Joan in 1628 which was never published, but of which Lenglet-Dufresnoy made use to correct his own work, published in 1754 in two volumes. Charles du Lys, a descendant of her kin, published *L'extradition et parenté de la Pucelle d'Orléans*, 1611, enlarged edition 1612, 3d in 1638, all of which were republished by Vallet de Virville in *Trésor des pièces rares et antiques*, 1866. In 1790 L'Avery published an analysis of the manuscript of the *Procès* in the 8d vol. of *Mémoires de l'Académie or Inscriptions*. The principal other works previous to the publication of the *Procès* are those of Lebrun des Charmettes, 1817, 4 vols.; Saint-Prix, 1817; Lemaire, 1813; Jolios, 1821; Dumas, 1848; De Beauregard, 1847; and the accounts by De Barante, Michelot, and Sismondi in their several histories. Since the publication of the *Procès* the works of original critical value are *Aperçus Nouveaux* by J. Quicherat, 1850; the lives by B. Henri Martin, last ed., 1875; Wallon, 1880, and Villiamé, 1868. Other lives have been written by Lamarque, 1862; Lafontaine, 1854; Desjardins, 1846; Michaud, 1861; Septet, 1869. See also Vallet de Virville, *Recherches sur la famille de Jeanne d'Arc*, 1854; *Histoire de Charles VII.*, by the same, 8 vols., 1862-65; De Robillard de Beaupre, *Recherches sur le procès de condamnation de Jeanne d'Arc*, 1869; Boucher de Moland, *Première Expédition de Jeanne d'Arc*, 1874; E. de Bouteiller, *Jeanne d'Arc dans les chroniques*, *Mémoires de P. Vignaud*, 1878; and E. de Bouteiller and G. de Braux, *La famille de Jeanne d'Arc*, 1878, *Nouvelles Recherches sur la famille de Jean d'Arc*, 1879, and *Notes Iconographiques*, 1879. The principal German works are those of Görres, 2d ed., 1855 (French trans., 1848); Haug, 1861; Ryell, 1861; and Hirsch, 1871. In English, in addition to the essays of De Quincy and Lord Mahon, there are lives by Harriet Prior, 1866; Mrs Bray, 1874; and Janet Tuckey, 1880. Of the numerous dramas and poems of which Joan of Arc has been the subject, mention can only be made of *Die Jungfrau von Orléans* of Schiller, the *Joan of Arc* of Southey, and the scandalous burlesque-epic of Voltaire. A drama in verse by Jules Barbier has been set to music by C. Gounod, 1873.

JOB. The book of Job, (Heb. *איוב* *Iyyob*, Gr. *Ἰάβ*), the most splendid creation of the Hebrew poetry, is so called from the name of the man whose history and afflictions and sayings form the theme of it.

Contents.—As it now lies before us it consists of five parts. 1. The prologue, in prose, ch. i.-ii., describes in rapid and dramatic steps the history of this man, his piety and prosperity and greatness corresponding to his godliness; then how his life is drawn in under the operation of the trying, sifting providence of God, through the suspicion suggested by the Satan, the minister of this aspect of God's providence, that his godliness is but selfish and only the natural return for the unexampled prosperity bestowed upon him, and the insinuation that if stripped of his prosperity he will renounce God to His face. These suspicions bring down two severe calamities on Job, one depriving him of all external blessings, children and possessions alike, and the other throwing the man himself under a loathsome and painful malady. In spite of these afflictions Job retains his integrity and ascribes no wrong to God. Then the advent of Job's three friends is described, Eliphaz the Temanite, Bildad the Shuhite, and Zophar the Naamathite, who, having heard of Job's calamities, come to condole with him. 2. The body of the book, in poetry, ch. iii.-xxxi., contains a series of speeches in which the problem of Job's afflictions and the relation of external evil to the righteousness of God and the conduct of men is brilliantly discussed. This part is divided into three cycles, each containing four speeches, one by Job and one by each of the friends (ch. iii.-xiv.;

ch. xv.-xxi.; ch. xxii.-xxxi.), although in the last cycle the third speaker Zophar fails to answer, and Job, having driven his opponents from the field, carries his reply through a series of discourses in which he dwells in pathetic words upon his early prosperity, contrasting with it his present misery and humiliation, and ends with a solemn repudiation of all the offences that had been insinuated or might be suggested against him, and a challenge to God to appear and put His hand to the charge which He had against him and for which He afflicted him. 3. A youthful bystander named Elihu, the representative of a younger generation, who had been a silent observer of the debate, intervenes and expresses his dissatisfaction with the manner in which both Job and his friends had conducted the cause, and offers what is in some respects a new solution of the question (ch. xxxii.-xxxvii.). 4. In answer to Job's repeated demands that God would appear and solve the riddle of his life, the Lord answers Job out of the whirlwind. The Divine speaker does not condescend to refer to Job's individual problem, but in a series of ironical interrogations asks him, as he thinks himself capable of fathoming all things, to expound the mysteries of the origin and subsistence of the world, the phenomena of the atmosphere, the instincts of the creatures that inhabit the desert, and, as he judges God's conduct of the world amiss, invites him to seize the reins himself and gird him with the Divine thunder and quell the rebellious forces of evil in the universe (ch. xxxviii.-xlii. 6). Job is humbled and abashed, and lays his hand upon his mouth, and repents his hasty words in dust and ashes. No solution of his problem is vouchsafed; but God Himself effects that which neither the man's own thoughts of God nor the representations of the friends could accomplish: he heard of Him with the hearing of the ear without effect, but now his eye saw Him. This is the profoundest religious deep in the book. 5. The epilogue, also in prose, ch. xlii. 7-17, describes Job's restoration to a prosperity double that of his former estate, his family felicity, and long life.

Design.—With the exception of the episode of Elihu, the connexion of which with the original form of the poem may be doubtful, all these five parts are essential elements of the work as it came from the hand of the first author, although some parts of the second and fourth divisions may have been expanded by later writers. The idea of the composition is not to be derived from any single element of the book, as from the prologue, but from the teaching and movement of the whole piece. Job is unquestionably the hero of the work, and in the ideas which he expresses and the history which he passes through combined we may assume that we find the author himself speaking and teaching. The discussion of the question of suffering between Job and his friends occupies two-thirds of the book, or, if the space occupied by Elihu be not considered, nearly three-fourths, and in the direction which the author causes this discussion to take we may see revealed the main didactic purpose of the book. When the three friends, the representatives of former theories of providence, are reduced to silence and driven off the ground by Job, we may be certain that it was the author's purpose to discredit the ideas which they represent. Job himself offers no positive contribution to the doctrine of evil; his position is negative, and merely antagonistic to that of the friends. But this negative position victoriously maintained by him has the effect of clearing the ground, and the author himself supplies in the prologue the positive truth, when he communicates the real explanation of his hero's calamities, and teaches that they were a trial of his righteousness. It was therefore the author's purpose in his work to widen men's views of the providence of God and set before them a new view of suffering. This may be considered the first great

object of the book. This purpose, however, was in all probability no mere theoretical one, but subordinate to some wider practical design. No Hebrew writer is merely a poet or a thinker. He is always a teacher. He has men before him in their relations to God. And it is not usually men in their individual relations, but as members of the family of Israel, the people of God. It is consequently scarcely to be doubted that the book has a national scope. The author considered his new truth regarding the meaning of affliction as of national interest, and to be the truth needful for the heart of his people in their circumstances. But the teaching of the book is only half its contents. It contains also a history—deep and inexplicable affliction, a great moral struggle, and a victory. The author meant his new truth to inspire new conduct, new faith, and new hopes. In Job's sufferings, undeserved and inexplicable to him, yet capable of an explanation most consistent with the goodness and faithfulness of God, and casting honour upon his faithful servants; in his despair bordering on unbelief, at last overcome; and in the happy issue of his afflictions—in all this Israel may see itself, and from the sight take courage, and forecast its own history. Job, however, is not to be considered Israel, the righteous servant of the Lord, under a feigned name; he is no more parable (though such a view is found as early as the Talmud); he and his history have both elements of reality in them. It is these elements of reality common to him with Israel in affliction, common even to him with humanity as a whole, confined within the straitened limits set by its own ignorance, wounded to death by the mysterious sorrows of life, tortured by the uncertainty whether its cry finds an entrance into God's ear, alarmed and paralyzed by the irreconcilable discrepancies which it seems to discover between its necessary thoughts of Him and its experience of Him in His providence, and faint with longing that it might come into His place, and behold Him, not girt with His majesty, but in human form, as one looketh upon his fellow,—it is these elements of truth that make the history of Job instructive to Israel in the times of affliction when it was set before them, and to men in all ages. It would probably be a mistake, however, to imagine that the author consciously stepped outside the limits of his nation, and assumed a human position antagonistic to it. The chords he touches vibrate through all humanity, but this is because Israel is the kernel of humanity, and because from Israel's heart the deepest music of mankind is heard, whether of pathos or of joy.

Two threads requiring to be followed, therefore, run through the book,—the one the discussion of the problem of evil between Job and his friends, and the other the varying attitude of Job's mind towards heaven, the first being subordinate to the second. Both Job and his friends advance to the discussion of his sufferings, and of the problem of evil, ignorant of the true cause of his calamities,—Job strong in his sense of innocence, and the friends armed with their theory of the righteousness of God, who giveth to every man according to his works. With this psychological instinct the poet lets Job altogether lose his self-control first when his three friends, the men he follows, came to visit him. His bewilderment and the acute anguish of his mind he bore with a steady courage, and the direct instigations to godlessness of the woman, his wife, he repelled with severity and resignation. But when men, his equals and the old associates of his happiness, came to see him, and when he read in their looks and in their seven days' silence the depth of his own misery, his self-command deserted him, and he broke out into a cry of despair, cursing his day and crying for death (ch. iii.). Job had somewhat misinterpreted the demeanour of his friends. It was not all pity that it expressed. Along with their pity they had also brought their theology with them, and they trusted to heal Job's malady with this. Till a few days ago Job would have agreed with them on the sovereign virtues of this remedy. But he had learned through a higher teaching, the events of God's providence, that it was no more a specific in his case. His violent impatience, however, under his afflictions and his covert attacks upon the divine rectitude only served to confirm the view of his sufferings which their theory of evil had already suggested to his friends. And thus

commences the high debate which continues through thirty chapters of the book.

The principle with which the three friends of Job came to the consideration of his history was the principle that calamity is the result of evil-doing, as on the other hand prosperity is the reward of righteousness. Suffering is not an accident or a spontaneous growth of the soil; man is born unto trouble as the sparks fly upwards; there is in human life a tendency to do evil which draws down upon man the chastisement of heaven (ch. x, 6). The form in which the principle is enunciated by Eliphaz, from whom the other speakers take their cue, is this: where there is suffering there has been sin in the sufferer, not necessarily deadly sin, though where the suffering is great the sin must have been heinous. Not suffering in itself, but the effect of it on the sufferer is what gives insight into his true character. Suffering is not always punitive, it is far oftener disciplinary, designed to wean the good man from his sin. If he sees in his suffering the monition of God and turns from his evil, his future shall be rich in peace and happiness, and his latter estate more prosperous than his first. If he murmurs or resists, he can only perish under the multiplying chastisements which his impudence will provoke. Now this principle of the friends is far from being a peculiar crochot of theirs; its truth is undeniable, though they erred in supposing it a principle that would cover the wide providence of God. The principle is the fundamental idea of moral government, the expression of the natural conscience, a principle common more or less to all peoples, though perhaps more prominent in the Semitic mind, because all religious ideas are more prominent and simple there,—not suggested to Israel first by the law, but found and adopted by the law, though it may be sharpened by it. It is the fundamental principle of prophecy no less than of the law, and, if possible, of the wisdom or philosophy of the Hebrews more than of either. Speculation among the Hebrews had a simpler task before it than it had in the West or in the further East. The Greek philosopher began his operations upon the sum of things; he threw the universe into his crucible at once. His object was to effect some analysis of it, such an analysis that he could call one element cause and another effect. Or, to vary the figure, his endeavour was to pursue the streams of tendency which he could observe upwards till he reached at last the central spring which sent them all forth. God, a single cause and explanation, was the object of his search. But to the Hebrew this was already fatal. The analysis resulting in the destruction of God and the world had been effected for him long ago, so long that the very first breath of philosophy was the breath of his foundation, and only the unchangeable result remained. His philosophy was not a quest of God whom he did not know, but a recognition on all hands of God whom he knew. The great primary idea to his mind was that of God, a Being wholly just, doing all. And the world was little more than the phenomena that revealed the mind and the presence and the operations of God. Consequently the nature of God as known to him and the course of events formed a perfect equation. The idea of what God was in Himself was in complete harmony with His manifestation of Himself in providence, in the events of human life, and the history of man and nations. The philosophy of the wise did not go behind the origin of sin, or referred it to the freedom of man; but, sin existing, and God being in immediate personal contact with the world, every event was a direct expression of His moral will and energy; calamity fell on wickedness, and success attended right-doing. This view of the moral harmony between the nature of God and the events of providence in the fortunes of men and nations is the view of the Hebrew wisdom in its oldest form, denunciated what might be called the wisdom of principles, to which belong Prov. x 27; and this is the position maintained by Job's three friends. And the significance of the book of Job in the history of revelation arises from this that it marks the point when such a view was definitively overcome, closing the long period when this principle was merely subjected to questionings, and makes a new positive addition to the doctrine of evil.

Job agreed with the friends that afflictions came directly from the hand of God, and also that God afflicted those whom His held guilty of sin. But his conscience denied the imputation of guilt, whether insisted by his friends or implied in God's chastisement of him. Hence he was driven to conclude that God was unjust, that He sought occasions against him, and perverted his right. The position of Job appeared to his friends nothing else but impiety, as it came very near being; while there was to him mere falsehood and the special pleading of egoists in behalf of God because He was the stronger. Within those two iron walls the debate moves, making little progress, but with much brilliancy, if not of argument, of illustration. A certain advance indeed is perceptible. In the first series of speeches, ch. ix-xiv, the keynote of which is struck by Eliphaz, the oldest and most conservative of the three, the position is that affliction is caused by sin, and is chastisement designed for the sinner's good; and the moral is that Job should recognize it and use it for the purpose for which it was sent. In the second, ch. xv-xxi., the other side of the picture is held up, the terrible fate of the sinner, and those brilliant pictures of a restored future,

thrown in by all the speakers in the first series, are absent. Job's demeanour under the consolation offered him afforded little hope of his repentance. In the third series, ch. xxii-xxv, the friends cast off all disguise, and openly charge Job with a course of evil life. That their animosity was now exhausted is shown by the brevity of the second speaker, and the failure of the third to answer in any form. In reply Job disdains for a time to touch what he well knew lay under all their exhortations; he laments with touching pathos the defection of his friends on whom he counted, who were like the winter storms looked for in vain by the perishing caravan in the summer heat; he meets with bitter scorn their constant cry that God will not cast off the righteous man, by asking—How can he be righteous with God? what can human weakness, however innocent, do against infinite might and subtlety? they are righteous whom an omnipotent and perverse will thinks fit to console so; he falls into a hopeless will over the universal misery of man, who has a weary campaign of life appointed him; then, rising up in the strength of his conscience, he upbraids the Almighty with His misuse of His power and His indiscriminate tyranny,—righteous and innocent He destroys alike—and challenges Him to lay aside His majesty and meet His creature as a man, and then he would not fear Him. Even in the second series Job can hardly bring himself to face the personal issues raised by the friends. His relations to God absorb him almost wholly,—his mutable isolation, the indignities showered on his once honoured head, the loathsome spectacle of his body; and, abandoned by all, he turns for pity from God to men and from men to God. Only in the third series of his songs does he put out his hand and grasp firmly the theory of his friends, and their "defusion of mind" fall to dust in his hands. Instead of that roscate moral order which they are never weary mistaking upon, he finds only disorder and moral confusion. When he thinks of it, trembling takes hold of him. It is not the lightness but the wicked lust live, grow old, you was mighty in strength, that send forth their children like a flock and establish them in their sight. Before the logic of facts the theory of the friends goes down; and with this negative result, which the author skillfully reaches through the debate, has to be combined his own positive doctrine of the uses of adversity advanced in the prologue.

To a reader of the poem now it appears strange that both parties were so entangled in the meshes of their preconceptions regarding God as to be unable to break through to broader views. The friends, while maintaining their position that injustice on the part of God is inconceivable, might have given us due weight to the persistent testimony of Job's conscience that the present was not the permanent, and found refuge in the reflection that there might be something inexplicable in the ways of God, and that affliction might have some other meaning than to punish the sinner or even to wean him from his sin. And Job, while maintaining his innocence from overt sins, might have bled beneath the rod of God and confessed that there was such sinfulness in every human life as to account for the severest chastisement from heaven, or at least have stopped short of charging God foolishly. Such a position would certainly be taken up by an educated saint now, and such an explanation of his sufferings would suggest itself to the sufferer, even though it might be in truth a false explanation. Perhaps here, where an artistic fault might seem to be committed, the art of the writer, or what is the same thing his truth to nature, and the extraordinary freedom with which he moves among his materials, as well as the power and individuality of his dramatic creations, are most remarkable. It was the rôle which the author reserved for himself to touch the truth on the question of the truth in the things which he was allowing his party to push their false principles to their proper extreme. There is nothing about which men are usually so sure as about God. They are ever ready to take Him in their own hand, to interpret His providence in their own sense, to say what things are consistent or not with His character and word, and beat down the opposing consciences of other men, by His so-called authority, which is nothing but their own. The friends of Job were religious Orientals, men to whom God was a Being in immediate contact with the world and life, effecting all things with no intervention of second causes, men to whom the idea of second causes was unknown, on whom science had not yet begun to dawn, nor the conception of a divine scheme pursuing a distant end by complicated means, in which the individual's interest may suffer for the larger good. The broad sympathies of the author and his sense of the truth lying in the theory of the friends are seen in the scope which he allows them, in the richness of the thought and the splendid luxuriance of the imagery—drawn from revelation, the immemorial moral consent of mankind, the testimony of the living conscience, and the observation of life,—with which he makes them clothe their views. He felt it needful to make a departure from a position too narrow to confine the providence of God within, but he remembered the elements of truth in the theory which he was departing from, that it was a national heritage, which he himself perhaps had been constrained not without a struggle to abandon; and, while showing its insufficiency, he sets it forth in its most brilliant form.

Then, in regard to the position maintained by Job,—the extravagance of his assertions was occasioned greatly by the extreme position of his friends, which left no room for his conscious innocence along with the rectitude of God. Again, the poet's purpose, as the prologue shows, was to teach that afflictions may fall on a man out of all connexion with any offence of his own, and merely as the trial of his righteousness; and hence he allows Job, as by a true insight into the nature of his sufferings, to repudiate all connection between them and an sin in himself. And further, the terrible conflict into which the suspicious Satan brought Job could not be exhibited without pushing him to the verge of ungodliness. These are all elements of the poet's art; but art and nature are one. Under the Old Covenant the sense of sin was less deep than it is now. In the desert, too, men speak boldly of God. Such a creation as Job would be an anomaly in Christianity. But nothing is more false than to judge the poet's creation from our later point of view, and construct a theory of the book according to a more developed sense of sin and a deeper reverence to the testimony of the book itself. In complete contradiction to the testimony of the book itself, some theorists, as Hengstenberg, have assumed that Job's spiritual pride was just the cause of his afflictions, that this was the root of bitterness in him which must be killed down ere he could become a true saint. The fundamental position of the book is that Job was already a true saint; this is testified by God Himself, is the radical idea of the author in the prologue, and the very hypothesis of the drama. We might be ready to think that Job's afflictions did not befall him out of all connection with his own condition of mind, and we might be disposed to find a vindication of God's ways in this. There is no evidence that such an idea was shared by the author of the book. The interpretation of Job has suffered not a little from the righteousness overmuch of its exponents. The writer did not consider that God's ways needed this vindication. The confession of sin which he puts into Job's mouth had reference exclusively to his demeanor under his afflictions. This demeanor may be evidence of the imperfection of his previous religious state. It is evidence of this, of which, however, no evidence was needed, for Job does not claim to be nor is he supposed sinless, but it is no evidence that this imperfection was the cause of his afflictions. These were the trial of his faith, which, maintaining itself in spite of them, and becoming stronger through them, was rewarded with a higher felicity. It is remarkable that the attitude which we imagine it would have been so easy for Job to assume, viz., while holding fast his integrity, to fall back upon the inexpugnableness of Providence, of which theme are so many inspiring descriptions in his speeches, is just the attitude which he takes up in ch. xxviii. It is far from certain, however, that this chapter is an integral part of the original book.

The other line running through the book, the varying attitude of Job's mind towards heaven, exhibits dramatic action and tragic interest of the highest kind, though the movement is internal. That the exhibition of this struggle in Job's mind was a main point in the author's purpose is seen from the fact that at the end of each of his great trials he notes that Job sinned not, nor ascribed wrong to God (ch. i. 22; ii. 10), and from the effect which the divine voice from the whirlwind is made to produce upon him (ch. xl. 8). In the first cycle of debate (ch. i-v-xiv.), Job's mind reaches the deepest limit of estrangement. There he not merely charges God with injustice, but, unable to reconcile His former goodness with His present enmity, he regards the latter as the true expression of the divine mind towards His creatures, and the former, comprising all His infinite creative skill in weaving the delicate organism of human nature and the rich endowments of His providence, but as the means towards exorcising His mad and immoral cruelty in the time to come. When the Semitic skin of Job is scratched, we find a modern pessimist beneath. Others in later days have brought the keen sensibility of the human frame and the torture which it endures together, and asked with Job to whom at last all this has to be referred. Towards the end of the cycle a star of heavenly light seems to rise on the horizon; the thought seizes the sufferer's mind that man might have another life, that God's anger pursuing him to the grave might be averted, and that He might call him out of it to Himself again (ch. xiv. 13). This idea of a resurrection, unfamiliar to Job at first, is one which he is allowed to reach out of the necessities of the moral complications around him, but from the author's manner of using the idea we may judge that it was not unfamiliar to himself. In the second cycle the thought of a future reconciliation with God (for of course he regarded his afflictions as evidence of God's anger) is more firmly grasped. That satisfaction or at least composure which, when we observe calamities that we cannot morally account for, we reach by reflecting that providence is a great science not subject to general laws, and that it does not always truly reflect the relation of God to the individual, Job reached in the only way possible to a Semitic mind. He drew a distinction between God and God, between an outer God whose events obey, pursuing him in His anger, and an inner God whose heart was with him, who was conscious of his innocence; and he appeals from him to God, and beseeches God to pledge Himself that

he shall receive justice from God (ch. xvi. 19; xvii. 3). And so high at last does this consciousness that God is at one with him rise that he avows his assurance that He will yet appear to do him justice before men, and that he shall see Him with his own eyes, no more estranged but on his side, and for this moment he faints with longing (ch. xix. 25 sq.).

After this expression of faith Job's mind remains calm, though he ends by firmly charging God with perverting his right, and demanding to know the cause of his afflictions (ch. xxvii. 2 sq.; xxxi. 35, where reader, Oh, that I had the indictment which mine adversary has written). In answer to this demand the Divine voice answers Job out of the tempest—Who is this that darkeneth counsel by words without knowledge? The word "counsel" intimates to Job that God does not act without a design, large and beyond the comprehension of man; and to impress this is the purpose of the Divine speeches. The speaker does not enter into Job's particular cause; there is not a word tending to unravel his riddle; his mind is drawn away to the wisdom and majesty of God Himself. His own words and those of his friends are but re-echoed, but it is God Himself who now utters them. Job is in immediate nearness to the majesty of heaven, wise, unfathomable, ironical over the littleness of man, and he is abased; God Himself effects what neither the man's own thoughts of God nor the representations of his friends could accomplish, though by the same means. The religious insight of the writer sounds here the profoundest depths of truth.

Integrity.—Doubts whether particular portions of the present book belonged to the original form of it have been raised by many. Half a century ago De Wette expressed himself as follows: "It appears to us that the present book of Job has not all flowed from one pen. As many books of the Old Testament have been several times written over, so has this also" (Ersch and Gruber, *Mythik*, sect. ii, vol. viii.). The judgment formed by De Wette has been adhered to more or less by most of those who have studied the book. Questions regarding the unity of such books as these are difficult to settle; there is not unanimity among scholars regarding the idea of the book, and consequently they differ as to what parts are in harmony or conflict with unity; and it is dangerous to apply modern ideas of literary composition and artistic unity to the works

¹ This remarkable passage reads thus: "*But I know that my redeemer liveth, and afterwards he shall arise upon the dust, and after my skin, even this body is destroyed, without my flesh shall I see God; whom I shall see for myself, and mine eyes shall behold, and not as a stranger; my reins within me are concerned with longing.*" The redeemer who liveth and shall arise or stand upon the earth is God whom he shall see with his own eyes, on his side. The course of exegesis was greatly influenced by the translation of Jerome who, departing from the Itala, rendered: "*In novissimo die de terra surrecturus sum . . . et rursus circumdabor pelle mea et in carne mea videbo deum meum.*" The only point now in question is whether—(a) Job looks for this manifestation of God to him while he is still alive, or (b) after death, and therefore in the sense of a spiritual vision and union with God in another life; that is, whether the words "*destroyed*" and "*without my flesh*" are to be taken relatively only, of the extreme effects of his disease upon him, or literally, of the separation of the body in death. A third view which assumes that the words rendered "*without my flesh*," which run literally, "*out of my flesh*," mean *looking out from my flesh*, that is, clothed with a new body, and finds the idea of resurrection suggested, perhaps imposes more into the language than it will fairly bear. In favour of (b) may be adduced the persistent refusal of Job throughout to entertain the idea of a restoration in this life; the word "*afterwards*," and perhaps the analogy of other passages where the same situation appears, as Ps. xix. and lxxiii., although the actual disavowal of the latterly supports (c). The difference between the two senses is not important, when the Old Testament view of immortality is considered. To the Hebrew the life beyond was not what it is to us, a freedom from sin and sorrow and admission to an immediate divine fellowship not attainable here. To him the life beyond was at best a prolongation of the life here; and all he desired was that his fellowship with God here should not be interrupted in death, and that Sheol, the place into which deceased persons descended and remained, cut off from all life with God, might be overlooked. On this account the theory of Ewald, which throws the centre of gravity of the book into this passage in ch. xiv., considering its purpose to be to teach that the riddles of this life shall be solved and its inequalities corrected in a future life, appears one-sided. The point of the passage does not lie in any distinction which it draws between this life and a future life; it lies in the assurance which Job expresses that God, who even now knows his innocence, will vindicate it in the future, and that, though estranged now, He will at last take him to His heart.

of antiquity and of the East. The problem raised in the book of Job has certainly received frequent treatment in the Old Testament; and there is no likelihood that all efforts in this direction have been preserved to us. It is probable that the book of Job was but a great effort amidst or after many smaller. It is scarcely to be supposed that one with such poetic and literary power as the author of chap. iii.—xxxi., xxxviii.—xli. would embody the work of any other writer in his own. If there be elements in the book which must be pronounced foreign, they have been inserted in the work of the author by a later hand. It is not unlikely either in itself or when the history of other books is considered that our present book may, in addition to the great work of the original author, contain some fragments of the thoughts of other religious minds upon the same question, and that these, instead of being loosely appended, have been fitted into the mechanism of the first work. Some of these fragments may have originated at first quite independently of our book, while others may be expansions and insertions that never existed separately. At the same time it is scarcely safe to throw out any portion of the book merely because it seems to us out of harmony with the unity of the main part of the poem, or unless several distinct lines of consideration conspire to point it out as an extraneous element.

The arguments that have been used against the originality of the prologue—as, that it is written in prose, that the name Jehovah appears in it, that sacrifice is referred to, and that there are inconsistencies between it and the body of the book—are of little weight. There must have been some introduction to the poem explaining the circumstances of Job, otherwise the poetical dispute would have been unintelligible, for it is improbable that the story of Job was so familiar that a poem in which he and his friends figured as they do here would have been understood. And there is no trace of any other prologue or introduction having ever existed. The prologue, too, is an essential element of the work, containing the author's positive contribution to the doctrine of suffering, for which the discussion in the poem prepares the way. The intermixture of prose and poetry is common in Oriental works containing similar discussions; the reference to sacrifice is to primitive not to Mosaic sacrifice; and the author, while using the name Jehovah freely himself, puts the patriarchal Divine names into the mouth of Job and his friends because they belonged to the patriarchal age and to a country outside of Israel. That the observance of this rule had a certain awkwardness for the writer perhaps appears from his allowing the name Jehovah to slip in once or twice (xli. 9, comp. xxviii. 28) in familiar phrases in the body of the poem. The discrepancies, such as Job's references to his children as still alive (xix. 17, the interpretation is doubtful), and to his servants, are trivial, and even if real imply nothing in a book admittedly poetical and not history. The objections to the epilogue are equally unimportant,—as that the Satan is not mentioned in it, and that Job's restoration is in conflict with the idea of the poem that earthly felicity does not follow righteousness, and undoes its teaching. The epilogue confirms the teaching of the poem when it gives the Divine sanction to Job's doctrine regarding God in opposition to that of the friends (xlii. 7). And it is certainly not the intention of the poem to teach that earthly felicity does not follow righteousness, but to correct the exclusiveness with which the friends of Job maintained that principle. The Satan is introduced in the prologue, exercising his function as minister of God in heaven; but it is to misinterpret the doctrine of evil in the Old Testament wholly to assign to the Satan any such personal importance or independence of power as that he should be called before the curtain to receive the hisses

that accompany his own discomfiture. The Satan, though he here appears with the beginnings of a malevolent will of his own, is but the instrument of the trying, sifting providence of God. His work was to try; that done he disappears, his personality being too slightly important to have any place in the result.

Much graver are the suspicions that attach to the speeches of Elihu. It is the opinion of most of those who have studied the book carefully that this part does not belong to the original cast of it, but has been introduced at a considerably later time. The piece is one of the most interesting parts of the book; both the person and the thoughts of Elihu are marked by a strong individuality. This individuality has indeed been very diversely estimated. The ancients for the most part passed a very severe judgment on Elihu; he is a buffoon, or a boastful youth whose shallow intermeddling is only to be explained by the feyness of his years, the incarnation of folly, or even the Satan himself gone a-mumming. Some moderns on the other hand have regarded him as the incarnation of the voice of God or even of God Himself. The main objections that may be urged against the connexion of the episode of Elihu with the original book are—that the prologue and epilogue know nothing of him; that on the cause of Job's afflictions he occupies virtually the same position as the friends; that his speeches destroy the dramatic effect of the Divine manifestation by introducing a lengthened break between Job's challenge and the answer of God; that the language and style of the piece are marked by an excessive mannerism, too great to have been created by the author of the rest of the poem, even when introducing an interlocutor out of the ranks of the bystanders, and of another race; that the allusions to the rest of the book are so minute as to betray a reader rather than a hearer; and that the views regarding sin, and especially the scandal given to the author by the irreverence of Job, indicate a religious advance which marks a later age. The position taken by Elihu is almost that of a critic of the book. Regarding the origin of afflictions he is at one with the friends, although he dwells more on the general sinfulness of man than on actual sins, and his reprobation of Job's position is even greater than theirs. His anger was kindled against Job because he made himself righteous before God, and against his friends because they found no answer so as to condemn Job. His whole object is to refute Job's charge of injustice against heaven. What is novel in Elihu, therefore, is not his position but entirely his arguments. These do not lack cogency, but betray a kind of thought different from that of the friends. Injustice in God, he argues, can only arise from selfishness in Him; but the very existence of creation implies unselfish love on God's part, for if He thought only of Himself, He would cease actively to uphold creation, and it would fall into death. Again, without justice mere earthly rule is impossible; how then is injustice conceivable in Him who rules over all? It is probable that the original author found his three interlocutors a sufficient medium for expressing all that he desired to say, and that this new speaker is the creation of another. To a devout and thoughtful reader of the original book, belonging perhaps to a more reverential age, it appeared that the language and bearing of Job had scarcely been sufficiently reprobated by the original speakers, and that the religious reason, apart from any theophany, could suggest arguments sufficient to condemn such demeanour on the part of any man.

It is more difficult to come to a decision in regard to some other portions of the book, particularly eh. xxvii. 7—xxviii. In the latter part of ch. xxvii. Job seems to go over to the camp of his opponents, and expresses sentiments in complete contradiction to his former views. Hence

some have thought the passage to be the missing speech of Zophar. Others, as Hitzig, believe that Job is parodying the ideas of the friends; while others, like Ewald, consider that he is offering a recantation of his former excesses, and making such a modification as to express correctly his views on evil. None of these opinions is quite satisfactory, though the last probably expresses the view with which the passage was introduced, whether it be original or not. The meaning of ch. xviii. can only be that "Wisdom," that is, a theoretical comprehension of providence, is unattainable by man, whose only wisdom is the fear of the Lord or practical piety. But to bring Job to the feeling of this truth was just the purpose of the theophany and the Divine speeches; and, if Job reached it already through his own reflexion, the theophany becomes an irrelevancy. It is difficult, therefore, to find a place for these two chapters in the original work. The hymn on Wisdom is a most exquisite poem, which probably originated separately, and was brought into our book with a purpose similar to that which suggested the speeches of Eliphaz. Objections have also been raised to the descriptions of Leviathan and behemoth (ch. xl. 15-xl.). Regarding these it may be enough to say that in meaning these passages are in perfect harmony with other parts of the Divine words, although there is a breadth and detail in the style unlike the sharp, short, ironical touches, otherwise characteristic of this part of the poem.

Data.—The age of such a book as Job, dealing only with principles and having no direct references to historical events, can be fixed only approximately. Any conclusion can be reached only by an induction founded on matters which do not afford perfect certainty, such as the comparative development of certain moral ideas in different ages, the pressing claims of certain problems for solution at particular epochs of the history of Israel, and points of contact with other writings of which the age may with some certainty be determined. It may be said without doubt that the book belongs to the period between David and the return from exile. The Jewish tradition that the book is Mosaic, or the other idea that it is a production of the desert, written in another tongue and translated into Hebrew, wants even a shadow of probability. The book is a genuine outcome of the religious life and thought of Israel, the product of a religious knowledge and experience that was possible among no other people. That the author lays the scene of the poem outside his own nation and in the patriarchal age is a proceeding common to him with other dramatic writers, who find freer play for their principles in a region removed from the present, where they are not hampered by the obtrusive forms of actual life, but free to mould occurrences into the moral form that their ideas require.

It is the opinion of many scholars, e.g., Delitzsch, that the book belongs to the age of Solomon. It cannot be earlier than this age, for Job (ch. vii. 17) travesties the ideas of Ps. viii. in a manner which shows that this hymn was well known. Undoubtedly many of the means and conditions necessary for its production existed in this age. It is a creation of that direction of thought known as the Wisdom, a splendid efflorescence of which distinguished this time, unless history and tradition alike are to be altogether discredited. The cosmopolitanism of Solomon's reign, and the close relations into which Israel then entered with Egypt, the further East, and even the West, may seem reflected in the poem, the author of which had seen many lands and strange peoples, and draws his illustrations from many distant sources. When, however, we compare Job with the literature of the Wisdom, presumably of the Solomonic age and even later, the difference is found to be extreme. Job is not only a creation of the Wisdom; it is its highest creation. The literature of the Wisdom falls

into three periods:—the period of principles, referred to above, to which belongs the book of Proverbs; the period of problems, illustrated by such compositions as Ps. xxxvii., xlix., lxxiii., and others; and the period of exhaustion, where a solution of the problems was scarcely sought, and only a *modus vivendi* in the face of them, through a practical prudence, was aimed at, to which belongs Ecclesiastes. Job has no affinity with the last-named period. But it is almost equally impossible that it can belong to the first. The point of view of this period on the question of evil is that represented by Job's friends, a point of view from which our book signalizes a final departure. On the other hand, the spirit of Job is that which breathes in the psalms referred to and in many other fragments of the Scriptures of the prophetic age. Such problems as burn in the pages of Job—the miseries of the just, and the felicity of the ungodly—were not likely to force themselves on men's attention in the Solomonic age. In the settled, well-ordered life of Israel in this happy time, the general principles of moral well-being were receiving their most splendid illustration. Only later, when the state began to receive fatal blows from without, and when through revolution and civil discord at home great and unmerited sufferings befell the best citizens in the state, would such problems rise with an urgency that demanded some solution. In some of the psalms which treat of these questions, the "ungodly" oppressor, whose felicity occasions disquietude to the religious mind, is probably the heathen conqueror. But these shorter pieces in all likelihood preceded in time the elaborate treatment to which such problems are subjected in Job. It is doubtful if there is a trace of such questions in Proverbs, which, however, did not receive its final form till the age of Hezekiah. In one direction the Wisdom receives a higher development in Prov. viii. than it does in Job, but that despair of the attainment by man of any theoretical wisdom at all, which is the burden of Job xxviii., is unheard of even in Prov. i.-ix., which certainly dates from a time long posterior to the Solomonic age. The book of Job probably has behind it some public calamity which forced the question of evil on men's minds with an urgency that could not be resisted. Such a calamity, wide and national, could be nothing less than the dismemberment or subjugation of the state. The question may be difficult to settle whether it was a misfortune befalling the northern kingdom or that of the south. We gain no help here from the book itself, for the author of Job is an Israelite indeed, who belongs to none of its divisions. Somewhere in the troubled period between the early part of the 7th and the early part of the 5th century the poem may have been written. Ewald and many distinguished writers on the book support the earlier date, while on the part of living scholars there is rather a growing feeling that the book is later than some of the prophecies of Jeremiah.

This question has to be settled largely by a comparison of literary coincidences and allusions. This is a very delicate operation. For, first, owing to the unity of thought and language which pervades Scripture, in which, regarding it for a moment merely as a national literature, it differs from all other national literatures, we are apt to be deceived, and to take mere similarities for literary allusions and quotations; and, secondly, even when we are sure that there is dependence, it is often uncommonly difficult to decide which is the original source. The reference to Job in Ezek. xiv. 14 may not be to our book, but to the man who was afterwards made the hero of it. The affinities between Job and Isa. xl.-lvi. are very close. The date of this part of Isaiah is uncertain, but it cannot have received its final form, if it be composite, long before the return. Its affinity with Job is not only literary; the problem is the

same, the meaning of the afflictions of the "servant" of the Lord. "My servant Job" may not be the same as "my righteous servant" of Isaiah, but there is no doubt national allusion in Job. The solution of the problem differs in the two. In Job sufferings are a trial of faith, which, successfully borne, issues in restoration. In Isaiah they are vicarious, borne by one element in the nation in behalf of the whole, and issuing in the national redemption. Two such solutions can scarcely be entirely contemporaneous. That of Isaiah is the profounder truth and may be the later, though certainty on such a point is of less consequence than the reflexion both solutions force upon us that this is the period in Israel's history at which the profoundest depths of religious thought were sounded. Between Job iii. and Jer. xx. 14 *sq.* there is certainly literary connexion. The judgment of different minds differs on the question which passage is dependent on the other. The language of Jeremiah has a natural pathos and genuineness of feeling in it, somewhat in contrast with the elaborate poetical finish of Job's words, which might suggest the originality of the former; and there is a growing feeling among many in favour of this view. At the same time a good deal remains yet to be said on both sides.

The book of Job is not literal history, though it reposes on an historical tradition. To this tradition belong probably the name of Job and his country, and the names of his three friends, and perhaps also many other details impossible to specify particularly. The view that the book is entirely a literary creation with no basis in historical tradition is as old as the Talmud, in which a rabbi is cited who says, Job was not, and was not created, but is an allegory. And this view has still supporters, *e.g.*, Hengstenberg. Pure poetical creations on so extensive a scale are not probable in the East and at so early an age.

Author.—The author of the book is wholly unknown. No literature has so many great anonymous works as that of Israel. The religious life of this people was at certain periods very intense, and at those times the spiritual energy of the nation expressed itself almost impersonally, through men who forgot themselves and were speedily forgotten in name by others. Itzig conjectures that the author was a native of the north on account of the free criticism of providence which he allows himself. Others, on account of some affinities with the prophet Amos, infer that he belonged to the south of Judah, and this is supposed to account for his intimate acquaintance with the desert. Ewald considers that he belonged to the exile in Egypt, on account of his minute acquaintance with that country. But all these conjectures localize an author whose knowledge was not confined to any locality, who was a true child of the East and familiar with life and nature in every country there, who was at the same time a true Israelite and felt that the earth was the Lord's and the fulness thereof, and whose sympathies and thought took in all God's works.

Literature.—The literature of the book will be found fully given in Dollfus's commentary, or in Lange's *Bibltheok.* A few more recent essays may be mentioned bearing on the criticism and the problem of the book: Klockner, "Job, de Knecht van Jehovah," in the *Theolog. Tijds.*, 1873, and in *nyds.*, Kuenen, "Job en de Joodse Knecht van Jehovah," *ibid.*, 1878; Studer, "Ueber die Integrität des Buches Job," in the *Jobab. fur Prot. Theologie*, 1875, and *Das Buch Hiob für geliebte Laien*, Bremen, 1881; Budde, *Beiträge zur Kritik des B. Hiob*, Bonn, 1876, with the review of Smend, *Stud. u. JOB'S TEARS. The seeds, or properly fruits of Job's tears, *Cotula lachryma*, Willd., a species of grass, are contained singly in a stony involucre or bract, which does not open until the enclosed seed germinates. The young involucre surrounds the female flower and the stalk support-

ing the spike of male flowers, and when ripe has the appearance of bluish white porcelain. Being shaped somewhat like a large drop of fluid, the form has suggested the name Job's tears, or *Lachryma Jobi*, under which the plant has been long known. The seeds are esculent, but the involucre are the part chiefly used, for making necklaces and other ornaments. The plant is a native of the East Indies, and was cultivated by Gerard as a tender annual.

JODHPUR, also called **MARWAR**, a native state in Rajputana, India, situated between 24° 36' and 27° 42' N. lat., and between 70° 6' and 75° 24' E. long. It is bounded on the N. by Bikaner and Jeypore states, on the E. by Jeypore and Kishangarh, on the S. by Sirohi and Palanpur states, and on the W. by the Rann of Kachchh (Rann of Cutch) and the British district of Thar and Parkar in Sind. The general aspect of the country is that of a sandy plain, divided into two unequal parts by the river Luni, and dotted with bold and picturesque conical hills, attaining in places an elevation rising to 3000 feet. The river Luni is the principal feature in the physical aspects of Jodhpur. It takes its rise in the sacred lake of Pushkar in Ajmere, and flows through Jodhpur in a south-westerly direction till it is finally lost in the marshy ground at the head of the Rann of Cutch. It is fed by numerous tributaries and occasionally overflows its banks, fine crops of wheat and barley being grown on the saturated soil. Its water is, as a rule, saline or brackish, but comparatively sweet water is obtained from wells sunk at a distance of 20 or 30 yards from the river bank. The famous salt-lake of Sambhar is situated on the borders of Jodhpur and Jeypore, and two smaller lakes of the same description lie within the limits of the district, from which large quantities of salt are annually extracted. Zinc is also obtained in considerable quantities, and marble is mined in the north of the state, and along the south-east border.

The population consists of Rājput Rājputs (who form the ruling class), Charans, Bhāts, Jāts, Bishnavis, Minas, Bhāds, and Bauris, with a small proportion of Mahometans. The Charans, a sacred race, hold large religious grants of land, and enjoy peculiar immunities as traders in local produce. The Bhāts are by profession genealogists, but also engage in trade. The Minas, Bauris, and Bhāds are predatory classes, but are employed in menial capacities. The Mahometans are principally soldiers. The natives, as a race, are enterprising and industrious, but the agricultural classes have to undergo great privations from poor food, and often bad water. Mārwarī traders are to be found throughout the length and breadth of the peninsula. No census of the population has ever been taken, but it has roughly been estimated at about 2,850,000, of whom 86 per cent. are said to be Hindus, 10 per cent. Jains, and 4 per cent. Mahometans.

The principal crops are pulses and millets, but wheat and barley are largely produced in the fertile tract watered by the Luni river. The manufactures comprise leather boxes and brass utensils; and turbans and scarfs and a description of unbleached silk knotted thread are specialties of the country. A large proportion of the population can read and write Hindi, including most ladies of good birth, which is believed to be peculiar to this state. Jodhpur town contains two good schools, one for the sons of chiefs and the higher classes, and the other for the children of tradespeople downwards. Every large village also has a school of its own, in which the vernacular is taught.

The maharaja belongs to the Rājput clan of Rājputs. The local historians relate that after the downfall of the Rājput dynasty of Kanauj in 1194 at Sivaji, the grandson of Jai Chand, the last king of Kanauj, entered Mārwar on a pilgrimage to Dwarka, and on halting at the town of Pāli he and his followers settled there to protect the Brahman community from the constant raids of marauding bands. The Rājput chief thus laid the foundation of the state, but it was not till the time of Rao Chandra, the tenth in succession from Sivaji, that Mārwar was actually conquered. His grandson Jodha founded the city of Jodhpur, which he made his

capital. In 1561 the country was invaded by Akbar, and the chief was forced to submit, and to send his son as a mark of homage to take service under the Mughal emperor. When this son Uddi Singh succeeded to the chieftainship, he gave his sister Jodhbai in marriage to Akbar, and was rewarded by the restoration of most of his former possessions. Uddi Singh's son, Rājā Geve Singh, held high service under Akbar, and conducted successful expeditions in Gujarat and the Deccan. The bigoted and intolerant Aurangzeb invaded Mārwār in 1679, plundered Jodhpur, sacked all the large towns, and commanded the conversion of the Rāhtors to Mahomedanism. This cemented all the Rājput clans into a bond of union, and a triple alliance was formed by the three states of Jodhpur, Udaipur, and Jeypore, to throw off the Mahomedan yoke. One of the conditions of this alliance was that the chiefs of Jodhpur and Jeypore should regain the privilege of marriage with the Udaipur family, which they had forfeited by contracting alliances with the Mughal emperors, on the understanding that the offspring of Udaipur princesses should succeed to the state in preference to all other children. The quarrels arising from this stipulation lasted through many generations, and led to the invitation of Marhatta help from the rival aspirants to power, and finally to the subjection of all the Rājput states to the Marhattas. Jodhpur was conquered by Sindhia, who levied from it a tribute of £90,000, and took from it the fort and town of Ajmere. Interminable disputes and succession wars disturbed the peace of the early years of the century, until in January 1818 Jodhpur was taken under British protection. In 1839 the misgovernment of the rājā led to an insurrection which compelled the interference of the British, and Jodhpur was held in military occupation for five months, until the rājā entered into engagements for the future good government of his subjects. In 1849 the chief having died without a son, and without having adopted an heir, the nobles and state officials were left to select a successor from the nearest kin. Their choice fell upon Rājā Takht Singh, chief of Ahmādnagar. This chief, who did good service during the mutiny, died in 1873. The constitution of Jodhpur may be described as a tribal suzerainty rapidly passing into the feudal stage. The *patel* or tribal chief is the ruler of his estate, and the judge almost exclusively in all matters of civil and criminal jurisdiction over his people. These chiefs owe military service to their suzerain, and exact the same from their dependants, to whom assignments of land have been made, and who form their following—the whole constituting the following of the suzerain himself. The mahārājā alone has the power of life and death. The revenue of the state is mainly derived from the land, salt, and customs duties, a tax imposed on the feudatory nobles, excise on duties, &c., estimated at a total of about £250,000 a year. The state pays a tribute to the British of £9800 a year, besides an annual payment of £11,500 for the support of a contingent—the Empress Irregular Force. The mahārājā also maintains an independent military force of 20 field and 250 other guns, 200 gunners, 3545 cavalry, and 5020 infantry.

JODHPUR, the capital of the above state, in 26° 17' N. lat. and 73° 4' E. long., was built by Rāo Jodha in 1549, and from that time has been the seat of government of the principality. It is surrounded by a strong wall nearly 6 miles in extent, with seventy gates. The fort stands on an isolated rock, and contains the mahārājā's palace, a large and handsome building, completely covering the crest of the hill on which it stands, and overlooking the city, which lies several hundred feet below. The city contains many handsome buildings—palaces of the mahārājā, and town residences of the *thikurs* or nobles, besides numerous fine temples and tanks. Building stone is plentiful, and close at hand, and the architecture solid and handsome. Three miles north from Jodhpur are the ruins of Mandor, the site of the ancient capital of the Purihar princes of Mārwār, prior to its conquest by the Rāhtors.

JOEL. The second book among the minor prophets is entitled *The word of Jehovah that came to Joel the son of Pethuel*, or, as the Septuagint, Latin, Syriac, and other versions read, *Bethuel*. Nothing is recorded as to the date or occasion of the prophecy, which presents several peculiarities that aggravate the difficulty always felt in interpreting an ancient book when the historical situation of the author is obscure. Most Hebrew prophecies contain pointed references to the foreign politics and social relations of the nation at the time. In the book of Joel there are only scanty allusions to Phœnicians, Philistines, Egypt, and Edom, couched in terms applicable to very different ages,

while the prophet's own people are exhorted to repentance without specific reference to any of those national sins of which other prophets speak. The occasion of the prophecy, described with great force of rhetoric, is no known historical event, but a plague of locusts, perhaps repeated in successive seasons; and even here there are features in the description which have led many expositors to seek an allegorical interpretation. The most remarkable part of the book is the eschatological picture with which it closes; and the way in which the plague of locusts appears to be taken as foreshadowing the final judgment—the great day or assize of Jehovah, in which Israel's enemies are destroyed—is so unique as greatly to complicate the exegetical problem. It is not therefore surprising that the most various views are still held as to the date and meaning of the book. Allegorists and literalists still contend over the first and still more over the second chapter, and, while the largest number of recent interpreters accept Credner's view that the prophecy was written in the reign of Josiah of Judah, a rising and powerful school of critics follow the view suggested by Vatke (*Bib. Theol.*, p. 462 *sq.*), and reckon Joel among the post-exile prophets. Other scholars give yet other dates: see the particulars in the elaborate work of Merx, *Die Prophetie des Joels und ihre Ausleger*, Halle, 1870. The followers of Credner are literalists; the opposite school of moderns includes some literalists (as Duhm), while others (like Hilgenfeld, and in a modified sense Merx) adopt the old allegorical interpretation which treats the locusts as a figure for the enemies of Jerusalem.

The reasons for placing Joel either earlier or later than the great series of prophets extending from this time when Amos first proclaimed the approach of the Assyrian down to the Babylonian exile are cogent. In Joel the enemies of Israel are the nations collectively, and among those specified by name neither Assyria nor Chaldaea finds a place. This circumstance might, if it stood alone, be explained by placing Joel with Zephaniah in the brief interval between the decline of the empire of Nineveh and the advance of the Babylonians. But it is further obvious that Joel has no part in the internal struggle between spiritual Jehovah-worship and idolatry which occupied all the prophets from Amos to the captivity. He presupposes a nation of Jehovah-worshippers, whose religion has its centre in the temple and priesthood of Zion, which is indeed conscious of sin, and needs forgiveness and an outpouring of the Spirit, but is not visibly divided, as the kingdom of Judah was, between the adherents of spiritual prophecy and a party whose national worship of Jehovah involved for them no fundamental separation from the surrounding nations. The book, therefore, must have been written before the ethico-spiritual and the popular conceptions of Jehovah came into conscious antagonism, or else after the fall of the state and the restoration of the community of Jerusalem to religious rather than political existence had decided the contest in favour of the prophets, and of the Law in which their teaching was ultimately crystallized.

The considerations which have given currency to an early date for Joel are of various kinds. The absence of all mention of one great oppressing world-power seems most natural before the westward march of Assyria involved Israel in the general politics of Asia. The purity of the style is also urged, and a comparison of Amos i. 2, Joel iii. 16 (Heb. iv. 16), and Amos ix. 13, Joel iii. 18 (iv. 18), has been taken as proving that Amos knew our book. The last argument might be inverted with much greater probability, and numerous points of contact between Joel and other parts of the Old Testament (*e.g.*, Joel ii. 2, Exod. x. 14; Joel ii. 3, Ezek. xxxiv. 35; Joel iii. 10, Mic. iv. 3) make it not incredible that the purity of his style—which is rather elegant than original and strongly marked—is in

large measure the fruit of literary culture. The absence of allusion to a hostile or oppressing empire may be fairly taken in connexion with the fact that the prophecy gives no indication of political life at Jerusalem. When the whole people is mustered in chap. i., the elders or sheikhs of the municipality and the priests of the temple are the most prominent figures. The king is not mentioned,—which on Credner's view is explained by assuming that the plague fell in the minority of Joash, when the priest Jehoiada held the reins of power,—and the princes, councillors, and warriors necessary to an independent state, and so often referred to by the prophets before the exile, are altogether lacking. The nation has only a municipal organization with a priestly aristocracy, precisely the state of things that prevailed under the Persian empire. That the Persians do not appear as enemies of Jehovah and His people is perfectly natural. They were hard masters but not invaders, and under them the enemies of the Jews were their neighbours, just as appears in Joel.¹ Those, however, who place our prophet in the minority of King Joash draw a special argument from the mention of Phœnicians, Philistines, and Edomites (iii. 4 *sq.*, 19), pointing to the revolt of Edom under Joram (2 Kings viii. 20) and the incursion of the Philistines in the same reign (2 Chron. xxi. 16, xxii. 1). These were recent events in the time of Joash, and in like manner the Phœnician slave trade in Jewish children is carried back to an early date by the reference in Amos i. 9. This argument is rather specious than sound. Edom's hostility to Judah was incessant, but the feud reached its full intensity only after the time of Deuteronomy (xxiii. 7), when the Edomites joined the Chaldeans, drew profit from the overthrow of the Jews, whose land they partly occupied, and exercised barbarous cruelty towards the fugitives of Jerusalem (Obad. *passim*; Mal. i. 2 *sq.*; Isa. lxxiii.). The offence of shedding innocent blood charged on them by Joel is natural after those events, but hardly so in connexion with the revolt against Joram.

As regards the Philistines, it is impossible to lay much weight on the statement of Chroniclers, unsupported as it is by the older history, and in Joel the Philistines plainly stand in one category with the Phœnicians, as slave dealers, not as armed foes. Gaza in fact was a slave emporium as early as the time of Amos (i. 6), and continued so till Roman times.

Thus, if any inference as to date can be drawn from chap. iii., it must rest on special features of the trade in slaves, which was always an important part of the commerce of the Levant. In the time of Amos the slaves collected by Philistines and Tyrians were sold *en masse* to Edom, and presumably went to Egypt or Arabia. Joel complains that they were sold to the Grecians (Javan, Ioniae).² It is probable that some Hebrew and Syrian slaves were exported to the Mediterranean coasts from a very early date, and Isa. xi. 11 already speaks of Ismahelites captive in these districts as well as in Egypt, Ethiopia, and the Bætyæ. But the traffic in this direction hardly became extensive till a later date. In Deut. xxviii. 68 Egypt is still the chief goal of the maritime slave trade, and in Ezek. xxvii. 13 Javan exports slaves to Tyre, not conversely. Thus the allusion to Javan in Joel better suits a later date, when Syrian slaves were in special request in Greece.³ And the name of Javan is not found in any part of the Old Testament certainly older than Ezekiel. In Joel it seems to stand as a general representative of the distant countries reached by the Mediterranean sea (in contrast with the southern Arabians, *Sodoma*, chap. ii. 8), the furthest nation reached by the fleets of the Red Sea. This is precisely the geographical standpoint of the post-exilic author of Gen. x. 4, where Javan includes Carthage and Tartessus.

¹ On the Authorized Version of ii. 17 it appears that subjection to a foreign power is not a pressing fact, but a thing feared. But the parallelism and ver. 19 justify the now prevalent rendering, "that the heathen should make a mock of them."

² The hypothesis of an Arabian Javan, applied to Joel iii. 6 by Credner, Hitzig, and others, may be viewed as exploded. See Stade, *De Populo Javan*, Gießen Programme, 1880.

³ Compare Movers, *Phöniciisches Alterthum*, III. i. p. 70 *sq.*

Finally, the allusion to Egypt in Joel iii. 19 must on Credner's theory be explained of the invasion of Shishak a century before Joash. From this time down to the last period of the Hebrew monarchy Egypt was not the enemy of Judah.

If the arguments chiefly relied on for an early date are so precarious or can even be turned against their inventors, there are others of an unambiguous kind which make for a date in the Persian period. It appears from chap. iii. 1, 2 that Joel wrote after the exile. The phrase "to bring again the captivity" would not alone suffice to prove this, for it is used in a wide sense, and perhaps means rather to "reverse the calamity;"⁴ but the dispersion of Israel among the nations, and the allotment of the Holy Land to new occupants, cannot fairly be referred to any calamity less than that of the captivity. With this the whole standpoint of the prophecy agrees. To Joel Judah and the people of Jehovah are synonyms; northern Israel has disappeared. Now it is true that those who take their view of the history from Chroniclers, where the kingdom of Ephraim is always treated as a sect outside the true religion, can reconcile this fact with an early date. But in ancient times it was not so; and under Joash, the contemporary of Elisha, such a limitation of the people of Jehovah is wholly inconceivable. The earliest prophetic books have a quite different standpoint; otherwise indeed the books of northern prophets and historians could never have been admitted into the Jewish canon. Again, the significant fact that there is no mention of a king and princes, but only of sheikhs and priests, has a force not to be invalidated by the ingenuous reference of the book to the time of Joash's minority and the supposed regency of Jehoiada.⁵ And the assumption that there was a period before the prophetic conflicts of the 8th century when spiritual prophecy had unchallenged sway, when there was no gross idolatry or superstition, when the priests of Jerusalem, acting in accord with prophets like Joel, held the same place as heads of a pure worship which they occupied after the exile (comp. Ewald, *Prophezen*, i. 89), is not consistent with history. It rests on the old theory of the antiquity of the Levitical legislation, so that in fact all who place that legislation later than Ezekiel are agreed that the book of Joel is also late. In this connexion one point deserves special notice. The religious significance of the plague of drought and locusts is expressed in chap. i. 9 in the observation that the daily meat and drink offering are cut off, and the token of new blessing is the restoration of this service, chap. ii. 14. In other words, the daily offering is the continual symbol of gracious intercourse between Jehovah and His people and the main office of religion. This conception, which finds its parallel in Dan. vii. 11, xi. 31, xii. 11, is quite in accordance with the later law. But under the monarchy the daily oblation was the king's private offering, and not till Ezra's reformation did it become the affair of the community and the central act of national worship (Neh. x. 33 *sq.*).⁶ That Joel wrote not only after the exile but after the work of Ezra and Nehemiah may be viewed as confirmed by the allusions to the walls of Jerusalem in chap. ii. 7, 9. Such is the historical basis which we seem to be able to lay for the study of the exegetical problems of the book.

The style of Joel is clear, and his language presents little difficulty beyond the occurrence of several unique words, which in part may very well be due to errors of the text.

⁴ See Ewald on Jer. xlviii. 47, and Kuenen, *Theol. Tijdschrift*, 1873, p. 519 *sq.*

⁵ Stade not unreasonably questions whether 2 Kings xii. 1-3 implies the paramount political influence of Jehoiada. *Op. cit.*, p. 17.

⁶ See Wellhausen, *Geschichte Israels*, p. 73 *sq.*

But the structure of the book, the symbolism, and the connexion of the prophet's thoughts have given rise to much controversy. It seems safest to start from the fact that the prophecy is divided into two well-marked sections by chap. i. 18, 19a. According to the Massoretic vocalization, which is in harmony with the most ancient exegetical tradition as contained in the LXX., these words are historical: "Then the Lord was jealous, . . . and answered and said unto his people, Behold," &c. Such is the natural meaning of the words as pointed, and the proposal of Merx to change the pointing so as to transform the perfects into futures, and make the priests pray that Jehovah will answer and deliver the gracious promises that tell the rest of the book, is an exegetical monstrosity not likely to find adherents.

Thus the book falls into two parts. In the first the prophet speaks in his own name, addressing himself to the people in a lively description of a present calamity caused by a terrible plague of locusts which threatens the entire destruction of the country, and appears to be the vehicle of a final consuming judgment (the day of Jehovah). There is no hope save in repentance and prayer; and in chap. ii. 12 the prophet, speaking now for the first time in Jehovah's name, calls the people to a solemn fast at the sanctuary, and invites the intercession of the priests. The calamity is described in the strongest colours of Hebrew hyperbole, and it seems arbitrary to seek too literal an interpretation of details, *e.g.*, to lay weight on the four names of locusts, or to take chap. i. 20 of a conflagration produced by drought, when it appears from ii. 3 that the ravages of the locusts themselves are compared to those of fire. But when due allowance is made for Eastern rhetoric, there is no occasion to seek in this section anything else than literal locusts. Nay, the allegorical interpretation, which takes the locusts to be hostile invaders, breaks through the laws of all reasonable writing; for the poetical hyperbole which compares the invading swarms to an army (ii. 4 *sq.*) would be inconceivably lame if a literal army was already concealed under the figure of the locusts. Nor could the prophet so far forget himself in his allegory as to speak of a victorious host as entering the conquered city like a thief (ii. 9). The second part of the book is Jehovah's answer to the people's prayer. The answer begins with a promise of deliverance from famine, and of fruitful seasons compensating for the ravages of the locusts. In the new prosperity of the land the union of Jehovah and His people shall be sealed anew, and so the Lord will proceed to pour down further and higher blessings. The aspiration of Moses (Num. xi. 29) and the hope of earlier prophets (Isa. xxxii. 15, lix. 21; comp. Jer. xxxi. 33) shall be fully realized in the outpouring of the Spirit on all the Jews and even upon their servants (compare Isa. lxi. 5 with Ivi. 6, 7); and then the great day of judgment, which had seemed to overshadow Jerusalem in the now averted plague, shall draw near with awful tokens of blood and fire and darkness. But the terrors of that day are not for the Jews but for their enemies. The worshippers of Jehovah on Zion shall be delivered (comp. Obad. ver. 17, whose words Joel expressly quotes in chap. ii. 32), and it is their heathen enemies, assembled before Jerusalem to war against Jehovah, who shall be mowed down in the valley of Jehoshaphat (*Jehovah's judgment*) by no human arm but by heavenly warriors. Thus definitively freed from the profane foot of the stranger (comp. Isa. lii. 1), Jerusalem shall abide a holy city for ever. The fertility of the land shall be such as was long ago predicted in Amos ix. 13, and streams issuing from the temple, as Ezekiel had described in his picture of the restored Jerusalem (Ezek. xlvii.), shall fertilize the barren Wady of Acacias. Egypt and Edom, on the other hand, shall be desolate, because they have shed the blood of

Jehovah's innocents. Compare the similar predictions against Edom, Isa. xxxiv. 9 *sq.* (Mal. i. 3), and against Egypt, Isa. xix. 5 *sq.*, Ezek. xxix. Joel's eschatological picture appears indeed to be largely a combination of elements from older unfulfilled prophecies. Its central feature, the assembling of the nations to judgment, is already found in Zeph. iii. 8, and in Ezekiel's prophecy concerning Gog and Magog, where the wonders of fire and blood named in Joel ii. 30 are also mentioned (Ez. xxxvii. 23). The other physical features of the great day, the darkening of the lights of heaven, are a standing figure of the prophets from Amos v. 6, viii. 9, downwards. It is characteristic of the prophetic eschatology that images suggested by one prophet are adopted by his successors, and gradually become part of the permanent scenery of the last times; and it is a proof of the late date of Joel that almost his whole picture is made up of such features. In this respect there is a close parallelism, extending to minor details, between Joel and the last chapters of Zechariah.

That Joel's delineation of the final deliverance and glory attaches itself directly to the deliverance of the nation from a present calamity is quite in the manner of the so called prophetic perspective. But the fact that the calamity which bulks so largely is natural and not political is characteristic of the post-exile period. Other prophets of the same age speak much of dearth and failure of crops, which in Palestine then as now were aggravated by bad government, and were far more serious to a small and isolated community than they could ever have been to the old kingdom. It was indeed by no means impossible that Jerusalem might have been altogether undone by the famine caused by the locusts; and so the conception of these visitants as the destroying army, executing Jehovah's final judgment, is really much more natural than appears to us at first sight, and does not need to be explained away by allegory. The chief argument relied upon by those who still find allegory at least in chap. ii. is the expression צפני, "the Northerner," in ii. 20. In view of the other points of affinity between Joel and Ezekiel, this word inevitably suggests Gog and Magog, and it is difficult to see how a swarm of locusts could receive such a name, or if they came from the north could perish, as the verse puts it, in the desert between the Mediterranean and the Dead Sea. The verse remains a *crux interpretum*, and no exegesis hitherto given can be deemed thoroughly satisfactory; but the interpretation of the whole book must not be made to hinge on a single word in a verse which might be altogether removed without affecting the general course of the prophet's argument.

The whole verse is perhaps the addition of an allegorizing glossator. The prediction in ver. 19, that the seasons shall henceforth be fruitful, is given after Jehovah has shown His zeal and pity for Israel, not of course by mere words, but by acts, as appears in verses 20, 21, where the verbs are properly perfects recording that Jehovah hath already done great things, and that vegetation has already revived. In other words, the mercy already experienced in the removal of the plague is taken as a pledge of future grace not to stop short till all God's old promises are fulfilled. In this context ver. 20 is out of place. Observe also that in ver. 25 the locusts are spoken of in the plain language of chap. i.

For the literature on Joel in connexion with the other minor prophets, see *THESE*. There are separate commentaries by Greiner (Halle, 1861), Wilschke (Lepe, 1872), Morx (Lille, 1875). The last-named gives an elaborate history of interpretation from the Septuagint down to Calvin, and appends the *Bible* text edited by Dillmann. Of older commentaries the most valuable is Prece's (Oxford, 1691). Bochart's *Hierozoicon* may also be consulted. (W. R. S.)

JOHN, the Apostle (יהוה), "Jehovah hath been gracious"), was the son of Zebedee, a Galilean fisherman, and Salome. It is probable that he was born at Bethsaida, where along with his brother James he followed his father's occupation. The family appear to have been in easy circumstances; at least we find that Zebedee employed hired servants, and that Salome was among the number of those

women who contributed to the maintenance of Jesus; he himself was perhaps related to Annas the high priest (John xviii. 15, 16). It seems to have been when attending as a disciple the preaching of John the Baptist at Bethany beyond Jordan that he first became personally acquainted with our Lord (John i. 35 sq.); his "call" to follow Him occurred simultaneously with that addressed to his brother and to Andrew and Peter (Mark i. 19, 20). He speedily took his place among the twelve apostles, sharing with James the title of Boanerges ("sons of thunder"), became a member of that inner circle to which, in addition to his brother, Peter alone belonged, and ultimately was recognized as the disciple *par excellence* whom Jesus loved, a distinction usually attributed to his amiability and gentleness of character, but much less probably due to any special sweetness of temperament (see Luke ix. 54; Mark iii. 17, ix. 38) than to a quickness and depth of insight which enabled him to enter more fully than his companions into the larger and wider-reaching views of his Master. After the departure of Jesus John remained at Jerusalem, where he was one of the most prominent among those who bore personal testimony to the fact of the resurrection; we find him for a short time in Samaria (Acts viii. 14, 25) after the martyrdom of Stephen, but on Paul's second visit to the Jewish capital (Gal. ii. 9) John was again there. His subsequent movements are obscure, but he can hardly have been in Jerusalem at the time of Paul's last visit there in 58 A.D.

At this point the history of the apostle is taken up by ecclesiastical tradition. Polykrates, bishop of Ephesus, 190 A.D. (in Euseb., *H. E.*, ii. 21, v. 24), attests that John "who lay on the bosom of the Lord" died at Ephesus; and, though this evidence is weakened by the legendary trait that he "was a priest wearing the *πέπλος*" or gold plate that distinguished the high-priestly mitre, it is fair to infer that the grave of the apostle was already shown (comp. *H. E.*, iii. 39). Irenæus in various passages of his works confirms this tradition. He says that John lived up to the time of Trajan, and published his Gospel in Ephesus. Irenæus also identifies the apostle with John the disciple of the Lord, who wrote the Apocalypse under Domitian, whom his teacher Polycarp had known personally, and of whom Polycarp had much to tell. These traditions are accepted and enlarged by later authors, Tertullian adding that John was banished to Patmos after he had miraculously survived the punishment of immersion in boiling oil. As it is evident that Irenæus was living with John as early as the time of Polykrates, while Irenæus's view that the Apocalypse was written under Domitian is inconsistent with the internal evidence offered by that book, the real worth of these traditions requires to be tested by examination of their ultimate source. This inquiry has been pressed upon scholars since the apostolic authorship of the Apocalypse or of the Fourth Gospel or of both these works has been disputed. See GOSPELS AND REVELATION. The question is not strictly one between radical and conservative criticism, for the Tubingen school recognized the Apocalypse as apostolic, and found in it a confirmation of John's residence in Ephesus. On the other hand, Lützelberger (1840), Krüm (*Zeits. v. New.*, vol. i, 1867), Holtzmann (*in Bibl.-Lex.*, s.v.), Schollen (*Theol. Tijdsch.*, 1871), and other recent writers wholly reject the tradition, while it has able defenders in Stettin (*Stud. v. Kthl.*, 1868), Hilgenfeld (*Zeit.*, 1875, p. 394 sq.; *J. W. T.*, 1872, 1877), and Lightfoot (*Contemp. Rev.*, 1875, 1876).

The opponents of the tradition lay weight on the absence of positive evidence before the latter part of the 2d century, especially in Papias, and in the epistles of Ignatius and of Irenæus's authority Polycarp. But they also find it necessary to assume that Irenæus mistook Polycarp, and that John "the disciple of the Lord," who was known to the latter, was not the apostle but a certain preacher John of whom we hear from Papias. This view would be at once refuted if we could hold with some scholars that the preacher is but another name for the apostle. This identification had already supporters in the time of Jerome (*Vit. Ill.*, 9; comp. Ussener, *Acta S. Timothei*, Bonn, 1877), but seems inconsistent with a fair reading of the words of Papias. It is therefore very possible that some change which Irenæus in his later years imposed Polycarp to have related of the apostle really belong to the other John (see GOSPELS, p. 820); but it is a much stronger thing to assume that he was mistaken in supposing that Polycarp had conversed with the apostle at all. An altogether independent and apparently inconsistent tradition that John was killed by the Jews is given on the authority of Papias by Georgius Pammartius in the 9th century.

JOHN, EPISTLES OF. Of the three Epistles which are ascribed to the apostle John, the First is by far the most important, both from the space which it occupies in the canon and from the weightiness of its teaching.

FIRST EPISTLE.—Title.—Some exception has been taken to the title "epistle" as applied to this document, seeing that it bears the name neither of sender nor of recipient, and carries with it no definiteness of message to a special correspondent. But, though it may be admitted that with regard to its literary form it would more properly be described as a homily or discourse, the frequently recurring terms "I wrote," "I have written," imply that the message was written, not orally delivered.

Genuineness.—The external evidence for the genuineness of this epistle is weighty. Polycarp, a disciple of John, writes with evident reference to 1 John iv. 3: *πάς γὰρ ὁς ἂν μὴ ὁμολογῇ Ἰησοῦν Χριστὸν ἐν σαρκὶ ἐληλυθέντα ἀντιχριστός ἐστιν* (*Ad Phil.*, vii.). Eusebius, writing of Papias (*Il. E.*, iii. 39), says: *Κέχυται δ' οὗτος μαρτυρίας ἀπὸ τῆς Ἰωάννου ἡρωϊκῆς ἐπιστολῆς καὶ ἀπὸ τῆς Πέτρου ὁμιλίας*.¹ The epistle was frequently cited by Irenæus, a disciple of Polycarp, as we learn both from the statement of Eusebius (*Il. E.*, v. 8) and from his extant work against heretics (*Adv. Hæret.*, iii. 16, v. and vii.). The two epistles of St John mentioned in the canon of Muratori are probably the Second and Third, but the absence of reference to the First in that particular connexion implies its acknowledged canonicity; moreover, the same canon contains a citation of 1 John i. 1, 4. The early fragment called the letter to Diognetus has unmistakable allusions to the Johannine epistles. The Peshito contains the epistle, and there is an undoubted reference to it in the letter from the churches of Vienne and Lyons. All these authorities belong to the first two centuries. In the succeeding centuries the volume of evidence grows. Eusebius reckons the epistle among the *Homologoumena* or writings of acknowledged authority, and the testimony of Tertullian, Clemens Alexandrianus, Origen, and Cyprian, in addition to the evidence already adduced, indicates its reception in all the churches.²

To those who accept the Fourth Gospel as John's, the strength of the internal evidence for the Johannine authorship of the epistle lies in the similarity of words, of teaching, and of style between the two writings. This similarity is so marked that it requires no argumentative proof. It is a similarity not only of diction, or of parallel expressions and peculiarities of style, but one which is penetrated by the more subtle correspondences of under-currents of thought and of implied knowledge. See on this part of the subject Westcott, *Introduction to the Gospel of St John*, p. lxi. sq., in the *Speaker's Commentary*; and Davidson's *Introduction to the Study of the New Testament*, ii. 293 sq. On the other hand, the very closeness of the connexion between the epistles and the gospel has necessarily involved the former in the assaults of recent criticism upon the genuineness of the latter.³ Some critics, however, while admitting the similarity of style, contend that there are differences of doctrine between the gospel and epistle which preclude identity of authorship. The main points advanced in behalf of this statement are—the supposed differences in eschatological views, the application of the term "Paraclete" to the work of the Holy Spirit in the gospel and to the office of Christ alone in the epistle, the introduction into the epistle of such terms as *λαοί* and *χρῆματα*, which are not found in the gospel, and, lastly, the polemical and

¹ See, however, for exceptions that may be taken to these testimonies, GOSPELS, vol. x. pp. 820, 822.

² The epistle was not included in the Marcionite canon, and the Alogi, an obscure sect so named by Epiphanius (*Hæret.*, i. 1-8), seem to have rejected this, together with the other writings of St John.

³ See GOSPELS, vol. x. p. 828.

strongly anti-Doctetic tone which is said to distinguish the epistle from the gospel. Such differences, however, are in part more apparent than real (they are certainly not contradictions), and in part may be naturally explained by the changed circumstances in which the two writings were composed and the different aims proposed in them. On this point see Westcott, p. lxxviii., and Reuss, *Introduction*, p. 358 sq.

Date.—The date of the epistle must remain in uncertainty; but it is generally viewed as later in composition than the gospel. "The phrases in the gospel," writes Professor Westcott, "have a definite historic connexion; they belong to circumstances which explain them. The phrases in the epistle are in part generalizations and in part interpretations of the earlier language in view of Christ's completed work, and of the experience of the Christian church." The same writer assigns on good grounds to the gospel as well as to the epistle a date subsequent to the fall of Jerusalem. In this view *ἡ ἀγάπη* *ἡ ἀγαπᾷ*, ch. ii. 18, must be understood of the approach of the second advent of Christ.

Occasion and Contents.—Mr Brownning has in his *Death in the Desert* caught the true occasion of the apostle's letter: it was written in view of the time when

"There is left on earth
No one alive who knew (consider this),—
Saw with his eyes and handled with his hands
That which was from the first, the Word of Life;
How will it be when none more saith 'I saw'!"

It is the testimony of the last surviving eyewitness of the Lord, far removed from the scenes and words which he attests, giving, in view of rising error,—Gnostic and Doctetic,—the apostolic judgment on questions of the day, and founding the truth of Christian doctrine on a recognition of the historical Christ.

The subject and character of the epistle answer these conditions. The direct testimony to the real existence of Jesus Christ in the flesh, the declaration of spiritual truths (as in ch. i. 6, ii. 29, iii. 19, and in many other passages) which gives an introspective element to the epistle, and, lastly, the impressive re-delivery of familiar truths not freshly defined but exhibited in different mutual relations, are characteristic of an address given by an aged teacher to a generation of men who had not seen the Lord,—from whom therefore objective proof had been withdrawn, and who in consequence would desire some clear testimony of the facts about Jesus, and some definite tests of communion with God and of the reality of their spiritual condition. It is an address to the instructed. Much therefore is taken for granted; many elementary principles and truths of the Christian life are left unnoticed; and religious terms frequent in other parts of the New Testament are absent from this epistle. The apostle writes "because they have known Him that was from the beginning" (ii. 13), and his aim is a deepening of the spiritual life and a confirmation of faith.

After an introduction, giving his credentials as a witness and stating his aim, the apostle delivers his message to the church, "God is light" (i. 5). This thought is the subject of the epistle; it is illustrated by the opposite of light—darkness, and by analogous pairs of opposites, in which the principal theme is exhibited in different aspects: these are—righteousness and sin, truth and falsehood, love and hate, God and the world, life and death. To those ideas, which are in truth varied expressions of one and the same idea, the apostle turns and returns, not repeating himself, but on each reiteration of the truth adding some fresh thought and deeper truth. Through these opposites runs another thought—judgment or decision,—which is viewed not as a future but as an ever-present fact in the Christian life.

After the delivery of his message (*ἐγγελία*) the apostle proceeds to set forth some effects of the "light,"—fellowship with one another, confession of sin, forgiveness of sin (i. 6–10). This suggests one aspect of the object of the "message," freedom from sin, the test of which, *i.e.*, in other words, the test of knowing God, is observance of His commandments, which are summed up in love (*ἀγάπη*) (ii. 1–11). Here the apostle reminds his readers why he sends the message; it is because (*ὅτι*) they to whom it comes are Christians, whose sins have been forgiven, who have known Christ, who have conquered Satan; it comes to all,—to little children, to young men, to the aged (ii. 12–14). Therefore let them not love the world nor the things of the world (ii. 15–17). Hence the thought of the end of the world and the signs thereof. Of these one is the Antichrist. There are now many Antichrists even in the nominal church. But there is a test of the true Christian,—to have the Father, the Son, the unction (*χρῆσμα*) of the Holy Spirit, and the truth (ii. 18–28).

A new section begins with the thought of sonship of God. The test of sonship is doing righteousness because God is righteous. Sonship is a proof of the Father's love, and the condition of it is likeness to the Father (ii. 28–iii. 9). The connexion is then traced between righteousness and love (10–13), between love and life, and hate and death (14, 15). This suggests the range of love,—self-sacrifice even to death (16–18). Truth (suggested by reality of love) is shown to be tested by keeping the commandments, the first of which is love (19–23), the result is the indwelling of Christ which the Spirit testifies (24). The mention of the Spirit leads the apostle's thoughts once more, as in ch. ii. 18 sq., to the distinction between true spirits and false. The test is the same, the acknowledgment that Christ has come in the flesh (iv. 1–6). The thought of the true Christian as distinguished from the false again suggests mutual love, which springs from God's love to us manifested by the mission of Christ. Mutual love is a proof of the indwelling Christ (7–13). Here the apostle pauses to bear impressive witness to the mission of Christ and the love of God (14–16), and then resumes the subject of love. A result of perfect love is confidence in the day of judgment. But absence of brotherly love means want of love to God (17–21). For the test of brotherly love is love to God, which consists in keeping His commandments through the faith in Jesus Christ that overcomes the world (v. 1–5). Jesus Christ then is the object of faith. Faith brings its own evidence, and its evidence is that God gave eternal life (6–12). To effect the knowledge of this (the possession of eternal life), and the belief in the Son of God, were the apostle's objects in writing. Such knowledge and belief bring assurance, from which results certainty of answer to prayer. The instance given is intercessory prayer (13–17). In conclusion the apostle recapitulates some of the leading truths dwelt upon in the epistle.

From this brief summary it will be seen that the sections are sometimes linked together by a manifest chain of reasoning, and that sometimes the concluding word in one paragraph suggests the fresh train of thought in the next. Some expositors detect a more logical sequence in the epistle. But the varying results of their expositions go to prove the improbability that the apostle had in view any such systematic arrangement. See, however, Diisterdieck, whose scheme is mainly followed by Alford, and Davidson, *Introduction to the Study of the New Testament*.

Where Written and to Whom Addressed.—The epistle was probably written at Ephesus, where the most ancient tradition places the closing scenes of St John's life, and addressed to the church of Ephesus, or as an encyclical letter to the churches of Asia. In some Latin MSS., how-

over, and in St Augustine's *Quest. Evang.* ii. 39, the address *ad Parthos* is found. Beale adds testimony to the same effect. But such a destination of the epistle is unlikely in itself, receives no support from the Greek Church, and is opposed to ecclesiastical tradition. Hence the best criticism rejects the superscription. It is variously accounted for. Whiston, in his *Commentary on the Epistles* (1719), suggests that the original address was *πρὸς παρθένους*, and that this abbreviated appeared in Latin as *ad Parthos*; according to others it is a corruption of *ad Sparso*, "to the dispersed."

Before textual criticism was studied scientifically, much controversy turned upon the words contained in vers. 7 and 8 of ch. v. The disputed passage, *ἐν τῷ σίρηνῳ* . . . *ἐν τῇ γῇ*, is now omitted by all the leading editors, on indisputable authority.

SECOND AND THIRD EPISTLES.—These are interesting as the only examples of apostolic letters to private persons, except the epistle to Philemon, which have descended to us. Their genuineness is well attested, though with less decisive evidence than that of the First Epistle. Irenæus quotes 2 John 10, 11. Clement of Alexandria (*Strom.* ii. 66) alludes to the First Epistle in a way which implies another, *ἐν τῇ μέλλοντι ἐπιστολῇ*. Dionysius of Alexandria (248 A.D.) makes express mention of the Second and Third Epistles; Alexander, bishop of Alexandria, cites a passage from the Second The Muratorian canon, as already stated, probably contains a reference to the two minor epistles.

On the other hand, Eusebius mentions those epistles among the *ἀντιλεγόμενα*, or disputed writings (*II. E.* iii. 25); Jerome writes that they were ascribed to John the Presbyter; Cyprian appears never to cite from them in his own writings (though his records words of Bishop Arelolus, who, speaking in a synod, quotes 2 John 9), Tertullian is equally silent; the Peshito does not contain either epistle.

In answer to the doubts thus raised it has been urged that the brevity and unimportance of the two minor epistles sufficiently account for the comparative silence of the first two centuries respecting them; that the existence of John the Presbyter rests on the slender authority of an inference from a statement by Papias (*Eus.* *II. E.* iii. 39); that the style and expressions in the disputed epistles are so manifestly Johannine that, if they did not proceed from John the apostle, they must be the work of a conscious imitator, who, if honest, would have used his own name, if an intentional deceiver, that of the apostle; that the term *δὲ πρεσβύτερος* ("the elder," or "the aged"), 2 John 1, 3 John 1, is either a title of dignity or descriptive of age (if the first it may be paralleled by the use of *συμπρεσβύτερος*, 1 Pet. v. 1; if the second, by that of *πρεσβύτερος*, Phil. 9, both applied by an apostle to himself).

The greeting in the Second Epistle *ἐλεγκτὴ κυρία* is variously interpreted—either (a) of a person to the elect lady, to the elect Kyria, or to the lady Eclecta, or (b) of a church mystically addressed under a personal appellation. The last hypothesis is unlikely, and is not supported either by New Testament usage or by the early apocryphal writings. If either *ἐλεγκτὴ* or *κυρία* be a proper name, it is better to regard *κυρία* as such, since *ἐλεγκτὴς* is a term applied to all the saints, and in this very letter to the lady's sister, ver. 13. On the whole it is more probable that both *ἐλεγκτὴ* and *κυρία* bear their ordinary meanings, and that the A.V. is correct.

The Third Epistle is addressed to Gaius or Caius, a name so common that all identifications must be regarded as purely conjectural. From the epistle we learn that he was a Christian of good report, probably a layman, whom the apostle commends for his hospitality to certain missionaries of the faith who seem to have visited his city. Two other

names are mentioned—Diotrephes, a leading and ambitious presbyter, who had refused to obey the apostle's injunctions, and Demetrius, either the bearer of the epistle or a member of the same church to which Caius belonged.

The time when and the place where these epistles were written must remain unknown from the absence of any data by which to determine them.

The works consulted for this article have been the commentaries of Alford, Elward, Lucke, and Reuss on the Epistles, and that of Westcott on the Gospel of St John (*Speaker's Commentary*); Westcott, *The Canon of the New Testament*; Neander's *Planting of Christianity* (Bohn's trans., vol. ii.); F. D. Maurice's *Lectures on the Epistles of St John*; and Davidson's *Introduction to the New Testament*. There are also commentaries, among others, by Dusterdieck, 1853; Luthardt, 1860; Haupt, 1869; Baur, 1848; Hilgenfeld, 1854, the last two representing the Tubingen school of criticism (A. C.).

JOHN, GOSPEL OF. See GOSPELS, vol. x. p. 818.

JOHN THE BAPTIST, the last of the prophets and the "forerunner" of Christ, was born in a *πλῆθις τοῦδα* (according to rabbinical tradition, at Hebron, but according to an ingenious modern interpretation of the phrase, at Jutta), in the beginning of the second half of the year 749 A.U.C. His father Zechariah was a priest "of the course of Abia"; his mother Elizabeth was related to Mary, the mother of Jesus, whose senior he was by six months. The circumstances of his birth are related with much detail in Luke i., but those of his early years are summed up in the single expression at ver. 80 that he "grew, and waxed strong in spirit, and was in the deserts till the day of his shewing unto Israel." In his thirtieth year (Autumn, 779 A.U.C.) he began his public life in the "wilderness of Judæa," the wild district that lies between the Kidron and the Dead Sea, and particularly in the neighbourhood of the Jordan, where multitudes were attracted by his eloquence. His appearance, costume, and habits of life were such as to recall to the minds of his hearers what they had read of the ancient prophets, and particularly about Elijah, who came to be regarded as his prototype. Nor was his preaching in substance different from theirs: his central doctrine was that "the kingdom of heaven" had come near, and preparation for its speedy arrival by an appropriate change of heart and life was the practical duty he urged. With regard to the nature of the baptism he administered, much uncertainty exists; for some discussion of its origin and meaning, the reader is referred to the article BAPTISM (vol. iii. p. 348-9). Amongst those who resorted to this rite was John's kinsman, Jesus of Nazareth, whom he had foretold, and now acknowledged, as one mightier than himself, the latchet of whose shoes he was not worthy to unloose. The duration of John's ministry cannot be determined with certainty; it terminated in his imprisonment in the fortress of Machærus, to which he had been committed by Herod Antipas, whose incestuous marriage with Herodias the Baptist had sternly rebuked, and where he was beheaded under circumstances which are familiar to every reader of the Bible. The date of this event cannot with safety be placed later than the end of 782 A.U.C. For our knowledge of John the Baptist we are almost entirely dependent on the notices contained in the Gospel narratives, but a brief account of his career is also given by Josephus (*Ant.* xviii. 5); some legends of an obviously fictitious character are contained in the apocryphal Gospels.

JOHN, the name of twenty-two popes.

JOHN I. (pope from 523 to 529) was a Tuscan by birth, Pope, and was consecrated pope on the death of Hormisdas. In 525 he was sent by Theodoric at the head of an embassy to Constantinople to obtain from the emperor Justin toleration for the Arians; but, whether designedly or not, he succeeded so imperfectly in his mission that Theodoric on his return, suspecting that he had acted only halfheartedly, threw him into prison, where he shortly afterwards died, Felix IV. (or

III.) succeeding him. He was enrolled among the martyrs, his day being May 27.

JOHN II. (pope from 532 to 535), surnamed on account of his eloquence Mercurius, was elevated to the papal chair on the death of Boniface II. During his pontificate a decree against simony was engraven on marble and placed before the altar of St Peter's. At the instance of the emperor Justinian he adopted the proposition *unus de Trinitate passus est in carne* as a test of the orthodoxy of certain Scythian monks accused of Nestorian tendencies. He was succeeded by Agapetus I.

JOHN III. (pope from 560 to 573), successor to Pelagius, was descended from a noble Roman family. He is said to have been successful in preventing an invasion of Italy by the recall of his deposed exarch Narses, but the Lombards still continued their incursions, and, especially during the pontificate of his successor Benedict I., inflicted great miseries on the province.

JOHN IV. (pope from 640 to 642) was a Dalmatian by birth, and succeeded Severinus after the papal chair had been vacant four months. While he adhered to the reputation of the Monothelitic doctrine by Severinus, he endeavoured to explain away the connexion of Honorius I. with the heresy. His successor was Theodorus I.

JOHN V. (pope from 686 to 687) was a Syrian by birth, and on account of his knowledge of Greek had in 680 been named papal legate to the sixth oecumenical council at Constantinople. He was the successor of Benedict II., and after a pontificate of little more than a year, passed chiefly in bed, was followed by Conon.

JOHN VI. (pope from 701 to 705) was a native of Greece, and succeeded to the papal chair two months after the death of Sergius I. An attempt of the exarch Theophylact of Ravenna to extort from him certain concessions to the Byzantine emperor Tiberius was frustrated by the revolt of the Italian portion of the army with which he threatened Rome, who but for the intervention of the pope would have put their leader to death. Partly by persuasion and partly by means of a bribe, John also succeeded in inducing Gisulph, duke of Benevento, to withdraw from the territories of the church.

JOHN VII. (pope from 705 to 707), successor of John VI., was also of Greek nationality. He declined to accede to the request of the emperor Justinian II. that he should give his sanction to the decrees of the Quinisext or Trullan council of 691, on the ground that a papal legate was not present, and his death shortly afterwards delivered him from the necessity of committing himself to a more decided opinion. He was followed by Sisinnius.

JOHN VIII. (pope from 872 to 882), successor of Adrian II., was a Roman by birth. His chief aim during his occupancy of the papal chair was to build up his temporal power by uniting the various discordant political elements of Italy into a theocracy under his own immediate control, and by subordinating the empire to the ecclesiastical authority of Rome. The qualifications he brought to the task he had undertaken were a resolute and unbending will, an unscrupulous readiness to employ any means that might best advance his purpose, and a thorough mastery of diplomatic intrigue. Events, however, were so fatally opposed to his designs that no sooner did one of his schemes begin to realize itself in fact than it was shattered and dissipated by an unlooked-for chance. To take advantage of the opportunity of winning a recognition of the dependence of the imperial authority on that of Rome, as well as to obtain an influential alliance against his enemies, he agreed, in 875, to bestow the imperial crown on Charles the Bald, but that monarch was too much occupied in Germany to grant him much effectual aid, and about the time of the death of Charles he found it necessary to come

to ignominious terms with the Saracens, who were only prevented from entering Rome by the promise of an annual tribute. Carloman, the opponent of Charles's son Louis, soon after invaded northern Italy, and, securing the support of the bishops and counts, demanded from the pope the imperial crown. John attempted to temporize, but Duke Lambert of Spoleto, a partisan of Carloman, whom events had recalled to Germany, entered Rome in 878 with an overwhelming force, and for thirty days virtually held him a prisoner in St Peter's. He was, however, unsuccessful in winning any concession from the pope, who after his withdrawal carried out a previous purpose of going to France. There he presided at the council of Troyes, which promulgated a ban of excommunication against the supporters of Carloman—amongst others Adalbert of Tuscany, Lambert of Spoleto, and Formosus, bishop of Porto, who was afterwards elevated to the papal chair. In 879 John returned to Italy accompanied by Duke Bosco of Provence, whom he adopted as his son, and made an unsuccessful attempt to get recognized as king of Italy. In the same year he was compelled to give a promise of his sanction to the claims of Charles the Fat, who received from him the imperial crown in 881. Previous to this, in order to secure the aid of the Greek emperor against the Saracens, he had agreed to sanction the restoration of Photius to the see of Constantinople, and had withdrawn his consent on finding that he reaped from the concession no substantial benefit. Charles the Fat, partly from unwillingness, partly from natural inability, gave him also no effectual aid, and the last years of John VIII. were spent chiefly in hurling vain anathemas against his various political enemies. According to the authority of Fulda, he was murdered by one of his near relations. His successor was Martin II.

JOHN IX. (pope from 898 to 900) was of German birth, and belonged to the Benedictine order. He not only confirmed the judgment of his predecessor Theodorus II. in granting Christian burial to Formosus, but at a council held at Ravenna decreed that the records of the synod which had condemned him should be burned. Finding, however, that it was advisable to cement the ties between the empire and the papacy, John gave unhesitating support to Lambert in preference to Arnulf, and also induced the council to determine that henceforth the consecration of the popes should take place only in the presence of the imperial legates. The sudden death of Lambert shattered the hopes which this alliance seemed to promise. John was succeeded by Benedict IV.

JOHN X. (pope from 914 to 928) was deacon at Bologna when he attracted the attention of the empress Theodora, through whose influence he was elevated first to that see and then to the archbishopric of Ravenna. In direct opposition to a decree of council, he was also at the instigation of Theodora promoted to the papal chair as the successor of Lando. Like John IX. he endeavoured to secure himself against his temporal enemies through a close alliance with the imperial power and the establishment of an independent Italian kingdom. With this view he in December 915 granted the imperial crown to Berengar, and with the assistance of the imperial troops and the forces of the duke of Benevento and Naples he took the field in person against the Saracens, over whom he gained a great victory on the banks of the Garigliano. The defeat and death of Berengar through the combination of the Italian princes again frustrated the hopes of a united Italy subservient to papal purposes, and after witnessing several years of anarchy and confusion John perished through the intrigues of Marozia, daughter of Theodora. His successor was Leo VI.

JOHN XI. (pope from 931 to 938) was born in 906, the son of Marozia and the reputed son of Sergius III. Through the influence of his mother he was chosen to

succeeded Stephen VII. at the early age of twenty-one. He was the mere exponent of the purposes of his mother, until her son Alberic succeeded in 933 in overthrowing their authority. The pope was kept a virtual prisoner in the Lateran, where he is said to have died in 936, in which year Leo VII. was consecrated his successor.

JOHN XII. (pope from 955 to 964) was the son of Alberic, whom he succeeded as patrician of Rome in 954, being then only sixteen years of age. His original name was Octavian, but when he assumed the papal tiara as successor to Agapetus II., he adopted the apostolic name of John, the first example, it is said, of the custom of altering the surname in connexion with elevation to the papal chair. As a temporal ruler John was devoid of the vigour and firmness of his father, and his union of the papal office—which through his scandalous private life he made a byword of reproach—with his civil dignities proved a source of weakness rather than of strength. In order to protect himself against the intrigues in Rome and the power of Berengar II. of Italy, he called to his aid Otho the Great of Germany, to whom he granted the imperial crown in 963. Even before Otho left Rome the pope had, however, repented of his recognition of a power which threatened altogether to overshadow his authority, and had begun to conspire against him on whom he had newly conferred the dignity of emperor. His intrigues were discovered by Otho, who after he had defeated and taken prisoner Berengar, returned to Rome and summoned a council which deposed John, who was in hiding in the mountains of Campania, and elected Leo VIII. in his stead. An attempt at an insurrection was made by the inhabitants of Rome even before Otho left the city, and on his departure John returned at the head of a formidable company of friends and retainers, and caused Leo to seek safety in immediate flight. Otho determined to make an effort in support of Leo, but before he could the city John had died, in what manner is uncertain, and Benedict V. had mounted the papal chair.

JOHN XIII. (pope from 965 to 972) was descended from a noble Roman family, and at the time of his election as successor to Leo VIII. was bishop of Narni. He had been somewhat inconsistent in his relations with his predecessor Leo, but his election was confirmed by the emperor Otho, and his submissive attitude towards the imperial power was so distasteful to the Romans that they expelled him from the city. On account of the threatening procedure of Otho, they permitted him shortly afterwards to return, upon which, with the sanction of Otho, he took savage vengeance on those who had formerly opposed him. Shortly after holding a council along with the emperor at Ravenna in 967, he gave the imperial crown to Otho II. at Rome in assurance of his succession to his father; and in 972 he also crowned Theophania as empress immediately before her marriage. On his death in the same year, he was followed by Benedict VI.

JOHN XIV. (pope from 984 to 985), successor to Benedict VII., was born at Pavia, and before his elevation to the papal chair was imperial chancellor of Otho II. Otho died shortly after his election, and, taking advantage of the opportunity, Boniface VII., on the strength of the popular feeling against the new pope, returned from Constantinople and placed John in prison, where he died either by starvation or poison.

JOHN XV. (pope from 985 to 996) is now generally recognized as the successor of Boniface VII., the pope of the same name who was said to have ruled for four months after the murder of Boniface being now omitted by the best authorities. John XV. was the son of Leo, a presbyter in Gallina Alba. At the time he mounted the papal chair Crescentius was patrician of Rome, but, although his influence was on this account very much hampered, the

presence of the empress Theophania in Rome from 989 to 991 restrained also the ambition of Crescentius. On her departure the pope, whose venality and nepotism had made him very unpopular with the citizens, found it necessary to flee to Tuscany. The news of the approach of Otho III. made it possible for him soon afterwards to return, but he died of fever before the arrival of Otho, who elevated his own kinsman Bruno to the papal dignity under the name of Gregory V.

JOHN XVI. (pope or antipope from 997 to 998) was a Calabrian Greek by birth, and a favourite of the empress Theophania, from whom he had received the bishopric of Placentia. His original name was Philagathus. In 995 he was sent by Otho III. on an embassy to Constantinople to negotiate a marriage with a Greek princess. On his way back he either accidentally or at the special request of Crescentius visited Rome. A little before this Gregory V., in the beginning of 997, had been compelled to flee from the city; and the wily and ambitious Greek had now no scruple in accepting the papal tiara from the hands of Crescentius, to whom he consented to give up the temporal authority on condition that he recognized his subordination to the Western empire. The arrival of Otho at Rome in the spring of 998 put a sudden end to the treacherous compact. John sought safety in flight, but was discovered in his place of hiding and brought back to Rome, where after enduring cruel and ignominious tortures he was immured in a dungeon.

JOHN XVII., whose original name was Sisco, succeeded Silvester II. as pope in June 1003, but died in less than five months afterwards.

JOHN XVIII. (pope from 1003 to 1009) was, during his whole pontificate, the mere creature of the patrician John Crescentius, and ultimately he abdicated and retired to a monastery, where he died shortly afterwards. His successor was Sergius IV.

JOHN XIX. (pope from 1024 to 1033) succeeded his brother Benedict VIII., both being members of the powerful house of Tusculum. He merely took orders to enable him to ascend the papal chair, having previously been a consul and senator. He displayed his freedom from ecclesiastical prejudices, if also his utter ignorance of ecclesiastical history, by agreeing on the payment of a large bribe, to grant to the patriarch of Constantinople the title of an oecumenical bishop, but the general indignation which the proposal excited throughout the church compelled him almost immediately to withdraw from his agreement. On the death of the emperor Henry II. in 1024 he gave his support to Conrad II., who along with his consort was crowned with great pomp at St Peter's in Easter of 1027. In 1033 a conspiracy of the nobles compelled the pope to flee from Rome, but he was restored by Conrad, and died the same year in the full possession of his dignities. A successor was found for him in his nephew Benedict IX., a boy of only twelve years of age.

JOHN XXI. (pope from 1276 to 1277), successor to Adrian V., should, according to the order observed above, be named John XX., but there is an error in the reckoning through the insertion of an antipope before John XV. or some time after John XIX. At the time of his elevation to the papal chair he was cardinal-bishop of Tusculum, and he had previously been archbishop of Braga. He was a Portuguese by birth, and his original name was Pedro Juliani. The son of a physician, he had studied with distinction at Paris, was the author of several medical and scholastic treatises, and is mentioned by some chroniclers as a magician. His small affection for the monks, his unecclesiastical tone and habits, free and unaffected intercourse with every class of men, and proficiency in secular science, awakened against him

the jealousy and distrust of the clergy, but probably his comprehensive and liberal policy would have shed exceptional lustre on the church had not his life been brought to a premature close through the fall of the roof which he had planned for one of his rooms in the palace of Viterbo. His successor was Nicholas III.

JOHN XXII. (pope from 1316 to 1334) was born at Cahors about 1244. His original name was Jacques d'Esse, and his father is said to have been a cobbler. Tradition also affirms that the son learned the same employment, but afterwards he was taken charge of by his uncle, a successful merchant, who rose to be chancellor of Robert of Sicily. Through the instruction of a Franciscan friar, Jacques d'Esse acquired, besides an acquaintance with theology, a mastery of canon and civil law which afterwards stood him in good stead; but, although he was also versed in all the details of statesmanship, his learning was saturated with scholasticism, and his political ideas were narrowed by a mean and paltry ambition, the principal element of which was a miserly love of gold. He was small in stature and slightly deformed, and his features are said to have unpleasantly indicated his special moral defects. It is uncertain whether he ever joined the Franciscan order, but at any rate he afterwards had intimate connexions with the court of Naples, and some time before 1300 he was, at the instance of the king, appointed by Boniface VIII. bishop of Prejus. By means of forged letters purporting to have the authority of the king of Naples, Clement V. was induced in 1310 to bestow upon him the see of Avignon; and, notwithstanding that the fraud was soon discovered, he so recommended himself to the pope by his prudent conduct and his knowledge of law that in 1312 he was named cardinal-bishop of Porto. Robert of Naples also condescended to forget the liberty that had been taken in the use of the royal seal, and, on the death of Clement V. in 1316, the cardinals, through the liberal expenditure of Neapolitan gold, were won over to elect the bishop of Porto to the papal chair. The leanings of the new pope towards the French party were at once shown by his choice of Avignon as his residence, and by his first promotion of cardinals, all of whom except one were French. During the strife for the empire between Louis of Bavaria and Frederick of Austria, John took no active part on either side, but made use of the opportunity quietly to establish an Italian kingdom under the rule of King Robert of Sicily, and after fortune declared for Louis at the battle of Mühldorf in 1322 continued to act as if the imperial throne were still vacant. In consequence of this, Louis found himself compelled to enter into a league with the Ghibellines, whereupon the pope summoned him to appear before him at Avignon, and, on his declining immediate compliance with the request, promulgated against him a ban of excommunication. The empire was offered to Charles the Fair of France, who had married a daughter of the emperor Henry VII., but her death lost him his chief support in Germany; and Louis, owing in a great measure to the influence of the Franciscans, whom the persecutions of John had greatly incensed against the authority of Rome, was accepted as emperor with the unanimous consent of the states at Ratisbon in 1324, a decision fully confirmed by the diet of Spire in 1326. In the following year he experienced equal goodwill at the diet of the imperial feudatories at Trent. After receiving the crown of Italy at Milan he entered Rome with the general acclamation of the inhabitants, and was crowned emperor by two excommunicated bishops. But, although the election of Peter of Corvara as rival pope under the name of Nicholas V. was greeted with the loud approval of the citizens, the threatening attitude of Robert of Naples made it impossible for the emperor and antipope to prolong their stay in Rome, and

afterwards a gradual reaction against the imperial cause took place throughout the whole of Italy. Nicholas was taken prisoner at Pisa, but on making a complete recantation of his errors was forgiven and absolved. With Louis, however, the pope altogether declined to come to terms, although he found it impossible to establish a rival against him. The last years of John were disquieted by a dispute regarding his tenet—held by most theological authorities to be heretical—that the saints at death fall asleep and do not enjoy the beatific vision until after the resurrection. So great latterly became the general clamour against the doctrine that he found it necessary to make an ambiguous semblance of retracting what he had formerly promulgated with passionate zeal. He, however, never showed any tendency to relent in his persecution of the Franciscans, and his persistent animosity against them was a not unimportant element among the influences which produced the Reformation. He died in 1334. By means of *annates* he had greatly enriched the papal treasury. His successor was Benedict XII.

JOHN XXIII. (pope from 1410 to 1415) was born in Naples about 1360. He was of noble descent, his original name being Balthasar Cossa. In his youth he had, along with his brothers, served as a corsair, and at the university of Bologna, which he afterwards entered, he led a loose and intemperate life. After occupying the office of archdeacon of Bologna, he became chamberlain of Boniface IX., and in that office greatly enriched both himself and the pope by his unscrupulous traffic in indulgences. In recognition of the high value of his services he was in 1402 created by Boniface a cardinal, and shortly afterwards he was appointed papal legate to Bologna, which he succeeded in wresting from the Visconti. The scandalous and cruel excesses in which he indulged when governor of the city caused Gregory XII. to pass against him a sentence of excommunication, but he was restored to his full dignities by Alexander V. The death of this pope, which took place suddenly at Bologna in 1410, was generally believed to have been contrived by the governor, but the cardinals were unanimous in electing him his successor, other two popes, Benedict XIII. and Gregory XII., the predecessors of Alexander, being still alive. Previously John had entered into a close alliance with Louis of Anjou, and he now united with him against Ladislaus of Naples, but notwithstanding the victory of Rocca Secca in 1411 he found it necessary to come to ignominious terms with Ladislaus in 1412. The compact was, however, congenial to neither party, and in the following year Ladislaus, advancing on Rome, compelled the pope to flee to Florence and thence to Bologna. In his extremity John implored the protection and help of the emperor Sigismund, who condescended to acknowledge him to the extent at least of requiring him to summon a council at Constance by which his claims and that of the other two rival popes should be decided. John opened the council in person in 1414, but, after consenting to abdicate preliminarily to the council deciding on his claims, he made his escape in disguise to Freiburg, where he obtained the protection of the duke of Austria. On his refusal to return he was solemnly deposed by the council as guilty of a long list of heinous crimes. The duke of Austria then surrendered him to the emperor, and after he had acknowledged the justice of his sentence he was confined in the castle of Heideberg. At the end of four years' imprisonment he obtained his freedom, in all probability through a bribe, and, having made his submission to his successor Martin V., he was appointed by him cardinal-bishop of Frascati and dean of the college of cardinals, but he died a few months afterwards.

JOHN I. (925-976), emperor of Constantinople, (Greek surname on account of his short stature *Zimisces*, was emperors.

descended from a distinguished family of Cappadocia, and was the nephew of Nicephorus Phocas, whom he aided to obtain the throne, and with whom he afterwards shared the military command of the empire. Being, however, deprived of this dignity through the intrigues of the emperor's brother Leo, he entered into a conspiracy to assassinate Nicephorus, which was put into execution on the 10th December 969. The reign of Zimisceus is chiefly remarkable for his victories over the Russians, and the conquest of Bulgaria. Afterwards he achieved many brilliant exploits against the Saracens, but on his way home from his Syrian campaign he was seized near Constantinople with a sudden illness, caused it is supposed by poisoning, and died there in January 976.

JOHN II. (1088-1143), Comnenus, surnamed *Kaloioannes* (John the Good), was the eldest son of the emperor Alexius, whom he succeeded on the throne in 1118. On account of his mild and just reign he has been called the Byzantine Marcus Aurelius, but he displayed little vigour in the internal administration of his kingdom or in extirpating the governmental corruptions and abuses he had inherited. Nor did his various successes against the Hungarians, Servians, and Turks, though they won him the high admiration of his soldiers, add much to the stability of his kingdom. He was accidentally killed during a wild-boar hunt on Mount Taurus, 8th April 1143.

JOHN III. (1193-1254), Vatatzes, surnamed *Ducas*, emperor of Nicea, was born in 1193, and earned for himself such distinction as a soldier that in 1222 he was chosen to succeed Theodore I. His successes in war, which earned for him great renown, were rendered of little advantage to him through the intrigues of other sovereigns, but he administered the internal affairs of his dominions with much enlightenment and skill, and devoted great attention to agriculture. He died 30th October 1254,—not in 1255 as writers previous to Finlay have generally alleged.

JOHN IV., Lascaris, emperor of Nicea, son of Theodore II., was born about 1250. His father dying in 1258, Michael Palaeologus conspired shortly after to make himself regent, and in 1261 deposed the boy monarch and put out his eyes. John died in prison.

JOHN V. (1329-1411), Cantacuzenus. See CANTACUZENUS, vol. v. p. 27.

JOHN VI. (1332-1391), Palaeologus, emperor of Constantinople, born in 1332, was the son of Andronicus III., whom he succeeded in 1341. From 1349 John Cantacuzenus shared the throne with him, till on the abdication of his colleague, who had been virtually the sovereign, he became sole emperor in 1354. His reign was marked by the gradual dissolution of the imperial power through the rebellion of his son Andronicus and the encroachments of the Ottomans, to whom in 1381 John acknowledged himself tributary.

JOHN VII. (1390-1448), Palaeologus, emperor of Constantinople, son of Manuel II., was born in 1390, and in 1425 succeeded to the semblance of dominion and the wreck of the empire. To secure the favour of the Latins he consented to the union of the Greek and Roman Churches, which was ratified at Florence in 1439. The union failed of its purpose, but by his prudent conduct towards the Ottomans he succeeded in holding possession of Constantinople till his death in 1448.

JOHN (1167-1216), king of England, youngest son of Henry II. and Eleanor of Aquitaine, and third king of the Plantagenet family, was born December 24, 1167. He was his father's favourite child, and Henry hoped to bestow on him the kingdom of Ireland. The Irish princes did homage to John at Oxford in 1177, and in 1185 he was sent to Ireland. His arrogant behaviour roused the resentment of the natives, and he was recalled in disgrace.

In the last revolt of Richard against Henry, John was base enough to join with his father's enemies. This treachery was the death-blow of Henry II. (1189). Richard, on his accession, made the most ample provision for John, giving him several English counties, and marrying him to the heiress of the great earldom of Gloucester. But he had so little trust in his brother's character that, before his own departure on the third crusade, he bound John to stay away from England for three years. At the end of the term John returned, and harassed Richard's justiciar, William Longchamp. The unpopularity of Longchamp enabled John, aided by the archbishop of Rouen, to lead a revolutionary movement by which Longchamp was deprived of the justiciarship, and John recognized as *summus rector* of the kingdom; but the real power remained with the archbishop of Rouen. When the news of the king's captivity arrived, John entered into an active alliance with Philip II. of France, Richard's malignant enemy, and tried to seize the reins of government, asserting that the king was dead. But he was baffled by the fidelity of Richard's ministers and mother, and at Richard's return his castles had to be surrendered to the king. Richard treated John with great generosity, and for the rest of his reign John gave no further trouble. Richard on his deathbed declared John his heir. The principle of primogeniture, now generally adopted, would have pointed out Arthur of Brittany, son of John's elder brother Geoffrey, as the heir, and Philip II. made himself the champion of Arthur. John made fresh enemies by divorcing his wife, and marrying Isabella, heiress of the count of Angoulême, who was already betrothed to the Count of La Marche. The anger of the La Marche family caused a fresh outbreak of war, in which Arthur became involved. In a misguided attempt to capture his grandmother Eleanor, in the castle of Mirabeau, he was defeated and taken prisoner by John, who marched with great swiftness to his mother's aid. Arthur now disappears from history; and, though there is no certain information about his death, it was generally believed at the time that John murdered him. Philip's court of peers declared John guilty, and sentenced him to forfeiture. John abandoned himself to pleasure, and made no attempt to defend his dominions; he showed such complete indifference, while Philip was reducing castle after castle in Normandy, that it was said he was spell-bound by witchcraft. In 1204 all Normandy was lost. Anjou, Maine, and part of Aquitaine soon followed the fate of Normandy; John made only feeble or abortive attempts to save them. In 1205 his great quarrel with the church began. The monks of Canterbury had elected their sub-prior to the archbishopric, and John had nominated a minister of his own; all parties appealed to Pope Innocent III., who took the matter into his own hands, and ordered the convent proctors to elect Stephen Langton, an Englishman already distinguished by learning and character. John's refusal to accept Langton brought sentence of interdict on his kingdom (1208). He was personally excommunicated in 1209, and in 1211 the pope issued a bull deposing him from his throne; the execution of the decree was committed to Philip, who prepared to invade England. John at last gave way, moved chiefly by a prophecy that on the next Ascension Day he would be no longer king. He made an abject submission to the papal legate Pandulph, agreeing to hold his kingdom henceforth as a tributary fief of the pope. Thus the ecclesiastical difficulty was settled, but now John had to settle a quarrel with his own people. He had incurred their hatred by his personal vices, by his cruelty and perfidy, of which the supposed murder of Arthur was only one instance among many, and by his exaction of taxes greatly in excess of the customary rates. The barons of the north began the quarrel by refusing to

accompany John on the expedition to France which he planned immediately after his absolution, alleging that their tenures did not oblige them to service abroad. Langton restrained the king from doing immediate vengeance on the barons, and in the meantime an important assembly was held at St Albans (the first to which representatives from the towns are known to have been summoned), at which the justiciar promised in the king's name that the laws of Henry I. should be observed. At an assembly at St Paul's the same year, Langton, who was the moulding spirit of the movement, produced the charter of Henry I., which became the basis of Magna Charta. John was now bent on trying to knit together the Germanic confederacy against Philip, which had been originated by Richard. He showed both policy and energy in this matter, but the barons of Poitou failed him at the critical moment of the war, and his nephew the emperor Otho was utterly defeated by Philip at Bouvines. John was forced to conclude the peace of Chinon (1214), by which he ceded to Philip all his claims on lands lying north of the Loire. He had scarcely returned to England when his barons formed a confederacy against him at Bury St Edmunds. He attempted to bribe the clergy by granting them free election; but they stood firm to the national cause. The city of London gave its adhesion to the barons, and John found himself abandoned by all. He was obliged to grant the demands of the barons, and to sign (at Runnymede, June 15, 1215), the Great Charter, which for two hundred years was to be the watchword of English freedom. John signed the charter without the least intention of keeping it, and he found a powerful ally in his new master Innocent III., who issued a bull against the charter, and suspended Langton. Langton went to Rome to appeal, and the patriot party was thus deprived of its wisest leader. War soon broke out again, but John was able to obtain a host of foreign mercenaries, and the barons were driven to make alliance with France. Louis, son of Philip II., arrived in England in May 1216, and John's unusual audacity and success deserted him at once. In three months the greater part of the country was in the hands of Louis. Yet the national mistrust of the foreigner was already causing a reaction in favour of John, when in marching across the Wash he met with the accident which led to his death. He was overtaken by the tide, lost all his baggage and treasure, and narrowly escaped himself. Vexation and fatigue, aggravated by excess in eating and drinking, brought on an attack of dysentery; with difficulty he reached Newark, where he died October 19, 1216.

The reign of John is a turning point in English history, and marks the beginning of a new era. (1) The separation of Normandy insured the free development of English life, and the absorption of the Norman nobility in the English people. (2) Magna Charta marks the first united attempt of the English people to limit the power of the king. Hitherto the people had been the allies of the royal power against the baronage; for the two following centuries they are leagued with the baronage and the church against royal tyranny. (3) The surrender of John's kingdom to the pope, followed by the opposition of Innocent to English freedom and the papal exactions of the next reign, caused a change of feeling towards the papacy, and led to the anti-Roman legislation which went on from the reign of Edward I. till the Reformation. (E. S. A.)

JOHN I., king of France, son of Louis X. and Clementia of Hungary, was born, after his father's death, 15th November 1316, and only lived seven days.

JOHN II. (1319-1364), surnamed the Good, son of Philip VI. and Jane of Burgundy, was born in 1319, and succeeded his father in 1350. On the 19th September 1366 he was defeated and taken prisoner by the Black Prince at

the battle of Poitiers. He gained his liberty at the peace of Bretigny in 1360; but, his son the duke of Anjou, whom he left as hostage in England, having fled, John thought himself bound to return to captivity. He died in London in 1364. See FRANCE, vol. ix. p. 546.

JOHN II. (1609-1672), Casimir, king of Poland, second Kings of son of Sigismund III. and the duchess Constantia of Poland. Austria, was born March 21, 1609. After journeying in several countries of Europe, he in 1640 joined the Jesuit order at Rome, and shortly afterwards was chosen cardinal. Subsequently he returned to Poland, where he resided as a layman until the death of his brother, 20th November 1648, when he succeeded him on the throne. In September 1668 he abdicated, after which he went to France, and became abbot of St Germain des Prés and of St Martin at Nevers. He died September 16, 1672. For the events of his unfortunate reign see POLAND.

JOHN III. (1624-1696), Sobieski, king of Poland, son of Jakob Sobieski, castellan of Cracow, was born 2d June 1624, at Olesko in Galicia. He so distinguished himself in the defensive wars of Poland that in 1667 he received the supreme command of the army, and on the death of Michael Córybut was chosen king, 20th May 1674. He died June 17, 1696.

JOHN (JOÃO) I. (1357-1433), king of Portugal, the Kings of natural son of Pedro I. (el Justiciero), was born at Lisbon Portugal. on April 23, 1357, and in 1364 was created grand-master of Aviz. On the death of his lawful brother Ferdinand I., without male issue, in October 1383, strenuous efforts were made in various quarters to secure the succession in the legitimate line for Beatrice, the only child of Ferdinand I., who as heiress apparent had been married to John I. of Castile; but the popular voice declared decisively against an arrangement by which Portugal would virtually have become a Spanish province, and John was after violent tumults proclaimed protector and regent in the following December. In April 1385 he was unanimously chosen king by the estates of the realm at Coimbra, and the coronation took place some little time afterwards. The king of Castile resorted to arms on behalf of his wife, and invested Lisbon, but the besieging army was compulled by the ravages of a pestilence to withdraw, and subsequently by the decisive battle of Aljubarrota (14th August 1385) the stability of John's throne was permanently secured. Hostilities continued, however, with more or less of interruption until the death of John of Castile, without leaving issue by Beatrice, in 1390; and even after that event relations between the two countries continued to be strained. In the meanwhile John went on consolidating the power of the crown at home and the influence of the nation abroad. In 1415 Ceuta was taken from the Moors by his sons who had been born to him by his wife Philippa, daughter of John, duke of Lancaster; specially distinguished in the siege was Prince Henry, afterwards generally known as "the Navigator," who in this and also in the following reign did so much to prepare the way for the position of colonial importance subsequently held by Portugal. Porto Santo and Madeira were occupied respectively in 1419 and 1420. John I., sometimes surnamed "the Great," and sometimes "father of his country," died August 11, 1433, in the forty-eighth year of a reign which had been characterized by great prudence, ability, and success; he was succeeded by his son Edward or Duarte, so named out of compliment to Edward III. of England.

JOHN II. (1455-1495), "the Perfect," king of Portugal, succeeded his father, Alphonso V., in August 1481. His first business after ascending the throne was to curtail with a vigorous hand the overgrown power of his aristocracy; noteworthy incidents in the contest were the execution (in 1483) of the duke of Braganza for correspondence with

Castile, and the murder, by the king's own hand, of the youthful duke of Visen for conspiracy. This reign was signalized by Bartolommeu Dias's discovery of the Cape of Good Hope in 1489, and also by the equipment (1493) of a squadron for exploration of the new world recently discovered by Columbus. The latter proceeding led to disputes with Castile, until the claims of the disputants were adjusted by the famous treaty of Tordesillas (7th June 1494). John II. died, without leaving male issue, in October 1495, and was succeeded by his brother-in-law Emmanuel (Manoel) I.

JOHN III. (1502-1557) of Portugal was born at Lisbon, June 6, 1502, and ascended the throne as successor of his father Emmanuel I. in December 1521. In 1524 he married Catharina, sister to the emperor Charles V., who in turn shortly afterwards married the infanta Isabella, John's sister. Succeeding to the crown at a time when Portugal was at the height of its political power, and Lisbon in a position of commercial importance previously unknown, John III., unfortunately for his dominions, yielded so far to the counsels of the clerical party among his subjects as to consent to the introduction of the Inquisition (about 1526); this led to measures of tyranny and oppression which, notwithstanding the enactment of many wise laws, soon avenged themselves in disastrous consequences to the commercial and social prosperity of his kingdom. The conflicts in which Portugal engaged with the Moors and the Turks during his reign were comparatively unfruitful of results. He died of apoplexy on June 6, 1557, and was succeeded by his grandson Sebastian, then a child of only three years.

JOHN IV. (1603-1656), "the Fortunate," of Portugal, was born at Villavieiosa in March 1603, succeeded to the dukedom of Braganza in 1630, and married Luisa de Guzman, eldest daughter of the duke of Medina Sidonia, in 1635. By the unanimous voice of the people he was raised to the throne of Portugal (of which he was held to be the legitimate heir) at the revolution effected in December 1640 by a conspiracy of the nobles against the grievances inflicted by Spain and the insolence of Philip IV.'s minister, the duke of Olivarez. His accession ultimately led to a protracted war with Spain, of which the final issue—the recognized independence of Portugal—did not declare itself until a subsequent reign (1658). He died after a prosperous reign of sixteen years, on November 6, 1656, and was succeeded by his son Alphonso VI.

JOHN V. (1689-1750) of Portugal was born at Lisbon on October 22, 1689, and succeeded his father Pedro II. on December 1706, being proclaimed on January 1, 1707. One of his first acts was to intimate his adherence to the Grand Alliance, which his father had joined in 1703, and his resolution to take his full share in the war then in progress. Accordingly his general Das Minas, along with Lord Galway, advanced into Castile, but sustained the defeat of Almanza (14th April). In October 1708 he married Maria Anna, daughter of Leopold I., thus strengthening the alliance with Austria; the series of campaigns which ensued were equally unsuccessful with the first, but ultimately terminated in a favourable peace with France in 1713 and with Spain in 1715. The rest of his long reign presents no striking features, except that it was characterized by perfect subservience on his part to the clergy, the kingdom being administered by ecclesiastical persons and for ecclesiastical objects to an extent that gave him the best of rights to the title "Most Faithful King," bestowed upon him and his successors by a bull of pope Benedict XIV. in 1748. John V. died on July 31, 1750, and was succeeded by his son Joseph.

JOHN VI. (1769-1826) of Portugal was born at Lisbon May 13, 1769, and received the title of prince of Brazil in

1788. In 1792 he assumed the reins of government in name of his mother Queen Mary I., who had become insane. He himself having been brought up in an unhealthy ecclesiastical atmosphere, and being naturally of a somewhat weak and helpless character, was but ill adapted for the responsibilities he was thus called on to undertake. In 1799 he assumed the title of regent, which he retained until his mother's death in 1816. The political relations of Portugal with England and France from the period of the first coalition against France in 1793 to the treaty of Fontainebleau (1807), by which the partition of the first-named country was agreed upon, will be elsewhere explained (see PORTUGAL). In consequence of the latter treaty the prince of Brazil found it necessary to leave the kingdom (November 1807), and transfer the seat of his government to Rio Janeiro. The occupation and annexation of the whole country immediately ensued; against this he recorded his protest in November 1808, and in a more practical manner by the seizure of French Guiana in the following year. He also entered into alliance with England in 1810, and was a party to the treaty of Paris in 1814. In 1816 he was recognized as king of Portugal on the death of Mary, but he continued to reside abroad; the consequence was the spread of a feeling of natural dissatisfaction, which resulted in the peaceful revolution of 1820, and the proclamation of a constitutional government, to which he swore fidelity on his return to Portugal in 1822. In the same year, and again in 1823, he had to suppress a rebellion led by his son Dom Miguel, whom he ultimately was compelled to banish in 1824. He died at Lisbon, March 20, 1826, and was succeeded by Pedro IV.

JOHN (1801-1873), king of Saxony, brother and successor of Frederick Augustus II., and younger son of Duke Saxony. Maximilian and Caroline of Parma, was born at Dresden 12th December 1801. In youth he showed a special bent towards mathematics, and he also studied with great diligence law and history. His interest in Italian literature having been awakened by a journey to Italy in 1821, he in 1825 printed for private circulation, under the pseudonym of *Philadelphus*, a metrical translation of a portion of Dante's *Inferno*, and in 1829 he published a complete translation of the *Divine Comedy*, with critical and historical notes. At an early age he also took an active part in political life. In 1821 he became a member of the college of finance, of which he was president from 1825 to 1831. From 1831 to 1846 he acted as commander of the national guards. On ascending the throne in 1846 he followed the same enlightened and liberal policy as his brother, and introduced several reforms of great benefit to the country. In the wars of 1866 he sided with Austria against Prussia, and on that account had to submit to the payment of a large sum of money and the cession of the fortress of Königstein at the conclusion of peace. He, however, afterwards entered the North German federation, and his troops took a very prominent and distinguished part in the Franco-Prussian war of 1870-71. He died at Dresden, October 20, 1873.

JOHN (JUAN) I. (1350-1395), king of Aragon, was Spanish born December 27, 1350, and succeeded his father, Pedro IV., in 1387. He left the affairs of his kingdom to a large extent in the hands of his wife Yolande, a granddaughter of John the Good, king of France, while he himself led a life of pleasure and inglorious ease. A characteristic feature of his reign was the encouragement he gave to the poetical institutions of the troubadours, a "consistory of the *Gaya Sciencia*" having been founded at Barcelona under his auspices in 1390. In that year he repelled an attack by the count of Armagnac, who had laid claim to the domains in Majorca previously in possession of his family; and in 1392 he quelled a revolt of the Sardinians.

He died in 1395, in consequence of an accident on the hunting field, and was succeeded by his brother Martin.

JOHN II. (1397-1479), king of Aragon from 1458, was the younger son of Ferdinand I. (the Just), and was born June 29, 1397. He was twice married,—first to Blanche, daughter of Charles III. of Navarre, by whom he had three children (Carlos, heir to the crowns of Navarre and Aragon; Blanche, for some time the wife of Henry IV. of Castile; and Eleanor, wife of Gaston, count of Foix); and afterwards (in 1447) to Joanna Henriquez, of the blood-royal of Castile, by whom he became the father of Ferdinand V. (the Catholic). For a long time he acted as lieutenant-general in Aragon for his brother Alphonso V., whom business detained in his Neapolitan dominions; in this capacity he intervened frequently in the affairs of Castile, where his weak and inexperienced kinsman John II. occupied the throne, and on one occasion (1444) he invaded that kingdom, but was defeated at Olmedo. On his second marriage he irritated his son Carlos and the community by sending his queen Joanna to share the administration of Navarre with his son; in the revolt which ensued victory declared for John, Carlos himself being reduced to captivity (1452), in which he was detained for many months. In May 1458 John succeeded his brother in Aragon, Sicily, and Sardinia; but the influence of Joanna Henriquez prevented him from recognizing the legitimate claims of his own eldest son to the reversion; an attempt by Carlos to obtain support in other quarters led to his arrest and imprisonment, from which he was released only after Catalonia had risen in arms and the king of Castile had begun an irruption into Navarre. Shortly after this temporary triumph Carlos was carried off by a fever in September 1461, bequeathing the crown of Navarre to his sister Blanche and her posterity. Ferdinand, the half-brother of Carlos, was now put forward as heir apparent of the Aragonese throne, but the indignant Catalonians raised a revolt which did not come to an end until December 1472. Immediately afterwards John entered upon a war with Louis XI. of France in consequence of disputes about Roussillon and Cerdagne; first successful, but afterwards worsted, this bold and energetic but ambitious and unjust prince died January 20, 1479, before the conclusion of the peace. He was succeeded by Ferdinand V.

JOHN (JUAN) I. 1358-1390), king of Castile and Leon, born in August 1358, was the son of Henry II. ("El Bastardo"), whom he succeeded in 1379. At his accession the Lancastrian claims to the throne of Castile were renewed, and gained the support of Portugal; the result was a war with the latter power, which ended in a marriage (1382) between John and the Portuguese infanta. The peace thus ratified did not subsist long, for, on the death of Ferdinand of Portugal in the following year without male issue, John sought to establish a claim to the succession on behalf of his wife, and crossing the frontier penetrated as far as Lisbon, to which he began to lay siege while John, the grand-master of Aviz, was being proclaimed king. Compelled by pestilence and other unfavourable circumstances to withdraw, he encountered the Portuguese in the neighbourhood of Aljubarrota in August of 1385; the disastrous defeat he there sustained was followed by a descent of John of Gaunt, duke of Lancaster (July 1386), which led to the conclusion of the peace of Troncoso (1387), in virtue of which the constantly recurring disputes about the crown were settled by the marriage of the crown prince Henry to Catherine, the representative of the Lancastrian claims. The last four years of the reign of John were marked by important legislative reforms in the town brotherhoods (*hermandades*), in the army, and in the system of taxation. In 1390 he was

killed by a fall from his horse, and was succeeded by his son Henry III.

JOHN II. (1404-1454) of Castile and Leon, grandson of the preceding, succeeded to the throne when only twenty-two months old. Until 1412 the regency was shared with his mother Catherine by his uncle Ferdinand (afterwards Ferdinand IV. of Aragon); this period was marked by much internal prosperity and by important conquests from the Moors, especially by the capture of Antequera. Unfortunately for Castile, Ferdinand was called away (in 1412) to occupy the throne of Aragon; but it was not until after the death of Catherine in 1418 that John's weakness and incapacity came to be fully seen. Abandoning himself recklessly to a life of frivolous pleasure, he left the affairs of his kingdom in the hands of a few favourites, such as the archbishop of Toledo and Juan de Velasco. From 1423 onwards he was the tool principally of Alvaro de Luna, a brilliant, ambitious, and crafty courtier. Henceforward the history of his reign is largely a record of the internal commotions, rising sometimes to the height of civil war, occasioned by the nobles' jealousy of Alvaro, and by the oppressions to which the common people were exposed under the absolutist policy of that minister. The period of John II. is chiefly and most favourably remembered in connexion with the history of Castilian literature: a man of some literary turn himself, he was a liberal patron of letters; and his countenance gave an impulse to refinement and culture of literary style, the effects of which were distinctly traceable through several subsequent generations. By his first wife John II. became the father of Henry IV., his successor; the daughter of a second marriage was Isabella, afterwards known as "the Catholic." He died in June 1454.

JOHN, Dux, of Austria (1545-1578), was the bastard ^{Don}son of the emperor Charles V. by Barbara Blomberg, the ^{John of}daughter of a well-to-do citizen of Ratibon. He was born in that free imperial city (according to a not very probable tradition in the "imperial hostelry" there, which still survives as the inn of the Golden Cross), on February 24, 1545, the anniversary of his father's birth and coronation, and of the battle of Pavia. On another visit to Ratibon in the following year, after arranging a marriage between the fair Barbara and one of his German courtiers, Hieronymus Piramis Kegell, the emperor carried off the young Geronimo, as he was then convulsively called. The worthy Don Luis de Quijada, to whose care he was heretupon confided, watched over his early childhood with jealous care. It was at first sought to conceal the connexion between the emperor and the child of his declining years, who was brought up in retirement, chiefly in Quijada's castle of Villagarcia in Spain. In the year before the emperor's death, however, the boy was brought into the immediate neighbourhood of San Yuste, where his presence brightened the close of his father's life. In his last will Charles V. acknowledged "Geronimo" as his son, and commended him to the care of his successors, expressing a wish that he should take monastic vows, but that in the event of his declining these a handsome income should be provided for him out of the revenues of Naples.

In September 1559 the boy was publicly recognized by king Philip II. as his brother; and henceforth he resided at court under the name of Don Juan d'Austria as a member of the royal family. With the heir to the throne, the unhappy Don Carlos, his relations were so friendly that, when at the end of the year 1567 the infante was plotting his flight from Spain, he confided his more or less reasonable scheme to his half-brother, and even requested the latter to accompany him on his expedition. A sense of duty, at which it is difficult to cavil, prompted Don John to reveal this unsought confidence to the king, and

thus he helped to bring about the fatal catastrophe, as it proved, of the imprisonment of Don Carlos.

It was not the habit of Philip II. to allow those who served him to choose their own seasons and methods of doing so. The impetuous Don John, whom the king would have preferred to see a monk, had in 1565 been refused permission to serve in the fleet ordered to sail for the relief of Malta; and an express royal command had been needed to bring him back when on the point of making the voyage on his own account. His obedience was rewarded when in 1568 he was appointed to the great office of *capitan general de la mar*. His first actual service, however, was by land, and of a kind unattractive to any but the genuine Spanish blood. In 1569 he was charged with a task, the execution of which the captain-general of Granada, the marquis of Mondejar, had begun, but was unwilling relentlessly to complete. The reformation of the converted Moriscos had come to mean the suppression of the remnants of their national as well as religious life; and after the insurrection of Aben Humeya had been overcome, the wholesale deportation of all the Moriscos from their habitations was decreed, and executed on All Saints' Day 1570. Don John cannot be held responsible either for the cruelty of this ordinance, or for the general policy of the war, which from the time when the jealousy of the king had allowed him to take the field, instead of remaining at Granada, he had carried on with vigour and skill. The capture of Guejar had been his first deed of arms (December 1569); it had been followed by that of Gálera, and in August 1570 the Alpujarras mountains were cleared of the Moriscos, of whom more than 10,000 are said to have been killed or captured in the space of a single month.

Before long a nobler crusade engaged the energy of the obedient and successful commander. Philip II., though he was during nearly the whole of his reign engaged in hostilities with the Turks, had hitherto displayed no great vigour in resisting their still unceasing inroads upon the domain of Christendom. His fleet had for the time saved Malta; but Cyprus was torn by the infidel from the Venetians without his having offered timely co-operation for its defence (1571); and the barbarous proceedings of the conquerors had filled Europe with horror and shame. Not even the waters of the Adriatic were secure from the Turkish vessels, and the league which shortly before the loss of Cyprus papal diplomacy had succeeded in knitting between Spain, Venice, and Rome, and which purported to aim at the extinction of the Mahometan power, had as yet remained a dead letter. At length the forces of the allies—208 galleys, 6 galleasses, and a number of smaller craft, with more than 20,000 Spanish, German, and Italian soldiers on board—assembled at Messina. Don John of Austria had been named admiral of the league, with power (granted at the request of Pope Pius V.) of free action after consultation with his captains and the Venetian commander. Thus the day of Lepanto was in every sense his own, though it was his good fortune that the Turks had underestimated his numbers, which were in truth little inferior to theirs. The Christian victory was complete. Only forty of the Turkish vessels effected their escape, the rest being burnt or captured; and 35,000 of their men were slain or captured, while 15,000 Christian galley-slaves were released. At Constantinople apprehensions were even entertained of an immediate attack on the part of the victors. The battle of Lepanto (October 7, 1571) was, as Ranke observes, like that of Actium, a decisive historic struggle between West and East; and the ecstatic joy which it inspired was shared by all Christian Europe. But though, on receiving the great news of a success which seemed in its momentousness to surpass any of his father's achievements, Philip II. had vowed to carry on this

Christian war, jealousy between the allies wasted the immediate fruits of the victory, and the by no means remotely possible consequences of an active Franco-Turkish alliance inclined the king of Spain to keep his brother inactive in Sicily. Soon the ever vigilant suspicions of Philip were aroused by information which he received—partly from the candid Don John himself—as to the vicious which (instigated by the inveterate papal habit of giving away kingdoms before they had been conquered) suggested themselves to the restless imagination of the hero of Lepanto. At one time Albania and the Morea entreated him to reign over them, after he should have previously freed them from the Turkish yoke; next, Rhodes besought the aid of his invincible arm for the work of its liberation. Meanwhile, after the Turks had brought together another fleet, he was unable to force them to accept another battle at Navarino (September 1572); and soon afterwards Venice, by concluding a separate treaty of peace with the sultan, put an end to the league which had been victorious at Lepanto. Spain was by herself no match for the Turkish power; and though in 1573 Don John captured Tunis, it was speedily recaptured in the following year.

Although unable to obtain from his brother even so much as the title of an infant of Spain, the ardent spirit of Don John had continued to indulge in wild dreams of a kingdom to be erected by him for himself in those regions which he had successfully disputed with the infidel; and, after suppressing a momentary hankering after the crown of France which the death of Charles IX. had excited, he had solicited the good offices of pope Gregory XIII. towards his establishment as king of Tunis. The pope, however, had destined him for higher things. As yet King Philip had shrunk from taking up the cause of Rome's unfortunate daughter, held captive in heretic England. Might not a share in the throne of three northern kingdoms tempt Don John to become the hero of a second and more rewardful crusade?

In the midst of schemes and dreams such as these Don John was summoned by King Philip to an office which might seem to bring him near to the accomplishment of the most glorious of them all. He was appointed (in 1576) to the government of the Netherlands, vacant by the death of Requesens. The administration of the latter had not been intended to introduce any radical change into the system of his predecessor Alva; his military operations had been only partially successful; and the pacification of Ghent (October 1576), concluded since his death, had greatly improved the prospects of William of Orange and the insurrection. The magic of Don John's name, and the loyal energy of which he had given proof, were to recover what had been lost; and he was willing to undertake a task the accomplishment of which might lead to higher tasks beyond. He was, however, now brought into conflict with an adversary of a very different calibre from his own. He showed himself willing to consent to the demand of the dismissal of the Spanish troops from the Netherlands, hoping to be able to employ them in a descent upon England. William of Orange, by warning Queen Elizabeth of these designs, secured not only her goodwill, but the rarer proof of it in the shape of a sum of money, and at home drew still tighter the alliance established by the Ghent pacification. Hereupon Don John found himself obliged to grant the perpetual edict (February 1577) which in accordance with the pacification dismissed the Spanish troops designed by him for the conquest of England, and held his entry into Brussels (May 1st) amidst popular acclamations. In secret, however, he was counselling and preparing a renewal of the war; and before the end of the summer he took Namur by a stratagem. The answer was the proclamation of Orange as protector of Brabant, and

the nomination as governor-general of the archduke Matthias, under whom Orange continued to hold the actual supremacy, while Don John's control was almost entirely confined to the south-western part of the Netherlands. He now (January 1578) declared war against the insurgent provinces, and the dismissed Spanish troops were soon with other forces reassembling under his standard. A large army brought from Lombardy by Alexander Farnese, prince of Parma (Don John's nephew), raised the Spanish forces to a virtual equality in numbers with those of their opponents; and Farnese's victory of Gemblours (January 31, 1578) hopefully opened the campaign. It remained an open question whether the aid of France (which appeared to be warranted by the arrival with an army of the duke of Anjou, the "protector" of the liberties of the Netherlands), together with the money of England and the men of the Palatinate, would suffice to make the cause of freedom prevail against the determination of Philip, the ambitious devotion of Don John, and the military genius of Alexander Farnese. On the other hand, it seemed doubtful whether the disunion among Philip's adversaries would weaken them more than his parsimony and suspicion vexed the soul and crippled the energies of his brother. Such was the situation when Don John was removed by death. After having shortly before escaped the dagger of an English assassin (a Catholic refugee, who had hoped by the act to secure the pardon of the queen), Don John succumbed to a sudden illness at Namur on October 1, 1578. An altogether unwarranted, but under the circumstances far from inexplicable, suspicion accused King Philip of having by poison brought about the death of a half-brother whose action his jealousy and distrust of all the world except himself had thwarted after Gemblours as after Lepanto. The settlement of the Netherlands, after whatever fashion Don John might have accomplished it, was a harder task than any he ever executed; and the subjection of heretic England to the authority of a Catholic queen seems to posterity a dream more marvellous than were even the actual glories of Lepanto. But his life, which spanned but little more than thirty-three years, was the reverse of an empty or an ignoble one, and though it was full of imperfections and disappointments, yet its enthusiasm shines forth even under the cold shade spread over it by the fraternal jealousy of a Philip II.

The only modern monograph on the life of Don John of Austria is that by Professor W. Havemann (Gotha, 1865), which corrects some of Motley's vivacities. For the rebellion of the Moriscos and the battle of Lepanto see Prescott's *Reign of Philip II.*, and Forester's *Histoire de Philippe II.* (vols. I and II, Paris, 1880); for the battle, see also Ranke's *Die Osmanen u. die Spanische Monarchie* (4th ed., 1877).

JOHN OF GAUNT. See LANCASTER, DUKE OF.

JOHN, ST., or NEPOMUK, or POMUK (c. 1330–1393), the patron saint of Bohemia, was born at Pomuk about 1330. After studying at the university of Prague he took holy orders and was for some time a priest in the diocese of Prague. In 1372 he is mentioned as imperial notary; in 1380 he became rector of the church of St Gall in Prague, and notary and secretary of the archbishop; and in 1381 he was made doctor of canon law and canon of the metropolitan chapter. He appears to have taken an important part as adviser or supporter of the archbishop John of Janstein in his disputes with King Wenceslaus, and on this account, after suffering cruel torture, he was drowned in the Moldau. The chief events of his life were afterwards adorned with a variety of legends, and in 1729 he was canonised by Benedict XIII. An annual procession in his honour takes place at Prague on May 16. See Abel, *Die Legende vom St. Johann von Nepomuk*, Berlin, 1855.

JOHN OF SALISBURY (c. 1115–1180), a distinguished writer of the 12th century, was born at Salisbury in Wiltshire between the years 1110 and 1120. From the cognomen *Parvus*, which he applies to himself, and from the fact that he was of Saxon, not of Norman race, it may be inferred that his name was Short, or Small, or Little. Few details are known regarding his early life or rank in society; but from his own statements it is gathered that he crossed to France about the year 1131, and began regular studies in Paris under Abelard, who had there for a brief period reopened his famous school on Mont St Geneviève. After Abelard's retirement, John carried on his studies under Alberich, Robert of Melun, and Robert Pullen. Three years he spent at the great school of Chartres, mainly under William of Conches, though it would seem that he had been a pupil of the founder of the school, Bernard Silvester. Bernard's teaching was distinguished partly by its pronounced Platonic tendency, partly by the stress laid upon literary study of the greater Latin writers; and the influence of the latter feature is noticeable in all John of Salisbury's works. Returning to Paris, he spent some years there, partly as teacher, partly as pupil of Adam de Ponto Parvo and Gilbert de la Porrée. Whether he attended any of the teachers of the Victorine school is uncertain, but his mode of thinking in theological subjects bears unmistakable traces of the peculiar views of these writers. Probably in the year 1147 or 1148 he crossed to England, with a letter of recommendation from Peter of Celli to Theobald, archbishop of Canterbury. For thirteen years he acted as secretary to Theobald, and was frequently ambassador from the English primate to the papal see. During this time he composed his greatest works, published almost certainly in 1159, the *Policraticus*, sive de *Anglia Curialium et de Vestigiis Philosophorum* and the *Metellogius*, writings invaluable as storehouses of information regarding the matter and form of scholastic education, and remarkable for their cultured literary style and humanist tendency. After the death of Theobald in 1061, John continued to occupy the post of secretary to his successor, the famous chancellor Thomas Becket, and took an active part in the long disputes between the primate and his sovereign, Henry II. His letters are of great value for the light they throw upon the obscure course of the constitutional struggle then agitating the English world. With Becket he withdrew to France during the king's displeasure; he returned with him in 1169, and was present at his assassination in 1170. In the following years, during which he continued in an influential situation in Canterbury, but at what precise date is unknown, he drew up the *Life of St Thomas à Becket*, and somewhat later the *Life of St Anselm*. In 1176 he was made bishop of Chartres, where he passed the remainder of his life. The date of his death has been variously given as 1182, 1181, or 1180; the strongest reasons are in favour of the last.

John's writings are not in any strict sense philosophical, but they give much information regarding the general currents of thinking at the time, and enable us to understand with much completeness the literary and scientific position of the 12th century. So far as his own views are concerned, they are such as one might expect from a cultured intelligence well versed in practical affairs. His doctrine, on the whole, is a kind of a utilitarianism, with a strong leaning, on the side of speculative questions, to the modified, literary scepticism of Cicero. For Cicero, indeed, he has unbounded admiration, and his Latin style, unusually excellent when compared with the average Latin of the scholastic writers, is evidently moulded on that of Cicero. The remarkable feature of his writings, apart from their value as giving information respecting studies in the 12th century, is their strongly marked humanist tendency. To

some extent this is common to John and to his predecessors in the school of Chartres, but no other writer seems to have possessed so extensive and competent an acquaintance with the great works of Latin classical literature. Of Greek writers he appears to have known nothing at first hand, and very little in translations. The *Timæus* of Plato in the Latin version of Chalcidius was known to him as to his contemporaries and predecessors, and probably he had access to translations of the *Phædo* and *Meno*. Of Aristotle he possessed, in Latin version, the whole of the *Organon*; he is, indeed, the first of the mediæval writers of note to whom the whole was known. Of other Aristotelian writings he appears to have known nothing.

The *Politeralius* seems first to have been printed in 1476, in folio; a quarto reprint reappeared in 1513, and an octavo in the same year, but from different MS. sources; the most common edition is that of 1639. The *Metaphysics* was first printed in 1510; the best known edition is that of 1639. The *Ethics*, or more correctly *Nuthetics*, was first printed in 1543 by C. Petersen. The collected editions of the works are by J. A. Giles, 5 vols., Oxford, 1848, and by Migne, in the *Patrologia Cursus*, vol. 199,—neither accurate. The most complete study of John of Salisbury is the monograph by Sehmarshmitt, *Johnannes Sarsburiensis nach Leben und Studien, Schriften und Philosophie*, which is a model of accurate and complete workmanship.

JOHN, PRESTER. See PRESTER JOHN.

JOHNSON, ANDREW (1808-1875), seventeenth president of the United States, was born in Raleigh, North Carolina, December 29, 1808. His youth was passed in such poverty that it was not till during his apprenticeship as tailor that he learned to read. His wife taught him to write and cipher after their marriage. Settling in Greenville, Tennessee, he worked at his trade, and in 1828 began to take an active part in politics, organizing a working man's party, by which he was elected to several local offices. He served in the State legislature; from 1843 till 1853 he was member of Congress; in 1853, and again in 1855, he was elected governor of Tennessee; and in 1857 he took his seat as United States senator from Tennessee. His independence procured him prominence in the senate. In opposition to the general policy of the Democratic party, whose nominees he was, he ardently supported the homestead bill; and, though in the important presidential election of 1860 he had supported Breckenridge and Lane, the candidates of the southern wing of the Democratic party, yet, when Lincoln was elected, Johnson made a strong speech in the senate, denouncing secession, and pledging himself to unconditional support of the Union. This loyalty to the Union subjected him to grave personal danger from the secessionists of Tennessee, when he returned to the State to organize a Union party. In 1862 Lincoln appointed Johnson military governor of Tennessee, a post of difficulty and danger, in which he displayed an amount of energy and ability in dealing with the secessionists that attracted attention in the north, and led to his nomination for the vice-presidency by the Republican convention of 1864, which nominated Lincoln for the presidency. When, a few weeks after his inauguration, the assassination of Lincoln, on April 14, 1865, made Johnson president, his vigorous denunciation of treason as "a crime that must be punished" placed him for a time high in public favour. The rest of his term of office was spent in dissension with Congress as to the conditions upon which the seceding States should be allowed to return to the Union. Johnson vetoed bill after bill; but Congress passed them over his veto. In August 1866 the president, attended by members of his cabinet, made a tour through several of the northern and western States, denouncing the action of Congress as rebellious, and appealing to the people to support him. But at the congressional elections of that year the policy of Congress was endorsed by large majorities. The conflict became still more bitter, and was at last brought to a crisis

by the president's attempts to remove secretary Stanton from office, after the senate had refused its approval. The Republicans in Congress claimed that Johnson had violated the tenure of office law, and on February 24, 1868, the House of Representatives passed a resolution impeaching him for high crimes and misdemeanours. At the trial before the senate the articles of impeachment were not sustained. A two-thirds majority was necessary for conviction; and thirty-five voted "guilty," nineteen "not guilty." On March 4, 1869, Johnson was succeeded in the presidency by U. S. Grant. Retiring to Greenville, he immediately prepared to re-enter public life; and in January 1875 he was elected United States senator. He died July 31, 1875.

JOHNSON, SAMUEL (1709-1784), one of the most eminent English writers of the 18th century, was the son of Michael Johnson, who was, at the beginning of that century, a magistrate of Lichfield, and a bookseller of great note in the midland counties. Michael's abilities and attainments seem to have been considerable. He was so well acquainted with the contents of the volumes which he exposed to sale that the country rectors of Staffordshire and Worcestershire thought him an oracle on points of learning. Between him and the clergy, indeed, there was a strong religious and political sympathy. He was a zealous churchman, and, though he had qualified himself for municipal office by taking the oaths to the sovereigns in possession, was to the last a Jacobite in heart. At his house, a house which is still pointed out to every traveller who visits Lichfield, Samuel was born on the 18th of September 1709. In the child the physical, intellectual, and moral peculiarities which afterwards distinguished the man were plainly discernible: great muscular strength accompanied by much awkwardness and many infirmities; great quickness of parts, with a morbid propensity to sloth and procrestation; a kind and generous heart, with a gloomy and irritable temper. He had inherited from his ancestors a scrofulous taint, which it was beyond the power of medicine to remove. His parents were weak enough to believe that the royal touch was a specific for this malady. In his third year he was taken up to London, inspected by the court surgeon, prayed over by the court chaplains, and stroked and presented with a piece of gold by Queen Anne. One of his earliest recollections was that of a stately lady in a diamond stomacher and a long black hood. Her hand was applied in vain. The boy's features, which were originally noble and not irregular, were distorted by his malady. His cheeks were deeply scarred. He lost for a time the sight of one eye; and he saw but very imperfectly with the other. But the force of his mind overcame every impediment. Indolent as he was, he acquired knowledge with such ease and rapidity that at every school to which he was sent he was soon the best scholar. From sixteen to eighteen he resided at home, and was left to his own devices. He learned much at this time, though his studies were without guidance and without plan. He ransacked his father's shelves, dipped into a multitude of books, read what was interesting, and passed over what was dull. An ordinary lad would have acquired little or no useful knowledge in such a way; but much that was dull to ordinary lads was interesting to Samuel. He read little Greek; for his proficiency in that language was not such that he could take much pleasure in the masters of Attic poetry and eloquence. But he had left school a good Latinist, and he soon acquired, in the large and miscellaneous library of which he now had the command, an extensive knowledge of Latin literature. That Augustan delicacy of taste which is the boast of the great public schools of England he never possessed. But he was early familiar with some classical writers who were quite unknown to the best

scholars in the sixth form at Eton. He was peculiarly attracted by the works of the great restorers of learning. Once, while searching for some apples, he found a huge folio volume of Petrarch's works. The name excited his curiosity, and he eagerly devoured hundreds of pages. Indeed, the diction and versification of his own Latin compositions show that he had paid at least as much attention to modern copies from the antique as to the original models.

While he was thus irregularly educating himself, his family was sinking into hopeless poverty. Old Michael Johnson was much better qualified to pore upon books, and to talk about them, than to trade in them. His business declined; his debts increased; it was with difficulty that the daily expenses of his household were defrayed. It was out of his power to support his son at either university; but a wealthy neighbour offered assistance; and, in reliance on promises which proved to be of very little value, Samuel was entered at Pembroke College, Oxford. When the young scholar presented himself to the rulers of that society, they were amazed not more by his ungainly figure and eccentric manners than by the quantity of extensive and curious information which he had picked up during many months of desultory but not unprofitable study. On the first day of his residence he surprised his teachers by quoting Macrobius; and one of the most learned among them declared that he had never known a freshman of equal attainments.

At Oxford Johnson resided during about three years. He was poor, even to raggedness; and his appearance excited a mirth and a pity which were equally intolerable to his haughty spirit. He was driven from the quadrangle of Christ Church by the sneering looks which the members of that aristocratical society cast at the holes in his shoes. Some charitable person placed a new pair at his door; but he spurned them away in a fury. Distress made him, not servile, but reckless and ungovernable. No opulent gentleman commoner, panting for one-and-twenty, could have treated the academical authorities with more gross disrespect. The needy scholar was generally to be seen under the gate of Pembroke, a gate now adorned with his effigy, haranguing a circle of lads, over whom, in spite of his tattered gown and dirty linen, his wit and audacity gave him an undisputed ascendancy. In every mutiny against the discipline of the college he was the ringleader. Much was pardoned, however, to a youth so highly distinguished by abilities and acquisitions. He had early made himself known by turning Pope's *Messiah* into Latin verse. The style and rhythm, indeed, were not exactly Virgilian; but the translation found many admirers, and was read with pleasure by Pope himself.

The time drew near at which Johnson would, in the ordinary course of things, have become a bachelor of arts; but he was at the end of his resources. Those promises of support on which he had relied had not been kept. His family could do nothing for him. His debts to Oxford tradesmen were small indeed, yet larger than he could pay. In the autumn of 1731 he was under the necessity of quitting the university without a degree. In the following winter his father died. The old man left but a pittance; and of that pittance almost the whole was appropriated to the support of his widow. The property to which Samuel succeeded amounted to no more than twenty pounds.

His life, during the thirty years which followed, was one hard struggle with poverty. The misery of that struggle needed no aggravation, but was aggravated by the sufferings of an unsound body and an unsound mind. Before the young man left the university, his hereditary malady had broken forth in a singularly cruel form. He had become an incurable hypochondriac. He said long after

that he had been mad all his life, or at least not perfectly sane; and, in truth, eccentricities less strange than his have often been thought ground sufficient for absolving felons, and for setting aside wills. His grimaces, his gestures, his mutterings, sometimes diverted and sometimes terrified people who did not know him. At a dinner table he would, in a fit of absence, stoop down and twitch off a lady's shoe. He would amaze a drawing-room by suddenly ejaculating a clause of the Lord's Prayer. He would conceive an unintelligible aversion to a particular alley, and perform a great circuit rather than see the hateful place. He would set his heart on touching every post in the streets through which he walked. If by any chance he missed a post, he would go back a hundred yards and repair the omission. Under the influence of his disease, his senses became morbidly torpid, and his imagination morbidly active. At one time he would stand poring on the town clock without being able to tell the hour. At another he would distinctly hear his mother, who was many miles off, calling him by his name. But this was not the worst. A deep melancholy took possession of him, and gave a dark tinge to all his views of human nature and of human destiny. Such wretchedness as he endured has driven many men to shoot themselves or drown themselves. But he was under no temptation to commit suicide. He was sick of life; but he was afraid of death; and he shuddered at every sight or sound which reminded him of the inevitable hour. In religion he found but little comfort during his long and frequent fits of dejection; for his religion partook of his own character. The light from heaven shone on him indeed, but not in a direct line, or with its own pure splendour. The rays had to struggle through a disturbing medium; they reached him refracted, dulled, and discoloured by the thick gloom which had settled on his soul, and, though they might be sufficiently clear to guide him, were too dim to cheer him.

With such infirmities of body and of mind, this celebrated man was left, at two-and-twenty, to fight his way through the world. He remained during about five years in the midland counties. At Lichfield, his birthplace and his early home, he had inherited some friends and acquired others. He was kindly noticed by Henry Horvey, a gay officer of noble family, who happened to be quartered there. Gilbert Walmesley, registrar of the ecclesiastical court of the diocese, a man of distinguished parts, learning, and knowledge of the world, did himself honour by patronising the young adventurer, whose repulsive person, unpolished manners, and squalid garb moved many of the petty aristocracy of the neighbourhood to laughter or to disgust. At Lichfield, however, Johnson could find no way of earning a livelihood. He became usher of a grammar school in Leicestershire; he resided as a humble companion in the house of a country gentleman; but a life of dependance was insupportable to his haughty spirit. He repaired to Birmingham, and there earned a few guineas by literary drudgery. In that town he printed a translation, little noticed at the time, and long forgotten, of a Latin book about Abyssinia. He then put forth proposals for publishing by subscription the poems of Politian, with notes containing a history of modern Latin verse; but subscriptions did not come in, and the volume never appeared.

While leading this vagrant and miserable life, Johnson fell in love. The object of his passion was Mrs Elizabeth Porter, a widow who had children as old as himself. To ordinary spectators the lady appeared to be a short, fat, coarse woman, painted half an inch thick, dressed in gaudy colours, and fond of exhibiting provincial airs and graces which were not exactly those of the Queensberrys and Lepels. To Johnson, however, whose passions were strong, whose eyesight was too weak to distinguish cerise

from natural bloom, and who had seldom or never been in the same room with a woman of real fashion, his Titty, as he called her, was the most beautiful, graceful, and accomplished of her sex. That his admiration was unfeigned cannot be doubted; for she was as poor as himself. She accepted, with a readiness which did her little honour, the addresses of a suitor who might have been her son. The marriage, however, in spite of occasional wranglings, proved happier than might have been expected. The lover continued to be under the illusions of the wedding-day till the lady died in her sixty-fourth year. On her monument he placed an inscription extolling the charms of her person and of her manners; and when, long after her decease, he had occasion to mention her, he exclaimed with a tenderness half ludicrous half pathetic, "Pretty creature!"

His marriage made it necessary for him to exert himself more strenuously than he had hitherto done. He took a house in the neighbourhood of his native town, and advertised for pupils. But eighteen months passed away, and only three pupils came to his academy. Indeed, his appearance was so strange, and his temper so violent, that his schoolroom must have resembled an ogre's den. Nor was the tawdry painted grandmother whom he called his Titty well qualified to make provision for the comfort of young gentlemen. David Garrick, who was one of the pupils, used, many years later, to throw the best company of London into convulsions of laughter by mimicking the endearments of this extraordinary pair.

At length Johnson, in the twenty-eighth year of his age, determined to seek his fortune in the capital as a literary adventurer. He set out with a few guineas, three acts of the tragedy of *Irene* in manuscript, and two or three letters of introduction from his friend Walmesley. Never since literature became a calling in England had it been a less gainful calling than at the time when Johnson took up his residence in London. In the preceding generation a writer of eminent merit was sure to be munificently rewarded by the Government. The least that he could expect was a pension or a sinecure place; and, if he showed any aptitude for politics, he might hope to be a member of parliament, a lord of the treasury, an ambassador, a secretary of state. It would be easy, on the other hand, to name several writers of the 19th century of whom the least successful has received forty thousand pounds from the booksellers. But Johnson entered on his vocation in the most dreary part of the dreary interval which separated two ages of prosperity. Literature had ceased to flourish under the patronage of the great, and had not begun to flourish under the patronage of the public. One man of letters, indeed, Pope, had acquired by his pen what was then considered as a handsome fortune, and lived on a footing of equality with nobles and ministers of state. But this was a solitary exception. Even an author whose reputation was established, and whose works were popular—such an author as Thomson, whose *Seasons* were in every library, such an author as Fielding, whose *Pasquin* had had a greater run than any drama since *The Beggar's Opera*—was sometimes glad to obtain, by pawning his best coat, the means of dining on tripe at a cookshop underground, where he could wipe his hands, after his groasy meal, on the back of a Newfoundland dog. It is easy, therefore, to imagine what humiliations and privations must have awaited the novice who had still to earn a name. One of the publishers to whom Johnson applied for employment measured with a scornful eye that athletic though uncomely frame, and exclaimed, "You had better get a porter's knot, and carry trunks." Nor was the advice bad, for a porter was likely to be as plentifully fed, and as comfortably lodged, as a poet.

Some time appears to have elapsed before Johnson was able to form any literary connexion from which he could

expect more than bread for the day which was passing over him. He never forgot the generosity with which Hervey, who was now residing in London, relieved his wants during this time of trial. "Harry Hervey," said the old philosopher many years later, "was a vicious man; but he was very kind to me. If you call a dog Hervey, I shall love him." At Hervey's table Johnson sometimes enjoyed feasts which were made more agreeable by contrast. But in general he dined, and thought that he dined well, on sixpennyworth of meat and a pennyworth of bread at an alehouse near Dirty Lane.

The effect of the privations and sufferings which he endured at this time was discernible to the last in his temper and his deportment. His manners had never been courtly. They now became almost savage. Being frequently under the necessity of wearing shabby coats and dirty shirts, he became a confirmed slob. Being often very hungry when he sat down to his meals, he contracted a habit of eating with ravenous greediness. Even to the end of his life, and even at the tables of the great, the sight of food affected him as it affects wild beasts and birds of prey. His taste in cookery, formed in subterranean ordinaries and *à la mode* beefshops, was far from delicate. Whenever he was so fortunate as to have near him a hare that had been kept too long, or a meat pie made with rancid butter, he gorged himself with such violence that his veins swelled and the moisture broke out on his forehead. The affronts which his poverty emboldened stupid and low-minded men to offer to him would have broken a mean spirit into sycophancy, but made him rude even to ferocity. Unhappily the insolence which, while it was defensive, was pardonable, and in some sense respectable, accompanied him into societies where he was treated with courtesy and kindness. He was repeatedly provoked into striking those who had taken liberties with him. All the sufferers, however, were wise enough to abstain from talking about their beatings, except Osborne, the most rapacious and brutal of booksellers, who proclaimed everywhere that he had been knocked down by the huge fellow whom he had hired to puff the Harleian Library.

About a year after Johnson had begun to reside in London he was fortunate enough to obtain regular employment from Cave, an enterprising and intelligent bookseller, who was proprietor and editor of the *Gentleman's Magazine*. That journal, just entering on the ninth year of its long existence, was the only periodical work in the kingdom which then had what would now be called a large circulation. It was, indeed, the chief source of parliamentary intelligence. It was not then safe, even during a recess, to publish an account of the proceedings of either House without some disguise. Cave, however, ventured to entertain his readers with what he called "Reports of the Debates of the Senate of Lilliput." France was Blifuscu; London was Mildendo; pounds were sprugs; the duke of Newcastle was the Nardac secretary of state; Lord Hardwicke was the Hurgio Hickrad; and William Pittney was Wingul Palnub. To write the speeches was, during several years, the business of Johnson. He was generally furnished with notes, meagre indeed, and inaccurate, of what had been said; but sometimes he had to find arguments and eloquence both for the ministry and for the opposition. He was himself a Tory, not from rational conviction—for his serious opinion was that one form of government was just as good or as bad as another—but from mere passion, such as inflamed the Capulets against the Montagues, or the Blues of the Roman circus against the Greens. In his infancy he had heard so much talk about the villainies of the Whigs, and the dangers of the church, that he had become a furious partisan when he could scarcely speak. Before he was three he had insisted on being taken to hear

Sacheverel preach at Lichfield cathedral, and had listened to the sermon with as much respect, and probably with as much intelligence, as any Staffordshire squire in the congregation. The work which had been begun in the nursery had been completed by the university. Oxford, when Johnson resided there, was the most Jacobitical place in England; and Pembroke was one of the most Jacobitical colleges in Oxford. The prejudices which he brought up to London were scarcely less absurd than those of his own Tom Tempest. Charles II. and James II. were two of the best kings that ever reigned. Laud, a poor creature who never did, said, or wrote any thing indicating more than the ordinary capacity of an old woman, was a prodigy of parts and learning over whose tomb Art and Genius still continued to weep. Hampden deserved no more honourable name than that of "the zealot of rebellion." Even the ship money, condemned not less decidedly by Falkland and Clarendon than by the bitterest Roundheads, Johnson would not pronounce to have been an unconstitutional impost. Under a Government the mildest that had ever been known in the world, under a Government which allowed to the people an unprecedented liberty of speech and action, he fancied that he was a slave; he assailed the ministry with obloquy which refuted itself, and regretted the lost freedom and happiness of those golden days in which a writer who had taken but one-tenth part of the licence allowed to him would have been pilloried, mangled with the shears, whipped at the cart's tail, and flung into a noisome dungeon to die. He hated dissenters and stock-jobbers, the excise and the army, septennial parliaments, and Continental connexions. He long had an aversion to the Scotch, an aversion of which he could not remember the commencement, but which, he owned, had probably originated in his abhorrence of the conduct of the nation during the Great Rebellion. It is easy to guess in what manner debates on great party questions were likely to be reported by a man whose judgment was so much disordered by party spirit. A show of fairness was indeed necessary to the prosperity of the *Magazine*. But Johnson long afterwards owned that, though he had saved appearances, he had taken care that the Whig dogs should not have the best of it; and, in fact, every passage which has lived, every passage which bears the marks of his higher faculties, is put into the mouth of some member of the opposition.

A few weeks after Johnson had entered on these obscure labours, he published a work which at once placed him high among the writers of his age. It is probable that what he had suffered during his first year in London had often reminded him of some parts of that noble poem in which Juvenal had described the misery and degradation of a needy man of letters, lodged among the pigeons' nests in the tottering garrets which overhung the streets of Rome. Pope's admirable imitations of Horace's *Satires* and *Epistles* had recently appeared, were in every hand, and were by many readers thought superior to the originals. What Pope had done for Horace, Johnson aspired to do for Juvenal. The enterprise was bold, and yet judicious. For between Johnson and Juvenal there was much in common, much more certainly than between Pope and Horace.

Johnson's *London* appeared without his name in May 1738. He received only ten guineas for this stately and vigorous poem; but the sale was rapid, and the success complete. A second edition was required within a week. Those small critics who are always desirous to lower established reputations ran about proclaiming that the anonymous satirist was superior to Pope in Pope's own peculiar department of literature. It ought to be remembered, to the honour of Pope, that he joined heartily in the applause with which the appearance of a rival genius was welcomed. He made inquiries about the author of

London. Such a man, he said, could not long be concealed. The name was soon discovered; and Pope, with great kindness, exerted himself to obtain an academical degree and the mastership of a grammar school for the poor young poet. The attempt failed, and Johnson remained a bookseller's hack.

It does not appear that these two men, the most eminent writer of the generation which was going out, and the most eminent writer of the generation which was coming in, ever saw each other. They lived in very different circles, one surrounded by dukes and earls, the other by starving pamphleteers and indexmakers. Among Johnson's associates at this time may be mentioned Boyse, who, when his shirts were pledged, scrawled Latin verses sitting up in bed with his arms through two holes in his blanket, who composed very respectable sacred poetry when he was sober, and who was at last run over by a hackney coach when he was drunk; Hoole, surnamed the metaphysical tailor, who, instead of attending to his measures, used to trace geometrical diagrams on the board where he sat cross-legged; and the penitent impostor, George Palmanazar, who, after poring all day, in a humble lodging, on the folios of Jewish rabbis and Christian fathers, indulged himself at night with literary and theological conversation at an alhousie in the city. But the most remarkable of the persons with whom at this time Johnson consorted was Richard Savage, an earl's son, a shoemaker's apprentice, who had seen life in all its forms, who had feasted among blue ribands in Saint James's Square, and had lain with fifty pounds weight of irons on his legs in the condemned ward of Newgate. This man had, after many vicissitudes of fortune, sunk at last into abject and hopeless poverty. His pen had failed him. His patrons had been taken away by death, or estranged by the riotous profusion with which he squandered their bounty, and the ungrateful insolence with which he rejected their advice. He now lived by begging. He dined on venison and champagne whenever he had been so fortunate as to borrow a guinea. If his questing had been unsuccessful, he appeased the rage of hunger with some scraps of broken meat, and lay down to rest under the piazza of Covent Garden in warm weather, and, in cold weather, as near as he could get to the furnace of a glass house. Yet, in his misery, he was still an agreeable companion. He had an inexhaustible store of anecdotes about that gay and brilliant world from which he was now an outcast. He had observed the great men of both parties in hours of careless relaxation, had seen the leaders of opposition without the mask of patriotism, and had heard the prime minister roar with laughter and tell stories not over-decent. During some months Savage lived in the closest familiarity with Johnson; and then the friends parted, not without tears. Johnson remained in London to drudge for Clive. Savage went to the west of England, lived there as he had lived everywhere, and in 1743 died, penniless and heart-broken, in Bristol jail.

Soon after his death, while the public curiosity was strongly excited about his extraordinary character and his not less extraordinary adventures, a life of him appeared widely different from the catchpenny lives of eminent men which were then a staple article of manufacture in Grub Street. The style was indeed deficient in ease and variety; and the writer was evidently too partial to the Latin element of our language. But the little work, with all its faults, was a masterpiece. No finer specimen of literary biography existed in any language, living or dead; and a discerning critic might have confidently predicted that the author was destined to be the founder of a new school of English eloquence.

The *Life of Savage* was anonymous; but it was well known in literary circles that Johnson was the writer.

During the three years which followed, he produced no important work; but he was not, and indeed could not be, idle. The fame of his abilities and learning continued to grow. Warburton pronounced him a man of parts and genius; and the praise of Warburton was then no light thing. Such was Johnson's reputation that, in 1747, several eminent booksellers combined to employ him in the arduous work of preparing a *Dictionary of the English Language*, in two folio volumes. The sum which they agreed to pay him was only fifteen hundred guineas; and out of this sum he had to pay several poor men of letters who assisted him in the humbler parts of his task.

The prospectus of the *Dictionary* he addressed to the earl of Chesterfield. Chesterfield had long been celebrated for the politeness of his manners, the brilliancy of his wit, and the delicacy of his taste. He was acknowledged to be the finest speaker in the House of Lords. He had recently governed Ireland, at a momentous conjuncture, with eminent firmness, wisdom, and humanity; and he had since become secretary of state. He received Johnson's homage with the most winning affability, and requited it with a few guineas, bestowed doubtless in a very graceful manner, but was by no means desirous to see all his carpets blackened with the London mud, and his soups and wines thrown to right and left over the gowns of fine ladies and the waistcoats of fine gentlemen, by an absent, awkward scholar, who gave strange starts and uttered strange growls, who dressed like a scarecrow, and ate like a cormorant. During some time Johnson continued to call on his patron, but, after being repeatedly told by the porter that his lordship was not at home, took the hint, and ceased to present himself at the inhospitable door.

Johnson had flattered himself that he should have completed his *Dictionary* by the end of 1750; but it was not till 1755 that he at length gave his huge volumes to the world. During the seven years which he passed in the drudgery of penning definitions and marking quotations for transcription, he sought for relaxation in literary labour of a more agreeable kind. In 1749 he published the *Vanity of Human Wishes*, an excellent imitation of the tenth satire of Juvenal. It is in truth not easy to say whether the palm belongs to the ancient or to the modern poet. The couplets in which the fall of Wolsey is described, though lofty and sonorous, are feeble when compared with the wonderful lines which bring before us all Rome in tumult on the day of the fall of Sejanus, the laurels on the doorposts, the white bull stalking towards the Capitol, the statues rolling down from their pedestals, the flatterers of the disgraced minister running to see him dragged with a hook through the streets, and to have a kick at his carcase before it is hurled into the Tiber. It must be owned too that in the concluding passage the Christian moralist has not made the most of his advantages, and has fallen decidedly short of the sublimity of his pagan model. On the other hand, Juvenal's Hannibal must yield to Johnson's Charles; and Johnson's vigorous and pathetic enumeration of the miseries of a literary life must be allowed to be superior to Juvenal's lamentation over the fate of Demosthenes and Cicero. For the copyright of the *Vanity of Human Wishes* Johnson received only fifteen guineas.

A few days after the publication of this poem, his tragedy, begun many years before, was brought on the stage. His pupil, David Garrick, had in 1741 made his appearance on a humble stage in Goodman's Fields, had at once risen to the first place among actors, and was now, after several years of almost uninterrupted success, manager of Drury Lane Theatre. The relation between him and his old preceptor was of a very singular kind. They repelled each other strongly, and yet attracted each other

strongly. Nature had made them of very different clay; and circumstances had fully brought out the natural peculiarities of both. Sudden prosperity had turned Garrick's head. Continued adversity had soured Johnson's temper. Johnson saw with more envy than became so great a man the villa, the plate, the china, the Brussels carpet, which the little mimic had got by repeating, with grimaces and gesticulations, what wiser men had written; and the exquisitely sensitive vanity of Garrick was galled by the thought that, while all the rest of the world was applauding him, he could obtain from one morose cynic, whose opinion it was impossible to despise, scarcely any compliment not acidulated with scorn. Yet the two Lichfield men had so many early recollections in common, and sympathized with each other on so many points on which they sympathized with nobody else in the vast population of the capital, that, though the master was often provoked by the monkey-like impertinence of the pupil, and the pupil by the bearish rudeness of the master, they remained friends till they were parted by death. Garrick now brought *Irene* out, with alterations sufficient to displease the author, yet not sufficient to make the piece pleasing to the audience. The public, however, listened, with little emotion, but with much civility, to five acts of monotonous declamation. After nine representations the play was withdrawn. It is, indeed, altogether unsuited to the stage, and, even when perused in the closet, will be found hardly worthy of the author. He had not the slightest notion of what blank verse should be. A change in the last syllable of every other line would make the versification of the *Vanity of Human Wishes* closely resemble the versification of *Irene*. The poet, however, cleared, by his benefit nights, and by the sale of the copyright of his tragedy, about three hundred pounds, then a great sum in his estimation.

About a year after the representation of *Irene*, he began to publish a series of short essays on morals, manners, and literature. This species of composition had been brought into fashion by the success of the *Tatler*, and by the still more brilliant success of the *Spectator*. A crowd of small writers had vainly attempted to rival Addison. The *Lay Monastery*, the *Censor*, the *Freethinker*, the *Plain Dealer*, the *Champion*, and other works of the same kind had had their short day. None of them had obtained a permanent place in our literature; and they are now to be found only in the libraries of the curious. At length Johnson undertook the adventure in which so many aspirants had failed. In the thirty-sixth year after the appearance of the last number of the *Spectator* appeared the first number of the *Rambler*. From March 1750 to March 1752 this paper continued to come out every Tuesday and Saturday.

From the first the *Rambler* was enthusiastically admired by a few eminent men. Richardson, when only five numbers had appeared, pronounced it equal if not superior to the *Spectator*. Young and Hartley expressed their approbation not less warmly. Bubb Dodington, among whose many faults indifference to the claims of genius and learning cannot be reckoned, solicited the acquaintance of the writer. In consequence probably of the good offices of Dodington, who was then the confidential adviser of Prince Frederick, two of his royal highness's gentlemen carried a gracious message to the printing office, and ordered seven copies for Leicester House. But these overtures seem to have been very coldly received. Johnson had had enough of the patronage of the great to last him all his life, and was not disposed to haunt any other door as he had haunted the door of Chesterfield.

By the public the *Rambler* was at first very coldly received. Though the price of a number was only two-

pence, the sale did not amount to five hundred. The profits were therefore very small. But as soon as the flying leaves were collected and reprinted they became popular. The author lived to see thirteen thousand copies spread over England alone. Separate editions were published for the Scotch and Irish markets. A large party pronounced the style perfect, so absolutely perfect that in some essays it would be impossible for the writer himself to alter a single word for the better. Another party, not less numerous, vehemently accused him of having corrupted the purity of the English tongue. The best critics admitted that his diction was too monotonous, too obviously artificial, and now and then turgid even to absurdity. But they did justice to the acuteness of his observations on morals and manners, to the constant precision and frequent brilliancy of his language, to the weighty and magnificent eloquence of many serious passages, and to the solemn yet pleasing humour of some of the lighter papers. On the question of precedence between Addison and Johnson, a question which, seventy years ago, was much disputed, posterity has pronounced a decision from which there is no appeal. Sir Roger, his chaplain, and his butler, Will Wimple and Will Honeycomb, the "Vision of Mirza," the "Journal of the Retired Citizen," the "Everlasting Club," the "Dunmow Flitch," the "Loves of Hildegarde and Shalun," the "Visit to the Exchange," and the "Visit to the Abbey" are known to everybody. But many men and women, even of highly cultivated minds, are unacquainted with Squire Bluster and Mrs. Busy, Quisquillus and Venustus, the "Allegory of Wit and Learning," the "Chronicle of the Revolutions of a Garret," and the sad fate of Avingset and Ajut.

The last *Rambler* was written in a sad and gloomy hour. Mrs. Johnson had been given over by the physicians. Three days later she died. She left her husband almost broken-hearted. Many people had been surprised to see a man of his genius and learning stooping to every drudgery, and denying himself almost every comfort, for the purpose of supplying a silly, affected old woman with superfluities, which she accepted with but little gratitude. But all his affection had been concentrated on her. He had neither brother nor sister, neither son nor daughter. To him she was beautiful as the Gunnings, and witty as Lady Mary. Her opinion of his writings was more important to him than the voice of the pit of Drury Lane Theatre, or the judgment of the *Monthly Review*. The chief support which had sustained him through the most arduous labour of his life was the hope that she would enjoy the fame and the profit which he anticipated from his *Dictionary*. She was gone; and in that vast labyrinth of streets, peopled by eight hundred thousand human beings, he was alone. Yet it was necessary for him to set himself, as he expressed it, doggedly to work. After three more laborious years, the *Dictionary* was at length complete.

It had been generally supposed that this great work would be dedicated to the eloquent and accomplished nobleman to whom the prospectus had been addressed. He well knew the value of such a compliment; and therefore, when the day of publication drew near, he exerted himself to soothe, by a show of zeal and at the same time of delicate and judicious kindness, the pride which he had so cruelly wounded. Since the *Ramblers* had ceased to appear, the town had been entertained by a journal called the *World*, to which many men of high rank and fashion contributed. In two successive numbers of the *World*, the *Dictionary* was, to use the modern phrase, puffed with wonderful skill. The writings of Johnson were warmly praised. It was proposed that he should be invested with the authority of a dictator, nay, of a pope, over our language, and that his decisions about the meaning and

the spelling of words should be received as final. His two folios, it was said, would of course be bought by everybody who could afford to buy them. It was soon known that these papers were written by Chesterfield. But the just resentment of Johnson was not to be so appeased. In a letter written with singular energy and dignity of thought and language, he repelled the tardy advances of his patron. The *Dictionary* came forth without a dedication. In the preface the author truly declared that he owed nothing to the great, and described the difficulties with which he had been left to struggle so forcibly and pathetically that the ablest and most malevolent of all the enemies of his fame, Horne Tooke, never could read that passage without tears.

The public, on this occasion, did Johnson full justice, and something more than justice. The best lexicographer may well be content if his productions are received by the world with cold esteem. But Johnson's *Dictionary* was hailed with an enthusiasm such as no similar work has ever excited. It was indeed the first dictionary which could be read with pleasure. The definitions show so much acuteness of thought and command of language, and the passages quoted from poets, divines, and philosophers are so skillfully selected, that a leisure hour may always be very agreeably spent in turning over the pages. The faults of the book resolve themselves, for the most part, into one great fault. Johnson was a wretched etymologist. He knew little or nothing of any Teutonic language except English, which indeed, as he wrote it, was scarcely a Teutonic language; and thus he was absolutely at the mercy of Junius and Skinner.

The *Dictionary*, though it raised Johnson's fame, added nothing to his pecuniary means. The fifteen hundred guineas which the booksellers had agreed to pay him had been advanced and spent before the last sheets issued from the press. It is painful to relate that twice in the course of the year which followed the publication of this great work he was arrested and carried to spunging-houses, and that he was twice indebted for his liberty to his excellent friend Richardson. It was still necessary for the man who had been formally saluted by the highest authority as dictator of the English language to supply his wants by constant toil. He abridged his *Dictionary*. He proposed to bring out an edition of Shakespeare by subscription, and many subscribers sent in their names and laid down their money; but he soon found the task so little to his taste that he turned to more attractive employments. He contributed many papers to a new monthly journal, which was called the *Literary Magazine*. Few of these papers have much interest; but among them was the very best thing that he ever wrote, a masterpiece both of reasoning and of satirical pleasantry, the review of Jenyns's *Inquiry into the Nature and Origin of Evil*.

In the spring of 1758 Johnson put forth the first of a series of essays, entitled the *Idler*. During two years these essays continued to appear weekly. They were eagerly read, widely circulated, and indeed impudently pirated, while they were still in the original form, and had a large sale when collected into volumes. The *Idler* may be described as a second part of the *Rambler*; somewhat livelier and somewhat weaker than the first part.

While Johnson was busied with his *Idlers*, his mother, who had accomplished her ninetieth year, died at Lichfield. It was long since he had seen her, but he had not failed to contribute largely out of his small means to her comfort. In order to defray the charges of her funeral, and to pay some debts which she had left, he wrote a little book in a single week, and sent off the sheets to the press without reading them over. A hundred pounds were paid him for the copyright, and the purchasers had great cause to be pleased with their bargain, for the book was *Rasselas*.

The success of *Rasselas* was great, though such ladies as Miss Lydia Languish must have been grievously disappointed when they found that the new volume from the circulating library was little more than a dissertation on the author's favourite theme, the "vanity of human wishes;" that the prince of Abyssinia was without a mistress, and the princess without a lover; and that the story set the hero and the heroine down exactly where it had taken them up. The style was the subject of much eager controversy. The *Monthly Review* and the *Critical Review* took different sides. Many readers pronounced the writer a pompous pedant, who would never use a word of two syllables where it was possible to use a word of six, and who could not make a waiting woman relate her adventures without balancing every noun with another noun, and every epithet with another epithet. Another party, not less zealous, cited with delight numerous passages in which weighty meaning was expressed with accuracy and illustrated with splendour. And both the censure and the praise were merited.

About the plan of *Rasselas* little was said by the critics; and yet the faults of the plan might seem to invite severe criticism. Johnson has frequently blamed Shakespeare for neglecting the proprieties of time and place, and for ascribing to one age or nation the manners and opinions of another. Yet Shakespeare has not sinned in this way more grievously than Johnson. *Rasselas* and *Imlac*, *Nekayah* and *Pekuah*, are evidently meant to be Abyssinians of the 18th century; for the Europe which *Imlac* describes is the Europe of the 18th century, and the inmates of the Happy Valley talk familiarly of that law of gravitation which Newton discovered, and which was not fully received even at Cambridge till the 18th century. What a real company of Abyssinians would have been may be learned from *Bruce's Travels*. But Johnson, not content with turning filthy savages, ignorant of their letters, and gorged with raw steaks cut from living cows, into philosophers as eloquent and enlightened as himself or his friend Burke, and into ladies as highly accomplished as Mrs Lennox or Mrs Sheridan, transferred the whole domestic system of England to Egypt. Into a land of harems, a land of polygamy, a land where women are married without ever being seen, he introduced the flirtations and jealousies of our ball-rooms. In a land where there is boundless liberty of divorce, wedlock is described as the indissoluble compact. "A youth and maiden meeting by chance, or brought together by artifice, exchange glances, reciprocate civilities, go home, and dream of each other. Such," says *Rasselas*, "is the common process of marriage." Such it may have been, and may still be, in London, but assuredly not at Cairo. A writer who was guilty of such improprieties had little right to blame the poet who made Hector quote Aristotle, and represented *Julio Romano* as flourishing in the days of the oracle of Delphi.

By such exertions as have been described Johnson supported himself till the year 1762. In that year a great change in his circumstances took place. He had from a child been an enemy of the reigning dynasty. His Jacobite prejudices had been exhibited with little disguise both in his works and in his conversation. Even in his massy and elaborate *Dictionary* he had, with a strange want of taste and judgment, inserted bitter and contumelious reflexions on the Whig party. The excise, which was a favourite resource of Whig financiers, he had designated as a hateful tax. He had railed against the commissioners of excise in language so coarse that they had seriously thought of prosecuting him. He had with difficulty been prevented from holding up the lord privy seal by name as an example of the meaning of the word "renegade." A pension he

had defined as pay given to a state hireling to betray his country; a pensioner as a slave of state hired by a stipend to obey a master. It seemed unlikely that the author of these definitions would himself be pensioned. But that was a time of wonders. George III. had ascended the throne, and had, in the course of a few months, disgusted many of the old friends, and conciliated many of the old enemies of his house. The city was becoming mutinous; Oxford was becoming loyal. Cavendishes and Bentincks were murmuring; Somersets and Wyndhams were hastening to kiss hands. The head of the treasury was now Lord Bute, who was a Tory, and could have no objection to Johnson's Toryism. Bute wished to be thought a patron of men of letters; and Johnson was one of the most eminent and one of the most needy men of letters in Europe. A pension of three hundred a year was graciously offered, and with very little hesitation accepted.

This event produced a change in Johnson's whole way of life. For the first time since his boyhood he no longer felt the daily goad urging him to the daily toil. He was at liberty, after thirty years of anxiety and drudgery, to indulge his constitutional indolence, to lie in bed till two in the afternoon, and to sit up talking till four in the morning, without fearing either the printer's devil or the sheriff's officer.

One laborious task indeed he had bound himself to perform. He had received large subscriptions for his promised edition of Shakespeare; he had lived on those subscriptions during some years; and he could not without disgrace omit to perform his part of the contract. His friends repeatedly exhorted him to make an effort, and he repeatedly resolved to do so. But, notwithstanding their exhortations and his resolutions, month followed month, year followed year, and nothing was done. He prayed fervently against his idleness; he determined, as often as he received the sacrament, that he would no longer doze away and trifle away his time; but the spell under which he lay resisted prayer and sacrament. His private notes at this time are made up of self-reproaches. "My indolence," he wrote on Easter eve in 1764, "has sunk into grosser sluggishness. A kind of strange oblivion has overspread me, so that I know not what has become of the last year." Easter 1765 came, and found him still in the same state. "My time," he wrote, "has been unprofitably spent, and seems as a dream that has left nothing behind. My memory grows confused, and I know not how the days pass over me." Happily for his honour, the charm which held him captive was at length broken by no gentle or friendly hand. He had been weak enough to pay serious attention to a story about a ghost which haunted a house in Cock Lane, and had actually gone himself, with some of his friends, at one in the morning, to St John's Church, Clerkenwell, in the hope of receiving a communication from the perturbed spirit. But the spirit, though adjured with all solemnity, remained obstinately silent; and it soon appeared that a naughty girl of eleven had been amusing herself by making fools of so many philosophers. Churchill, who, confident in his powers, drunk with popularity, and burning with party spirit, was looking for some man of established fame and Tory politics to insult, celebrated the Cock Lane ghost in three cantos, nicknamed Johnson *Pomposo*, asked where the book was which had been so long promised and so liberally paid for, and directly accused the great moralist of cheating. This terrible word proved effectual, and in October 1765 appeared, after a delay of nine years, the new edition of Shakespeare.

This publication saved Johnson's character for honesty, but added nothing to the fame of his abilities and learning. The preface, though it contains some good passages, is not in his best manner. The most valuable notes are those in

which he had an opportunity of showing how attentively he had during many years observed human life and human nature. The best specimen is the note on the character of Polonius. Nothing so good is to be found even in Wilhelm Meister's admirable examination of *Hamlet*. But here praise must end. It would be difficult to name a more slovenly, a more worthless edition of any great classic. The reader may turn over play after play without finding one happy conjectural emendation, or one ingenious and satisfactory explanation of a passage which had baffled preceding commentators. Johnson had, in his prospectus, told the world that he was peculiarly fitted for the task which he had undertaken, because he had, as a lexicographer, been under the necessity of taking a wider view of the English language than any of his predecessors. That his knowledge of our literature was extensive is indisputable. But, unfortunately, he had altogether neglected that very part of our literature with which it is especially desirable that an editor of Shakespeare should be conversant. It is dangerous to assert a negative. Yet little will be risked by the assertion that in the two folio volumes of the *English Dictionary* there is not a single passage quoted from any dramatist of the Elizabethan age, except Shakespeare and Ben Jonson. Even from Ben the quotations are few. Johnson might easily in a few months have made himself well acquainted with every old play that was extant. But it never seems to have occurred to him that this was a necessary preparation for the work which he had undertaken. He would doubtless have admitted that it would be the height of absurdity in a man who was not familiar with the works of Æschylus and Euripides to publish an edition of Sophocles. Yet he ventured to publish an edition of Shakespeare, without having ever in his life, as far as can be discovered, read a single scene of Massinger, Ford, Dekker, Webster, Marlow, Beaumont, or Fletcher. His detractors were noisy and scurrilous. Those who most loved and honoured him had little to say in praise of the manner in which he had discharged the duty of a commentator. He had, however, acquitted himself of a debt which had long lain heavy on his conscience, and he sank back into the repose from which the sting of satire had roused him. He long continued to live upon the fame which he had already won. He was honoured by the university of Oxford with a doctor's degree, by the Royal Academy with a professorship, and by the king with an interview, in which his Majesty most graciously expressed a hope that so excellent a writer would not cease to write. In the interval, however, between 1765 and 1775 Johnson published only two or three political tracts, the longest of which he could have produced in forty-eight hours, if he had worked as he worked on the *Life of Savage* and on *Rasselas*.

But, though his pen was now idle, his tongue was active. The influence exercised by his conversation, directly upon those with whom he lived, and indirectly on the whole literary world, was altogether without a parallel. His colloquial talents were indeed of the highest order. He had strong sense, quick discernment, wit, humour, immense knowledge of literature and of life, and an infinite store of curious anecdotes. As respected style, he spoke far better than he wrote. Every sentence which dropped from his lips was as correct in structure as the most nicely balanced period of the *Rambler*. But in his talk there were no pompous triads, and little more than a fair proportion of words in *-sity* and *-ation*. All was simplicity, ease, and vigour. He uttered his short, weighty, and pointed sentences with a power of voice, and a justness and energy of emphasis, of which the effect was rather increased than diminished by the rollings of his huge form, and by the asthmatic gaspings and puffings in which the peals of his

eloquence generally ended. Nor did the laziness which made him unwilling to sit down to his desk prevent him from giving instruction or entertainment orally. To discuss questions of taste, of learning, of casuistry, in language so exact and so forcible that it might have been printed without the alteration of a word, was to him no exertion, but a pleasure. He loved, as he said, to fold his legs and have his talk out. He was ready to bestow the overflowsings of his full mind on anybody who would start a subject, on a fellow-passenger in a stage coach, or on the person who sat at the same table with him in an eating-house. But his conversation was nowhere so brilliant and striking as when he was surrounded by a few friends, whose abilities and knowledge enabled them, as he once expressed it, to send him back every ball that he threw. Some of these, in 1764, formed themselves into a club, which gradually became a formidable power in the commonwealth of letters. The verdicts pronounced by this conclave on new books were speedily known over all London, and were sufficient to sell off a whole edition in a day, or to condemn the sheets to the service of the trunkmaker and the pastrycook. Nor shall we think this strange when we consider what grant and various talents and acquisitions met in the little fraternity. Goldsmith was the representative of poetry and light literature, Reynolds of the arts, Burke of political eloquence and political philosophy. There, too, were Gibbon the greatest historian and Jones the greatest linguist of the age. Garrick brought to the meetings his inexhaustible pleasantry, his incomparable mimicry, and his consummate knowledge of stage effect. Among the most constant attendants were two high-born and high-bred gentlemen, closely bound together by friendship, but of widely different characters and habits,—Dennet Langton, distinguished by his skill in Greek literature, by the orthodoxy of his opinions, and by the sanctity of his life, and Tojham Beauchlerk, renowned for his amours, his knowledge of the gay world, his fastidious taste, and his sarcastic wit. To predominate over such a society was not easy. Yet even over such a society Johnson predominated. Burke might indeed have disputed the supremacy to which others were under the necessity of submitting. But Burke, though not generally a very patient listener, was content to take the second part when Johnson was present; and the club itself, consisting of so many eminent men, is to this day popularly designated as Johnson's club.

Among the members of this celebrated body was one to whom it has owed the greater part of its celebrity, yet who was regarded with little respect by his brethren, and had not without difficulty obtained a seat among them. This was James Boswell, a young Scotch lawyer, heir to an honourable name and a fair estate. That he was a coxcomb and a bore, weak, vain, pushing, curious, garrulous, was obvious to all who were acquainted with him. That he could not reason, that he had no wit, no humour, no eloquence, is apparent from his writings. And yet his writings are read beyond the Mississippi, and under the Southern Cross, and are likely to be read as long as the English exists either as a living or as a dead language. Nature had made him a slave and an idolator. His mind resembled those creepers which the botanists call parasites, and which can subsist only by clinging round the stems and imbibing the juices of stronger plants. He must have fastened himself on somebody. He might have fastened himself on Wilkes, and have become the fiercest patriot in the Bill of Rights Society. He might have fastened himself on Whitfield, and have become the loudest field-preacher among the Calvinistic Methodists. In a happy hour he fastened himself on Johnson. The pair might seem ill-matched. For Johnson had early been prejudiced

against Boswell's country. To a man of Johnson's strong understanding and irritable temper, the silly egotism and adulation of Boswell must have been as teasing as the constant buzz of a fly. Johnson hated to be questioned; and Boswell was eternally catechizing him on all kinds of subjects, and sometimes propounded such questions as, "What would you do, sir, if you were locked up in a tower with a baby?" Johnson was a water drinker and Boswell was a winebibber, and indeed little better than an habitual sot. It was impossible that there should be perfect harmony between two such companions. Indeed, the great man was sometimes provoked into fits of passion, in which he said things which the small man, during a few hours, seriously resented. Every quarrel, however, was soon made up. During twenty years the disciple continued to worship the master; the master continued to scold the disciple, to sneer at him, and to love him. The two friends ordinarily resided at a great distance from each other. Boswell practised in the Parliament House of Edinburgh, and could pay only occasional visits to London. During those visits his chief business was to watch Johnson, to discover all Johnson's habits, to turn the conversation to subjects about which Johnson was likely to say something remarkable, and to fill quarto notebooks with minutes of what Johnson had said. In this way were gathered the materials out of which was afterwards constructed the most interesting biographical work in the world.

Soon after the club began to exist, Johnson formed a connexion less important indeed to his fame, but much more important to his happiness, than his connexion with Boswell. Henry Thrale, one of the most opulent brewers in the kingdom, a man of sound and cultivated understanding, rigid principles, and liberal spirit, was married to one of those clever, kind-hearted, engaging, vain, pert young women, who are perpetually doing or saying what is not exactly right, but who, do or say what they may, are always agreeable. In 1765 the Thrales became acquainted with Johnson, and the acquaintance ripened fast into friendship. They were astonished and delighted by the brilliancy of his conversation. They were flattered by finding that a man so widely celebrated preferred their house to any other in London. Even the peculiarities which seemed to unfit him for civilized society, his gesticulations, his rollings, his puffings, his mutterings, the strange way in which he put on his clothes, the ravenous eagerness with which he devoured his dinner, his fits of melancholy, his fits of anger, his frequent rudeness, his occasional ferocity, increased the interest which his new associates took in him. For these things were the cruel marks left behind by a life which had been one long conflict with disease and with adversity. In a vulgar hack writer such oddities would have excited only disgust. But in a man of genius, learning, and virtue their effect was to add pity to admiration and esteem. Johnson soon had an apartment at the brewery in Southwark, and a still more pleasant apartment at the villa of his friends on Streatham Common. A large part of every year he passed in those abodes, abodes which must have seemed magnificent and luxurious indeed, when compared with the dens in which he had generally been lodged. But his chief pleasures were derived from what the astronomer of his Abyssinian tale called "the endearing elegance of female friendship." Mrs Thrale rallied him, soothed him, coaxed him, and, if she sometimes provoked him by her flippancy, made ample amends by listening to his reproofs with angelic sweetness of temper. When he was diseased in body and in mind, she was the most tender of nurses. No comfort that wealth could purchase, no contrivance that womanly ingenuity, set to work by womanly compassion, could devise, was wanting to his sick room. He required her kindness by an affection pure

as the affection of a father, yet delicately tinged with a gallantry which, though awkward, must have been more flattering than the attentions of a crowd of the fools who gloried in the names, now obsolete, of Buck and Macaroni. It would seem that a full half of Johnson's life during about sixteen years was passed under the roof of the Thrales. He accompanied the family sometimes to Bath, and sometimes to Brighton, once to Wales and once to Paris. But he had at the same time a house in one of the narrow and gloomy courts on the north of Fleet Street. In the garrets was his library, a large and miscellaneous collection of books, falling to pieces and begrimed with dust. On a lower floor he sometimes, but very rarely, regaled a friend with a plain dinner—a veal pie, or a leg of lamb and spinach, and a rice pudding. Nor was the dwelling uninhabited during his long absences. It was the home of the most extraordinary assemblage of inmates that ever was brought together. At the head of the establishment Johnson had placed an old lady named Williams, whose chief recommendations were her blindness and her poverty. But, in spite of her murmurs and reproaches, he gave an asylum to another lady who was as poor as herself, Mrs Desmoulins, whose family he had known many years before in Staffordshire. Room was found for the daughter of Mrs Desmoulins, and for another destitute damsel, who was generally addressed as Miss Carmichael, but whom her generous host called Polly. An old quack doctor named Levett, who bled and dosed cold-headers and hackney coachmen, and received for fees crusts of bread, bits of bacon, glasses of gin, and sometimes a little copper, completed this strange menagerie. All these poor creatures were at constant war with each other, and with Johnson's negro servant Frank. Sometimes, indeed, they transferred their hostilities from the servant to the master, complained that a better table was not kept for them, and railed or maundered till their benefactor was glad to make his escape to Streatham, or to the Mitre Tavern. And yet he, who was generally the haughtiest and most irritable of mankind, who was but too prompt to resent anything which looked like a slight on the part of a purse-proud bookseller, or of a noble and powerful patron, bore patiently from mendicants, who, but for his bounty, must have gone to the workhouse, insults more provoking than those for which he had knocked down Osborne and bidden defiance to Chesterfield. Year after year Mrs Williams and Mrs Desmoulins, Polly and Levett, continued to torment him and to live upon him.

The course of life which has been described was interrupted in Johnson's sixty-fourth year by an important event. He had early read an account of the Hebrides, and had been much interested by learning that there was so near him a land peopled by a race which was still as rude and simple as in the Middle Ages. A wish to become intimately acquainted with a state of society so utterly unlike all that he had ever seen frequently crossed his mind. But it is not probable that his curiosity would have overcome his habitual sluggishness, and his love of the smoke, the mud, and the cries of London, had not Boswell importuned him to attempt the adventure, and offered to be his squire. At length, in August 1773, Johnson crossed the Highland line, and plunged courageously into what was then considered, by most Englishmen, as a dreary and perilous wilderness. After wandering about two months through the Celtic region, sometimes in rude boats which did not protect him from the rain, and sometimes on small shaggy ponies which could hardly bear his weight, he returned to his old haunts with a mind full of new images and new theories. During the following year he employed himself in recording his adventures. About the beginning of 1775 his *Journey to the Hebrides* was published, and

was, during some weeks, the chief subject of conversation in all circles in which any attention was paid to literature. The book is still read with pleasure. The narrative is entertaining; the speculations, whether sound or unsound, are always ingenious; and the style, though too stiff and pompous, is somewhat easier and more graceful than that of his early writings. His prejudice against the Scotch had at length become little more than matter of jest; and whatever remained of the old feeling had been effectually removed by the kind and respectful hospitality with which he had been received in every part of Scotland. It was, of course, not to be expected that an Oxonian Tory should praise the Presbyterian polity and ritual, or that an eye accustomed to the hedgerows and parks of England should not be struck by the bareness of Berwickshire and East Lothian. But even in censure Johnson's tone is not unfriendly. The most enlightened Scotchmen, with Lord Mansfield at their head, were well pleased. But some foolish and ignorant Scotchmen were moved to anger by a little unpalatable truth which was mingled with much eulogy, and assailed him whom they chose to consider as the enemy of their country with libels much more dishonourable to their country than anything that he had ever said or written. They published paragraphs in the newspapers, articles in the magazines, sixpenny pamphlets, five-shilling books. One scribbler abused Johnson for being blear-eyed, another for being a pensioner; a third informed the world that one of the doctor's uncles had been convicted of felony in Scotland, and had found that there was in that country one tree capable of supporting the weight of an Englishman. Macpherson, whose *Fingal* had been proved in the *Journey* to be an impudent forgery, threatened to take vengeance with a cane. The only effect of this threat was that Johnson reiterated the charge of forgery in the most contemptuous terms, and walked about, during some time, with a cudgel, which, if the impostor had not been too wise to encounter it, would assuredly have descended upon him, to borrow the sublime language of his own epic poem, "like a hammer on the red son of the furnace."

Of other assailants Johnson took no notice whatever. He had early resolved never to be drawn into controversy; and he adhered to his resolution with a steadfastness which is the more extraordinary because he was, both intellectually and morally, of the stuff of which controversialists are made. In conversation he was a singularly eager, acute, and pertinacious disputant. When at a loss for good reasons, he had recourse to sophistry; and when heated by altercation, he made unsparring use of sarcasm and invective. But when he took his pen in his hand, his whole character seemed to be changed. A hundred bad writers misrepresented him and reviled him; but not one of the hundred could boast of having been thought by him worthy of a refutation, or even of a retort. The Kenricks, Campbells, MacNicol's, and Hendersons did their best to annoy him, in the hope that he would give them importance by answering them. But the reader will in vain search his works for any allusion to Kenrick or Campbell, to MacNicol or Henderson. One Scotchman, bent on vindicating the fame of Scotch learning, defied him to the combat in a detestable Latin hexameter—

"Maxime, si tu vis, cupio contendere tecum."

But Johnson took no notice of the challenge. He had learned, both from his own observation and from literary history, in which he was deeply read, that the place of books in the public estimation is fixed, not by what is written about them, but by what is written in them, and that an author whose works are likely to live is very unwise if he stoops to wrangle with detractors whose works are certain to die. He always maintained that fame was a shuttlecock which could be kept up only by being beaten

back as well as beaten forward, and which would soon fall if there were only one battledore. No saying was oftener in his mouth than that fine apophthegm of Bentley, that no man was ever written down but by himself.

Unhappily, a few months after the appearance of the *Journey to the Hebrides*, Johnson did what none of his envious assailants could have done, and to a certain extent succeeded in writing himself down. The disputes between England and her American colonies had reached a point at which no amicable adjustment was possible. Civil war was evidently impending; and the ministers seem to have thought that the eloquence of Johnson might with advantage be employed to inflame the nation against the opposition here, and against the rebels beyond the Atlantic. He had already written two or three tracts in defence of the foreign and domestic policy of the Government; and those tracts, though hardly worthy of him, were much superior to the crowd of pamphlets which lay on the counters of Almon and Stockdale. But his *Taxation No Tyranny* was a pitiable failure. The very title was a silly phrase, which can have been recommended to his choice by nothing but a jingling alliteration which he ought to have despised. The arguments were such as boys use in debating societies. The pleasantry was as awkward as the gambols of a hippopotamus. Even Boswell was forced to own that in this unfortunate piece he could detect no trace of his master's powers. The general opinion was that the strong faculties which had produced the *Dictionary* and the *Rambler* were beginning to feel the effect of time and of disease, and that the old man would best consult his credit by writing no more.

But this was a great mistake. Johnson had failed, not because his mind was less vigorous than when he wrote *Rasselas* in the evenings of a week, but because he had foolishly chosen, or suffered others to choose for him, a subject such as he would at no time have been competent to treat. He was in no sense a statesman. He never willingly read or thought or talked about affairs of state. He loved biography, literary history, the history of manners; but political history was positively distasteful to him. The question at issue between the colonies and the mother country was a question about which he had really nothing to say. He failed, therefore, as the greatest men must fail when they attempt to do that for which they are unfit,—as Burke would have failed if Burke had tried to write comedies like those of Sheridan, as Reynolds would have failed if Reynolds had tried to paint landscapes like those of Wilson. Happily, Johnson soon had an opportunity of proving most signally that his failure was not to be ascribed to intellectual decay.

On Easter eve 1777 some persons, deputed by a meeting which consisted of forty of the first booksellers in London, called upon him. Though he had some scruples about doing business at that season, he received his visitors with much civility. They came to inform him that a new edition of the English poets, from Cowley downwards, was in contemplation, and to ask him to furnish short biographical prefaces. He readily undertook the task, a task for which he was pre-eminently qualified. His knowledge of the literary history of England since the Restoration was unrivalled. That knowledge he had derived partly from books, and partly from sources which had long been closed: from old Grub Street traditions; from the talk of forgotten poetasters and pamphleteers, who had long been lying in parish vaults; from the recollections of such men as Gilbert Walmesley, who had conversed with the wits of Button, Cibber, who had mutilated the plays of two generations of dramatists, Orrery, who had been admitted to the society of Swift, and Savage, who had rendered services of no very honourable kind to Pope. The biographer therefore

sat down to his task with a mind full of matter. He had at first intended to give only a paragraph to every minor poet, and only four or five pages to the greatest name. But the flood of anecdote and criticism overflowed the narrow channel. The work, which was originally meant to consist only of a few sheets, swelled into ten volumes, small volumes, it is true, and not closely printed. The first four appeared in 1779, the remaining six in 1781.

The *Lives of the Poets* are, on the whole, the best of Johnson's works. The narratives are as entertaining as any novel. The remarks on life and on human nature are eminently shrewd and profound. The criticisms are often excellent, and even when grossly and provokingly unjust, well deserve to be studied. For, however erroneous they may be, they are never silly. They are the judgments of a mind trammelled by prejudice and deficient in sensibility, but vigorous and acute. They therefore generally contain a portion of valuable truth which deserves to be separated from the alloy; and, at the very worst, they mean something, a praise to which much of what is called criticism in our time has no pretensions.

Savage's Life Johnson reprinted nearly as it had appeared in 1744. Whoever, after reading that life, will turn to the other lives will be struck by the difference of style. Since Johnson had been at ease in his circumstances he had written little and had talked much. When therefore he, after the lapse of years, resumed his pen, the mannerism which he had contracted while he was in the constant habit of elaborate composition was less perceptible than formerly, and his diction frequently had a colloquial ease which it had formerly wanted. The improvement may be discerned by a skilful critic in the *Journey to the Hebrides*, and in the *Lives of the Poets* is so obvious that it cannot escape the notice of the most careless reader.

Among the *Lives* the best are perhaps those of Cowley, Dryden, and Pope. The very worst is, beyond all doubt, that of Gray.

This great work at once became popular. There was, indeed, much just and much unjust censure; but even those who were loudest in blame were attracted by the book in spite of themselves. Malone computed the gains of the publishers at five or six thousand pounds. But the writer was very poorly remunerated. Intending at first to write very short prefaces, he had stipulated for only two hundred guineas. The booksellers, when they saw how far his performance had surpassed his promise, added only another hundred. Indeed Johnson, though he did not despise or affect to despise money, and though his strong sense and long experience ought to have qualified him to protect his own interests, seems to have been singularly unskilful and unlucky in his literary bargains. He was generally reputed the first English writer of his time. Yet several writers of his time sold their copyrights for sums such as he never ventured to ask. To give a single instance, Robertson received four thousand five hundred pounds for the *History of Charles V.*; and it is no disrespect to the memory of Robertson to say that the *History of Charles V.* is both a less valuable and a less amusing book than the *Lives of the Poets*.

Johnson was now in his seventy-second year. The infirmities of age were coming fast upon him. That inevitable event of which he never thought without horror was brought near to him; and his whole life was darkened by the shadow of death. He had often to pay the cruel price of longevity. Every year he lost what could never be replaced. The strange dependants to whom he had given shelter, and to whom, in spite of their faults, he was strongly attached by habit, dropped off one by one; and, in the silence of his home, he regretted even the noise of their scolding matches. The kind and generous Thrale

was no more; and it would have been well if his wife had been laid beside him. But she survived to be the laughing-stock of those who had envied her, and to draw from the eyes of the old man who had loved her beyond anything in the world tears far more bitter than he would have shed over her grave. With some estimable and many agreeable qualities, she was not made to be independent. The control of a mind more steadfast than her own was necessary to her respectability. While she was restrained by her husband, a man of sense and firmness, indulgent to her taste in trifles, but always the undisputed master of his house, her worst offences had been impertinent jokes, white lies, and short fits of pettishness ending in sunny good humour. But he was gone; and she was left an opulent widow of forty, with strong sensibility, volatile fancy, and slender judgment. She soon fell in love with a music-master from Brescia, in whom nobody but herself could discover anything to admire. Her pride, and perhaps some better feelings, struggled hard against this degrading passion. But the struggle irritated her nerves, soured her temper, and at length endangered her health. Conscious that her choice was one which Johnson could not approve, she became desirous to escape from his inspection. Her manner towards him changed. She was sometimes cold and sometimes petulant. She did not conceal her joy when he left Streatham; she never pressed him to return; and, if he came unbidden, she received him in a manner which convinced him that he was no longer a welcome guest. He took the very intelligible hints which she gave. He read for the last time a chapter of the Greek Testament in the library which had been formed by himself. In a solemn and tender prayer he commended the house and its inmates to the Divine protection, and, with emotions which choked his voice and convulsed his powerful frame, left for ever that beloved home for the gloomy and desolate house behind Fleet Street, where the few and evil days which still remained to him were to run out. Here, in June 1783, he had a paralytic stroke, from which, however, he recovered, and which does not appear to have at all impaired his intellectual faculties. But other maladies came thick upon him. His asthma tormented him day and night. Dropsical symptoms made their appearance. While sinking under a complication of diseases, he heard that the woman whose friendship had been the chief happiness of sixteen years of his life had married an Italian fiddler, that all London was crying shame upon her, and that the newspapers and magazines were filled with allusions to the Ephesian matron and the two pictures in Hamlet. He vehemently said that he would try to forget her existence. He never uttered her name. Every memorial of her which met his eye he flung into the fire. She meanwhile fled from the laughter and hisses of her countrymen and countrywomen to a land where she was unknown, hastened across Mount Cenis, and learned, while passing a merry Christmas of concerts and lemonade parties at Milan, that the great man with whose name hers is inseparably associated had ceased to exist.

He had, in spite of much mental and much bodily affliction, clung vehemently to life. The feeling described in that fine but gloomy paper which closes the series of his *Idlers* seemed to grow stronger in him as his last hour drew near. He fancied that he should be able to draw his breath more easily in a southern climate, and would probably have set out for Rome and Naples but for his fear of the expense of the journey. That expense, indeed, he had the means of defraying; for he had laid up about two thousand pounds, the fruit of labours which had made the fortune of several publishers. But he was unwilling to break in upon this hoard, and he seems to have wished even to keep its existence a secret. Some of his friends

hoped that the Government might be induced to increase his pension to six hundred pounds a year, but this hope was disappointed, and he resolved to stand one English winter more. That winter was his last. His legs grew weaker; his breath grew shorter; the fatal water gathered fast, in spite of incisions which he, courageous against pain but timid against death, urged his surgeons to make deeper and deeper. Though the tender care which had mitigated his sufferings during months of sickness at Streatham was withdrawn, he was not left desolate. The ablest physicians and surgeons attended him, and refused to accept fees from him. Burke parted from him with deep emotion. Windham sat much in the sick room, arranged the pillows, and sent his own servant to watch at night by the bed. Frances Burney, whom the old man had cherished with fatherly kindness, stood weeping at the door; while Langton, whose piety eminently qualified him to be an adviser and comforter at such a time, received the last pressure of his friend's hand within. When at length the moment, dreaded through so many years, came close, the dark cloud passed away from Johnson's mind. His temper became unusually patient and gentle; he ceased to think with terror of death, and of that which lies beyond death; and he spoke much of the mercy of God, and of the propitiation of Christ. In this serene frame of mind he died on the 13th of December 1784. He was laid, a week later, in Westminster Abbey, among the eminent men of whom he had been the historian.—Cowley and Denham, Dryden and Congreve, Gay, Prior, and Addison.

Since his death the popularity of his works—the *Lives of the Poets*, and perhaps the *Famity of Human Wishes*, excepted—has greatly diminished. His *Dictionary* has been altered by editors till it can scarcely be called his. An allusion to his *Rambler* or his *Idler* is not readily apprehended in literary circles. The fame even of *Rasselas* has grown somewhat dim. But, though the celebrity of the writings may have declined, the celebrity of the writer, strange to say, is as great as ever. Boswell's book has done for him more than the best of his own books could do. The memory of other authors is kept alive by their works. But the memory of Johnson keeps many of his works alive. The old philosopher is still among us in the brown coat with the metal buttons and the shirt which ought to be at wash, blinking, puffing, rolling his head, drumming with his fingers, tearing his meat like a tiger, and swallowing his tea in oceans. No human being who has been more than seventy years in the grave is so well known to us. And it is but just to say that our intimate acquaintance with what he would, himself have called the anfractuosités of his intellect and of his temper serves only to strengthen our conviction that he was both a great and a good man.

(M.)

JOHNSTON, ALBERT SIDNEY (1803-1862), American soldier, was born in Kentucky in 1803. After graduating at West Point in 1826 he served for eight years in the United States army, emigrated to Texas in 1834, and entered the Texan service as private in 1836. His promotion was so rapid that in 1838 he was appointed commander-in-chief, and till 1840 acted as secretary for war. From 1840 till 1846 he lived in retirement on his farm in Texas; but in the latter year he accepted the colonelcy of a regiment of Texan volunteers to serve against Mexico. As a staff-officer he was present at the battle of Monterey in September 1846. Texas joined the Union in 1845; and in 1849 Johnston received a major's commission in the United States army. After various services he won the rank of brevet brigadier-general by his skillful conduct of the expedition sent to Utah in 1857 to bring the Mormons to order. In January 1861 he was transferred from the command of the Texas department to that of

the Pacific department; but in April he was superseded, probably on account of his secessionist sympathies. He resigned his national commission in May 1861, and accepted a command in the Confederate army. While acting as commander-in-chief at the battle of Shiloh, he was killed, April 6, 1862.

JOHNSTON, ALEXANDER KEITH (1804-1871), geographer, was born at Kirkhill near Edinburgh, in December 1804. After an education at the High School of Edinburgh he was apprenticed to an engraver; and about 1830 he joined his brother in a prosperous printing and engraving business. His passion for geography had early developed itself, but his first important work was the *National Atlas* of general geography, which gained for him in 1843 the appointment of geographer-royal for Scotland. Johnston was the first to bring the study of physical geography into competent notice in England. His attention had been called to the subject by Humboldt; and after years of labour he published his magnificent *Physical Atlas* in 1848, followed by a second and enlarged edition in 1856. This, by means of maps with descriptive letterpress, illustrates the geology, hydrography, meteorology, botany, zoology, and ethnology of the globe, and undoubtedly marks an epoch in the history of English geographical science. The rest of Johnston's life was equally given to geography, his later years to its educational aspects especially. His services were recognized by election to fellowships of the leading scientific societies of Europe, India, and America. For his chart of the geographical distribution of health and disease he received the diploma of the London Epidemiological Society; in 1855 he received the degree of LL.D. from Edinburgh University; and in 1871 the Royal Geographical Society awarded him its Victoria medal. He died July 9, 1871. His son of the same name (1844-1879) was also the author of various geographical works and papers.

Johnston published a *Dictionary of Geography* in 1850, with many later editions; *The Royal Atlas of Modern Geography*, begun in 1855; an atlas of military geography to accompany Alison's *History of Europe*; and a variety of other atlases and maps for educational or scientific purposes.

JOHNSTONE, a manufacturing town in the county of Renfrew, Scotland, is situated on the Black Cart river, about 10 miles west of Glasgow, with which it is connected by rail. First founded in 1781, it rose rapidly in prosperity owing to the introduction of the cotton-manufacture. The town contains several engineering works, a paper mill, and the largest flax mill in Scotland. About a mile to the east is Elderslie, the traditional birthplace of Wallace. The population in 1871 was 7538, and in 1881 9268.

JOHNSTOWN, a burgh of Cambria county, Pennsylvania, U.S., is situated on the Stony Creek and the Cone-maugh river, 78 miles east of Pittsburgh and 277 miles west of Philadelphia. It is the centre of nine contiguous boroughs constituting one town of 22,000 inhabitants, who are mainly employed by the Cambria Iron Company in the manufacture of iron, steel, railway bars, wire, &c. There are large woollen and flouring mills, numerous churches, and a public library. The library building was presented to the Library Association by the Cambria Iron Company. The population in 1870 was 6028, and in 1880 8380.

JOHORE, a native state at the southern end of the Malay or Malacca peninsula, bounded by the Moar river on the N.W. and by the Indu on the N.E., with an area estimated at 20,000 square miles. The territory, covered for the most part by virgin forest, has been but partially explored; but it is gradually being opened up under the patronage of the rajah Abubakar (born 5th December 1833), who has visited Europe, as well as Java and other eastern countries, and takes a keen interest in the development of his country. At present the principal

exports from Johore are gambier and catechu, black pepper, timber, rattans, and dammar; but the soil and climate are well fitted for the growth of sugar-cane, rice, tobacco, coffee, and similar products, and the rajah is promoting the formation of regular plantations. The town of Johore is a flourishing little settlement 15 miles north-east of Singapore, in $1^{\circ} 0' 26''$ N. lat. and $103^{\circ} 47'$ E. long. A school where English is taught has been founded in the town by the rajah, who also maintains a similar institution in Singapore. The population of the country, exclusive of the tribes of the interior, is estimated at 100,000, the greater number being Malays and Chinese. It was the present rajah's grandfather—Abdulrahman Tumongong of Rio, Singapore, and Johore—who ceded Singapore to the British. The dynasty is the continuation of the sultans of Malacca, who retired to Johore on the conquest of their capital in 1311 by Albuquerque. Bokhari, author of *Makotta Raja Raja*, one of the most remarkable productions in the Malay tongue, was a native of Johore.

JOIGNY, chief town of an arrondissement in the department of Yonne, France, is situated on the right bank of the Yonne, about 12 miles north-west of Auxerre. Its streets are steep and narrow; some of the houses are of wood, and date from the 15th or 16th century. Joigny has tribunals of first instance and commerce, a communal college, a library with 9000 volumes, and a civil and military hospital, and manufactures cloth, hunting and other arms, percussion-caps, leather, cooper work, and brandy. It has also trade in corals, cattle, and wood, and in an excellent variety of wine, produced in the neighbourhood. The chief buildings are the old and interesting churches of St Andrew, St John, and St Thibaut; the ruins of the old castle of the 10th century; the partly destroyed later castle; the large 10th century tower beside the prison; the hôtel-de-ville, of 1737; the palais-de-justice, including the fine chapel of the Ferrands; the collegio; and the stone bridge of seven arches. Of the former massive fortifications, St John's gate and the moat are the chief remains. The population in 1876 was 5975.

Joigny, in Latin *Jovinianum*, is held to have been founded by Flavius Jovinius, *magister equitum* under the emperor Valentinian (361 A.D.). It gave its name to an important line of mediæval counts (whence sprang the counts of Jolivillo), who about 1716 merged in the dukes of Villarois.

JOINERY. See **BUILDING**, vol. iv. p. 485.

JOINT, in law, as applied to obligations, estates, &c., implies that the rights in question relate to the aggregate of the parties joined. Obligations to which several are parties may be *several*, i.e., enforceable against each independently of the others, or *joint*, i.e., enforceable only against all of them taken together, or *joint and several*, i.e., enforceable against each or all at the option of the claimant. So an interest or estate given to two or more persons for their joint lives continues only so long as all the lives are in existence. Joint-tenants are co-owners who take together at the same time, by the same title, and without any difference in the quality or extent of their respective interests; and when one of the joint-tenants dies his share, instead of going to his own heirs, lapses to his co-tenants by survivorship. This estate is therefore to be carefully distinguished from *tenancy in common*, when the co-tenants have each a separate interest which on death passes to the heirs and not to the surviving tenants. When several take an estate together any words or facts implying severance will prevent the tenancy from being construed as joint.

JOINTS, in the sense in which engineers use the word, may be classed either (a) according to their material, as in stone or brick, wood, or metal; or (b) according to their object, to prevent leakage of air, steam, or water, or to transmit force, which may be thrust, pull, or shear; or (c) according as they are stationary or moving ("working"

in technical language). Many joints, like those of ship-plates and boiler-plates, have simultaneously to fulfil both objects mentioned under (b).

All stone joints of any consequence are stationary. It being uneconomical to dress the surfaces of the stones resting on each other smoothly and so as to be accurately flat, a layer of mortar or other cementing material is laid between them. This hardens and serves to transmit the pressure from stone to stone without its being concentrated at the "high places." If the ingredients of the cement are chosen so that when hard the cement has about the same coefficient of compressibility as that of the stone or brick, the pressure will be nearly uniformly distributed. The cement also adheres to the surfaces of the stone or brick, and allows a certain amount of tension to be borne by the joint. It likewise prevents the stones slipping one on the other, i.e., it gives the joint very considerable shearing strength. The composition of the cement is chosen according as it has to "set" in air or water. The joints are made impervious to air or water by "pointing" their outer edges with a superior quality of cement.

Wood joints are also nearly all stationary. *Lignum vitæ* is still used by engineers for the one half of some special working joints, but even in these few instances its use is rapidly dying out. Wood joints are made partially fluid-tight by "grooving" and "tenoning," and by "caulking" with oakum or similar material. If the wood is saturated with water, it swells, the edges of the joints press closer together, and the joints become tighter the greater the water-pressure is which tends to produce leakage.

Relatively to its weaker general strength, wood is a better material than iron so far as regards the transmission of a thrust past a joint. So soon as a heavy pressure comes on the joint all the small irregularities of the surfaces in contact are crushed up, and there results an approximately uniform distribution of the pressure over the whole area (i.e., if there be no bending force), so that no part of the material is unduly stressed. To attain this result the abutting surfaces should be well fitted together, and the bolts binding the pieces together should be arranged so as to ensure that they will not interfere with the timber surfaces coming into this close contact.

Owing to its weak shearing strength on sections parallel to the fibre, timber is peculiarly unfitted for tension joints. If the pieces exerting the pull are simply bolted together with wooden or iron bolts, the joint cannot be trusted to transmit any considerable force with safety. The stresses become intensely localized in the immediate neighbourhood of the bolts. A tolerably strong timber tension-joint can, however, be made by making the two pieces abut, and connecting them by means of iron plates covering the joint and bolted to the sides of the timbers by bolts passing through the wood. These plates should have their surfaces which lie against the wood ribbed in a direction transverse to the pull. The bolts should fit their holes loosely, and should be well tightened up so as to make the ribs sink into the surface of the timber. There will then be very little localized shearing stress brought upon the interior portions of the wood.

Metal Joints.—Iron and the other commonly used metals possess in variously high degrees the qualities desirable in substances out of which joints are to be made. The joint ends of metal pieces can easily be fashioned to any advantageous form and size without waste of material. Also these metals offer peculiar facilities for the cutting of their surfaces at a comparatively small cost so smoothly and evenly as to ensure the close contact over their whole areas of surfaces placed against each other. This is of the highest importance, especially in joints designed to transmit force.

Wrought iron and mild steel are above all other metals suitable for tension joints where there is not continuous rapid motion. Where such motion occurs, a layer, or, as it is technically termed, a "bush," of brass is inserted underneath the iron. The joint then possesses the high strength of a wrought iron one and at the same time the good frictional qualities of a brass surface.

Where the running speed is high and the intensity of pressure can be made small by adopting large bearing surfaces, cast iron is now increasingly preferred for pressure joints. But when, owing to want of space or for other reasons, the bearing surface cannot be made large in proportion to the thrust to be transmitted, gun-metal, *i.e.*, the toughest quality of brass, should be used if the speed be high, and steel if the speed be small.

Leakage past moving metal joints can be prevented by cutting the surfaces very accurately to fit each other. Steam-engine slide-valves and their seats, and piston "packing-rings" and the cylinders they work to and fro in, may be cited as examples. A subsidiary compressible "packing" is in other situations employed, an instance of which may be seen in the "stuffing boxes" which prevent the escape of steam from steam-engine cylinders through the piston-rod hole in the cylinder cover.

Fixed metal joints are made fluid tight—(a) by caulking a rivetted joint, *i.e.*, by hammering in the edge of the metal with a square-edged chisel (the tighter the joint requires to be against leakage the closer must be the spacing of the rivets—compare the rivet-spacing in bridge, ship, and boiler-plate joints); (b) by the insertion between the surfaces of a layer of one or other of various kinds of cement, the layer being thick or thin according to circumstances; (c) by the insertion of a layer of soft solid substance called "packing" or "insertion." A special kind of indiarubber and canvas sheet is prepared for this purpose. A very effective species of "insertion" is thin copper gauze. Sometimes a single round of thick copper wire laid in opposite grooves cut on joint-surfaces serves the purpose.

The Principles of the Strength of Joints.—The conditions of strength of cemented and glued joints are too obvious to require description. It may, however, be mentioned that in most cases the joint is stronger the thinner the layer of cementing material interposed between the surfaces.

Nearly all other joints are formed by cutting one or more holes in the ends of the pieces to be joined, and inserting in these holes a corresponding number of pins. The word "pin" is technically restricted to mean a cylindrical pin in a movable joint. The word "bolt" is used when the cylindrical pin is screwed up tight with a nut so as to be immovable. When the pin is not screwed, but is fastened by being beaten down on either end, it is called a "rivet." The pin is sometimes rectangular in section, and tapered or parallel lengthwise. "Gibs" and "cotters" are examples of the latter. It is very rarely the case that fixed joints have their pins subject to simple compression in the direction of their length. They are, however, frequently subject to simple tension in that direction. A good example is the joint between a steam cylinder and its cover. Here the bolts have to resist the whole thrust of the steam, and at the same time to keep the joint steam-tight.

If D be the cylinder diameter, t the thickness of the flange of the cover, and n the number of bolts used, it can be shown that the amount the flange rises between the bolts by bending is proportional to $\frac{pD^2}{n}$, where p is the steam pressure per unit area. If the same degree of tightness be desired for all sizes of cylinders, this deflexion should be the same for all. The spacing of the bolts is proportional to $\frac{D}{n}$, and, therefore, we should have the spacing $\propto p^{-\frac{1}{2}}$. If then the total bolt area is made proportional to the total steam

pressure, it would follow that the diameter of bolt $\propto p^{\frac{1}{2}} D^{\frac{1}{2}}$. Again, if t were reckoned in accordance with the shearing force of the steam on the circular section of the cover at the circumference of the cylinder, *i.e.*, $t \propto pD$, we would have

$$\text{spacing} \propto p^{\frac{1}{2}} D^{\frac{1}{2}}, \\ \text{and bolt diam.} \propto p^{\frac{1}{2}} D^{\frac{1}{2}}.$$

For reasons connected with technical difficulties in the foundry, t is made larger in proportion to D than this rule indicates for the smaller sizes of cylinders; and, therefore, the spacing and the bolt diameter are not made to increase quite so rapidly as the $\frac{1}{2}$ and $\frac{1}{2}$ powers of D .

No moving joints have their pins exposed to simple stress on sections transverse to the pins' axes. The pins of such joints have these transverse sections subjected to shearing and bending stresses, and the sections parallel to the pin axes to compressive stress.

The simplest case by which the subject can be illustrated is that in which a cylindrical pin passes through the ends of two links—one forked, and the other simple and lying between the branches of the fork of the other.

Let the accompanying diagram represent the end of the unforked link. The width of the link parallel to CC' is taken as unity, and the letters on the figure indicate the ratios of the respective dimensions to this width. Let δ represent the ratio of the thickness, perpendicular to the paper, of the "eye" to the thickness in the same direction of the main body of the link at D . Let also f be the intensity of uniform tensile stress on the section at D . Evidently no pressure comes on the under side of the pin below OC' . The whole pull at D is passed round half on each side of the pin, and is delivered to the upper side of the pin, on which it produces compression. Since the side sections t , through which the pull passes, lie out of the direct line of that pull, the stress is much higher on the parts of these sections towards the centre line DD' than on those further off. The lines of force crowd as close as possible together near the surface of the pin, *i.e.*, towards the main line DD' of the pull. In other words, the inequality of stress is occasioned by the bending moments due to the centre of force not passing through the centres of gravity of area of the sections. The inequality begins at the root of the widening out of the link to form the eye, and reaches its maximum at OC' .

The bending moment at OC' and the stress caused by it at the edge of the section can be found by the help of the ordinary theory of elasticity. The best method of doing so is to calculate the amount by which the portion of the eye below OC' is bent by the forces applied to it. In the equations the bending moment at OC' is inserted as an unknown quantity. The section on DD' remaining unmoved, each element of the linear deflexion is resolved parallel to OC' , and the integral from DD' up to OC' of all these components parallel to OC' is equated to zero, the resultant deflexion at O in the direction of OC' being evidently nil. This equation gives the value of the bending moment at OC' , and from it the corresponding stress is obtained.

If the section at D be rectangular, as also that at OC' , then the average tensive stress on t is

$$f' = f \frac{1}{2\delta D};$$

and the extra stress caused at the edge of the section by the bending moment is

$$f'' = f \frac{1}{4\delta D} \left\{ 8(t + \delta) - \frac{1}{3\delta + \delta^2} \right\}.$$

The total maximum stress is, therefore,

$$f' + f'' = f \frac{1}{4\delta D} \left\{ 8t + 3\delta - \frac{1}{3\delta + \delta^2} \right\}.$$

This gives the ratio of the maximum tension at the side of the eye

to the uniform tension (f) on the main body of the link at D. If the section at D be circular while t remains rectangular, the corresponding ratio is a little more than $\frac{1}{2}\pi$, or about $\frac{1}{2}$ of the above. If it is desired that this maximum should not exceed f , we obtain a relation between the ratios d , t and b by putting $f' + f'' = f$. The following table exhibits the results of this calculation for rectangular section at D:—

$t =$	$\frac{1}{2}$	$\frac{2}{3}$	$\frac{3}{4}$	$\frac{4}{5}$	1
$d = \frac{1}{2}b$ and $b =$	3.1	2.5	2	1.7	1.5
$d = \frac{2}{3}b$ " $b =$	4	3	2.4	2	1.7
$d = \frac{3}{4}b$ " $b =$	4.9	3.5	2.8	2.3	1.9

For circular section at D, b is about $\frac{2}{3}$ of these values.

Although the values of t and d that are commonly used all fall considerably within the limits of the above tables, the values of b usually found in practice are much less than those shown above. This means that the eyes of links as commonly proportioned are much more severely stressed than is the main body of the link.

In working joints the frictional resistance to rotation throws more than half the main pull on one side of the eye, and this side is therefore still more severely stressed than is indicated by the above equations.

The stresses on the portion of the eye lying above CC' are complicated by the combination with the direct pull already mentioned of the pressure of the upper surface of the pin. This latter is normal at each point if the surface be smooth and the joint a motionless one. It increases from zero at CC' to a maximum at the line DD' . At this point the intensity of the surface pressure is, according to an approximate theoretic estimate, about $\frac{1}{2}\pi$, or 1.5

times greater than if the whole pull were evenly distributed over the projection on CC' of the upper half surface of the pin. It has often been fallaciously imagined that the central section t_1 is exposed to severe shearing stress. From the symmetry of the case, however, it is evident that on this section the shear is zero. The maximum shear occurs on a section nearly parallel to DD' , and somewhat less than $\frac{1}{2}d$ distant from DD' . The exact position of this section of maximum shear depends upon the dimension-ratio t_1 , which is usually made considerably greater than t .

The pin surface pressure has transverse components parallel to CC' , which produce tension and a bending moment on the section t_1 .

A theoretical approximation to this bursting pressure is $\frac{1}{2}\pi$, or about $\frac{1}{2}$ of the whole pull exerted by the link, and the line of the resultant (parallel to CC') is situated $\frac{1}{2}d$ distant from the centre of the pin. A small portion of this is borne by the central section on DD' of the main part of the link below CC' , but by far the larger part is borne by the section marked t_1 . If it were wholly borne by that section, the average tension on t_1 would, for a circular section at D, be $\frac{f}{4t_1b}$, and the extra stress produced by this bending moment

would be $\frac{f}{4t_1b} \left(8 + \frac{d}{t_1} \right)$. Other bending moments, however, are thrown on this section due to—first, the resultant of the pin-surface-pressure-components parallel to DD' , which lies at $\frac{2}{3}\pi$, or about $\frac{1}{2}d$, from the line DD' ; and, second, the stress at the section CC' . Adding all these together, there is obtained an approximation to the actual tension parallel to CC' on the lower edge of the section t_1 , namely,

$$\frac{f}{4t_1b} \left\{ 1 + \frac{1}{2} \frac{d}{t_1} - \frac{2}{3} \frac{d}{t_1} - \frac{1}{6t_1(3d+d)} \right\}.$$

The shearing and bending stresses upon the pin itself depend upon whether one of the links is forked or both are simple; and also greatly upon the exactitude with which the pin fits the holes. When the link exerts a thrust instead of a pull through the joint, a similar investigation of the state of stress may be made.

A couple of plates joined together by a single row of rivets may, so far as concerns the sections lying between the rivets, be looked upon as a number of flat links laid side by side with their eyes of equal width with the body of the link.

We may therefore apply the first of the above equations for $f' + f''$ to find the stress close to the rivets on the section coinciding with the line of the rivets. To adapt the formula to this case, it is only necessary to put $b = 1$ and $t = \frac{1}{2}(1 - \delta)$. The formula thus derived, however, gives results probably considerably higher than those actually occurring, because of the strips into which the plate has been supposed to be divided, acting on each other in such a way as to produce bending moments partly neutralizing the above increase of stress.

The strip of metal between the rivets and the edge of the plate is in the condition of a continuous beam supported by the rivets.

The maximum moment occurs just over the rivets, and is nearly the same as if the load were uniformly distributed over the length of the beam. If t_1 be the ratio to the rivet-spacing of the distance of the edge of the plate to the rivet hole, the supposition of uniformity of distribution of load gives the equation $f' = \frac{1}{2t_1}$ for the maximum stress on a section perpendicular to the plate edge. To make $f' = f$, it is necessary to make $t_1 = \sqrt{0.5} = 0.7$. The edge of the plate will then be amply strong enough to resist the greatest shear to which it is anywhere exposed.

When there are two or more rows of rivets the investigation of the stress is quite similar to the above.

In joints where the movement is rapid and continuous, the size of the pin is determined by considerations of durability against wear. The metal wears rapidly if the bearing surfaces are not well lubricated. The lubricant is pressed out from between these surfaces if the intensity of pressure exceeds a limit determined by the character of the lubricant. The size of the pin must be sufficient to prevent this limiting pressure being reached. Even before the oil is wholly squeezed out the friction becomes so great as to heat the metal surfaces to a high temperature, which hastens the evaporation of the remaining oil. In order to ensure that the temperature may be kept low by the continuous dissipation of the heat generated, some engineers design the bearing surface in proportion to the product of the pressure and the speed, so as to allow a certain area of "conducting surface" for each unit of heat generated per second.

JOINT STOCK COMPANIES. See COMPANY, vol. vi. p. 221.

JOINVILLE, JEAN DE (1224–1319), was the second great writer of history in Old French, and in a manner occupies the interval between Villehardouin and Froissart. From the point of view of literary history there are numerous minor chroniclers who fill up the gaps, but no one of them has the idiosyncrasy which distinguishes these three writers, and for general purposes it may be said that they complete the series of historians illustrating, as no series in any other country or language illustrates, the three periods of the Middle Ages—adolescence, complete manhood, and decadence. Joinville was born in 1224 of a good family of the province of Champagne, allied to many distinguished houses in the east of France and connected by marriage with the emperor Frederick II. The property of the Joinvilles came, curiously enough, like that of Comines, the fourth great historian of old France, into the hands of the Orleans family, and the castle, which overhung the Marne, was sold in 1791 for purposes of demolition. The provincial court of the counts of Champagne had long been a distinguished one, and the action of Thibaut the poet, together with the neighbourhood of the district to Paris, made the province less rebellious than most of the great feudal divisions of France to the royal authority. Joinville's first appearance at the king's court was in 1241, when he performed the functions of carver for his feudal superior on the occasion of the knightings of Louis IX.'s younger brother Alphonse. Seven years afterwards, when he was four and twenty, he took the cross, thereby giving St Louis a valuable follower, and supplying himself with the occasion of an eternal memory. His family had been persistent crusaders for several generations. The crusade, however, in which he distinguished himself equally by wisdom and prowess, taught his practical spirit several lessons. He returned with the king in 1254. But, though his reverence for the personal character of his prince seems to have known no bounds, he had probably gauged accurately enough the strategic faculties of the saintly king, and he certainly had imbibed the spirit of the dictum that a man's first duties are those to his own house. He was in the intervals of his residence on his own fief a constant attendant on the court, but he declined to accompany the

king on his last and fatal expedition. Some years later, in 1282, he was one of the witnesses whose testimony was formally given at St Denis in the matter of the canonization of Louis, and long afterwards, in 1298, being then a man of more than seventy years, he was present at the exhumation of the saint's body. It was not till even later that he began his literary work, the occasion being a request from Jeanne of Navarre, the wife of Philippe le Bel and the mother of Louis le Hutin. The great interval between his experiences and the period of the composition of his history is important for the due comprehension of the latter. Books were not hastily written in those days, and some years passed before the task was completed, on its own showing, in October 1309. Jeanne was by this time dead, and Joinville presented his book to her son Louis the Quarreller. This the original manuscript is now lost, whereby hangs a tale. Great as was his age, Joinville had not ceased to be actively loyal, and in 1315, being then almost ninety, he complied with the royal summons to bear arms against the Flemings. He was at Joinville again in 1317, and on the 11th July 1319 he died at the age of ninety-five, leaving his possessions and his position as seneschal of Champagne to his second son Anselm. He was buried in the neighbouring church of St Laurent, where during the Revolution his bones underwent the usual profanation. In the next generation but one his male heirs failed, and the fief passed by marriage through the house of Lorraine to the Guises, and so to the house of Orleans. Besides his *Histoire de Saint Louis* and his *Credo* or "Confession of Faith," written much earlier, a considerable number, relatively speaking, of letters and business documents concerning the fief of Joinville and so forth are extant. These have an importance which we shall consider further on; but Joinville owes his place in general estimation only to his history of his crusading experiences and of the subsequent fate of his hero.

Of the famous French history books of the Middle Ages Joinville's is beyond all doubt that which bears most vivid impress of the personal characteristics of its composer. It does not, like Villehardouin, give us the picture of the temper and habits of a whole order or cast of men during an heroic period of human history; it falls far short of Froissart in vivid portraying of the picturesque and external aspects of social life; but it is altogether a more personal book than either. As has been already noticed, the age and circumstances of the writer must not be forgotten in reading it. He is a very old man telling of circumstances which occurred in his youth. He evidently thinks that the times have not changed for the better—what with the frequency with which the devil is invoked in modern France, and the sinful expenditure common in the matter of embroidered silk coats. But his laudation of times past concentrates itself almost wholly on the person of the sainted king whom, while with feudal independence he had declined to swear fealty to him, "because I was not his man," he evidently regarded with an unlimited reverence. His age, too, while it is garrulous to a degree, seems to have been entirely free from the slightest taint of boasting. No one perhaps ever took less trouble to make himself out a hero than Joinville. He is constantly admitting that on such and such an occasion he was terribly afraid, he confesses without the least shame that, when one of his followers suggested defiance of the Saracens and voluntary death, he (Joinville) paid not the least attention to him; nor does he attempt to gloss in any way his refusal to accompany St Louis on his unlucky second crusade, or his invincible conviction that it was better to be in mortal sin than to have the leprosy, or his decided preference for wine as little watered as might be, or any other weakness. Yet he was a sincerely religious man, as the curious *Credo*

written at Acre and forming a kind of anticipated appendix to the history seems sufficiently to show. He presents himself as an altogether human person, brave enough in the field, and at least when young capable of extravagant devotion to an ideal, provided the ideal was fashionable, but having at bottom a sufficient respect for his own skin and a full consciousness of the side on which his bread is buttered. Nor can he be said to be in all respects an intelligent traveller. There were in him what may be called glimmerings of deliberate literature, but they were hardly more than glimmerings. His famous description of Greek fire has a most provoking mixture of circumstantial detail with absence of verifying particulars. It is as matter of fact and comparative as Dante, without a touch of Dante's genius. "The fashion of Greek fire was such that it came to us as great as a tun of verjuice, and the fiery tail of it was as big as a mighty lance; it made such noise in the coming that it seemed like the thunder from heaven, and looked like a dragon flying through the air; so great a light did it throw that throughout the host men saw as though it were day for the light it threw." Certainly the excellent seneschal has not stinted himself of comparisons here, yet they can hardly be said to be luminous. That the thing made a great flame, a great noise, and struck terror into the beholder, is about the sum of it all. Every now and then indeed a striking circumstance, strikingly told, occurs in Joinville, such as the famous incident of the woman who carried in one hand a chafing dish of fire, in the other a phial of water, that she might burn heaven and quench hell, lest in future any man should serve God merely for hope of the one or fear of the other. But in these cases the author only repeats what he has heard from others. On his own account he is much more interested in small personal details than in greater things. How the Saracens, when they took him prisoner, he being half dead with a complication of diseases, kindly left him "un nien couverture d'écarlate" which his mother had given him, and which he put over him, having made a hole therein and bound it round him with a cord; how when he came to Acre in a dilapidated condition an old servant of his house presented himself, and "brought me clean white hoods and combed my hair most comfortably"; how he bought a hundred tuns of wine and served it—the best first, according to high authority—well-watered to his private soldiers, somewhat less watered to the squires, and to the knights neat, but with a suggestive phial of the weaker liquid to mix "si comme ils vouloient,"—these are the details in which he seems to take greatest pleasure, and for readers six hundred years after date perhaps they are not the least interesting details.

It would, however, be a mistake to imagine that Joinville's book is exclusively or even mainly a chronicle of small beer. If he is not a Villehardouin or a Carlyle, his battlepieces are vivid and truthful, and he has occasional passages of no small episodic importance, such as that dealing with the Old Man of the Mountain. But, above all, the central figure of his book redeems it from the possibility of the charge of being commonplace or ignoble. To St Louis Joinville is a nobler Boswell, and hero-worshipper, hero, and heroic ideal, all have something of the sublime about them. The very pettiness of the details in which the good seneschal indulges as to his own weaknesses only serves to enhance the sublime unworldliness of the king. Joinville is a better warrior than Louis, but, while the former frankly prays for his own safety, the latter only thinks of his army's when they have escaped from the hands of the aliens. One of the king's knights boasts that ten thousand pieces have been "forcontés" (counted short) to the Saracens; and it is with the utmost trouble that Joinville and the rest can persuade the king that this is a

joke, and that the Saracens are much more likely to have got the advantage. He warns Joinville against wine-bibbing, against bad language, against all manner of foibles small and great; and the pupil acknowledges that this physician at any rate had healed himself in these respects. It is true that he is severe towards infidels; and his approval of the knight who, finding a Jew likely to get the better of a theological argument, resorted to the baculine variety of logic, does not meet the views of the 19th century. But Louis was not of the 19th century but of the 13th, and after his kind he certainly deserved Joinville's admiration. Side by side with his indignation at the idea of cheating his Saracen enemies may be mentioned his answer to those who after Taillebourg complained that he had let off Henry III. too easily. "He is my man now, and he was not before," said the king, a most unpractical person certainly, and in some ways a sore saint for France. But it is easy to understand the half-despairing adoration with which a shrewd and somewhat prosaic person like Joinville must have regarded this flower of chivalry born out of due time. He has had his reward, for assuredly the portrait of St Louis from the early collection of anecdotes to the last hearsay sketch of the woeful end at Tunis, with the famous *Enseignement* which is still the best summary of the theoretical duties of a Christian king in medieval times, is such as to take away all charge of vulgarity or more *commérage* from Joinville, a charge to which otherwise he might perhaps have been exposed.

The arrangement of the book is, considering its circumstances and the date of its composition, sufficiently methodical. According to its own account it is divided into three parts,—the first dealing generally with the character and conduct of the hero; the second with his acts and deeds in Egypt, Palestine, &c., as Joinville knew them; the third with his subsequent life and death. Of those the last is very brief, the first not long; the middle constitutes the bulk of the work. The contents of the first part are, as might be expected, miscellaneous enough, and consist chiefly of stories chosen to show the valour of Louis, his piety, his justice, his personal temperance, and so forth. The second part enters upon the history of the crusade itself, and tells how Joinville—who would hardly have done this later—pledged all his land save so much as would bring in a thousand livres a year, and started with a brave retinue of nine knights (two of whom besides himself wore banners), and shared a ship with the Sire d'Aspremont, leaving Joinville without raising his eyes, "pour ce que le cuer ne me attendrist d'au biax chastel que je lessaie et de mes deux enfans"; how they could not get out of sight of a high mountainous island (Lampedusa or Pantellaria) till they had made a procession round the masts in honour of the Virgin; how they reached first Cyprus and then Egypt; how they took Damietta, and then entangled themselves in the Delta. Bad generalship, which is sufficiently obvious, unwholesome food,—it was Lent, and they ate the Nile fish which had been feasting on the carcases of the slain,—and Greek fire did the rest, and personal valour was of little avail, not merely against superior numbers and better generals, but against dysentery and a certain "mal de l'est" which attacked the mouth and the legs, a curious human version of a well-known bestial malady. After ransom Acre was the chief scene of Louis's stay in the East, and here Joinville lived in some state, and saw not a few interesting things, hearing besides much gossip as to the interior affairs of Asia from ambassadors, merchants, and others. At last they journeyed back again to France, not without considerable experiences of the perils of the deep, which Joinville tells with a good deal of spirit. The remainder of the book is very brief. Some anecdotes of the king's "justice," his favourite and distinguishing

attribute, during the sixteen years which intervened between the two crusades are given; then comes the story of Joinville's own refusal to join the second expedition, a refusal which bluntly alleged the harm done by the king's men who stayed at home to the vassals of those who went abroad as the reason of Joinville's resolution to remain behind. The death of the king at Tunis, his *Enseignement* to his son, and the story of his canonization, complete the work.

The book in which this interesting story is told has had a literary history which less affects its matter than the vicissitudes to which Froissart has been subjected, but which is hardly less curious in its way. There is no reason for supposing that Joinville indulged in various editions, such as those which have given MM Kervyn de Lettenhove and Siméon Luce so much trouble, and which make so vast a difference between the first and the last redaction of the chronicle of the Hundred Years' War. Indeed the great age of the seneschal of Champagne, and his intimate first-hand acquaintance with his subject, made such variations extremely improbable. But, whereas there is no great difficulty (though much labour) in ascertaining the original and all subsequent texts of Froissart, the original text of Joinville was until a few years ago unknown, and even now may be said to be in the state of a conjectural restoration. It has been said that the book was presented to Louis le Hutin. Now we have a catalogue of Louis le Hutin's library, and, strange to say, Joinville does not figure in it. The book seems to have undergone very much the same fate as that which befell the originals of the first two volumes of the *Paston Letters* which Sir John Penn presented to George the Third. Several royal library catalogues of the 14th century are known, but in none of these does the *Itinéraire de St Louis* appear. It does appear in that of Charles V. (1411), but apparently no copy even of this survives. As everybody knows, however, books could be and were multiplied by the process of copying tolerably freely, and a copy at first or second hand which belonged to the siddler King René in the 15th century was used for the first printed edition in 1647. Other editions were printed from other versions, all evidently posterior to the original. But in 1741 the well-known medievalist La Curne de St Yaléry found at Lucca a manuscript of the 16th century, evidently representing an older text than any yet printed. Three years later a 14th century copy was found at Brussels, and this is the standard manuscript authority for the text of Joinville. Those who prefer to rest on MS. authority will probably hold to this text, which appears in the well-known collection of MM. Michard and Penjonias as well as that of Buchon, and in a careful and useful separate edition by M. Françoise Michel. The modern science of critical editing, however, which applies to medieval texts the principles long recognized in editing the classics, has discovered in the 16th century manuscript, and still more in the original miscellaneous works of Joinville, the letters, deeds, &c., already alluded to, the materials for what we have already called a conjectural restoration, which is not without its interest, though perhaps it is possible for that interest to be exaggerated. M. Natis de Wailly is the Joinvillist Orelli or Leuchmann, and his later editions (for he has produced several) exhibit the results of the new learning. These results are not trifling, for all students of Old French know that a remarkable change—from the purely linguistic point of view more remarkable perhaps than any of subsequent occurrence—passed over the language between the beginning and the end of the century in which Joinville died. But they affect the matter of the book little, and as such cannot be compared with the changes evident in the Anglian and Gallican editions, so to speak, of Froissart. Their interest, however, is much too great and too typical not to deserve that some notice should be given to them here.

For merely general readers Buchon's or Michard's editions of Joinville will amply suffice. Both possess translations into modern French, which however, are hardly necessary, for the language is very easy. M. de Wailly's editions of 1868 and 1874 are critical editions, the value of which is considerable, but contestable. They are accompanied by ample annotations and appendices, with illustrations of great merit and value. Much valuable information appeared for the first time in the edition of M. F. Michel, 1859. To these may be added M. A. F. Didot's *Études sur Joinville*, and some articles in the *Bibliothèque de l'École des Chartes* and in *Romania*. A good sketch of the whole subject will be found in Aubertin's *Histoire de la Langue et de la Littérature Françaises au Moyen Âge*, ii. p. 196-211. (G. SA.)

JOLLET, the county seat of Will county, Illinois, United States, is situated on both sides of the Des Plaines river, 40 miles south-west of Chicago, with which it is connected by three railroads and the Illinois and Michigan canal. The State penitentiary near the city, erected at a cost of over \$1,000,000, is one of the largest in the United States.

Manufactures of various kinds, especially of iron and steel, barbed fence wire, agricultural implements and machinery, paper, boots and shoes, cut stone, draining tiles, and sewer pipes, are extensively carried on. The coal-fields of Wilmington, Morris, and Streator are within a few miles of the city. Quarries of good building stone, and deposits of fireclay, sand, and cement gravel abound in the neighbourhood. Joliet is an important railroad centre, from which large quantities of manufactured articles, grain, cattle, and hogs are despatched daily. Population in 1880, 11,659.

JOMINI, HENRY, BARON (1779-1869), general in the French and afterwards in the Russian service, and writer on military tactics, was born 6th March 1779 at Payerne in the canton of Vaud, Switzerland, where his father held the dignity of magistrate. At an early period he showed a marked preference for a military life, but at first he was disappointed of his hopes by the dissolution of the Swiss regiments of France at the Revolution. For some years he acted as clerk in a banking house in Paris, until the outbreak of the Swiss revolution, when he returned to his native country, and at the early age of nineteen was appointed chief secretary of war. At the peace of Lunéville in 1801 he returned to Paris and introduced himself to Marshal Ney, who made him his aide-de-camp and private secretary. In 1804 he published *Traité des grandes opérations militaires*, which in 1805 he presented to Napoleon on the field of Austerlitz as the work of a young Swiss officer. A few days afterwards he was named colonel, and appointed first aide-de-camp to Marshal Ney. In 1806 he published a treatise on the probabilities of the war with Prussia, the ability of which so impressed Napoleon that he resolved to attach him to his person. He was present with Napoleon at the battle of Jena, but afterwards joined Ney, and afforded him important assistance in delivering his army from a very perilous situation. After the peace of Tilsit he was made chief of the staff to Ney, and created a baron. In the Spanish campaign of 1808 his skillful advice contributed in no small degree to the victories of Ney, but on account of that general's jealousy he resigned his commission, and he was entering into negotiations with the emperor of Russia, when Napoleon, learning his intention, compelled him to remain in the French service with the rank of brigadier-general. On his refusal to take part in the Russian campaign, Napoleon named him governor of Wilna; but during the retreat from Moscow he at once placed his strategic skill and knowledge of the country at the service of France, and, having after the battle of Lützen obtained his old office under Marshal Ney, he suggested the happy manœuvre which led to the victory of Bautzen. Finding, however, that the road to promotion was closed against him, he again offered his services to Russia. They were accepted, and he obtained the rank of lieutenant-general and was named aide-de-camp to the emperor. He gave the important assistance of his counsel to the allied armies during the German campaign, but declined to take part in the passage of the Rhine and the invasion of France in 1814. In 1817 he returned to Paris, where he published *Principes de la stratégie*, 3 vols., 1818; *Histoire critique et militaire des campagnes de la Révolution* de 1792 à 1801, 15 vols., 1819-24; *Vie politique et militaire de Napoléon*, 1827. In 1826 he again entered the service of Russia, and in the Turkish campaign of 1828 his sagacious advice led to the capitulation of Varna. Afterwards he was employed in organizing the military academy at St Petersburg and in superintending the military studies of the czarowitz, for the use of whom he wrote *Tableau analytique des principales combinaisons de la guerre*, the new and improved edition of which was named *Précis de l'art de la guerre*. During the later period of his life

Jomini resided at Brussels, but he afterwards returned to Paris, where he died March 24, 1869. Although Jomini played a secondary and unobtrusive part in the great military events of his time, the military triumphs of France were in no inconsiderable degree due to his masterly counsels; and doubtless, had circumstances conspired to grant him the opportunity of playing a practical and independent rôle, he would have achieved for himself a place among the greatest generals of his country. His delineations of the campaigns of Napoleon are the ablest military account of these great wars, and his exposition of the laws of tactics and strategy have achieved for him European fame.

See Ferdinand Lecomte, *Le Général Jomini, sa vie et ses écrits*, 1861, and *Le Général Jomini*, by Sainte-Beuve, 1869.

JOMMELLI, NICCOLÒ (1714-1774), a famous Italian composer of the last century, was born at Aversa near Naples, September 11, 1714, and received his musical education at two of the famous music schools of that capital, being at first a pupil of Durante at the Conservatorio di San Onofrio, and subsequently studying composition under Leo at La Pietà dei Turchini. His first opera, *L'Erore Amoro*, was produced when Jommelli was only twenty-three, at Naples, and so timid was the young composer that he prefixed a pseudonym to his work. The result, however, was favourable beyond all expectation, and encouraged Jommelli to continue his career as a dramatic composer. Three years afterwards he went to Rome to produce two new operas, and thence to Bologna, where he became acquainted with and profited by the advice of Padre Martini, the greatest contrapuntist of his age. In the meantime Jommelli's fame began to spread beyond the limits of his country, and in 1745 he went for the first time to Vienna, where one of his finest operas, *Dulone*, was produced. Three years later he returned to Italy, and in 1754 he obtained the post of chapel-master to the music-loving duke of Würtemberg at Stuttgart, which city he made his home for a number of years. Here he considerably modified his style in accordance with German taste, so much so that, when after an absence of fifteen years he returned to Naples, his countrymen hissed two of his operas off the stage. He retired in consequence to his native village, and only occasionally emerged from his solitude to take part in the musical life of the capital.

His last composition was a *Miserere* written a few weeks before his death, which took place at Naples, August 28, 1774. In the last-named work, as well as in his other church compositions, Jommelli proves himself to be a musician of earnest purpose and sound scholarship. In his operatic music he follows essentially the style of his age, being intent on writing effective pieces for the voice rather than upon expressing the feelings and passions of the characters; but even here he betrays a certain elevation of sentiment not always to be found amongst the composers of the latter half of the 18th century. His best dramatic work is generally supposed to be *Armida*, one of the operas scored by the Neapolitans in 1771.

JONAH. The Book of Jonah is so named from the principal personage of the narrative, only mentioned elsewhere in 2 Kings xiv. 25. Jonah there appears as a native of Zebulun, and a contemporary of Jeroboam II. (8th century B.C.). If the book of Jonah were written then, it has a claim to rank as the oldest of the prophetic writings (Joel being in all probability of post-exile origin). The problems connected with this little book are, however, so great that no judicious critic would think of admitting such a date as proved. The problems are twofold:—(1) was the book written at one jet? and (2) is it to be understood as a history, or as an allegorical tale, and, if the latter, is it, or is it not, based at all upon tradition, or upon a

nature-myth? Köhler thinks that he can trace "the hand of a late reviser, who has made alterations, interpolations, and transpositions of verses and sentences . . . There is at the very beginning of the story a perceptible lacuna in the second verse, where we are not told what Jonah was to announce to the men of Nineveh." He offers very plausible grounds for preferring the reading of the Septuagint in iii. 4, "yet *three* days, and Nineveh shall be overthrown," and points out that the alteration into "forty days" involves an interference with part of the details of the narrative. He detects traces of interpolation in i. 8, ii. 2-10 (A. V. 1-9), iii. 9, iv. 1-4, and other passages, and regards the passage iv. 5-8 as "full of insertions and variants." After purging the text from later additions and enlargements, we obtain a brief but simple and striking story, which, according to Köhler, formed part of a book of prophetic narrations, and therefore commenced with "And." Later Jews, by very plausible conjectures, in search of a lesson-book on penitence for reading in times of public calamity, modified and interpolated it (comp. Mishna, *Taanit*, ii.). This is not the place to discuss this conjecture in detail; it is favoured by analogy and cannot be rejected without consideration. It enables us to account for comparatively primitive conceptions of the Godhead, and the naïveté in the description of the heathen mariners, and supplies a *locus standi* to the orthodox view of the book which would otherwise be destroyed by acute rationalistic criticism. The additions may be later, but the kernel of the narrative may be old.

At the same time, it will be seen at once that to grant that the kernel of the narrative may be pre-exile is not to grant that it is historical. From a purely literary point of view it has been urged that "the marks of a story are as patent in the book of Jonah as in any of the tales of the Thousand and One Nights." The greatest of the improbabilities is a moral one; can we conceive of a large heathen city being converted by an obscure foreign prophet? "To judge of the degree of this improbability, it is enough to read any inscription you please of an Assyrian king. Fancy Sargon or Sennacherib in the presence of Jonah. The case quoted by the *Speaker's Commentary* of a Christian priest frightening a Mahometan town into repentance is not to the point, for Christians and Moslems have a common basis in theism. How could the Ninevites give credence to a man who was not a servant of Asshur?" It is obvious that in New Testament times (see Matt. xii. 39-40, Luke xi. 29-30, and Matt. xvi. 4) the symbolic meaning of the book was the most important part of it. Why should it not have been originally composed with a symbolic or allegorical object? For the hearers of Christ, one symbolic meaning was the most important, but probably enough (for Scripture is many-sided) other ages saw different meanings. The truths of the equality of Jews and heathen before God, the prophetic and missionary character of the people of Israel, and the conditional character of prophecy, have all been suggested as possible meanings, and all possess great plausibility.

Mr Tylor (*Early History of Mankind*, pp. 336, 337, and *Primitive Culture*, i. 306) has already pointed out the close superficial resemblance between the story of Jonah and various solar myths; and indeed the former was long ago connected with the myths of Hercules and Hesione, and Perseus and Andromeda. To suppose a direct imitation of these Greek myths is, indeed, quite gratuitous. Preller's handbook will show that the most circumstantial parallels to the Hebrew only occur in the narratives of later writers. These late narratives, however, are not improbably derived in part from earlier sources, and at any rate M. Lenormant and M. Clermont Ganneau have pointed out Babylonian and Egyptian affinities for the Greek myths in

question. "In Mesopotamia the story is naturally more original and more transparent. In Mr George Smith's translation, Tiamtu the dragon opens its mouth to swallow Bel Merodach, but in vain (Smith's *Chaldean Genesis*, by Sayce, p. 111)." A remarkable passage in Jeremiah (ii. 44), evidently alluding to a popular mythic story, seems to supply a missing link between the narrative of Jonah and the original myth. "Like the latter, it describes the destroyer as the dragon, like the former, it converts both destroyer and destroyed into symbols," no uncommon phenomenon in poetical passages of the Old Testament.¹

The evidences of date are difficult to seize. The use of the uncommon phrase, Yahveh Elohim (iv. 6), points to a date synchronizing with that of Gen. ii., iii., but when those chapters were written is a debatable question. Many have argued the exile or post-exile origin of the book from the supposed Aramaizing character of the style; against this view, Pusey's introduction deserves reading. The arguments from internal evidence have been made best use of by Kuenen, who couples it with the book of Ruth as a product of the opposition to the strict and exclusive policy of Ezra towards heathen nations. Kalisch's theory is that the book is a romance founded perhaps on fact. "Why should not the substance of the story, though the historical annals make no allusion to such enterprise, be founded on a real fact? Jonah, being on intimate relations with his sovereign, might have been employed by him for important offices; foreign embassies were not unusual, and some such legation from the king of Israel to the king of Assyria is actually mentioned by Jonah's contemporary Hosea (v. 13)" (*Bible Studies*, ii. 122).

Literatur*, Leipzig, 1866, pp. 72-80; Cheyne, "Jonah, a Study in Jewish Folklore and Religion," in *Theological Review*, 1877, pp. 211-19; Kalisch, *Bible Studies*, part ii., 1878 (reviewed by Oort, *Theologische Tijdschrift*, 1878); Köhler, "The Original Form of the Book of Jonah," in *Theological Review*, 1879, pp. 186-44. (T. K. C.)

JONAH, RABBI, of Cordova, the most eminent Jewish grammarian and lexicographer of the Middle Ages, known also among Hebrew authors as R. Merinos (Marinus), but now usually called by his Arabic name Abu 'l Walid Merwān ibn Janāh, was born at Cordova towards the close of the 10th century, but spent his youth partly at the neighbouring Jewish town of Lucena (Alisana), where he studied under Isaac ben Gikatila and Isaac ben Saul. He appears not to have returned to Cordova till after the death of the famous Hayyūj, the founder of a scientific Hebrew grammar based on the doctrine of trilateral roots. Though not a personal disciple of Hayyūj, Abu 'l Walid adopted the general principles of his system, and early applied himself to the task of completing and correcting the observations of his predecessor on the subject of weak roots. While engaged in these studies he retired from Cordova during the siege of the town by the Berber prince Suleiman (1013), and took up his residence in Saragossa, where he published his first work, the *Kutāb el Mustalik*, so named because it contained an attempt to supply the omissions of Hayyūj. The Jews of Saragossa were not favourably disposed to the new philology, and the writings of Abu 'l Walid were not only displeasing to men of the old school, but involved him in bitter controversy with the professed disciples of Hayyūj, on whose views he had presumed to improve. The most formidable of these antagonists was Samuel Ibn Nagdala Hallevy, the prime minister of Granada. Abu 'l Walid had much to suffer from the rancour of so influential an opponent, but he persisted in his studies, which were finally crowned by the

¹ It is worth noticing that the "fish" of Jonah is found five or six times in paintings in the Roman catacombs assigned to the first two centuries, and that it is distinctly a dragon.

publication of the *Kitāb el Tanqīh*, or "Book of Minute Research," a grammatical and lexicographical work of the first order, which is still consulted by scholars, and can never be opened without admiration for the range and precision of the author's scholarship and the soundness of his philological method. There is more Hebrew to be learned from Abu 'l Walid than from all the later rabbins put together. Abu 'l Walid was essentially a philologist. He had essayed poetry in his youth, was read in philosophy, and not only practised as a physician but wrote on medicine; but the devotion of his life was concentrated on the exact verbal study of Scripture. Armed with a thorough knowledge of the language and grammatical system of the Arabs, as well as of the dialects of Jewish Aramaic, he studied the Biblical idiom in the light of the cognate Semitic tongues, and in a spirit of pure scholarship, free from traditional prejudice.

The extant minor works of R. Jonah have been published in Arabic with a French translation by J. and H. Derenbourg, *Opusculs et Traités d'Abou 'l-Walid*, Paris, 1880. The first or grammatical part of the *Kitāb el-Tanqīh* has been published in the imperfect Hebrew version entitled *Sifor Harikma* by Goldberg, Frankfurt-on-the-Main, 1869. The lexicographical part of the *Kitāb el-Tanqīh*, or *Book of Roots*, was published in Arabic by Neubauer, Oxford, 1875. For further details as to the life and works of Abu 'l-Walid see Munk's articles in *Journal Asiatique*, 1850, 1851; and Derenbourg, *op cit*.

JONAS, JUSTUS (1493-1555), a German Protestant Reformer, was born at Nordhausen in Thuringia 5th June 1493. In 1506 he entered the university of Erfurt, where he graduated in law in 1516; but, having been converted to the doctrines of Luther, he, about 1519, resolved to study theology. In 1521 he accompanied Luther to the diet of Worms. The same year he was appointed professor of canon law at Wittenberg, where shortly afterwards he became doctor in theology, and occupied himself much in preaching. During the next twenty years he took part in many church visitations and conferences, and translated into German several of the works of Luther and Melancthon. In 1541 he became superintendent of the churches at Halle, whence he was banished by the elector Maurice of Saxony in 1546. He returned for a short time in 1547 and again in 1548, but was unable to resume his interrupted tasks; after a short stay at Jena, where he had some share in the ordering of the new university, he became court-preacher at Coburg in 1551. In 1553 he was called as first pastor to Eislefeld, where he died 9th October 1555. Among the theological tracts of Jonas is *Discussio pro conjugio sacerdotali*, 1523. He also wrote an account of the proceedings of the conference of Marburg.

See Reinhard, *De Vita et obitu Justo Jonæ*, 1718; Knappe, *Narratio de Justo Jonæ*, 1817; and the life by Hasse in *Meinert's Leben des Altvaters der luth. Kirche*, 1864.

JONES, INIGO (c. 1572-1651), an English architect, sometimes called the "English Palladio," was the son of a cloth-worker, and was born in London about 1572. It is stated that he became apprenticed to a joiner, but at any rate his talent for drawing attracted somehow the attention of a nobleman, by some affirmed to have been the earl of Arundel, by others the earl of Pembroke, who sent him to study landscape-painting in Italy. His preference soon transferred itself to architecture, and, following chiefly the style of Palladio, he acquired at Venice such considerable reputation that in 1604 he was invited by Christian IV. to Denmark, where he is said to have designed the two great royal palaces of Rosenberg and Frederiksborg. In the following year he accompanied Anne of Denmark to the court of James I. of England, where, besides being appointed architect to the queen and Prince Henry, he was employed in supplying the designs and decorations of the court masques. After a second visit to Italy in 1612, Jones was appointed surveyor-general of the royal buildings by

James I., and was engaged to prepare designs for a new palace at Whitehall. In 1620 he was employed by the king to investigate the origin of Stonehenge, when he came to the absurd conclusion that it had been a Roman temple. Shortly afterwards he was appointed one of the commissioners for the repair of St Paul's, but the work was not begun till 1633. Under Charles I. he enjoyed the same offices as under his predecessor, and in the capacity of designer of the masques he came into collision with Ben Jonson, who on this account has frequently made him the butt of his satire. After the civil war Jones was forced to pay heavy fines as a courtier and malignant. He died in poverty July 5, 1651.

A list of the principal buildings designed by Jones is given in Dallaway's edition of Walpole's *Anecdotes of Painting*, and for an estimate of him as an architect see the article ANTHURTON, vol. ii. p. 442, and also Ferguson's *History of Modern Architecture*. The *Architecture of Palladio*, in 4 books, by Inigo Jones, appeared in 1715; *The Most Noble Antiquity of Great Britain, called Stonehenge, restored by Inigo Jones*, in 1655 (an edition, with memoir, 1725); the *Designs of Inigo Jones*, by W. Kent, in 1727, and *The Designs of Inigo Jones*, by J. Ware, in 1757.

JONES, JOHN PAUL (1747-1792), was born July 6, 1747, on the estate of Arbignland, in the parish of Kirkcubbin and the stewardry of Kirkcubright, Scotland, where his father, John Paul, was gardener. At twelve he went to sea as apprentice to a merchant of Whitehaven, in whose ships he visited America several times. He became a skillful sailor, and was for some time mate of a slaver in the West Indies. On his way back to England, after leaving the slave trade in disgust, the captain and mate of the ship in which he was both died; and the skillful manner in which Paul Jones brought the ship safely into port induced the owners to appoint him captain. In 1778, having for some unknown reason assumed the cognomen Jones, he settled in Virginia, on a property which had fallen to him on the death of an older brother. When the American war of independence broke out two years later, Jones took up arms for the colonies, and accepted a command in the navy of the new republic. He did good service against his native land, and in 1777 was sent to France to receive a more important command. Disappointed in that, he sailed in 1778 to the English coast in his ship "Ranger," and availed himself of his early knowledge to hunt at Whitehaven, where, however, he was unsuccessful in his attempt to fire the shipping. Next year he sailed on a similar expedition in the "Bonhomme Richard," along with other vessels, and, steering up the Firth of Forth, was only prevented by a strong westerly gale from attacking Loth. On his way south again he fell in, off Flamborough Head, with the English ship "Serapis," which after a long and bloody combat he compelled to strike. That exploit raised his fame to its acme. On his return to Paris he was fetted and caressed by the best society; and Louis XVI. presented him with a gold-hilted sword, and decorated him with the military Order of Merit. After some time spent in America, where he was much chagrined by the neglect that met his boastful requests for further employment, Paul Jones returned to Paris as agent for all prizes taken in Europe under his own command. While he resumed his efforts to pose as a man of *ton*, he attended carefully to his duties. A favourable report to Congress as to his naval services was followed by a vote of a gold medal from that body in 1786. In 1788 the Chevalier Jones entered the service of the empress Catherine of Russia, and became as enthusiastic a Russian as he had been an American. He was appointed to a command in the Black Sea, with the rank of rear-admiral, to act against the Turks; but the jealousy and rivalry of the Russian commanders brought about his recall in less than eight months. Summoned to St Petersburg, on pretext of

receiving a post in the North Sea, he was left in restless idleness, until at last two years' formal leave of absence was granted him. On this virtual dismissal, Paul Jones retired to Paris, sore and disappointed; and after two years spent in fruitlessly importuning the Russian court, he died in that city on July 18, 1792.

Paul Jones is described as a "short, thick, little fellow, about 5 feet 8 inches in height, of a dark swarthy complexion." Naval skill and bravery he certainly had, but his letters prove him to have been boastful and quarrelsome. He writhed under the suspicion of being an "adventurer"; once and again he eagerly repels the charge. English contemporary accounts generally speak of him as a pirate; and, though he certainly ranked as an officer of the United States, the independent manner in which he cruised might well suggest letters of marque rather than a Government commission.

The life of Paul Jones has given rise to much romance. Cooper, Dumas, and Allan Cunningham have celebrated him in their novels; and scarcely less fictitious are some of his so-called biographies. The most authentic seems to be the *Memoirs of Paul Jones*, 2 vols., Edinburgh, 1830.

JONES, OWEN (1741-1814), a Welsh antiquary, was born in 1741 at Llanvihangel Glyn y Myrwr in Denbighshire, and died September 26, 1814, in Thames Street, London. Introduced in 1760 to the service of a London firm of furriers (Kidney & Nutt), he ultimately succeeded to their business, and continued to carry it on with success till his death. His fancy had been fired in boyhood with a passion for the poetry of his country, and, when wealth and leisure were attained, he devoted them both to the acquisition of the ancient monuments of the art. Assisted by Edward William of Glamorgan (Iolo Morganwg), and Dr Owen Pughe, he published, at a cost of more than £1000, the well-known *Myvyrian Archaeology of Wales* (London, 1801-7, 3 vols.), a great collection of pieces dating from the 6th to the 14th century. The manuscripts which he had brought together are now deposited in the British Museum,—the material not utilized in the *Myvyrian Archaeology* amounting to 100 volumes containing 16,000 pages of verse and 15,300 pages of prose. Jones was the founder of the Gwyneddigion Society (1772) in London for the encouragement of Welsh studies and literature; and he commenced in 1805 a miscellany—the *Greal*—of which, however, only one volume appeared. An edition of the poems of Dafydd ab Gwilym was also issued at his expense. A new edition of the *Myvyrian Archaeology* was published at Donbigh in 1870.

JONES, OWEN (1809-1874), architect and art-decorator, son of the subject of last notice, was born in London in 1809. After an apprenticeship of six years in an architect's office, he travelled for four years in Italy, Greece, Turkey, Egypt, and Spain, making a special study of the Alhambra in the last-mentioned country. On his return to England in 1836 he busied himself in his professional work. His forte was interior decoration, for which his formula was—"form without colour is like a body without a soul." He was one of the superintendents of works for the Exhibition of 1851; and, as director of decorations for the Crystal Palace at Sydenham, he arranged the Egyptian, Greek, Roman, and Alhambra courts, besides being responsible for the general decoration of the whole building. Along with Mr (afterwards Sir Digby) Wyatt, Jones collected the casts of works of art on the Continent which adorn the different courts. In his later years he was much engaged in the decoration of private houses, among which may be reckoned the vicerey of Egypt's palace at Gosh. In 1857 he received the royal medal for architecture; and after other distinctions, he was awarded a diploma of honour at the Vienna Exhibition of 1873. He died in London, April 19, 1874.

Owen Jones is described in *The Builder* for 1874 as "the most potent apostle of colour that architectural England has had in these days." His range of activity is to be traced in his works: *Plans, Elevations, and Details of the Alhambra* (1838-45), in which he was assisted by MM. Goury and Gayangos; *Designs for Mosaeic and Tessellated Pavements*, 1842; *Polychromatic Ornament of Italy*, 1845; *An Attempt to define the Principles which regulate the Employment of Colour in Decorative Arts*, 1852; *Handbook to the Alhambra Court; Grammar of Ornament*, fol., 1856, a very important work; *One Thousand and One Initial Letters*, 1864; *Seven Hundred and Two Monograms*, 1864; and *Examples of Chinese Ornament*, 1867.

JONES, SIR WILLIAM (1746-1794), one of the most accomplished linguists and Oriental scholars that England has produced, was born in London September 28, 1746. When seven years old he was sent to Harrow, where he soon far excelled all his school-fellows in every branch of study. But the classical routine of a public school failed to satisfy the ardent thirst for knowledge displayed by the boy from his earliest childhood. He accordingly began to apply himself, during the last three years of his life at Harrow, to the study of Oriental languages, teaching himself the rudiments of Arabic, and becoming sufficiently familiar with Hebrew to be able to read that language with tolerable ease. The greater part of his vacations he devoted to the improvement of his acquaintance with French and Italian by assiduously practising composition in those tongues. In 1764 young Jones went to Oxford and entered University College, where he continued to prosecute his studies with unabated vigour. Though obliged to give up a considerable portion of his time to the classical studies required by the university course, he still directed his attention chiefly to Oriental literature, particularly to Persian and Arabic. In acquiring the latter language he received effective assistance from a Syrian named Mirza, whom he discovered in London and brought with him to Oxford. Meanwhile, however, not content with all this work, he managed to make considerable progress in Italian, Spanish, and Portuguese. At nineteen he left Oxford to become tutor to Earl Spencer's eldest son, and remained with that nobleman's family for five years. In 1766 Jones obtained a fellowship which placed him in a position of independence, and enabled him to give his undivided attention to his linguistic pursuits. On his return from a short visit to the Continent, where he picked up some knowledge of German, he began the study of Chinese, and made himself master of the radical characters of that language. Though not more than twenty-two years of age, he was already becoming famous for his acquirements as a linguist and Oriental scholar. Accordingly when Christian VII., king of Denmark, visited England in 1768, bringing with him a life of Nadir Shah in Persian, Jones was requested to render the MS. into French. He agreed, and the translation appeared in 1770, with an introduction containing a description of Asia and a short history of Persia (3 vols. 8vo; new ed., 1790). This was followed in the same year by a treatise in French on Oriental poetry, and by a metrical translation, in the same language, of the odes of Hafiz.

For some time Jones had been thinking of taking up the law as a profession, and, having now finally decided on doing so, he became a member of the Temple. About this time the French Orientalist, Anquetil Du Perron, published his translation of the *Zend Avesta*, in the introduction to which he made an unjustifiable attack on Oxford. Jones, taking on himself the defence of his university, addressed an anonymous letter in French to Du Perron, in which he convicted that scholar of unwarrantable invective and wilful misrepresentation. It is a remarkable proof of Jones's great talent for languages that the racy and idiomatic style of the French in this pamphlet led several foreign savans to attribute it to the pen of some *bel esprit*.

of the French capital. In the same year appeared his grammar of the Persian language (9th ed., with corrections and, additions by Samuel Lee, D.D., Lond., 1828), which is still considered one of the best text-books on the subject. In 1772 Jones published a small volume of poems, chiefly translations from Asiatic languages, together with two elegant essays on the poetry of Eastern nations and on the arts commonly called imitative. His next publication, which appeared in 1774, was a treatise entitled *Poeseos Asiaticae commentariorum libri sex*, the chief aim of which was to familiarize the European mind with the genius of Oriental poetry.

Being now admitted to the bar, Jones determined to give up all his energies to his legal studies, and renounced polite literature for some years. Setting to work with the same eagerness which he displayed in the pursuit of all other kinds of knowledge, he made it his endeavour, not merely to master the technicalities of law, but to devote himself to it as a branch of philosophy. Having within two years acquired a considerable legal reputation, he was in 1776 appointed commissioner of bankrupts. In 1780 he was induced by his friends to come forward as a candidate for the representation of the university of Oxford in parliament, but he withdrew from the contest before the day of election, as he found he had no chance of success, owing to the liberal principles he held, especially on the questions of the American war and of the slave trade.

In the winter of 1780-81 he found leisure to complete his translation of the seven ancient Arabic poems called *Muallakat*. Besides writing an *Essay on the Law of Bailments*, Jones translated in 1781 the speeches of Issus on the right of inheritance, and an Arabian poem on the Mahometan law of succession to the property of intestates, as bearing on his legal studies.

The hopes which he had for some time entertained of obtaining a seat on the judicial bench in Bengal, were at last gratified on the accession to power of the Shelburne administration, by which he was in 1783 appointed a judge of the supreme court of judicature at Fort William, at the same time receiving the honour of knighthood. Shortly after his arrival in Calcutta he founded, in January 1784, the Asiatic Society, of which he remained president till his death. Convinced as he was of the great importance of consulting the Hindu legal authorities in the original, he lost no time in commencing the study of Sanskrit. Having in a few years made himself complete master of the language, he undertook, in 1788, the task of compiling a digest of Hindu and Mahometan law, the completion of which he did not live to see; the work was finished, however, by Colebrooke, who edited it at Calcutta in 1800 under the title of *Digest of Hindu Laws*. In 1789 Sir William Jones published the first volume of *Asiatic Researches* and his translation of *Sakuntala*, the most famous play of Kālidāsa, the greatest Indian dramatist. He also translated the well-known collection of fables entitled the *Hitopadesa*, the *Gitaopinda*, an erotic poem by Jayadava, and considerable portions of the Veda, besides editing the text of the *Ritusaamhāra*, a short but celebrated poem by Kālidāsa. His last work, which appeared in 1794, was the translation of the *Institutes of Manu*, a compilation of laws and ordinances, dating from the 6th century B.C. Sir William's unremitting literary labours, together with the conscientious performance of his heavy judicial work, could not fail to tell on his health after a ten years' residence in the climate of Bengal; and he was about to return to England when a sudden attack of inflammation of the liver carried him off in the forty-eighth year of his age (April 27, 1794).

The amount of labour of various kinds which Sir William Jones compressed into the space of a comparatively short life seems almost

incredible. In addition to numerous other acquirements, he knew thirteen languages well, and had an elementary acquaintance with twenty-eight others. His capacity for assimilating and reproducing knowledge of every sort was almost unparalleled. But his works, though they display a vast amount of learning, do not bear the stamp of genius. He shows no originality either in discovering new truths or in placing old truths in a new light. Had he concentrated his powers, his extraordinary industry might have secured him greatness in some one branch of knowledge; but their diffusion over so great a surface contributed greatly to that weakness which is so manifest both in his style and in his critical faculty. His chief claim to the remembrance of posterity will rest on the fact that by founding the Asiatic Society he rendered the language and literature of the ancient Hindus accessible to European scholars, and thus became the indirect cause of the splendid achievements in the field of Sanskrit and comparative philology which the present century has witnessed.

Sir William Jones's complete works were edited in 1799 (6 vols. 4to), and reprinted in 1807 (13 vols. 8vo). Lord Teignmouth published memoirs of his life, writings, and correspondence in 1807 (new ed. 1826, 2 vols. 8vo); and an autobiography, published by his son, was printed in 1816. (A. A. M.)

JONES, WILLIAM (1726-1800), a divine of the Church of England, and one of the principal followers of John Hutchinson, was born at Lowick, Northamptonshire, July 30, 1726. By his father's side he was descended from an old Welsh family, and one of his progenitors was Colonel Jones, brother-in-law of Cromwell. He was educated at Charterhouse school, from which he received an exhibition to University College, Oxford. There a kindred taste for music, as well as a similarity in regard to other points of character, led to his close intimacy with George Horne, afterwards bishop of Norwich, who, chiefly through his arguments, was induced to embrace Hutchinsonian doctrines. After obtaining his bachelor's degree in 1749, Jones was curate successively at Finedon and Waddenhoe in Northamptonshire. In 1764 he was presented to the vicarage of Bethesda in Kent, and shortly afterwards to the rectory of Pluckley in the same county, where he took up his residence. In 1776 he removed to Nayland, Suffolk, of which he obtained the perpetual curacy, and, although in 1798 he became rector of Hollingbourn, Kent, he continued to reside at Nayland till his death, 6th January 1800.

In 1756 Jones published his treatise *On the Catholic Doctrine of the Trinity*, a statement of the doctrine from the Hellenistic point of view, with a succinct and able summary of Scriptural proofs. This was followed in 1762 by an *Essay on the First Principles of Natural Philosophy*, in which he maintained the theories of Hutchinson in opposition to those of Sir Isaac Newton, and in 1781 he gave a more extended exposition of his opinions in *Theological Disquisitions*. Among his other works are—*Lectures on the Figurative Language of the Holy Scripture*, 1786; *The Scholar Armed*, 1792; and a life of Bishop Horne, prefixed to Horne's collected Works, 1795. Jones was also the originator of the *British Critic*, the first number of which appeared in May 1793. His collected works, with a life by W. Stevens, appeared in 1801, in 12 vols., and his theological and miscellaneous works with life were reprinted in 1810. Since that time various editions of his works have appeared, as well as some volumes of his sermons. A life of Jones, forming part 5 of the *Biography of English Divines*, was published in 1849.

JONKÖPING, a town of Sweden, at the head of the län of the same name, in 57° 48' N. lat., about 170 miles south-west of Stockholm, and 80 east of Gothenburg. It occupies a beautiful but somewhat unhealthy position in a valley between the southern end of Lake Vetter and two smaller lakes known as the Rocksjö and the Munksjö; the very names, indeed, of two parts of the town, the Tyska Mad and the Svenska Mad, refer to the time when the site was a marsh and the buildings had to be erected on piles. The church of St Christina, dating from 1649-1673, the supreme court (built as a private enterprise in 1665), the town-house (rebuilt after the conflagration of 1691), the buildings of the provincial administration, the artillery barracks, a theatre, and the high school are the more noteworthy edifices. Jönköping is well known as the seat of a great safety-match factory, which produced in 1860

upwards of 35,000,000 boxes, of the value of £11,390, while in 1874 the value reached the sum of £150,000. It also contains snuff and cigar factories, an asphalt factory, dye-works, damask factories, and a variety of minor establishments. The population, which has been steadily increasing, numbered 15,037 in 1878.

Jönköping is mentioned as early as 1284 or 1288, and the castle in 1263, when Waldemar Birgersson married the Danish princess Sophia. It was afterwards the scene of many events of moment in Scandinavian history—the parliaments of 1357, 1439, and 1599; the meeting of the Danish and Swedish plenipotentiaries in 1448; and the death of Sten Sture, the elder, in 1508. In 1612 Gustavus Adolphus caused the inhabitants to destroy their town lest it should fall into the hands of the Danes; but it was rebuilt soon after, and in 1620 received special privileges from the king. It was from the Dutch and German workmen, introduced at this time, that this quarter Tyska Mad received its name. In 1809 the plenipotentiaries of Sweden and Denmark concluded peace in the town.

JONSON, BEN (for thus his Christian name was usually abbreviated by himself and his contemporaries, and thus, in accordance with his famous epitaph, it will always continue to be abbreviated by posterity), was born about the beginning (N. S.) of the year 1573. By the poet's account his grandfather had been a gentleman who "came from" Carlisle, and originally, the grandson thought, from An-nam-ble, where Johnstons or Johnstones appear to have abounded, and where indeed at least one resident of that name is noticed in the reminiscences of a later native of the border district resembling Ben himself in the quickness of his temper and in his impatience of pretences and pretenders,—the late Thomas Carlyle. Ben Jonson further related that he was born a month after the death of his father, who, after suffering in estate and person under Queen Mary, had in the end "turned minister." Two years after the birth of her son the widow married again; she may be supposed to have loved him in a passionate way peculiar to herself, since on one occasion we shall find her revealing an almost ferocious determination to save his honour at the cost of both his life and her own. Jonson's stepfather was a master bricklayer in or near Westminster, who—whether or not he afterwards constrained his step-son, while acquainting himself with the business into which he had been admitted, to undergo the degradation of laying a few bricks with his own trowel—certainly allowed him to lay for himself the foundations of a good education. After attending a private school in the neighbourhood, he was sent to Westminster school,—nor is it at all obvious why the master bricklayer should have been denied the credit of having sent him there. Jonson's gratitude, however, for an education to which in truth he owed an almost inestimable debt, concentrated itself upon the "most reverend head" of the illustrious Camden, then second and afterwards head master of the famous school, and the firm friend of his pupil in later life.

After reaching the highest form at Westminster, Jonson is stated, but on unsatisfactory evidence, to have proceeded to the university of Cambridge; but at the utmost he can only have made a transitory appearance in a scene of which as a painter of men and manners he nowhere reproduces a single feature. And doubtless he felt that neither his crop of learning and experience nor his wild oats were yet fully sown, when, goose quill or other implement in hand, he had to apply himself to the family business. He soon had enough of it, and was soldiering in the Netherlands, much to his own subsequent satisfaction when the days of self-conscious retrospect arrived, but to no further purpose beyond that of seeing something of the world. By the middle of 1597 we at last come across documentary evidence of him at home in London, in the shape of an entry in Henslowe's diary on July 28th of 3s. 6d. "received of Bengemenes Johnstones share." He was therefore by

this time, when Shakespeare, his senior by nearly nine years, was already in prosperous circumstances and good esteem, at least a regular member of the profession, with a fixed engagement in the Lord Admiral's company, then performing under the experienced Henslowe's management at the Rose. The traditions may very possibly be true according to which he had previously acted at the Curtain (a former house of the Lord Admiral's men), and "taken mad Jeronimo's part" as a stroller. This latter appearance would in that case have probably been in *The Spanish Tragedy*, since in *The First Part of Jeronimo Jonson* would have had to dwell on the "smallness" of his "bulk." He was at a subsequent date (1601) employed by Henslowe to write up *The Spanish Tragedy*, in pursuance of a fashion differing from that of later times, when old plays have more usually been written *down* to the taste of modern audiences. Jonson's additions, which were not the first changes made in the play, are usually supposed to be those printed with *The Spanish Tragedy* in the edition of 1602; Charles Lamb's doubts on the subject are an instance of that subjective kind of criticism in which it is unsafe to put absolute trust.

Ben Jonson may be supposed to have married two or three years before the date of Henslowe's first entry of his name. Of his wife he afterwards spoke with scant enthusiasm, and for one (undated) interval of five years he preferred to live without her. Long burnings of "oil" among his books, and long spells of recreation at the tavern, such as Jonson loved, are not the most favoured accompaniments of family life. But Jonson was no stranger to the tenderest of affections: two at least of the several children whom his wife bore to him he commemorated in touching little tributes of verse; nor in speaking of his lost eldest daughter did he forget "her mother's tears."

Within a year's time, or little more, from the date at which we first find Ben Jonson in well-authenticated connexion with the English stage, he had produced one of the most memorable plays in its history. *Every Man in his Humour*, the original example of a species of English comedy which cannot be said to have become altogether extinct even with the Restoration, was first acted in 1598—probably in the earlier part of September—by the Lord Chamberlain's company, which was then still performing at the so-called Theatre, and in which Shakespeare was just on the eve of acquiring one or more shares. He certainly was one of the actors in Jonson's comedy, and it is in the character of Old Knowell in this very play that, according to a bold but ingenious guess, Shakespeare is represented in the half-length portrait of him in the folio of 1623, beneath which were printed Jonson's lines concerning the picture. *Every Man in his Humour* was probably followed by *The Case is Altered*, which was certainly acted by 1599, and which contains a satirical attack upon the pagenet poet Anthony Munday. Inas-much as the earlier of these two comedies was indisputably successful, and as Jonson's reputation was already sufficient to ensure him a mention in the *Palladis Tunnia* of Francis Meres, published in the same year, 1598, as one of the chief writers in tragedy (on the strength of what play or plays is unknown), it was an awkward fatality that before the year was out he should have found himself in prison and in danger of the gallows. He had had the misfortune of killing in a duel, fought in Hogsdon Fields, for some cause unknown, an actor of Henslowe's company named Gabriel Spenser; possibly Henslowe's uncourteous designation of Jonson as a "bricklayer" may imply that the success of the new comedy at the other house had not been a subject of congratulation at that to which its author had formerly belonged. In prison Jonson was visited by a

Roman Catholic priest—a prison being the most likely place in which to meet a priest in those days; and the result was his conversion to the Church of Rome, to which he adhered for twelve years. Jonson was afterwards a diligent student of divinity; but, though his mind was religious, it is not probable that its natural bias much inclined it to dwell upon creeds and their controversies. Though in prison spies were set upon him, which was then thought to be an admirable method for expediting justice, yet his judges (he afterwards boasted) could get nothing out of him but “aye” or “no.” And thus after a short imprisonment he was released, some time early in 1599, in which year he is found back again at work for Henslowe, receiving, together with Dekker, Chettle, and “another gentleman,” earnest-money for a tragedy called *Robert II., King of Scots*. It is of more importance that in the same year he brought out through the Lord Chamberlain’s company (possibly already at the Globe, then newly built or building) the elaborate comedy of *Every Man out of his Humour*,—a work which subsequently had the honour, for which it was in some respects specially fitted, of being presented before Queen Elizabeth. The sunshine of court favour, rarely diffused during her reign in rays more than metaphorically golden, was not to bring any material comfort to the most learned of her dramatists, before the inevitable hand was laid upon her of which his courtly epilogue had besought death to forget the use. Indeed, of his *Cynthia’s Revels* (1600), no doubt primarily designed as a piece of unctuous flattery to the address of the queen, the most marked result had been to offend two playwrights of note with whom he had formerly worked in company—Dekker, who had a coarse and healthy grip of his own, and Marston, who was perhaps less dangerous by his strength than by his versatility. Learning their intention, or at least that of Dekker, to wreak literary vengeance upon him, he seems to have sought to anticipate its effect by covering them with contemptuous ridicule beforehand. *The Poetaster* (1601), which he states to have been completed fifteen weeks after the plot of it was first conceived, did not, however, silence his adversaries; it rather gave them the opportunity of the last word, which Dekker took in producing his *Satirasticon, or the Unravelling of the Humorous Poet* (1602). There was indeed an attempt at some more last words on Jonson’s part; but on the whole he appears to have thought (and very wisely) that the time for a season of silence had arrived for him as a court poet. According to a statement by Overbury, early in 1603, “Ben Jonson, the poet, now lives upon one Townesend”—who this generous patron was we do not know—“and scorns the world.” That, however, he was not sulking in the friendly tent with which he had been accommodated is shown by the fact that in this year (1603) was produced at the Globe the earlier of his two extant tragedies, *Sejanus*,—Shakespeare once more taking a part in the performance.

Meanwhile, in the year which dates the tragedy concerning the fall of the great favourite, there had begun a reign in England destined to be remembered as that of favourites hardly less hated than he. Adulatory loyalty seemed intent on showing that it had not exhausted itself at the feet of Gloriana, and Jonson’s well-stored brain and ready pen had their share in devising and executing ingenious variations on the theme “Welcome—since we cannot do without thee!” It is very remarkable how promptly his genius, which it is sheer prejudice to describe as wanting in flexibility and lightness, suited itself to the sudden demands of the new taste for masks and entertainments—new of course in degree rather than in kind—introduced with the new reign. The pageant which on the 7th of May 1603 bade the king welcome to a capital dissolved in joy was partly of Jonson’s partly of

Dekker’s devising; and, having thus been prominently brought into notice, he was able to deepen and diversify the impression by the composition of masks presented to James I. when entertained at houses of the nobility. He was soon occasionally employed by the court itself,—already in 1606 in conjunction with Inigo Jones as responsible for the “painting and carpentry,”—and thus speedily showed himself master in a species of composition to which he, more than any other of our poets before Milton, secured an enduring place in our national poetic literature. Personally, no doubt, he derived considerable material benefit from the new fashion, very valuable to poets in days when there were no monthly magazines,—more especially if his statement to Drummond was anything like correct, that out of his plays he had never gained a couple of hundred pounds.

Good humour seems to have come back with good fortune. Joint employment had reconciled him with Dekker, and with Marston also he was again on good terms. When therefore, in 1604, the latter and Chapman (who, Jonson told Drummond, was loved of him, and whom he had probably honoured as “Virgil” in *The Poetaster*) produced the excellent comedy of *Eastward Ho*, it appears to have contained some contributions by Jonson; at all events, when the authors were arrested on account of one or more passages in the play which were deemed insulting to the Scotch, he voluntarily imprisoned himself with them. They were soon released, and a banquet at his expense, attended by Camden and Selden, terminated the incident. If Jonson is to be believed, there had been a report that the prisoners were to have their ears and noses cut, and, with reference apparently to this peril, “at the midst of the feast his old mother drank to him, and showed him a paper which she had intended (if the sentence had taken execution) to have mixed in the prison among his drink, which was full of lusty strong poison; and that she was no churl, she told him, she minded first to have drunk of it herself.” Strange to say, in 1605 Jonson and Chapman, though the former, as he avowed, had so “attempted” his style as to have “given no cause to any good man of grief,” were again in prison on account of “a play”; but they appear to have been once more speedily set free, in consequence of the (very mainly and dignified) letter addressed by Jonson to the earl of Salisbury. In the same year he played a part—which had till recently remained unknown, and is still in some measure obscure—in the mysterious history of the Gunpowder Plot. On November 7th, very soon after the discovery of the conspiracy, whose threads it became the immediate duty of the council to unravel, that body appears to have sent for Ben Jonson, at the advice no doubt of Salisbury, who (as has just been seen) knew of Jonson; indeed, the latter has been supposed to have given his support as a dramatist to the party headed by Robert Cecil before Queen Elizabeth’s death. As a loyal Roman Catholic Jonson was asked, and undertook to give, his good offices in inducing the priests to do something required by the council,—one hardly likes to conjecture it to have been some tampering with the secrets of confession. In any case, the negotiations fell through, because the priests declined to come forth out of their hiding-places to be negotiated with—greatly to the wrath of Ben Jonson, who declares in a letter to Lord Salisbury that “they are all so enwreathed in it that it will make 500 gentlemen less of the religion within this week, if they carry their understanding about them.” Jonson himself, however, did not declare his separation from the Church of Rome for five years longer, however much it might have been to his advantage to do so.

His powers as a dramatist were at their height during

the earlier half of the reign of James I.; and by the year 1616 he had produced nearly all the plays which are worthy of his genius. They include the tragedy of *Catiline* (1611), which achieved only a doubtful success, and the comedies of *Volpone* or *The Fox* (acted 1605), *Epicure* or *The Silent Woman* (1609), *The Alchemist* (1610), *Bartholomew Fair* (1614), and *The Devil is an Ass* (1616). During the same period he produced several masks, usually in connexion with Inigo Jones, with whom, however, he seems to have quarrelled already in this reign, though it is very doubtful whether the architect is really intended to be ridiculed in *Bartholomew Fair* under the character of Lanthorn Leatherhead. In 1616 a modest pension of 100 marks a year was conferred upon him; and possibly this mark of royal favour may have encouraged him to the publication of the first volume of the folio collected edition of his works (1616).

He had other patrons more bountiful than the crown, and for a brief space of time (in 1613) had travelled to France as governor to the eldest son of Sir Walter Raleigh, then a state prisoner in the Tower, for whose society Jonson may have gained a liking at the Mermald Tavern in Cheap-side, but for whose moral character he, like so many of his contemporaries, seems to have had but small esteem. Thus by the year 1616 Jonson seems to have made up his mind to cease writing for the stage, where neither his success nor his profits had equalled his merits and expectations. He continued to produce masks and entertainments when called upon; but he was attracted by many other literary pursuits, and had already accomplished enough to furnish plentiful materials for retrospective discourse over pipe or cup. He was already entitled to lord it at the Mermald, where his quick antagonist in earlier wit-combats no longer appeared over on a visit from his comfortable retreat at Stratford. That on the other hand Ben carried his wicked town habits into Warwickshire, and there, together with Drayton, made Shakespeare drink so hard with them as to bring upon himself the fatal fever which ended his days, is a bit of petty scandal with which we may fairly refuse to load his memory.

It was in the year 1618 that Ben Jonson, like his great namesake a century and a half afterwards, resolved to have a real holiday for once, and about midsummer started for his ancestral country, Scotland. He had (very heroically for a man of his habits) determined to make the journey on foot; and—in imitation is the sincerest kind of flattery—was speedily followed by John Taylor, the water-poet, who still further handicapped himself by the condition that he would accomplish the pilgrimage without a penny in his pocket. Jonson (who put money in his good friend's purse when he came up with him at Leith) spent more than a year and a half in the hospitable Lowlands, being solemnly elected a Burgess of Edinburgh, and on another occasion entertained at a public banquet there. But the best remembered hospitality which he enjoyed was that of the learned and refined Scottish poet Drummond of Hawthornden, to which we owe the so-called *Conversations*. In these famous jottings, the work of no extenuating hand, Jonson lives for us to this day, delivering his censures freely in praise and blame, but by no means generously described in the postscript added by his exhausted host as "a great lover and praiser of himself, a contemner and scorner of others." A poetical account of this journey, "with all the adventures," was burnt with Jonson's library.

After his return to England Jonson appears to have resumed his former course of life. In 1619 his visits to the country seats of the nobility were varied by a sojourn at Oxford with Corbet at Christ Church, on which occasion a master's degree was conferred upon him by the university. He confessed about this time that he was or seemed

growing "restive," i.e., lazy, though it was not long before he returned to the occasional composition of masks. The extremely spirited *Cypriotes Metamorphosed* (1621) was thrice presented before the king, who was so pleased with it as to grant to the poet the reversion of the office of master of the revels, besides proposing to confer upon him the honour of knighthood. This honour Jonson (hardly in deference to the memory of Sir Petronel Flash) declined, but there was no reason why he should not gratefully accept the increase in his pension, which was in the same year (1621) raised to 200 marks. Yet the close of king James I.'s reign found the foremost of the poets of the time in an anything but prosperous condition. It would be unjust to hold "The Sun," "The Dog," "The Triple Tun," or the "Old Devil" with its Apollo club-room, where Ben's supremacy must by this time have become established, responsible for this result; taverns were the clubs of that day, and a man of letters is not considered lost in our own because he "haunts" a smoking-room in Pall Mall. Disease had weakened the poet's strength, and the burning of his library, as his *Execration upon Fulcan* sufficiently shows, must have been no mere transitory trouble to a poor man of letters. He thus thought it best to recur to writing for the stage, and in 1625 produced, with no faint heart, but with a very clear anticipation of the comments which would be made upon the reappearance of the "huge, overgrown play-maker," *The Staple of News*, a comedy excellent in some respects, but little calculated to become popular. In 1628, on the death of Middleton, some interest obtained for him the appointment of city chronologer, with a salary of 100 nobles a year—an office of which he appears to have considered the duties as purely ornamental, inasmuch as in 1631 his salary was suspended until he should have presented some fruits of his labours in his place, or—as he more succinctly phrased it—"yesterday the barbarous court of audacem have withdrawn their chandlerly pension for verjuice and mustard, £33, 6s. 8d." After being in 1628 arrested by mistake on the utterly false charge of having written certain verses in approval of the assassination of Buckingham, he was soon allowed to return to Westminster, where it would appear from a letter of his "son and contiguous neighbour," James Howell, he was living in 1629, and about this time narrowly escaped another conflagration. In the same year (1629) he once more essayed the stage with the comedy of *The New Inn*, which was actually, and on its own merits not unjustly, damned on the first performance. The epilogue dwelt not without dignity upon the neglect which the poet had experienced at the hands of "king and queen"; and it is honourable to King Charles I. that he should not only have immediately sent the unlucky author a gift of a hundred pounds, but on receiving another more cheerful versified appeal in response, should have increased his standing salary to the same sum, with the addition of an annual tierce of canary,—henceforth the poet-laureate's customary royal gift. But though he afterwards composed one or two little entertainments, and even a comedy or two, there seemed little power left in his palsy-stricken hand. The patronage of kind friends like the earl of Newcastle was never wholly wanting to him, nor could he have ended in neglect. He was the acknowledged chief of English literature, both at the festive meetings where he ruled the roost among the younger authors whose pride it was to be "sealed of the tribe of Ben," and by the avowal of grave writers, old or young, not one of whom would have ventured to dispute his pre-eminence. Nor was he to the last unconscious of the claims upon him which his position brought with it. When death came upon him on August 6, 1637, he left behind him an unfinished work of great beauty, the pastoral drama

of *The Sad Shepherd*. For forty years, he said in the prologue, he had feasted the public; at first he could scarce hit its taste, but patience had at last enabled it to identify itself with the working of his pen.

We are so accustomed to think of Ben Jonson presiding, attentive to his own applause, over a circle of youthful followers and admirers, that we are apt to forget the hard struggle which he had passed through before gaining the crown now universally acknowledged to be his. Howell records, in the year before Ben's death, that at a solemn supper at the poet's own house, where the host had almost spoiled the relish of the feast by vilifying others and magnifying himself, "T. Ca." (Thomas Carew) buzzed in the writer's ear "that, though Ben had barbelled up a great deal of knowledge, yet it seemed he had not read the *Ethics*, which, among other precepts of morality, forbid self-commendation." Self-reliance is but too frequently coupled with self-consciousness, and for good and for evil self-confidence was no doubt the most prominent feature in the character of Ben Jonson. Hence the combativeness which involved him in so many quarrels in his earlier days, and which jarred so harshly upon the gentler nature of Drummond. But his quarrels do not appear to have entered deeply into his soul, or indeed usually to have lasted long.¹ He was too exuberant in his vituperations to be bitter, and too outspoken to be malicious. He loved of all things to be called "honest," and there is every reason to suppose that he deserved the epithet. The old superstition, which may perhaps still linger here and there, hardly needs notice, according to which Jonson was filled with malignant envy of the greatest of his fellow-dramatists, and lost no opportunity of giving expression to it. Those who consider that Shakespeare was beyond the criticism of his contemporaries—as he certainly very frequently is above that of posterity—may find blasphemy in the saying of Jonson that Shakespeare "wanted art." Occasional jesting allusions to particular plays of Shakespeare may be found in Jonson, among which should hardly be included the sneer at *Pericles*; but these amount to nothing collectively, and to very little individually; and against them have to be set, not only the many pleasant traditions concerning the long intimacy between the pair, but also the noble lines, as noble as they are judicious, dedicated by the survivor to "the star of poets." But if Gifford had rendered no other service to Jonson's fame, he must be allowed to have once for all vindicated him from the cruellest aspersion which has ever been cast upon it. That in general Ben Jonson was a man of strong likes and dislikes, and was wont to manifest the latter as vehemently as the former, it would be idle to deny. He was at least impartial in his censures, dealing them out freely to Puritan poets like Wither and princes of his church like Cardinal Duperron. And, if sensitive to attack, he seems to have been impervious to flattery—to judge from the candour with which he condemned the foibles even of so enthusiastic an admirer as Beaumont. The personage that he disliked the most, and abused the most roundly to its face, was unfortunately one with many heads and a tongue to hiss in each,—no other than that "general public" which it was the radical mistake of his life to fancy he could "rail into approbation" before he had effectively secured its goodwill. And upon the whole it may be said that the admiration of the few, rather than the favour of the many, has kept green the fame of the most independent among all the masters of an art which, in more senses than one, must please to live.

¹ With Inigo Jones, however, in quarrelling with whom, as Howell reminds Jonson, the poet was virtually quarrelling with his bread and butter, he seems to have found it impossible to live permanently at peace; his satirical *Expostulation* against the architect was published as late as 1635.

Jonson's learning and industry, which were alike exceptional, by no means exhausted themselves in furnishing and elaborating the materials of his dramatic works. His enemies sneered at him as a translator—a title which only a generation earlier would have been esteemed of all literary titles the most honourable. But his classical scholarship shows itself not only in his translations from the Latin poets (the *Ars Poetica* in particular), in addition to which he appears to have written a version of Barclay's *Argenis*; it was likewise the basis of his *English Grammar*, of which nothing but the rough draft remains (the MS. itself having perished in the fire in his library), and in connexion with the subject of which he appears to have pursued other linguistic studies (Howell in 1629 is trying to procure him a Welsh grammar). And its effects are very visible in some of the most pleasing of his non-dramatic poems, which often display that combination of polish and simplicity hardly to be attained to—hardly even to be appreciated—without some measure of classical training.

Exclusively of the few lyrics in Jonson's dramas (which, with the exception of the stately choruses in *Catiline*, charm, and perhaps may surprise, by their lightness of touch), his non-dramatic works are comprised in the following collections. The book of *Epigrams* (published in the first folio of 1616) contained, in the poet's own words, the "ripest of his studies." His notion of an epigram was the ancient not the restricted modern one—still less that of the critic (R. C., the author of the *Times' Whistle*) in whose language, according to Jonson, "witty" was "obscene." On the whole, these epigrams excel more in encomiastic than in satiric touches, while the pathos of one or two epitaphs in the collection is of the truest kind. In the lyrics and epistles contained in the *Forest* (also in the first folio), Jonson shows greater variety in the poetic styles adopted by him; but the theme of love, which Dryden considered conspicuous by its absence in the author's dramas, is similarly eschewed here. The *Underwoods* (which were not published collectively till the second and surreptitious folio) are a miscellaneous series, comprising, together with a few religious and a few amatory poems, a large number of epigrams, epitaphs, elegies, and "odes," including both the tributes to Shakespeare and several to royal and other patrons and friends, besides the *Exsecration upon Vulcan*, and the characteristic ode addressed, apparently in the earlier part of his career, by the poet to himself. To these pieces in verse should be added the *Discoveries*—an often highly interesting commonplace-book of aphorisms that occurred to the poet in his daily readings,—self-communings of a more tranquil and perhaps a more sober kind than the outpourings of the *Conversations at Hawthornden*.

The dramatic works of Ben Jonson fall into three or, if his fragmentary pastoral drama be considered to stand by itself, into four distinct divisions. His tragedies are only two in number—*Sejanus his Fall*, and *Catiline his Conspiracy*.² Of these the earlier, as is worth noting, was produced at Shakespeare's theatre, in all probability before the first of Shakespeare's Roman dramas, and still contains a considerable admixture of rhyme in the dialogue. Though perhaps less carefully elaborated in diction than its successor, *Sejanus* is at least equally impressive as a highly-wrought dramatic treatment of a complex historic theme. The character of Tiberius adds an element of curious psychological interest which is wanting in *Catiline* and his surround-

² Of *The Fall of Mortimer* Jonson left only a few lines behind him; but, as he also left the argument of the play, factious ingenuity contrived to furnish up the relics into a libel against Queen Caroline and Sir Robert Walpole in 1731, and to revive the contrivance by way of an insult to the princess dowager of Wales and Lord Bute in 1762.

ings; but in both plays the action is powerfully conducted, and the care bestowed by the dramatist upon the great variety of characters introduced cannot, as in some of his comedies, be said to distract the interest of the reader. Both these tragedies are noble works, though the relative popularity of the subject has perhaps secured the preference to *Catiline*. Yet this play and its predecessor were alike too manifestly intended by their author to court the goodwill of what he calls the "extraordinary" reader. It is difficult to imagine that (with the aid of judicious shortenings) either could altogether miss its effect on the stage; but, while Shakespeare causes us to forget, Jonson seems to wish us to remember, his authorities. The half is often greater than the whole; and Jonson, like all dramatists and, it might be said, all novelists in similar cases, has had to pay the penalty incurred by too obvious a desire to underline the learning of the author.

Perversity—or would-be originality—alone could declare Jonson's tragedy preferable to his comedy. Even if the revolution which he created in the latter branch of the drama had been mistaken in its principles or unsatisfactory in its results, it would be clear that the strength of his dramatic genius lay in the power of depicting a great variety of characters, and that in comedy alone he succeeded in finding a wide field for the exercise of this power. There may have been no very original or very profound discovery in the idea which he illustrated in *Every Man in his Humour*, and, as it were, technically elaborated in *Every Man out of his Humour*,—that in many men one quality is observable which so possesses them as to draw the whole of their individualities one way, and that this phenomenon "may be truly said to be a humour." But by refusing to apply this term to a mere peculiarity or affectation of manners, and restricting its use to actual or implied differences or distinctions of character, he broadened the whole basis of English comedy after his fashion, as Molière at a later date did that of French after his. It does not of course follow that Jonson's disciples, the Bromes and the Cartwrights, always adequately reproduced the master's conception of "humorous" comedy. Jonson's wide and various reading helped him to diversify the application of his theory, while perhaps at times it led him into too remote illustrations of it. Still, Captain Bobadil and Captain Tucca, Macilente and Fungoso, Volpone and Mosca, and a goodly number of other characters commend themselves readily as well as distinctly enough to the memory of those who have once made their acquaintance. It is a very futile criticism to condemn Jonson's characters as a mere series of types of general ideas; on the other hand, it is a very sound criticism to object, as Barry Cornwall does, to the "multitude of characters who throw no light upon the story, and lend no interest to it, occupying space that had better have been bestowed upon the principal agents of the plot."

In the construction of plots, as in most other respects, Jonson's at once conscientious and vigorous mind led him in the direction of originality; he depended to a far less degree than the greater part of his contemporaries (Shakespeare with the rest) upon borrowed plots. But either his inventive character was occasionally at fault in this respect, or his devotion (so to speak) to his characters often diverted his attention from a brisk conduct of his plot. The writer just quoted has directed attention to the essential likeness in the plot of two of Jonson's best comedies, *Volpone* and *The Alchemist*, and another critic, unsurpassed in his delicate appreciation of the relations between the drama and the stage,—Mr W. Bodham Donne,—has dwelt on the difficulty which, in *The Poetaster* and elsewhere, Ben Jonson seems to experience in sustaining the promise of his actions. *The Poetaster* is, however, a play

sui generis, in which the real business can hardly be said to begin till the last act.

Dryden, when criticizing Ben Jonson's comedies in a superlative vein, which (to do him justice) he very rarely indulged, thought fit, while allowing the old master humour and incontestable "pleasantness," to deny him wit and those ornaments thereof which Quintilian reckons up under the terms *urbana, salso, facetia*, and so forth. Such wit as Dryden has in view is the mere outward fashion or style of the day, the euphuism or "sheerwit" or *chic* which is the creed of the Fastidious Bricks and of their crafty purveyors at any given moment. In this Ben Jonson was no doubt defective; for he was too accurate an observer of men and manners to be himself a man of fashion, literary or otherwise. But it would be an error to suppose him, as a comic dramatist, to have stood towards the world around him in the attitude of a philosopher, careless of mere transient externalisms. It is said that the scene of his *Every Man in his Humour* was originally laid near Florence; and his *Volpone*, which is perhaps the darkest social picture ever drawn by him, plays at Venice. But the atmosphere of his comedies, wherever they may be supposed to play, is familiar enough to any one fairly acquainted with the native surroundings amidst which they were produced; and Ben Jonson's times live for us in his men and women, his country gulls and town gulls, his alchemists and exorists, his "skeldring" captains and whining Puritans, and the whole ragamuffin rout of his *Bartholomew Fair*, the comedy *par excellence* of Elizabethan low life. After he had described the pastimes, fashionable and unfashionable, of his age, its feeble superstitions and its flaunting naughtinesses, its vapouring affectations and its lying effronteries, with an odour as of "divine tobacco" pervading the whole, little might seem to be left to describe for his "sons" and successors. Enough, however, remained; only that his followers speedily again threw manners and "humours" into one undistinguishing medley.

The gift which both in his art and in his life Jonson lacked was that of exercising the influence or creating the effects which he wished to exercise or create without the appearance of consciousness. Instead of this, influenced no doubt by the example of the free relations between author and public permitted by Attic comedy, he resorted again and again, from *Every Man out of his Humour* to *The Magnetic Lady*, to sundry devices of inductions and commentary intermezzos and appendices, which, though occasionally effective by the excellence of their execution, are to be regretted as introducing into his dramas an exotic and often vexatious element. A man of letters to the very core, he never quite understood that there is and ought to be a wide difference between the world of letters and the world of the theatre.

The richness and versatility of Jonson's genius will never be fully appreciated by those who fail to acquaint themselves with what is preserved to us of his "masks" and cognate entertainments. He was conscious enough of his success in this direction—"next himself," he said, "only Fletcher and Chapman could write a mask." He introduced, or at least established, the ingenious innovation of the anti-mask, which Schlegel has described as a species of "parody added by the poet to his device, and usually prefixed to the serious entry," and which accordingly supplies a grotesque antidote to the often extravagantly imaginative main conception. Jonson's learning, creative power, and humorous ingenuity—combined, it should not be forgotten, with a genuine lyrical gift—all found abundant opportunities for displaying themselves in these productions. Though a growth of foreign origin, the mask was by him thoroughly domesticated in the high places of English literature. He lived long enough to see the species produce its poetic

masterpiece in *Comus*, after which it soon faded away in times too fierce to allow of its further cultivation.

The Sad Shepherd, of which Jonson left behind him three acts and a prologue, is distinguished among English pastoral dramas by its freshness of tone; and, though not altogether without either allegorical allusions or classical ornament, breathes something of the spirit of the greenwood, and is not unnatural even in its supernatural element. While this piece, with its charming love-scenes between Robin Hood and Maid Marion, remains a fragment, another pastoral by Jonson, *The May Lord*, has been lost, and a third, of which Loch Lomond was intended to be the scene, probably remained unwritten.

Though Ben Jonson never altogether recognized the truth of the maxim that the dramatic art has properly speaking no didactic purpose, his long and laborious life was not wasted upon a barren endeavour. In tragedy he added two works of uncommon merit to our dramatic literature. In comedy his aim was higher, his effort more sustained, and his success more solid, than were those of any of his fellows. In the subsidiary and hybrid species of the mask, he helped to open a new and attractive though undoubtedly devious path in the field of dramatic literature. His intellectual endowments surpassed those of most of our great dramatists in richness and in breadth; and in energy of application he probably surpassed them all. Yet it is less by these gifts or even by his power of hard work than by the true ring of his manliness that he is uniquely distinguished among his peers.

The date of the first folio volume of Jonson's *Works* (of which title his novel but characteristic use in applying it to plays was at the time much ridiculed) has already been mentioned as 1616; the second is described by Gifford as "a wretched continuation of the first, printed from MSS surreptitiously obtained during his life, or ignorantly hurried through the press after his death, and bearing a variety of dates from 1621 to 1641 inclusive." The whole works were reprinted in a single folio volume in 1692, and again in 6 vols. 8vo in 1715. Whalley's edition in 7 vols., with a life, appeared in 1756, but was superseded in 1816 by Gifford's, in 9 vols. (of which the first includes a biographical memoir, and the famous essay on the "Proofs of Ben Jonson's Maliginity, from the Commentators on Shakespeare"). A new edition of Gifford's excellent book was published in 9 vols in 1876 by Colonel F. Cunningham, as well as a cheap reprint in 3 vols in 1870. Both contain the "Conversations with Drummond," which were first printed in full by David Laing in the *Shakespeare Society's Publications* (1842), and the *Jonsonian Verbius*, a collection (unparalleled in number and variety of authors) of poetical tributes published about six months after Jonson's death by his friends and admirers. There is also a single-volume edition, with a very readable memoir, by Barry Cornwall (1838). Recently *Every Man in his Humour* has been edited, with an excellent brief biographical as well as special introduction, to which the present sketch owes some details, by H. B. Whistley (1877). The criticisms of Jonson are too numerous to mention, but among many deserving to be overlooked should not be included that of Dryden in the preface to *An Evening's Love, or the Mock Astrologer*. (A. W. W.)

JOPLIN, a flourishing city of Jasper county, Missouri, U.S., chiefly engaged in smelting lead and zinc, of which very large quantities are turned out annually. The population in 1880 was 7038.

JOPPA, the Greek Ἰόππη, Ἰόππη, Hebrew יַפְּפוֹ, and Arabic يَافَا, incorrectly written JAFFA, an ancient seaport of Palestine. It is mentioned in the lists of Thothmes III., and in an inscription of Sennacherib, but in the Bible probably in no writing older than the exile. After the exile it was the harbour of Judea (Ezra iii. 7; Strabo, xvi. 2), and as such appears as an important point in the Maccabean wars, when it was fortified by Simon. Strabo and Josephus speak of it as a haunt of pirates, and on this account it was destroyed by Vespasian in the Jewish war. The small bay south of the town, called *Birket el Kama* ("Moonpool"), is possibly the old harbour, the present one being formed by a reef having a broad entrance on the north-west and a narrow passage in the middle. The coast being quite straight and unsheltered, the port possesses neither natural

nor artificial advantages. In the 5th, 6th, and 11th centuries bishops of Joppa are noticed, under the metropolitan of Jerusalem. In 1187 Saladin took the town, which was recovered by King Richard in 1191 and retaken by Malek el 'Adil in 1196. In 1799 Napoleon stormed the city, then protected by walls. The fortifications were further increased at a later period by the English. The modern town, the seaport of Jerusalem, with which it is connected by a carriage road in very bad repair, is built on a rounded hillock rising 100 feet above the shore; to the north and south are sandhills; to the east are gardens of oranges, pomegranates, figs, and olives. Sweet water is derived from numerous wells, and palms and bananas occur in these orchards, which cover an area of 3 square miles. The walls of the town still remain standing; the houses are of stone, well built, and the bazaars are good. The town is the seat of a caim-macem or lieutenant-governor. It contains English, French, German, and American consulates, and Latin and Greek monasteries. The trade consists of wheat, sesame, oranges and other fruit, olives, and soap; the population is stated at 8000, the majority being Moslems. A German colony established in 1869 has built two villages, one just outside the town on the north-east, the second (Sarona) at a distance of 2 miles. The colonists number about 800.

Joppa claimed to be the place where Andromeda was exposed. There her chains were shown (Jos., *B. J.*, ii. 9, 13), and thence the skeleton of the monster was brought to Rome by Scæurus (Pliny, ix. 4).

JORDAENS, JACOB (1593-1678), painter, was born at Antwerp in 1593. He studied, like Rubens, under Adam van Noort, and his marriage with his master's daughter in 1616, the year after his admission to the guild of painters, prevented him from visiting Rome. He was forced to content himself with studying such examples of the Italian masters as he found at home; but a far more potent influence was exerted upon his style by Rubens, who employed him sometimes to reproduce small sketches in large. Jordaens is second to Rubens only in their special department of the Flemish school. In both there is the same warmth of colour, truth to nature, mastery of chiaroscuro, and energy of expression; but Jordaens is wanting in dignity of conception, and is inferior in choice of forms, in the character of his heads, and in correctness of drawing. Not seldom he sins against good taste, and in some of his humorous pieces the coarseness is only atoned for by the animation. Of these last he seems in some cases to have painted several replicas. He employed his pencil also in Scriptural, mythological, historical, and allegorical subjects, and is well-known as a portrait painter. He also etched some plates. He died at Antwerp in 1678.

JORDAN (יַרְדֵּן "swift-flowing"), the principal river of Palestine. The historical source of this famous stream is the cave at Bānīs (Cæsarea Philippi), while the stream from Dan (Tell el Kādī) is called Lesser Jordan by Josephus, although the larger of the two springs at the Tell is probably the largest fountain in Syria. A third affluent, which has a better geographical claim to be considered the true Jordan, is the Nahr Hasbāny, rising near Hasbeiya on Hermon. The stream from Bānīs joins that from Tell el Kādī after a course of 5 miles, descending by cascades through thickets and cane brakes, and a little lower down the Nahr Hasbāny, after a course of 15 miles, joins the united stream from the other sources. The Bānīs source is about 1000 feet above the Mediterranean; and, after passing through the papyrus swamps, the river reaches the Huleh Lake (Merom or Semehonitis), falling 1000 feet in 12 miles. The Huleh is 4 miles long, and thence to the Sea of Galilee is 10½ miles, with a fall of 682 feet. The second lake (see GALTZER) is 12½ miles

long. The fall of the river after leaving it is at first 40 feet per mile, but on entering the plain of Beisan it becomes only 10 or 12 feet per mile, and further south only 4 or 5 feet. The total length from Baniás to the Dead Sea is 104 miles direct, and, as the level of the Dead Sea is 1292·5 below the Mediterranean, the total fall is nearly 2300 feet. Thus the Jordan is only half as long as the Thames, and the Sea of Galilee about equal in length to Windermere. The Ghôr or valley of Jordan south of the Sea of Galilee varies in width from 4 to 14 miles east and west; the course of the river is extremely tortuous, and it is hidden by a dense jungle of cane, willow, and tamarisk, growing on the water's edge in the sunken channel called Zôr, which is about a mile wide, with steep banks of white marl 50 to 100 feet high. For the last few miles the stream is free from jungle, flowing through a muddy flat. The average width is from 30 to 50 yards, but in February the river "overflows its banks" (Josh. iii. 15) and fills the Zôr. The Arabs enumerate some forty fords, mostly passable in summer only. Of these the most important is *Abedrah* near Beisan,—probably the Bethabara of Origen, the *Onomasticon*, and the common text of John i. 28, where Bethany is the true reading. There is a forry immediately south of the Sea of Galilee, and another on the road from Shechem to Gilgal; the latter is called Ed Dâmieh, and has been conjectured to preserve the name of Adam (Josh. iii. 16) or Admah (Gen. x. 19). The ford of Hâjjlah, east of Jericho, is probably that of Josh. iii., and is the traditional site of Bethabara. The four main affluents of Jordan are the Hieromax (Yarmuk) and the Jabbok on the east, and on the west the Jâldid passing Beisan, and the Fâria rising not far from Shechem. The supply of these and other perennial streams scarcely, however, balances the loss from evaporation of the river. Salt springs flow to Jordan along the greater part of its course south of Beisan. The valley, formed by a depression in the early Tertiary period, was once filled by a chain of lakes, and raised benches have been found in various parts of the Ghôr.

JORDAN, CAMILLE (1771–1821), French politician, was born in Lyons, January 11, 1771, of a well-to-do mercantile family. He was educated in Lyons, and from an early age was imbued with the royalist principles that distinguished his township. He actively supported by voice, pen, and musket his native town in its gallant resistance to the Convention; and when Lyons fell, in October 1793, Jordan fled. From Switzerland he passed in six months to England, where he formed acquaintances with other French exiles and with prominent British statesmen, and imbibed a lasting admiration for the English constitution. In 1796 he returned to France, and next year he was sent by Lyons as a deputy to the council of five hundred. There his eloquence won him consideration. He earnestly supported what he felt to be true freedom, especially in matters of religious worship, though the energetic appeal on behalf of church bells in his *Rapport sur la liberté des cultes* procured him the sobriquet of Jordan-Cloche. Jordan would have been one of the victims of the *coup d'état* of the 18th Fructidor (September 4, 1797) had he not escaped to Basel. Thence he went to Germany, where he met Goethe, and probably laid the foundation of his affection for German literature, especially as represented by Klopstock. Back again in France by 1800, he boldly published in 1802 his *Vrai Sens du Vote National pour le Consulat à Vie*, in which he exposed the ambitious schemes of the First Consul. He was unmolested, however, and during the first empire lived in literary retirement at Lyons with his wife and family, producing for the Lyons Academy occasional papers on the *Influence réciproque de l'Éloquence sur la Révolution et de la Révolution sur l'Éloquence*; *Études sur Klopstock*, &c. At the

Restoration in 1814 he again emerged into public life. By Louis XVIII. he was ennobled and named a councillor of state; and from 1816 he sat in the chamber of deputies as representative of Ain. At first he supported the ministry, but when they began to show signs of reaction he separated from them, and gradually came to be at the head of the constitutional opposition. His speeches in the chamber were always eloquent and powerful. Though warned by failing health to resign, Camille Jordan remained at his post till his death, May 19, 1821.

To his pen we owe *Lettre à M. Lamourette*, 1791; *Histoire de la Conversion d'un Dune Parisienne*, 1792; *La Loi et la Religion*, 1792; *Adresse à ses Concitoyens sur la Révolution du 4 Septembre*, 1797, 1797; *Sur les Troubles de Lyon*, 1818; *La Session de 1817*, 1818. His *Discours* were collected in 1818. The "Fragments Choisis," and translations from the German, were published in *L'Abolition française*.

Besides the various histories of the time, see for further details, vol. x. of the *Revue Encyclopédique*, and a paper on Jordan and Madame de Staël, by Sainte-Benoît, in the *Revue de Saint-Jeune* for March 1868.

JORDANES, or JORDANDES, the historian of the Gothic nation, flourished about the middle of the 6th century of the Christian era¹. All that we certainly know about his life is contained in three sentences of his history of the Goths (cap. 50), from which, among other particulars as to the history of his family, we learn that his grandfather Peria was notary to Candac, the chief of a confederation of Alans and other tribes settled during the latter half of the 5th century on the south of the Danube in the provinces which are now Bulgaria and the Dobruzscha. Jordanes himself was a notary until he renounced his worldly calling and took the vows of a monk. This, according to the manner of speaking of that day, is the meaning of his words "ante conversionem meam," though it is quite possible that he may at the same time have renounced the Ariian creed of his forefathers, which it is clear that he no longer held when he wrote his Gothic history.

It is probable that the latter part at any rate of the life of Jordanes was spent in Italy. In some early editions of his works he is called "episcopus Ravennae," but the ample details which we possess as to the bishops of Ravenna make it certain that he never occupied that see. He may have been a bishop, but the best authority for that assertion (according to the statement in Muratori's *Rerum Italicarum Scriptores*, i. 189) is only Sigebert of Gembloux, who lived five centuries later. Traces have been discovered of a certain Jordanes, bishop of Crotona, in 551, and a "Jordanes defensor ecclesie nostre" is mentioned in a letter of Pope Pelagius in 556.

We pass from the extremely shadowy personality of Jordanes to the more interesting question of his works.

1. The *De Regnorum et Temporum Successione*, or, as he himself called it, *Breviatio Chroniconum*, was probably composed in 550 or 551. It is a short and dry sketch of the history of the world from the creation, founded on the chronicles of Eusebius and Jerome. The book has no value, literary or historical, till the historian comes near to his own times; and here, from about 450 to 550, the *De Regnorum Successione* is sometimes a really important authority, owing to the extreme scarcity of other information as to this epoch.²

2. The other work of Jordanes, *De Rebus Geticis*, as it is commonly called, was styled by himself *De Origine Actaque Geticæ Gentis*, and was probably written in the year 552. He informs us that while he was engaged upon

¹ The evidence of MSS. is overwhelming against the form *Jordanes* adopted in the two earliest editions. Strictly speaking, the MSS. favour *Jordanis*; but this seems to be only an incorrect spelling of *Jordanes*.

² The terms of the dedication of this book to a certain Vigilus make it impossible that the pope of that name is meant.

the *Breviatio* a friend named Castalius invited him to compress into one small treatise the twelve books—now lost—of the senator Cassiodorus, or Cassiodorus, on *The Origin and Actions of the Goths*. Jordanes professes to have had the work of Cassiodorus in his hands for but three days, and to reproduce the sense, not the words; but his book, short as it is, evidently contains long verbatim extracts from the earlier author, and it may be suspected that the story of the "triduana lectio" and the apology "quamvis verba non recolo," possibly even the friendly invitation of Castalius, are mere blinds to cover his own entire want of originality. This suspicion is strengthened by the fact (discovered by Von Sybel) that even the very preface to his book is taken almost word for word from Rufinus's translation of Origen's commentary on the epistle to the Romans. There is no doubt, even on Jordanes's own statements, that his work is based upon that of Cassiodorus, and that any historical worth which it possesses is due to that fact. Cassiodorus was one of the very few men who, Roman by birth and sympathies, could yet appreciate the greatness of the barbarians by whom the empire was overthrown. The chief adviser of Theodoric, the East Gothic king in Italy, he accepted with ardour that monarch's great scheme, if indeed he did not himself originally suggest it to his master, of welding Roman and Goth together into one harmonious state, which should preserve the social refinement and the intellectual culture of the Latin-speaking races, without losing the hardy virtues of their Teutonic conquerors. To this aim everything in the political life of Cassiodorus was subservient, and this aim he evidently kept before him in his Gothic history. He translated into his somewhat stilted prose the sagas which were still sung by the Gothic warriors round their camp-fires,¹ telling of the past migrations and dangers of their people. He reduced into form the pedigree which traced the descent of the Amals, Theodoric's kingly house, from gods and heroes. In all this he worked on such lines as a modern historical inquirer would have him work on. Unfortunately, he also accepted the current theory of his age which identified the Goths with the Scythians, whose country Darius Hystaspis invaded, and with the Getae of Dacia whom Trajan conquered. This double identification enabled him to bring the favoured race in line with the people of classical antiquity, to interweave with their history stories about Hercules and the Amazons, to make them invade Egypt, to claim for them a share in the wisdom of the semi-mythical Scythian philosopher Zamolxis. He was thus able with some show of plausibility to represent the Goths as "wiser than all the other barbarians and almost like the Greeks" (Jord., *De Reb. Get.*, cap. v.), and to send a son of the Gothic king Telephus to fight at the siege of Troy, on the right side, in rank with the ancestors of the Romans. All this we can now perceive to have no relation to history, but at the time it may have made the subjugation of the Roman less bitter to feel that he was not after all bowing down before a race of barbarian upstarts, but that his Amal sovereign was as firmly rooted in classical antiquity as any Julius or Claudius who ever wore the purple. A grateful king of the Goths, the young Athalaric, truly said of Cassiodorus, "Originem Gothicum historiam fecit esse Romanam, colligens quasi in unam coronam germen florum, quod per librorum campos passim fuerat ante dispersum" (Cassiod., *Var. ix.* 25).

Cassiodorus completed his history of the Goths probably about the year 534. In the eighteen years which elapsed between that date and the composition of the *De Rebus*

Geticis of Jordanes, great events, and most disastrous for the Romano-Gothic monarchy of Theodoric, had transpired. It was no longer possible to write as if the whole civilization of the Western world would sit down contentedly under the shadow of East Gothic dominion and Amal sovereignty. And moreover, the instincts of Jordanes, as churchman and Catholic, predisposed him to flatter the sacred majesty of Justinian, by whose victorious arms the overthrow of the barbarian kingdom in Italy had been effected. Hence we perceive two currents of tendency in the *De Rebus Geticis*. On the one hand, as a Goth himself and as a transcriber of the philo-Goth Cassiodorus, he magnifies the race of Alaric and Theodoric, and claims for them their full share, perhaps more than their full share, of glory in the past. On the other hand, he speaks of the great anti-Teuton emperor Justinian, and of his reversal of the German conquests of the 5th century, in language which would certainly have grated on the ears of Totila and his heroes. Gelimer the Vandal is "overtaken by the revenge of Justinian," and Africa "long subject to the Vandal yoke is recalled into the liberty of the Roman kingdom." When Ravenna is taken, and Vitigis carried into captivity, Jordanes almost exults in the fact that "the nobility of the Amals and the illustrious offspring of so many mighty men have surrendered to a yet more illustrious prince and a yet mightier general, whose fame shall not grow dim through all the centuries."

This laudation, both of the Goths and of their Byzantine conquerors may perhaps help us to understand the political motive with which the *De Rebus Geticis* was written. In the year 551 Germanus, nephew of Justinian, accompanied by his bride, Matsuntia, granddaughter of Theodoric, set forth to reconquer Italy for the empire. His early death (in 552) prevented any schemes for a revived Romano-Gothic kingdom which may have been based on his personality. His widow, however, bore a posthumous child, also named Germanus, of whom Jordanes speaks (cap. 60) as "blending the blood of the Anicii and the Amals, and furnishing a hope under the divine blessing of one day uniting their glories." This younger Germanus did nothing in after life to realize these anticipations; but the somewhat pointed way in which his name and his mother's name are mentioned by Jordanes lends some probability to the idea that the *De Rebus Geticis* was put forth in the interests of a third party, Italian rather than Gothic or Byzantine, and possibly headed by Pope Vigilius, who may have wished to advocate the claims of this infant to an independent sovereignty in Italy.

The *De Rebus Geticis* falls naturally into four parts. The first (chaps. i.-xiii.) commences with a geographical description of the three quarters of the world, and in more detail of Britain and "Scanzia" (Sweden), from which the Goths under their king Berig migrated to the southern coast of the Baltic. Their migration across what has since been called Luthania, to the shores of the Euxine, and their differentiation into Visigoths and Ostrogoths, follow. Chaps. v.-xiii. contain an account of the intrusive Geta-Scythian element before alluded to.

The second section (chaps. xiv.-xxiv.) returns to the true history of the Gothic nation, sets forth the genealogy of the Amal kings, and describes the mroads of the Goths into the Roman empire in the 3d century, with the foundation and the overthrow of the great but somewhat shadowy kingdom of Hermanric. The author here probably rests to some extent on Orosius, Ammianus, and other Latin historians, but draws partially at least from native sources.

The third section (chaps. xxv.-xxvii.) traces the history of the West Goths from the Hunnish invasion to the downfall of the Gothic kingdom in Gaul under Alaric II. (375 to 507 A.D.). The best part of this section, and indeed of the whole book, is the seven chapters devoted to Attila's invasion of Gaul and the battle of the Mauriac plains. Here we have in all probability a verbatim extract from Cassiodorus, who has interwoven with his narrative large portions of the Gothic sagas. The celebrated expression "certaminis gaudia" assuredly came at first neither from the suave minister Cassiodorus nor from the small-souled

¹ "Quemadmodum et in prisca eorum carminibus pene historico ritu in commune recolitur," *De Reb. Get.*, iv.

notary Jordanes, but is the translation of some thought which first found utterance through the lips of a Gothic minstrel.

The fourth section (chaps. xlviii.-lx.) traces the history of the East Goths from the same Hunnish invasion to the first overthrow of the Gothic monarchy in Italy (376-539). In this fourth section are inserted, somewhat out of their proper place, some valuable details as to the *Gothi Minores*, "an immense people dwelling in the region of Nicopolis, with their high priest and primeval Vulfilas, who is said also to have taught them to letters." The book closes with the almost unimportant and the panegyric on Justinian as the conqueror of the Goths referred to above.

As to the style and literary character of Jordanes, every author who has used him speaks in terms of severe censure. When he is left to himself and not merely transcribing, he is sometimes scarcely grammatical. There are awkward gaps in his narrative and statements inconsistent with each other. His quotes, as if he were familiarly acquainted with their writings, about twenty Greek and Roman writers, of whom it is almost certain that he had not read more than three or four. At the same time he does not quote the chronicler Marcellinus, from whom he has copied verbatim the history of the deposition of Augustulus. All these faults make him a peculiarly unsatisfactory authority to depend upon where we cannot check his statements by those of other authors. It may, however, be pleaded in extenuation that he is professionally a transcriber, and, if his story be correct, a transcriber under peculiarly unfavourable circumstances. He has also himself suffered much from the inaccuracy of copyists. But nothing has really been more unfortunate for the reputation of Jordanes as a writer than the extreme precociousness of the information which he has preserved to us. The Teutonic tribes whose dim original he records have in the course of centuries attained to world-wide dominion. The battle in the Mauriac plains, of which he is really the sole historian, is now seen to have had at least as important bearings on the destinies of the world as Marathon or Waterloo. And thus the hasty pamphlet of a half-educated Gothic monk has been forced into prominence, almost into rivalry with the finished productions of the great writers of classical antiquity. No wonder that it stands the comparison badly; but with all its faults the *De Reb. Geticis* of Jordanes will probably ever retain its place side by side with the *De Moribus Germanorum* of Tacitus, as a chief source of information respecting the history, institutions, and modes of thought of our Teutonic forefathers.

Manuscripts.—The chief MSS. of the *De Reb. Geticis* are at Heidelberg of the 8th century and one at the Vatican of the 10th, one at Altona, two of the 11th and 12th centuries, and one at the Bodleian at Oxford. Unfortunately the Heidelberg and Vienna MSS. perished in the fire at Prof. Mommsen's house, but before he had recently collated them.

Editions.—The edition of the *Edm. Olfers* was published by Prof. Mommsen, at Augsburg, 1875. Two of the best known editions are those in Mommsen's *Requæ Historiarum Scriptores*, vol. i. (which gives France's text collated by J. A. Saxe with the Ambrosian MS., and which also contains the *De Germanorum Sacerdotibus*), and in Grolin's *Historia Gotthorum, Vandalarum, et Lombardorum*, Amsterdam, 1836. A new edition is expected from Professor Mommsen.

Literature.—The following article is chiefly founded on Von Sybel's essay, *De Paulino Jordanis* (1838). See also *De ratione qua inter Jordanem et Cassiodorum intercedat Communis*, Dorpat, 1858; Köpcke's *Die Anfänge der Königslisten bei den Goten*, Berlin, 1859; Dahl's *Die Könige der Germanen*, vol. ii., Munich, 1861; Florin's *Geschichte der Christlich-Literarischen Literatur*, Leipzig, 1874, and Wattenbach's *Deutschland's Geschichtsquellen im Mittelalter*, Berlin, 1877.

JORTIN, JOHN (1698-1770), a writer on theological subjects, was the son of a Protestant refugee from Brittany, and was born in London 23d October 1698. In his tenth year he entered Charterhouse school, and in 1715 he became a pensioner of Jesus College, Cambridge, where his reputation as a Greek scholar led the classical tutor of his college to select him to translate certain passages from Rastachius for the use of Pope in his translation of Homer. He graduated B.A. in 1719 and M.A. in 1722. In the latter year he published a small volume of Latin verse entitled *Lusus Poeticæ*. Having received priest's orders in 1724, he was in 1726 presented by his college to the vicarage of Swavesey in Cambridgeshire, an appointment which he resigned in 1730 to become preacher of a chapel in New Street, London. In 1731, along with some friends, he began a publication entitled *Miscellaneous Observations on Authors Ancient and Modern*, which appeared at intervals during two years. In 1737 he was presented to the vicarage of Eastwell in Kent, and in 1751 he became rector of St Dunstan's-in-the-East. Shortly after becoming chaplain to the bishop of London in 1762, he was appointed to a prebendal stall of St Paul's, and to the vicarage of Kensington, and in 1764 he was made archdeacon of London. He died at Kensington, September 6, 1770.

The principal works of Jortin are *Discussions Concerning the Truth of the Christian Religion*, 1746; *Remarks on Ecclesiastical History*, 1751; *Life of Erasmus*, 2 vols., 1750, 1760, founded on the life by Le Clerc, but containing a large amount of new matter; and *Tracts Philological, Critical, and Miscellaneous*, 1790. All his works display great learning and some acuteness both of research and criticism, but though written in a lively style they do not bear that stamp of originality which confers permanent interest.

See Dunsey's *Life of Jortin*, 1792; and the "Account of his Life and Writings," prefixed to an edition of the *Remarks on Ecclesiastical History* published in 1816.

JOSEPH, the most powerful tribe of northern Israel, occupied the centre of the land from the plain of Esdraelon to the mountain country of Benjamin and threw out colonies to Bashan and northern Gilead (see ISRAEL, p. 397). Unlike the other sons of Jacob, Joseph is usually reckoned as two tribes, the younger but more numerous tribe of Ephraim, to which Joshua belonged, having the pre-eminence over the other—Manasseh. In Ephraim lay the city of Shechem with the tomb of the tribal ancestor, and the great sanctuary of Shiloh where the ark stood till the battle of Ebenezer destroyed for a time the hegemony of Joseph, till after the division of the kingdoms he again became "the crowned one of his brethren" (Gen. xlix. 26; Dent. xxxiii. 16). Along with the small tribe of Benjamin, which as its name indicates lay immediately to the south, the house of Joseph constituted the group known as sons of Rachel (the ewe), which with the sons of Leah (the antelope) claimed a higher ancestry than the other Hebrews (the sons of Jacob's concubines).

The name of Joseph, the tribal ancestor, is explained in Gen. xxx. 24, in accordance with the usual spelling יוסף, as meaning "he addeth" (hence in Ps. lxxxi. 6 [E. V. 5] the resolved form יוסף). Another hand in Gen. xxx. 23 takes the word from יסף, "he taketh away." The history of Joseph, Gen. xxxvii.-l., belongs almost wholly to the earliest strata of the Pentateuch, the narratives of the Jehovist and non-Levitical Elohist, the larger share belonging to the latter author, himself probably a member of the house of Joseph.

The history of Joseph in Egypt displays remarkable familiarity with the circumstances and usages of that country (see *Libra, Aegyptien und die Bucher Moses*, Leipzig, 1868), but presents no data which enable us with certainty to combine the Biblical record with known events in Egyptian history. It is still disputed whether Joseph came to Egypt before, under, or after the Hyksos. The first opinion, which is supported by Bunsen and others, involves a considerable re-union in the period of five hundred and eleven years assigned to the Hyksos by Manetho, while on the other hand a date subsequent to the expulsion of the Semitic invaders (e.g., under Sethi I. as Lepsius suggests) demands a great shortening of the four hundred and thirty years of Exod. xi. 40, if the Pharaoh of the oppression was Sethi's successor, Rameses II. That the Ismaelites entered Egypt under the Hyksos is already mentioned as the current opinion of his time by George Syncellus, and is followed by many moderns, who observe that the promotion of a Hebrew appears most natural under a Semitic dynasty. See EHRICH, vol. vii. p. 741, and for Bunsen's supposed monumental reference to the seven years' famine, *ibid.*, p. 798. The Egyptian tale of "The Two Brothers," which presents a remarkable parallel to the story of Joseph, is given in *Records of the Past*, vol. ii.

The name of Joseph was common among the later Jews; of the Biblical personages by whom it was borne the best known are Joseph the husband of Mary, Joseph of Arimathea, Joseph Barnabas, and Joseph Barsabas.

JOSEPH, the husband of Mary the mother of Jesus, was a descendant of the house of David, and followed the trade of a carpenter in the village of Nazareth. Of his personal history practically nothing is recorded in Scripture. It is probable that he had died before the beginning of the public ministry of Christ; at least this seems a fair inference from the fact that no mention of him is made in passages relating to this period where the mother and brethren of Jesus are introduced. From John xix. 26 it is clear

that he was not alive at the time of the crucifixion. Ecclesiastical tradition, probably influenced by dogmatic prepossessions, has it that when married to Mary he was already eighty years of age and the father of four sons and two daughters, and that his first wife was named Salome, a connexion of the family of John the Baptist. In the Roman Catholic Church the 19th of March has since 1643 been a feast of obligation in his honour. His cultus is on the increase.

JOSEPH I. (1678-1711), Holy Roman emperor, was born in Vienna July 26, 1678. In 1689 he received the crown of Hungary, in 1690 that of the king of the Romans; and in 1705 he succeeded his father, Leopold I., as Holy Roman emperor. The war of the Spanish succession was raging at the time of his accession to the imperial throne; and it continued during the whole of his reign. Thanks to the genius of Marlborough and Eugene, Joseph was able to maintain in this struggle the greatest military traditions of the empire; and, the French troops having been gradually driven out of Italy and the Netherlands, Louis XIV. was compelled to ask several times for the conclusion of peace. The pope also gave evidence of the emperor's power by recognizing his brother Charles as king of Spain. In 1706 the electors of Cologne and Bavaria, and in 1708 the duke of Mantua, were put to the ban of the empire for supporting the enemy of their sovereign; and the emperor not only seized Bavaria, but began to partition it. He was successful, too, in Hungary, where he put down a rebellion that had broken out in the time of his father. On the other hand, he found it prudent to manifest a conciliatory spirit in his relations to Charles XII. of Sweden, who in 1706 made his way from Poland to Saxony through Silesia. In 1707 the emperor concluded treaties with him, granting religious liberty to the Silesian Protestants, and restoring to them upwards of two hundred churches which had been seized by the Jesuits. These concessions were not unwillingly made by the emperor, who, although a sincere Catholic, was of a tolerant disposition. He showed his respect for the constitution and dignity of the empire by supporting the diet in the free exercise of its functions, by promoting the activity of the imperial chamber, and by restoring Donauwörth, which had been mediatized by Bavaria, to the position of a free imperial city. He died of small-pox on the 17th of April 1711.

JOSEPH II. (1741-1790), Holy Roman emperor, born in Vienna March 13, 1741, was the son of the emperor Francis I. and Maria Theresa. He was made king of the Romans in 1764; and in 1765 he succeeded his father as Holy Roman emperor. Maria Theresa declared him co-regent of her hereditary states, but almost all real power she retained in her own hands. He received full authority only in the regulation of the military system, into which he introduced many changes, following in the main the example of Frederick the Great. Chiefly by his advice Maria Theresa was induced to associate herself with Russia and Prussia in the partition of Poland; and in 1777 he persuaded her to force Turkey to surrender Bukowina. When the younger branch of the house of Wittelsbach died out in 1777, Joseph claimed a large part of its territory; but Frederick the Great resisted his pretensions, and in 1779, after a nominal war, the emperor accepted the treaty of Teschen, by which he obtained only a small concession. Before this time he had sought to prepare himself for his future duties by extensive travels in his own states and in foreign countries; and everywhere he had made a favourable impression by his genial courtesy. In 1769 he had visited Frederick the Great, for whom he had at that time a warm admiration; and in the following year Frederick returned the visit, going back to Prussia with the conviction that it would be necessary "to keep his eye on that

young man." On the death of Maria Theresa in 1780, Joseph became sole ruler of the Austrian states. He was penetrated by the characteristic ideas of the 18th century as to the duties of an absolute monarch, and began at once to give effect to them in a fearless and almost revolutionary spirit. His first step was to combine the various nationalities subject to him into a single state with thirteen administrative districts. He refused to be crowned king of Hungary, and would not summon the Hungarian diet, insisting that the country should be governed as a province, and causing German to be used as the official language. Among other reforms he proclaimed the abolition of serfdom, substituted various punishments for the capital penalty, established common tribunals, and issued new codes based on the principle that all citizens are equal before the law. He transferred the censorship of books from the clergy to laymen of liberal sympathies, and granted complete freedom to journalism. He instituted public libraries and observatories, founded a medical college in Vienna, a university in Lemberg, and schools for the middle classes in various parts of the monarchy, and encouraged art by offering prizes in connexion with the academy of the plastic arts. Industry and trade he fostered by destroying many monopolies, by aiding in the establishment of new manufactures, by raising Fiume to the position of a free harbour, and by opening the Danube to his subjects from its source to the Black Sea. His ecclesiastical policy was of so bold a character that Pope Pius VI. went to Vienna for the purpose of expostulating with him, but found that the emperor was beyond the range of his influence. The hierarchy was forbidden to correspond with the Roman see without express permission; and papal bulls were subjected to the *Placetum Regium*. In 1781 he issued an edict of toleration, granting freedom of worship to all Protestants and to members of the Greek Church; and between 1782 and 1790 about seven hundred monasteries were closed, the members of religious orders being reduced from 63,000 to 27,000. All these changes were well-meant, but the emperor, in the ardour of his philanthropy, shot too far ahead of the prevailing sentiment of his people. Moreover, his good intentions were often rendered fruitless by unskilful or unsympathetic subordinates. In nearly every part of the monarchy discontent soon manifested itself, and some of the inhabitants of Tyrol broke into open rebellion. The Hungarians bitterly resented the suppression of their ancient privileges, and in 1787 the emperor's new institutions led in several districts to a furious conflict between the peasantry and the nobles. The estates of the Austrian Netherlands persistently opposed the execution of his schemes, the clergy being especially active in stirring up popular indignation; and when, in 1789, he altogether destroyed their constitution, they rebelled and were able for some months to maintain their independence. In Hungary there was so dangerous an agitation that in January 1790 Joseph had to undo almost everything he had attempted to accomplish in that country during the previous nine years; he succeeded only in maintaining the decrees by which he had abolished serfdom and established toleration. Thus his last days were rendered miserable by the conviction that his career had been a failure. He was not more fortunate in his foreign policy than in his home government. Early in his reign, indeed, he gained some advantages over the Dutch, who were obliged to abandon their fortresses on the frontier of the Austrian Netherlands. And when they refused to open the Scheldt, they had to compensate him (in 1785) by a payment of ten million florins. In the same year he renewed his claims on Bavarian territory, but was thwarted by Frederick the Great, who formed his famous league of princes for the

protection of the German states against Austrian ambition. After the conclusion of the treaty of Teschen, Joseph made it one of the chief objects of his foreign policy to form an enduring alliance between Austria and Russia; and in 1788, in association with Catherine II., he declared war against Turkey. He did not live to see the end of this war, which brought him little honour. On the 20th of February 1790 he died, deeply disappointed that he had been able to achieve so few of the objects with which he had begun his reign. He was twice married, first to the Princess Marie Louise of Parma, afterwards to the Princess Marie Josephe of Bavaria. His only daughter died in childhood, so that he was succeeded by his brother Leopold II. Notwithstanding the defeat of so many of his plans, his reign marked an epoch in the history of Austria; and the interest still excited by his name was shown by the enthusiasm with which the people of Austria celebrated in 1880 the centenary of his accession as sole ruler. On the pedestal of his statue in Vienna, erected by Francis I. in 1807, are these words:—"Josepho secundo, qui saluti publicæ vixit non diu, sed totus." (J. SL.)

JOSÉPHINE (1763-1814), empress of the French, was born at Trois-Îlets, Martinique, on the 23d of June 1763, and was the eldest of three daughters born to Joseph Tascher de la Pagerie, lieutenant in the artillery, and his wife Roso-Claire des Vergers de Sannois. She was educated at a local convent, from which she was withdrawn in her fifteenth year, knowing how to dance, sing, and embroider, but little else. An aunt, resident in France, was godmother to the second son of the Marquis de Beaumont, once the governor of Martinique; and she suggested a marriage between her god-child and niece. After much negotiation between the families, in which the second and youngest daughters were both preferred to Joséphine, her father carried her to Havre in 1779, she being already described to her aunt and the Beauharnais as possessing a fine complexion, beautiful arms and eyes, and with a sweet voice and a remarkable taste for music—"altogether an *iris-avancée et formée pour son âge*." On the 13th of December she was married to the Vicomte Alexandre Beauharnais at Noisy-le-Grand. Her son Eugène was born at a time when her relations with her husband were embittered by jealousy; and after the birth of her daughter Hortense-Eugénie he sought a separation, but, though he carried his request to the parliament, his petition was dismissed. Joséphine went back to her parents in June 1783, and was with them when the Revolution broke out. At the request of the vicomte she returned, however, to France in 1790. He was then a member of the constituent assembly, receiving at his house the chiefs of the constitutional party; and Joséphine was admired by all of them for her dignity, simplicity, and sweetness. As the crisis became more acute, her husband thought it prudent to withdraw to Fort-de-Beauharnais, in Sologne, where he left his family when he went to command the army of the Rhine. After his execution by order of the Convention, Joséphine was reduced to great straits, and not till the end of 1795 did regular remittances from Martinique begin again. She was living in the Rue Chantourne, Paris, in a house of her own, when she paid her first visit to Napoleon, to thank him for restoring the sword of her husband. She was in the full flower of her womanhood; Napoleon was at once drawn to her; on the 9th of March 1796 they were married. In twelve days he left her to take command of the army in Italy; but in June, at his earnest request, she joined him at Milan and went on to Brescia. After the peace of Léoben they lived at Montebello near Milan, and Joséphine was for some time the queen of a court frequented by great officers and diplomats. Having visited Rome, she went back to Paris, and

at her house assembled the most distinguished men of the day. During the expedition to Egypt she moved between the capital and Plombières; but she had her first quarrel with Napoleon on his return, because, by an oversight, she omitted meeting him. Social duties of the most brilliant and difficult sort began to accumulate round her during the consulate. At the palace of the Luxembourg and the Tuileries her drawing-room was again the centre of attraction in Paris; her receptions were ruled by the old traditions of regal ceremony, and there was an endless round of fêtes, entertainments, and plays. Her beauty and amability won upon everybody; and when she wanted rest she retired to Malmaison, a country seat she had bought, and amused herself with a variety of light studies in botany and natural history. Rumours now began to reach her that Napoleon, in despair of offspring, meant to sue for a divorce. She had long known that his relatives were trying to undermine her position; and even when she knelt beside him at Notre Dame, and received the triple unction at the ceremony which crowned her empress, she knew it to be a concession wrung from him. After the coronation he gave her less and less of his society. It was not, however, until the winter of 1809 that he deliberately proposed to dissolve the connexion. He divorced her with much show of tenderness, and she retired to Malmaison with an annual grant of two million francs for her establishment. Her affection for Napoleon, and her anxiety for his success, remained strong to the hour of her death, on May 24, 1814; and but for his inordinate ambition he would never have sought to live apart from her. She often provoked him by a certain mild duplicity in her character; she was extravagant and superstitious; yet, to fulfil the high destiny to which she was called, she brought much gentleness, courage, and sweetness, qualities which carried her through her reverses with admirable dignity.

See Anbassan, *Histoire de l'Impératrice Joséphine*, 1853-60.

JOSEPHUS, FLAVIUS, the well-known historian of the Jews, was born at Jerusalem in the first year of the reign of Caligula; the precise date is uncertain, but it lies somewhere between September 13, 37, and March 16, 38 A.D. His early advantages were very considerable. His father Matthias belonged to one of the best priestly families in the city, while on his mother's side he was descended from Jonathan, the first Hasmonean high priest. The position of his parents procured for him a careful education, and such was his progress (at least if his own account of himself is to be believed) that at the age of fourteen he was often consulted by the high priests and prominent citizens on difficult points of Jewish law. At sixteen he resolved upon an experimental study of the doctrines of the three leading sects, or schools of philosophy, as he prefers to consider them; and, hearing that Bannus, a celebrated Essene, was living in the wilderness with the rigorous asceticism of a hermit, he joined him and remained under his teaching for three years. Returning to Jerusalem at the age of nineteen, he definitively joined the Pharisees, to whom he continued ever after to adhere. In 64 A.D. (æd. 20) he undertook a journey to Rome to intercede for some priests of his acquaintance whom Felix the procurator had sent thither as prisoners to be tried on some trifling charges. Landing safely at Puteoli after a narrow escape from death by shipwreck in the Adriatic, he gained the friendship of Alitrus, a famous Jewish mmo of the day, and a favourite of Nero; by this means he not only obtained the pardon of his friends, but was also loaded with many valuable gifts by the empress Poppæa. On reaching Judæa again he found his countrymen bent at all hazards on throwing off the Roman yoke; knowing well the resources of Rome, and the hopelessness of successfully

resisting her power, he (according to his own account, which is not in itself very improbable) did his best to dissuade them from any such attempt. Ultimately, however, after the victory over Cestius Gallus, he yielded to the force of the current, and joined the revolutionary movement in 66, being entrusted with the task of governing and defending the province of Galilee, an appointment for which he was indebted to family influence rather than to any known military skill. Proceeding at once to his province, he set about the execution of plans of political reorganization, at the same time fortifying various military positions, and getting together and drilling an army of 100,000 men. Very soon, however, he had to encounter the opposition of a strong party, headed by John of Giscala, and it was with difficulty that he averted an insurrection at Taricheæ, and afterwards saved himself by flight from Tiberias. His enemies actually at one time had succeeded in obtaining his recall; but the act was afterwards cancelled, through the powerful influence he still possessed in Jerusalem. Meanwhile Vespasian had assembled a large force at Antioch, and in the spring of 67 threw a garrison into Sepphoris, whence (the troops of Josephus not waiting his attack) he made himself master of all Lower Galilee. Josephus himself falling back on Tiberias sent for large reinforcements from Jerusalem; these not being forthcoming, he in May shut himself up in Jotopata, the defence of which he maintained against all the efforts of the Romans for forty-seven days. At the end of that period the place was taken by storm, and such of the garrison as had not perished in the siege were put to death by the conquerors. The governor himself demanded to be led into the presence of the general, and, with great adroitness assuming the rôle of a prophet, told his captor that he was no chance prisoner, but had been commissioned by heaven to predict that he was shortly to become the sole head of the Roman empire. The plan was so far successful that the prisoner's life was spared; Vespasian, however, kept him in close confinement for two years, but on attaining the purple liberated him. Thenceforward Josephus assumed the family name of his patron (Flavians). After having accompanied Vespasian to Alexandria, he attended Titus to Palestine, and remained in his train until the close of the war. At the risk of his life he was more than once sent to urge his countrymen to yield, but without success. After the fall of the city he accompanied Titus to Rome, where Vespasian assigned him a residence in what had once been his own house, conferred on him the citizenship, and gave him a yearly pension, to which was afterwards added an estate in Judæa. Under Titus and Domitian he was confined in all his privileges, devoting the peaceful remainder of his days to those literary labours with which his name is now so exclusively associated. The precise date of his death is unknown; he must have survived the first century, for his autobiography mentions the death of Agrippa II., which occurred in 100 A.D.

His extant works are the following. (1) *History of the Jewish War* (*Ἱστορία τῆς Ἰουδαϊκῆς πολέμου*), in seven books. It was originally written in Aramaic for the benefit of the Jews dwelling beyond the Euphrates, but was afterwards translated by its author into the Greek, which alone we now possess. Books i.-ii. sketch the whole course of Jewish history from the period of the Maccabees to the beginning of the war. The remainder of the work gives a minute account of the entire struggle from 66 to its complete suppression in 73 A.D. On its completion the whole work was submitted to Vespasian, Titus, and Agrippa II., who, the author tells us, bore witness to its accuracy. Of its general trustworthiness there can be no reasonable doubt; Josephus had a considerable personal share in much of what he records; and on other points he seems to have had access to direct documentary evidence. The speeches which he reports are not of course to be construed by stricter rules than those which occur in the works of Livy or Thucydides; and apart from this some allowance also must be made for a tendency to exaggeration or false accentuation wherever his

vanity judged such a thing to be desirable. (2) *Antiquities of the Jews* (*Ἰουδαϊκὴ ἀρχαιολογία*), in twenty books, a comprehensive Jewish history from the earliest times down to the outbreak of the war in 66. It was completed in the thirteenth year of Domitian (93-94 A.D.), long after the author's own interest in it had exhausted itself. For the first eleven books, covered by the Scripture narrative, his exclusive authority seems to have been the Bible itself, especially the LXX. translation. He frequently, however, omits or modifies points which seemed to him likely to give offence; sometimes he supplements with current traditions or uses the works of his predecessors in the same field, Demetrius and Artapanus; and occasionally he gives excerpts from profane writers. The remaining nine books are very unequal in merit. The period between Alexander the Great and the Maccabees is almost an entire blank. For the Maccabean wars (xii. 5-xiii. 7) he had 1 Macc. to draw upon; for the reigns of the later Hasmoneans (xiii. 8-xiv.) he is dependent upon the historians Strabo and Nicolaus of Damascus. The last-named writer is also his chief authority for the portion of his narrative which relates to the times of Herod (xv.-xvii.), but he appears to have had access to some original memoirs. The last three books (xviii.-xx.), relating to the times immediately subsequent to the death of Herod, are more meagre than might have been expected, and by the carelessness of their manner bear witness to the author's confessed fatigue. Book xviii. (chap. ii. sec. 8) contains a remarkable passage relating to Jesus Christ, which is twice cited by Eusebius as genuine (*Ev. i. 11; Ev. xiv. 3, 105-6*), and which is met with in all the extant MSS. It is, however, unanimously believed to be, in its present form at least, spurious, and those who contend even for its partial genuineness are decidedly in the minority. (3) *Autobiography*, in seventy-six chapters, all of which, however, except the first six and the last two relate to the occurrences in Galilee in which he had so large a share during 66-67 A.D., written in defence of himself against the representations of a certain Justus of Tiberias. His narrative of these events cannot be regarded as an impartial one, and that in some points at least he was led to sacrifice truth to self-interest can be conclusively shown by comparison even with his own earlier work, the *History of the Jewish War*. The *Vita*, which contains the allusion to the death of Agrippa II., must have been written at a date subsequent to 100 A.D. (4) *Against Apion*, in two books. This is the usual but somewhat misleading title of a general apology for Judaism in which the polemic against Apion occupies only a subordinate place. Porphyry cites it by the title *Περὶ τοῦ Ἰουδαϊσμοῦ*, while Origen and Eusebius call it *Περὶ τῆς τοῦ Ἰουδαίου ἀπειρήσεως*. The date of its composition is later than that of the *Antiquities*. Other works referred to by Josephus, but no longer extant, are (1) *Περὶ τῶν νόμων* (*Ant.*, i. 5, 6), which is most probably to be identified with the composition elsewhere cited by the title *Περὶ ἑθῶν καὶ αἰτιῶν* (*Ant.*, iv. 8, 4); and (2) *Περὶ τοῦ κατὰ τὴν οὐρίαν ἀνθρώπου*, in four books (*Ant.*, xx. 11, 2). The so-called fourth book of Maccabees has sometimes, but erroneously, been assigned to Josephus. One or two philosophical treatises are also attributed to him by Photius; they are, however, obviously of Christian origin, and most probably are from the pen of Hippolytus of Ostia.

The Greek text of the works of Josephus was first printed at Basel in 1544. The earliest critical editions were those of Hudson (Oxford, 1720) and Havercamp (Utrecht, 1726); the text of the latter is that given by Obertlur (3 vols. 8vo., Leipzig, 1782-85) and by Richter (Leipzig, 1826-27). Further emendations occur in the edition of Dindorf (Paris, 1845-47), which is the basis of Bekker's edition (Leipzig, 1855-56). A new edition based upon fresh collation of MSS. is promised by Niese. The text of *Against Apion* was separately edited, with notes, by J. G. Müller, 1877. The translations of Josephus have been very numerous, and his writings are also the basis of the *Belizan Judaismum* which bears the name of Egesippus (corrupted from Josippus), and of the mediæval Hebrew history ascribed to Josippon ben Gorion. For the whole subject, biographical and literary, see Schürer's *NTische Zeitgeschichte* (1874) and his exhaustive article "Josephus" in Herzog-Plitt's *Real-Encyclop.*, vol. vii. (1880).

JOSHUA (יְהוֹשֻׁעַ), or in later Heb. יֵשׁוּעַ, Gr. Ἰησοῦς, whence "Jesus" in the A. V. of Heb. iv. 8; another form of the name is Hoshea, Num. xiii. 8, 16), first the lieutenant and afterwards the successor of Moses, was the son of Nun, of the tribe of Ephraim, and left Egypt, along with the rest of the children of Israel, at the time of the exodus. In the Pentateuch he is first mentioned as being the victorious commander of the Israelites in their battle against the Amalekites at Rephidim (Ex. xvii. 9-13), and he is represented as having earned further distinction along with Caleb by his calm and courageous demeanour in the midst of the popular tumult

caused by the report of the spies (Num. xiv. 6-9, 38). On the death of Moses he assumed the leadership to which he had previously been designated by his chief, and the book known by his name is entirely occupied with details of the manner in which he carried out the task thus laid to his hand,—that of taking possession of the land of Canaan. On the completion of the reconnaissance by the two spies, he left Shittim with his army, preceded by the priest-borne ark of the covenant. The Jordan having been miraculously crossed, his first encampment was at Gilgal. Jericho and Ai soon fell into his hands, and the people of Gibeon became vassals. In the neighbourhood of Gibeon the five kings of the Amorites were crushed in a decisive battle in which the very elements conspired to favour the invader, and (to use the poetical language of the book of Jashar) "the sun stood still and the moon stayed until the people had avenged themselves upon their enemies." The victorious arms of Israel were now directed northwards against a league of Canaanite potentates under the hegemony of Jabin, king of Hazor; anticipating the attack of the enemy, Joshua surprised and crushed them at the waters of Merom, Hazor itself being taken and burnt. Thus far the first twelve chapters of the book of Joshua; the remaining twelve describe the partition of the (conquered and unconquered) country among the twelve tribes, and conclude with a resumé of his parting exhortations. At the age of one hundred and ten he died and was buried in this inheritance in Timnath-serah, in the territory of Ephraim. For the book of Joshua, an integral part of that part of the Old Testament sometimes spoken of as Hexateuch, the reader is referred to the heading PENTATEUCH.

Critical investigation has shown that the history of Joshua as now sketched is a composite narrative, made up mainly from the two Elohistic (or, as they are now generally called, the Elohist) and the Levitical documents. Fragments of an account of the conquest of Canaan older than either of these writings are preserved in the book of Judges, and it is generally recognized by recent inquirers that the progress of the Israelites was much slower and their action less united than appears on the face of the book of Joshua as we now read it, the statistics of the Levitical record in particular applying properly to a much later date. From this point of view Joshua appears rather as the leader of Ephraim than of all Israel. He is for the north what Caleb was for the south. See ISRAEL and JUDAH, and compare a paper by Meyer in *Stade's Zeitsch. f. Altliche W'iss.*, vol. i. (1881). See also Ewald, *Geschichte*, vol. ii. The only extra-Biblical notice of Joshua is the inscription of the most doubtful genuineness given by Procopius (*Var.*, ii. 20), and mentioned also by Moses of Cherson (*Hist. Arme.*, i. 18). It is said to have stood at Tigris in Mesopotamia, and to have borne that those who erected it had lived before *Ἰησοῦς ὁ ἀγαθός*.

JOSIAH, the last but four of the kings of Judah, was the son of Amon, whom he succeeded when only eight years old, the people having declared in his favour against the conspirators who had murdered his unworthy father. The circumstances of the regency which must have existed during his minority are not recorded; it is not until his eighteenth year (for 2 Chr. xxxiv. 3 cannot be set against the explicit testimony of 2 Kings xxii., xxiii.) that he emerges into the light of history, when we find him interested in the repair of the temple at Jerusalem. The religious movement of which this was a symptom took more definite shape with the finding by Hilkiah the high priest of a copy of "the book of the law." The reasons for believing this to have been (substantially at least) the book of Deuteronomy cannot be detailed here. They were already appreciated by Jerome and Chrysostom, and no very careful examination is required to show that the effect of its perusal was to bring about a religious reformation, which in all its features was in accordance with the prescriptions and exhortations of that remarkable composition. The main features of the movement (which extended into the adjoining kingdom of Samaria, at that time a loosely

governed Assyrian dependency) have already been sketched in the article ISRAEL. On the secular aspects of the reign of Josiah Scripture is almost wholly silent. Thus nothing is related of the great Scythian invasion, which as we know from Herodotus (i. 105) took place at this period, and must have approached Judah, being probably alluded to by Zephaniah and Jeremiah. The storm which shook the great world powers was favourable to the peace of Josiah's kingdom; the power of Assyria was practically broken, and that of the Chaldeans had not yet developed itself into the aggressive forms it afterwards assumed. But in his thirty-first year Josiah for some unexplained reason was rash enough to place himself in the path of Pharaoh Necho in his military expedition against the king of Assyria; a disastrous encounter took place at Megiddo, in which he lost at once his crown and life (2 K. 23).

JÓSIKA, MIKLÓS or NICHOLAS, BARON (1794-1865), the greatest and, next to Jókai, most prolific Hungarian novelist, was born 28th April 1794, at Torda in Transylvania, of aristocratic and wealthy parents. After finishing the usual course of legal studies at Kolozsvár (Klausenburg), he in 1811 at the age of seventeen entered the army, joining a cavalry regiment, with which he subsequently took part in the Italian campaign. In 1813 he was promoted to the grade of sub-lieutenant, and on the battlefield of Mincio (February 8, 1814) to that of lieutenant. Elevated to the rank of captain, he served in the campaign against Napoleon, and was present at the entry of the allied troops into Paris (31st March 1814). In 1818 Jósika resigned his commission in the army, returned to Hungary, and married his first wife Elizabeth Kallai. The union proving an unhappy one, Jósika parted from his wife, settled on his estate at Szurdok in Transylvania, and devoted himself to agricultural and literary pursuits. Drawn into the sphere of politics, he took part in the memorable Transylvanian diet of 1834. At about this period Jósika first began to attract attention as a writer of fiction. In 1836 he brought out his *Abagy*, 2 vols., which laid the foundation of his literary reputation. He was soon afterwards elected member of the Hungarian Academy of Sciences and of the Kisfaludy Society; of the latter he became, in 1841, director, and in 1842 vice-president. In 1847 Jósika appeared at the Transylvanian diet as second deputy for the county of Szolnok, and zealously supported the movement for the union of Transylvania with Hungary proper. In the same year he was converted to Protestantism, was formally divorced from his wife, and married Baroness Julia Podmaniezky, with whom he continued to live happily until his death. So great was Jósika's literary activity that by the time of the revolution (1848) he had already produced about sixty volumes of romances and novels; besides numerous contributions to literary and political periodicals. Both as magnate of the upper house of the Hungarian diet and by his writings Jósika sided the revolutionary movement, with which he was soon personally identified, being chosen one of the members of the committee of national defence. Consequently, after the capitulation at Világos (13th August 1848), he found it necessary to flee the country, and settled first at Dresden and then, in 1850, at Brussels, where he resumed his literary pursuits anonymously. In 1864 he removed to Dresden, in which city he died on the 27th February 1865. The romances of Jósika, written somewhat after the style of Sir Walter Scott, are chiefly of a historical and social-political character, his materials being drawn almost entirely from the annals of his own country. Among his more important works may be specially mentioned, besides *Abagy*—*The Poet Zrínyi*, 1843; *The last of the Batoris*, 1837; *The Bohemians in Hungary*, 1839; *Esther*, 1853; *Francis Rákóczy II.*, 1861; and *A Végváriak*, a tale of the time

of the Transylvanian prince Bethlen Gábor, 1864. Many of Jósika's novels have been translated into German, the earlier ones by Klein, Schwarz, Steinacker, and Kovács, and the later by Jósika's second wife Julia, herself an authoress of considerable merit.

See K. Menich and S. Yutovich, *Magyar Irók Névtára*, Budapest, 1876; M. Jókay, "Jósika Miklós Emlékezete," *A Kétfalud-Társaság Estijáró*, 6 Jólajna, vol. II, Pest, 1869; G. W. Steinacker, *Ungarische Lyriker*, Leipzig, 1874. Cf. also Jósika's autobiography—*Émlékirat*, Pest, 1865, vol. iv.

JOSQUIN. See DEPRÉS, JOSQUIN, vol. vii. p. 101, musical composer, ordinarily designated by the name Josquin.

JOST, ISAAC MARCUS (1793-1860), historical writer, was born on February 22, 1793, at Bernburg, and studied at the gymnasium of Wolfenbüttel, whence he passed successively to the universities of Göttingen and Berlin. In Berlin he taught a school from 1826 till 1835, when he received the appointment of upper master in the Jewish commercial school (called the Philanthropin) at Frankfurt-on-the-Main. Here he remained until his death, 20th November 1860. The work by which he is chiefly known is a *Geschichte der Israeliten*, in 9 vols. (Berlin, 1820-29), which was afterwards supplemented by *Neuere Geschichte der Israeliten von 1815-45* (Berlin, 1846-47), and *Geschichte des Judenthums u. seiner Sekten* (Leipzig, 1857-59). He also published an abridgment of the *Geschichte* under the title *Allgemeine Geschichte des jüdischen Volks* (1831-32), and an edition of the Mishna with a German translation and notes (in 6 vols., 1832-34). The *Israelitische Annalen* were edited by him from 1839 to 1841, and he contributed extensively on pedagogic and historical subjects to scientific journals.

JOUFFROY, THEODORE-SIMON (1796-1842), a French philosopher, was born at Pontet, near Mouthé, department of Doubs, 1796. In his tenth year, his father, who was a taxgatherer, sent him to an uncle at Pontarlier, under whom he commenced his classical studies. At Dijon his compositions attracted the attention of an inspector who had him placed (1814) in the Normal School, Paris. He there came under the influence of Cousin, and in 1817 he was appointed assistant professor of philosophy at the Normal and Bourbon schools. Three years later, being thrown upon his own resources, he began a course of lectures in his own house, and formed literary connexions with *Le Courrier Français*, *Le Globe*, *L'Encyclopédie Moderne*, and *La Revue Européenne*. This variety of his pursuits at this time carried him over the whole field of ancient and modern literature. But he was chiefly attracted to the philosophical system represented by Reid and Stewart. The application of "common sense" to the problem of substance supplied a more satisfactory analytic for him than the scepticism of Hume which reached him through a study of Kant. He thus threw in his lot with the Scotch philosophy, and his first dissertations are, in their leading position, adaptations from *The Inquiry*. His tendency towards eclecticism makes his philosophical position undefinable, but his limpid style and capacity for generalizing historical movements are as distinct in his earlier as in his later works. In 1826 he wrote a preface to a translation of the *Moral Philosophy* of Stewart, demonstrating the possibility of a scientific statement of the laws of consciousness; in 1828 he began a translation of the works of Reid, and in his preface estimated the influence of Scotch criticism upon philosophy, giving a biographical account of the movement from Hutcheson onwards. In the same year he assisted Milon in ancient philosophy at the Faculty of Letters, and, while carrying on a course upon recent philosophy, he returned to the Normal School in 1830. Next year he was returned to parliament by the arrondissement of Pontarlier; but the

work of legislation was ill-suited to his powers. Swift, practical decisions on questions demanding immediate settlement were repugnant to his habits of mind. He tried to introduce a reform in the manner of considering petitions,—his sole suggestion of any weight during the years of his representation; though he frequently spoke, he never gained any real influence. Yet he attended to his parliamentary duties conscientiously, and ultimately broke his health in their discharge. In 1833 he was appointed professor of Greek and Roman philosophy at the college of France and a member of the Academy of Sciences; he then published the *Mélanges Philosophiques*, a collection of fugitive papers in criticism and philosophy and history. In them is foreshadowed all that he afterwards worked out in metaphysics, psychology, ethics, and aesthetics. He had already demonstrated in his prefaces the possibility of a psychology apart from physiology, of the science of the phenomena of consciousness distinct from the perceptions of sense. He now classified the mental faculties, premising that they must not be confounded with capacities or properties of mind. They were, according to his analysis, personal will, primitive instincts, voluntary movement, natural and artificial signs, sensibility and the faculties of intellect; on this analytic he founded his scheme of the universe. In 1835 he published a *Cours de Droit Naturel*, which, for precision of statement and logical coherence, is the most important of his works. Starting from the conception of a universal order in the universe, he reasons from it to a Supreme Being, who has created it and who has conferred upon every man in harmony with it the aim of his existence, leading to his highest good. As to the nature of good and evil, how is it to be judged? The good, he says, is the fulfilment of man's destiny, the evil the thwarting of it. Every man being organized in a particular way has, of necessity, an aim, the fulfilment of which is good; and he has faculties for accomplishing it, directed by reason. The aim is only good, however, when reason guides it for the benefit of the majority, but that is not absolute good. When reason rises to the conception of universal order, when actions are submitted, by the exercise of a sympathy working necessarily and intuitively, to the idea of the universal order, the good has been reached, the true good, good in itself, absolute good. But he does not follow his idea into the details of human duty, though he passes in review fatalism, mysticism, pantheism, scepticism, egotism, sentimentalism, and rationalism. In 1835 his health failed and he went to Italy, where he continued to translate the Scotch philosophers. On his return he became librarian to the university, and took the chair of recent philosophy at the Faculty of Letters. He died in Paris, 4th February 1842. After his death were published *Nouveaux Mélanges Philosophiques* and *Cours d'Esthétique*. The former contributed nothing new to the system except a more emphatic statement of the distinction between psychology and physiology. The latter formulated his theory of beauty. The beautiful, by his analysis, is that which aesthetically pleases, without consideration of interest. Utility being defined as the satisfaction of human wants, the beautiful may be useless. Order and proportion he takes to be the components of beauty,—an order and proportion not leading to the useful, but giving pleasure without consideration of the end. Unity and variety are the conditions of beauty; it demands their coexistence, the former for the satisfaction of sensibility, the latter of intelligence. Jouffroy's claim to distinction rests upon his ability as an expositor of other men's ideas. He founded no system; he contributed nothing of importance to philosophical science; he initiated nothing which has survived him. But his enthusiasm for mental science, and his command over the language of popular expo-

sition, made him a great, international medium for the trans-
fusion of ideas. He stood between Scotland and France
and Germany and France; and, though his expositions are
vitiated by loose reading of the philosophers he interpreted,
he did serviceable, even memorable work.

JOURDAIN, ALPHONSE, count of Toulouse, son of Count
Raymond IV. by his third wife, Elvire de Castile, was
born in 1103, in the castle of Mont-Pelerin, Tripoli. His
father died when he was two years old, and he remained
under the guardianship of the count of Cerdagne until he
was five. He was then taken to Europe, and his brother
gave him Rouergue; in his tenth year he succeeded to the
government of Narbonne, Toulouse, and Provence, but
Toulouse was taken from him by the duke of Aquitaine
while he was still in his minority. After the duke's death
the inhabitants of Toulouse revolted and recalled Jourdain;
he returned in triumph in 1123. He, however, drew upon
himself a sentence of excommunication by his treatment
of the religious community of St Gilles, which had pre-
viously thrown in its influence on the side of the duke of
Aquitaine. He had next to fight for the sovereignty of
Provence against Raymond Beranger III, and not till
September 1125 did the war end in an amicable agreement.
Under it Jourdain became absolute master of the regions
lying between the Pyrenees and the Alps, Auvergne and
the sea. His ascendancy was an unmixed good to the
country, for during a period of fourteen years art and
industry were successfully prosecuted. Louis VII., for
some reason which has not appeared, besieged Toulouse in
1141, but without result. Next year Jourdain again
incurred the displeasure of the church by siding with the
rebels of Montpellier against their lord. A second time
he was excommunicated. But his isolation from Rome
did not suit his taste or policy; so in the autumn of 1144
he took the cross at the meeting of Vézelay called by Louis
VII., and three years later he embarked for the East. He
lingered on the way in Italy, and probably in Constantinople;
but in 1148 he had arrived at Acre. Among his
companions he had made enemies, and he was destined to
take no share in the crusade he had joined. He was
poisoned at Acre before hostilities commenced, either the
wife of Louis or the mother of the king of Jerusalem
suggesting the draught.

JOUVENET, JEAN (1647–1717), born at Rouen in 1647,
came of a family of painters, one of whom had had the
honour of teaching Poussin. He early showed remarkable
aptitude for his profession, and, on arriving in Paris,
attracted the attention of Le Brun, by whom he was
employed at Versailles, and under whose auspices, in 1675,
he became a member of the Royal Academy, of which he
was elected professor in 1681, and one of the four perpetual
rectors in 1707. The great mass of works that he exe-
cuted, chiefly in Paris, many of which, including his cele-
brated *Miraculous Draught of Fishes* (engraved by Audran;
also London, *Annales*, i. p. 42), are now in the Louvre,
show his fertility in invention and execution, and also that
he possessed in a high degree that general dignity of
arrangement and style which distinguished the school of
Le Brun. Jouvonet died on April 5, 1717, having been
forced by paralysis during the last four years of his life
to work with his left hand. See *Mém. Ind. Acad. Roy.*
de P. et de Sc., 1854, and D'Argenville, *Vies des*
Peintres.

JOVELLANOS, or JOVELLANOS, GASPARD MELCHOR
DE (1744–1811), statesman and author, was born at Gijón
in Asturias, Spain, January 5, 1744. Selecting law as his
profession, he studied at Oviedo, Avila, and Alcala, and
in 1767 became criminal judge at Sevilla. His integrity
and ability were rewarded in 1778 by a judgeship in
Madrid, and in 1780 by appointment to the council of

military orders. In the capital Jovellanos took a good
place in the literary and scientific societies; for the society
of Friends of the Country he wrote in 1787 his most
valuable work, *Informe sobre un proyecto de Ley Agraria*.
Involved in the disgrace of his friend, the brilliant French
adventurer Cabarrus, Jovellanos spent the years 1790 to
1797 in a sort of banishment at Gijón, engaged in literary
work and in founding the Asturian institution for agricul-
tural, industrial, social, and educational reform throughout
his native province. This institution continued his darling
project up to the latest hours of his life. Summoned
again to public life in 1797, Jovellanos refused the post
of ambassador to Russia, but accepted that of minister
of grace and justice, under "the Prince of the Peace,"
whose attention had been directed to him by Cabarrus,
then a favourite of Godoy. Displeased with Godoy's policy
and conduct, Jovellanos combined with his colleague
Saavedra to procure his dismissal. They were but tem-
porarily successful; Godoy returned to power in 1798;
Jovellanos was again sent to Gijón, but in 1801 was thrown
into prison in Majorca. The revolution of 1808, and the
advance of the French into Spain, set him once more at
liberty. Joseph Bonaparte, on mounting the Spanish
throne, made Jovellanos the most brilliant offers; but the
latter, sternly refusing them all, joined the patriotic party,
became a member of the central junta, and contributed
to reorganize the cortes. This accomplished, the junta at
once fell under suspicion, and Jovellanos was involved
in its fall. To expose the conduct of the cortes, and to
defend the junta and himself were the last labours of his
pen. In 1811 he was enthusiastically welcomed to Gijón;
but the approach of the French drove him forth again.
The vessel in which he sailed was compelled by stress of
weather to put in at Vega in Asturias, where, on November
27, 1811, Jovellanos died.

The poetical works of Jovellanos comprise a tragedy *El Pelajo*, the
comedy *El Delincuente Honrado*, satires, and miscellaneous pieces,
including a translation of the first book of *Paradise Lost*. His prose
works, especially those on political and legislative economy, con-
stitute his real title to literary fame. In them depth of thought
and clear-sighted sagacity are coupled in a certain classical
elegance and classical purity of style. Besides the *Ley agraria* he
wrote *Elogios*; various political and other essays; and *Memorias*
Políticas, 1801, suppressed in Spain, and translated into French,
1825. An edition of his complete works was published at Madrid,
1881–82, in 7 vols., and another at Barcelona, 1839.

See *Noticias históricas de Don G. M. de Jovellanos*, Palma, 1812, and *Memorias*
para la vida del Señor . . . Jovellanos, by J. A. G. Bermúdez, Madrid, 1814, both
inserted in the *Foreign Quarterly Review*, No. x.

JOVIANUS, FLAVIUS CLAUDIUS, Roman emperor from
June 27, 363, to February 17, 364, was the son of the
brave general Varroianus, and was born at Singidunum
in Moesia about 332. As captain of the guard (*primus*
ordens domesticorum) he accompanied Julian in his Persian
expedition; and on the day after that emperor's death,
when the aged Sallust declined the purple, the voices
of the army beyond the Tigris were united in Jovian's
favour. It was perhaps the absence of any very invidious
ability, no less than his father's reputation, that set Jovian
on the throne. The new emperor's first care was to con-
tinue the retreat begun by Julian; and he had with diffi-
culty reached the rapid and well-nigh impassable Tigris,
when overtures of peace were made by the Persian king
Sapor II., who had not ceased to harass the Roman march.
Jovianus was not in a position to command easy terms;
the famished and exhausted state of his army compelled
his assent to a humiliating treaty, which gave up to the
Persians the provinces of Arzanene, Corduene, Moxoene,
Rehimene, and Zabdicene, which had been conquered by
Galerius in 297, and Nisibis and other cities. From this
time the Greek and Christian influence dates its decline in
the trans-Euphrates regions. Jovian was anxious to reach
Constantinople in order to establish his power; but the

news of the loyalty of the western legions gladdened him while still on the march through Asia Minor. After issuing a decree by which Christianity was restored as the state religion, though paganism was recognized, the emperor assumed the consulship at Ancyra, on January 1, 364, with his infant son as colleague. Within two months, on February 17, 364, Jovianus was found dead in his bed at Dadstana, a small town of Galatia. A surfeit of mushrooms or the fumes of a charcoal fire have been assigned as the causes of death. The suspicion of foul play is unsupported by evidence. He was succeeded by Valentinian and Valens, after an interregnum of ten days.

Besides the ancient historians of the period, see Gibbon's *Decline and Fall*; Le Beau's *Bas-Empire*; Finlay's *Græco under the Romans*; and the Abbé de la Blérierie's *Histoire de Josien*, Amsterdam, 1740. In Syriac literature Jovian (Iobannan) became the hero of a Christian romance, published by George Hoffmann (*Juliauer der Abbrunnig*, 1880). Compare the account of this work by Noldke, *Z.D.M.G.*, vol. xxvii.

JOVINIANUS, or JOVIANUS, a Roman monk and reputed heretic who flourished during the latter half of the 4th century. All our knowledge of him is derived from a passionately hostile polemic of Jerome (*Adv. Jovinianum Libri II.*), written at Bethlehem, and without any personal acquaintance with the man assailed, in 393 A.D. According to this authority he in 388 was living at Rome the celibate life of an ascetic monk, possessed a good acquaintance with Scripture, and was the author of several minor works, but, undergoing an heretical change of view, afterwards became a self-indulgent Epicurean and unrefined sensualist. The doctrinal heresies which had provoked the wrath of Jerome were mainly these:—(1) he held that in point of merit, so far as their domestic state was concerned, virgins, widows, and married persons who had been baptized into Christ were on a precisely equal footing; (2) those who with full faith have been regenerated in baptism cannot be overthrown (or, according to another reading, tempted) of the devil; (3) to abstain from meats is not more praiseworthy than thankfully to enjoy them; (4) all who have preserved their baptismal grace shall receive the same reward in the kingdom of heaven. Jerome's bitter polemic was chiefly provoked by those views of Jovinian as to fasting and marriage in which the entire Protestant world has declared itself substantially at one with the so-called heretic. He was, however, condemned by a Roman synod under Bishop Siricius in 390, and afterwards excommunicated by another at Milan under the presidency of Ambrose. The year of his death is unknown, but he is referred to as being no longer alive in Jerome's *Contra Vigilantium*, which was composed in 406.

JOVIUS, PAULUS, or PAOLO GIOVIO (1483-1552), an Italian historian and biographer, was born of an ancient and noble family at Como, April 19, 1483. His father died when he was a child, and Giovio owed his education to his brother Benedetto. After studying the humanities, he applied himself to medicine and philosophy at Padua; and afterwards he took a medical degree in the university of Pavia. But the attraction of literature proved irresistible for Giovio, and he was bent upon becoming the historian of his age. Some time, probably in or after 1516, he went to Rome, with a portion of his history already finished. This he presented to Leo X., who read the MS., and pronounced it superior in elegance to anything which had been produced since the decades of Livy. Giovio, encouraged by the success of his first step in authorship, took up his residence in Rome, and attached himself to the court of the cardinal Giulio de' Medici. The next pope, Adrian VI., gave him a canonry in his native town of Como, on the condition, it is said, that Giovio should mention him with honour in his history. This patronage from a pontiff who

was averse to the current tone of Italian humanism, proves that Giovio at this period passed for a man of sound learning and sober manners. After Adrian's death, Clement VII. assigned him chambers in the Vatican, with maintenance for servants befitting a courtier of rank. In addition to other benefices, he finally, in 1528, bestowed on him the bishopric of Nocera. Giovio had now become in a special sense dependent on the Medici. He was employed by that family on several missions,—as when he accompanied Ippolito to Bologna on the occasion of Charles V.'s coronation, and Caterina to Marseilles before her marriage to the duke of Orleans. During the siege of Rome in 1527 he attended Clement in his flight from the Vatican. While crossing the bridge which connected the palace with the castle of S. Angelo, Giovio threw his mantle over the pope's shoulders in order to disguise his master.

In the sack he suffered a serious literary loss if we may credit his own statement. The story runs that he deposited the MS. of his history, together with some silver, in a box at S. Maria Sopra Minerva for safety. This box was discovered by two Spaniards, one of whom secured the silver, while the other, named Herrera, knowing who Giovio was, preferred to hold the MS. for ransom. Herrera was so careless, however, as to throw away the sheets he found in paper, reserving only that portion of the work which was transcribed on parchment. This he subsequently sold to Giovio in exchange for a benefice at Cordova, which Clement VII. conferred to the Spaniard. Six books of the history were lost in this transaction. Giovio contented himself with indicating their substance in a summary. Perhaps he was not unwilling that his work should resemble that of Livy, even in its imperfection. But doubt rests upon the whole of this story. Apostolo Zeno asserts that in the middle of the last century three of the missing books turned up among family papers in the possession of Count Gio. Batt. Giovio, who wrote a panegyric on his ancestor. It is therefore not improbable that Giovio possessed his history intact, but preferred to withhold those portions from publication which might have involved him in difficulties with living persons of importance. The omissions were afterwards made good by Curzio Marcellino in the Italian edition, published at Venice in 1681. But whether Marcellino was the author of these additions is not known.

After Clement's death Giovio found himself out of favour with the next pope, Paul III. The failure of his career is usually ascribed to the irregularity of the life he led in the literary society of Rome. We may also remember that Paul had special causes for animosity against the Medici, whose servant Giovio had been. Despairing of a cardinal's hat, Giovio retired to his estates at Como, where he spent the wealth he had acquired from donations and benefices in adorning his villa with curiosities, antiquities, and pictures. He died upon a visit to Florence in 1552.

Giovio's principal work was the *History of his own Times*, from the invasion of Charles VIII. to the year 1547. It was divided into two parts, containing altogether forty-five books. Of these, vols. x.-xi. of part I. were said by him to have been lost in the sack of Rome, while books xix.-xxiv. of part II., which should have embraced the period from the death of Leo to the sack, were never written. Giovio supplied the want of the latter six books by his lives of Leo, Adrian, Alphonso I. of Ferrara, and several other personages of importance. But he alleged that the history of that period was too painful to be written in full. His first published work, printed in 1524 at Rome, was a treatise *De Piscibus Romanis*. After his retirement to Como he produced a valuable series of biographies, entitled *Storia Pavorum Illustrum*. They commemorate men distinguished for letters and arms, selected from all periods, and are said to have been written in illustration of portraits collected by him for the museum of his villa at Como. Besides these books, we may mention a biographical history of the Visconti, lords of Milan; an essay on mottoes and badges; a dissertation on the state of Turkey; a large collection of familiar epistles; together with descriptions of Britain, Muscovy, the Lake of Como, and Giovio's own villa. The titles of these miscellanies will be found in the bibliographical note appended to this article.

Giovio preferred Latin in the composition of his more important works. Though contemporary with Machiavelli, Guicciardini, and Varchi, he adhered to humanistic usages, and cared more for the Latinity than for the matter of his histories. His style is fluent and sonorous, rather than pointed or grave. Partly owing to the rhetorical defects

inherent in this choice of Latin, when Italian had gained the day, but more to his own untrustworthy and shallow character, Giovio takes a lower rank as historian than the bulk and prestige of his writings would seem to warrant. He professed himself a flatterer and a lampooner. The old story that he said he kept a golden and an iron pen, to use according as people paid him, condenses the truth in epigram. He had the faults of the elder humanists, in combination with that literary cynicism which reached its height in Aretino; and therefore his histories and biographical essays are not to be used as authorities, without corroboration. Yet Giovio's works, taken in their entirety and with proper reservation, have real value. To the student of Italy they yield a lively picture of the manners and the feeling of the times in which he lived, and in which he played no obscure part. They abound in vivid sketches, telling anecdotes, fugitive comments, which unite a certain charm of autobiographical romance with the worldly wisdom of an experienced courtier. A flavour of personality makes them not unpleasant reading. While we learn to despise and mistrust the man in Giovio, we appreciate the literateur. It would not be too far-fetched to describe him as a sort of 16th century Horace Walpole.

Bibliography.—The sources of Giovio's biography are—his own works, Trieboschi's *History of Italian Literature*; Litia's *Genealogy of Illustrious Italian Families*; and Giov Batt. Giovio's *Uomini illustri della Diocesi Comasca*, Molena, 1784. Cicogna, in his *Della Inscrizioni Veneziane Invenute* (Venice, 1830), gives a list of Giovio's works, from which the following notices are extracted.—1. Works in Latin:—(1) *Pauli Jovii Historiarum et temporum*, Florence, 1550–52, the same translated into Italian by L. Domenichi, and first published at Florence, 1551, afterwards at Venice; (2) *Leontis X., Hadriani P.P., Pompeii Columnarum Capit.*, Florence, 1548, translated by Domenichi, Florence, 1549; (3) *Vita XII. Ptolemaei Aetoliensis principum*, Paris, 1549, translated by Domenichi, Venice, 1549; (4) *Vita Sforzici claris. duels*, Rome, 1549, translated by Domenichi, Florence, 1549; (5) *Vita Fr. Rari. Jovialis*, Florence, 1551, translated by Domenichi, ibid., 1551; (6) *Vita novae Civitatis*, ibid., 1549, translated by Domenichi, ibid., 1550; (7) *Alfonsi Aetoliensis, etc.*, ibid., 1550, Italian translation by Giov. Batt. Gelli, Florence, 1553; (8) *Biografia virorum illustrium ptolemaei illustrium*, ibid., 1551, translated by Domenichi, ibid., 1554; (9) *Biografia virorum virorum*, etc., Venice, 1546 (these are biographies of men of letters), translated by Hippolyto Orto of Ferrara, Florence, 1552; (10) *Libellus de legatione Basilii Magni Principis Moscoviae*, Rome, 1525; (11) *Descriptio Lurii Larii*, Venice, 1550; (12) *Descriptio Adriaticae*, etc., Venice, 1548; (13) *De Jovianis Paschalis*, Rome, 1524. 2. Works in Italian:—(1) *Dialogo delle imprese militari et amorose*, Rome, 1555; (2) *Lettere Poligrici*, Venice, 1550. Some minor works and numerous reprints of those cited have been omitted from this list; and it should also be mentioned that some of the lives, with additional matter, are included in the *Vita Illustrum Virorum*, Basel, 1576. (J. A. S.)

JUANES, or JOANES, VICENTE (1523–1579), head of the Valencian school of painters, and often called "the Spanish Raphael," was born at Fuente de la Higuera in the province of Valencia in 1523. Of his biography practically no authentic facts have been preserved. He is said to have studied his art for some time in Rome, with which school his affinities are closest, but the greater part of his professional life was spent in the city of Valencia, where most of the extant examples of his work are now to be found. All relate to religious subjects, and are characterized by dignity of conception, accuracy of drawing, truth and beauty of colour, and minuteness of finish. The best known are the Entombment, the Nativity, the Burial of a Monk, and the Martyrdom of St Agnes. His style is also seen to full advantage in the series on the life of St Stephen, originally painted for the church of San Esteban in Valencia, and now in the Museo at Madrid. He died at Bocairente (near Jativa) while engaged upon an altarpiece in the church there, on 21st December 1579.

JUAN FERNANDEZ, a small island in the South Pacific in 34° S. lat., 400 miles west of Valparaiso. The Spaniards also designate it *Mas-a-Tierra*, "more to land,"

to distinguish it from a smaller island, *Mas-a-Fuera*, "more to sea," 9 miles farther west. The aspect of Juan Fernandez is beautiful and striking; only 13 miles in length by 4 in width, it consists of a series of precipitous rocks rudely piled into irregular blocks and pinnacles. The highest of these masses (about 3000 feet), a fine object from the anchorage, is called, from its massive form, *El Yunque*, the Anvil; it appears to be inaccessible. Any attempt to scale the higher peaks of the island is dangerous; the soil is very light and shallow, and the vegetation mostly a shrubby under growth, and on any attempt to pull oneself up by the help of this, the whole is apt to give way, and clamber and shrubs are precipitated together down the cliffs. The rocks are trap-tuffs, basalts, and greenstones, and the island seems to date back to the older trappean series. There is a doubtful story of light having been seen emanating from one of the higher peaks; but it seems likely that, if Juan Fernandez was ever a subaerial volcanic cone, its fires have been long extinguished. Small indentations are found all round the island, but Cumberland Bay on the north side is the only good anchorage, and even there, from the great depth of water, there is some difficulty and risk.

A wide valley collecting streams from several of the ravines on the north side of the island opens into Cumberland Bay, and is partially enclosed and cultivated; and the settlement, consisting of some thirty or forty dilapidated Chilean huts, faces the anchorage. As seen from the bay the mountains seem covered with foliage to the sky-line, except where precipitous faces of rock—basalt and greenstone—form a beautiful contrast to the luxuriant somewhat pale vegetation so characteristic of an island in the warmer temperate zone.

The flora and fauna of Juan Fernandez are in most respects Chilean,—the opportunities of immigration from any other direction being specially difficult, for nearly constant currents set from the south-west, a direction in which there is no land nearer than the antarctic continent. There are few trees on the island, and these are chiefly in inaccessible situations, the timber near the shore having been almost entirely cut down for fire-wood. Most of the valuable indigenous trees have been exterminated; the sandal-wood, which the earlier navigators found one of the most valuable products of the island, is now confined to almost inaccessible places, while the other prominent indigenous forms, a native palm (*Cerozylon australe*) and two tree-ferns, may be counted on the fingers as they raise their feathery heads over some overhanging crag or precipitous ravine. The steep paths up the hills are bordered by a thicket of flowering shrubs and herbs chiefly of South American origin. One of the most prominent of the latter (*Gumera chilensis*) expands its gigantic rhubarb-like leaves to an enormous size, while the procumbent rhizomes creep along the ground, throwing up leaf-stalks 8 and 10 feet in height, and forming with the leaves, which frequently measure 15 feet across, a canopy under which one can ride easily on the small Chilean horses. There are twenty-four species of ferns on the island, and of these four are special to it; so great a prevalence of ferns gives quite a character to the island flora.

The fauna of Juan Fernandez is likewise fairly rich and very special. There are no indigenous land mammals on the island. Pigs, which have long since become wild and numerous, were left by the earlier navigators, and wild goats imported in the same fashion are now abundant, and their flesh is excellent. Sea-elephants and fur-seals were at one time plentiful upon Juan Fernandez, and are still found in some numbers at Mas-a-Fuera. There are, besides the *Accipitres* and the *Natatoes*, four land birds on Juan Fernandez (and four somewhat different on Mas-a-Fuera).

The four Juan Fernandez birds are a thrush, a tyrant, and two humming-birds (*Eustephanus fernandensis* and *E. galerites*). The thrush and *Eustephanus fernandensis* are special to the island, and the latter has the great peculiarity of having the male of a bright cinnamon colour while the female is green. Both sexes are green in *E. galerites*. Of the shrubs in the jungle bordering the ravine, there seems scarcely a plant of myrtle, or of a bignonaceous plant with long dark bells associated with the myrtle, which is not inhabited by a pair of humming birds, so that the whirring and buzzing of the brilliant flutterers over the flowers is singularly attractive.

Juan Fernandez was discovered by a Spanish pilot of that name (who was also the discoverer of the island of Mas-a-Fuera) in 1563. Fernandez obtained from the Spanish Government a grant of the islands, where he resided for some time, stocking them with goats and pigs. He soon, however, appears to have abandoned his possessions, which were afterwards for many years only visited occasionally by fishermen from the coasts of Chili and Peru, who found the sea round the island well stocked with fish. In 1616 Le Maure and Schouten called at Juan Fernandez for water and fresh provisions. Hogs and goats were then abundant on the island, and the valleys coming down to the anchorage were filled with herbage and the sea with excellent fish. Sandal-wood was plentiful, and near the anchorage there was a grove of wild quince trees. The fleet under the command of Admiral l'Ermite next visited the island. Three soldiers and three gimmers remained behind when the fleet left; what became of these is altogether unknown. In the year 1668 the buccaneer Sharp anchored off Juan Fernandez, at first apparently on the south side of the island and afterwards in Cumberland Bay. At the time of his visit seals and sea-lions frequented the shores in large numbers, and pigs, the descendants of those originally imported by Fernandez, were so abundant that a hundred were salted down in addition to those killed for immediate use. At the end of 1687 five men voluntarily remained at Juan Fernandez from another buccaneer commanded by Captain Edward Davis. They remained on the island until October 1690, when the English ship "Wellfare," Captain John Story, took them off. In February 1700, at the time of his visit to Juan Fernandez, and whilst there Captain Stradling of the "Cingre Porto" galley quarrelled with his men, forty-two of whom deserted but were afterwards taken on board by Dampier, five seamen, however, remained on shore. In October 1704 the "Cingre Porto" returned and found two of these men, the others having been apparently captured by the French. On this occasion Captain Stradling had a disagreement with his master, Alexander Selkirk, who insisted upon being put on shore rather than serve longer with Stradling. Selkirk's desire was complied with, and he was sent on shore with a few ordinary necessities. Before the ship left he begged to be readmitted, but this was refused, with the curious result that, with little merit of his own, Selkirk has become a hero for all time, and "Robinson Crusoe's Island" the cynosure of all boys' eyes. It is extremely improbable that Alexander Selkirk ever actually placed his journal in the hands of Defoe, but his story excited some public interest, and in entering for the public amusement that prince of impostors was most likely to have adopted Selkirk's tale for combination with other material in one of his wonderful "realistic novels." Many of the incidents in the *Adventures of Robinson Crusoe* are evidently inconsistent with the narrative of Selkirk, and are undoubtedly taken from other sources; for example, the footprint on the sand, and the decidedly tropical description of "Robinson Crusoe's Island," would agree better with one of the outlying islands of the West Indies. Alexander Selkirk was relieved from what appears to have been by no means unbearable exile in 1709 by the ship "Duke," Captain Wood Rogers, and in 1668 the officers of H.M.S. "Topaze" erected a tablet at a point on the hill road called "Selkirk's Look-out," just where in a gap in the trap rock a magnificent view may be had of the whole island, and of the sea north and south, over which the exile must have often and eagerly watched for an approaching sail. It bears the following inscription:—"In memory of Alexander Selkirk, a native of Largo in the county of Fife, Scotland, who was on this island in complete solitude for four years and four months. He was landed from the 'Cingre Porto' galley, 96 tons, 12th February 1709, and was taken off in the 'Duke' privateer, 12th February 1709. He died lieutenant of the 'Weymouth,' 1723 A.D., aged forty-seven years. This tablet is erected near Selkirk's look-out by Commodore Powell and officers of H.M.S. 'Topaze,' 1868 A.D."

After Selkirk's relief, visits, especially from buccaneers, to the island of Juan Fernandez became more frequent. In June 1741 Commodore Anson anchored in Cumberland Bay in the "Centurion." During Anson's stay the "Trial" visited Mas-a-Fuera, and found the anchorage more exposed than at Juan Fernandez.

Anson found vegetables, of which the scurvy-struck crew of the "Centurion" stood greatly in need, much as formerly, — the cabbage palm, celery, water-cresses, and radishes being abundant. After having added to the resources of the island by sowing the stones of fruit trees and garden seeds, some of which did well, Anson continued his voyage in September. On Anson's return home it was proposed to form an English settlement on Juan Fernandez, but the Spaniards hearing that the matter had been mooted in England gave orders to occupy the island, and it was garrisoned accordingly in 1750. Carteret first observed this settlement in May, 1767, and on account of the hostility of the Spaniards preferred to put in at Mas-a-Fuera.

After the revolutionary wars Juan Fernandez passed into the possession of the Chilians, and has remained theirs ever since. Shortly after 1818 it was used as a state prison by the Chilian Government. In 1820 there appear to have been 800 convicts on the island, with 100 regular troops. In that year the island was swarming with wild horses, cattle, pigs, sheep, and goats, and vegetables and fruit were in abundance. In 1830 Juan Fernandez was visited by Captain King in H.M.S. "Adventure." There were then no convicts on the island. There was a small garrison of forty persons, and provisions were scarce. In 1833 Juan Fernandez was again used as a convict station by the Chilians. In 1885 the island appears to have been governed by a Mr Sutcliffe, an Englishman in the Chilian service. He was present when an earthquake took place on the 20th February of that year, of which he gives a description.

In November 1875 H.M.S. "Challenger," Captain F. T. Thomson, called at Juan Fernandez for two days, lying as usual in Cumberland Bay.

Shortly after 1835 Juan Fernandez was abandoned as a convict settlement, and since that time it has been leased by the Chilian Government to such as cared to occupy it for the supply of whalers and other passing ships, and for such remains of sea-lion hunting and fur-sealing as still exist. The speculation does not appear to be very profitable, and the island is likely to be by and by left so far as may be in the baner world of to-day to its pristine solitude. (U. W. T.)

JUAREZ, BENITO PABLO (1806-1872), president of Mexico, was born near Ixtlan, in the state of Oajaca, Mexico, March 21, 1806, of full Indian blood. Early left in poverty by the death of his father, he received from a charitable friar a good general education, and afterwards the means of studying law. Beginning to practise in 1834, Juarez speedily rose to professional distinction, and in the stormy political life of his time and country took a prominent part as an exponent of liberal views. In 1832 he sat in the state legislature; in 1846 he was one of a legislative triumvirate for his native state and a deputy to the republican congress, and from 1847 to 1852 he was governor of Oajaca. Banished in 1853 by Santa Anna, he returned to Mexico in 1855, and joined Alvarez, who, after Santa Anna's defeat, made him minister of justice. Under Comonfort, who succeeded Alvarez in December 1855, Juarez was made president of the supreme court of justice and minister of the interior; and, when Comonfort was unconstitutionally replaced by Zuloaga in 1858, the chief justice, in virtue of his office, claimed to be legal president of the republic. It was not, however, till the beginning of 1861 that he succeeded in finally defeating the unconstitutional party and in being duly elected president by congress. His decree of July 1861, suspending for two years all payments on public debts of every kind, led to the landing in Mexico of English, Spanish, and French troops. The first two powers were soon induced to withdraw their forces; but the French remained, declared war in 1862, placed Maximilian upon the throne as emperor, and drove Juarez and his adherents to the northern limits of the republic. Juarez maintained an obstinate resistance, which resulted in final success. In 1867 Maximilian was taken at Queretaro, and shot; and in August Juarez was once more elected president. His term of office was far from tranquil; discontented generals stirred up senseless revolts and insurrections; and, though he was re-elected in 1871, his popularity seemed to be on the wane. He died of apoplexy in the city of Mexico, July 18, 1872. In him Mexico lost a statesman of integrity, ability, and deter-

mination, whose good qualities are too apt to be overlooked in consequence of his connexion with the unhappy fate of Maximilian.

JUBA I., successor to his father Hiempsal on the throne of Numidia, owes his importance much more to the distracted state of the Roman world during the struggle betwixt Caesar and Pompey than to his intrinsic merit. He embraced Pompey's cause, moved by ancient hereditary friendship to that general, as well as by personal enmity to Caesar, who had insulted him at Rome a few years before, and to Curio, Caesar's general in Africa, who had openly proposed when tribune of the plebs in 50 B.C. that Numidia should be sold to colonists, and the king reduced to a private station. In 49 B.C. Juba marched against Curio, who was threatening Utica, and by a stratagem inflicted on the Cæsarean army a crushing defeat, in which Curio was slain. Juba's attention was momentarily distracted by a counter invasion of his territories by Bocchus and Sitius; but, finding that his lieutenant Sabura was able to defend his interests, he rejoined Scipio with a large body of troops. With Scipio he shared the defeat at Thapsus. Fleeing from the fold with the Roman general Petreus, the king wandered about for some time as a fugitive, spurred even from the gates of his own city Zama, where he had prepared for a desperate siege. The fugitives at length resolved to die by mutual slaughter. Juba killed Petreus, and sought the aid of a slave in despatching himself (46 B.C.). Juba's character may be summed up in the word savage; he was brave, treacherous, insolent, and cruel.

JUBA II., king of Mauretania, was on the death of his father Juba I. in 46 B.C. carried to Rome, a mere infant, to grace Caesar's triumph. He seems to have received a good education under the care of Octavianus (afterwards Augustus), whom he accompanied later in his campaign against Antony. In 20 B.C., after Antony's death, Octavianus gave the young African the hand of Cleopatra Selene, daughter of Antony and Cleopatra, and placed him on his paternal throne. In 25 A.D., however, he transferred him from Numidia to the kingdoms formerly held by Bocchus and Bogus, viz., Mauretania Tingitana and Mauretania Cæsariensis, to which was added a part of Gætulia. Juba fixed his royal residence at Jol, whose name he changed to Cæsarea, and which is now identified with the modern Cherchel, about 72 miles west of Algiers. He seems to have reigned in considerable prosperity, though in 6 A.D. the Gætulians rose in a revolt of sufficient importance to afford the surname Gætulicus to Cornelius Cosus, the Roman general whose aid the king called in to suppress it. According to Josephus (*Ant.* xvii. 13, 1 and 4; *B. J.*, ii. 7, 4), Juba married in second nuptials Glaphyra, daughter of Archelaus of Cappadocia, and widow of Alexander, son of Herod the Great, afterwards wife of Alexander's brother, the Archelaus of the New Testament. The date of Juba's death is by no means certain; from the evidence of coins and certain allusions in Strabo, scholars have been led to place it in 19 or 20 A.D.

Juba, to quote the words of Pliny, was more memorable for his writings than for his crown. He wrote many historical and geographical works, of which some seem to have been voluminous and of considerable value on account of the sources to which their author had access. Unfortunately they are known to us only from fragments imbedded in other writings. The list given by C. Müller in his *Fragmenta Historicorum Græcorum* (vol. iii, Paris, 1849), is as follows:—(1) *Panathic tropica*; (2) *Asyriacæ*; (3) *Libanæ*; (4) *De Arabia sine Desertiptione Arabibus*; (5) *Physiologia*; (6) *De Euphorbia herba*; (7) *Περὶ τοῦ τοῦ*; (8) *Περὶ γραμμῶν* (*Περὶ γράμματος*); (9) *Θεοποικη tropica*; (10) *Οἰκιστρικῶν*; (11) *Περὶ φλοῶν λέξεων*; (12) *Ἐντογραμμά*. Müller (*loc. cit.*) has collected at the head of Juba's fragments the scattered notices of the king from the writers of antiquity. See also Sevin in *Mém. de l'Acad. des Inscriptions*, vol. iv.

JUBBULFORE. See JABALPUR.

JUBILEE, or JUDILE, THE YEAR OF. In Ezek. xlv. 16, 17, there is indication of a law according to which "the prince" is at liberty to alienate in perpetuity any portion of his inheritance to his sons; but if he give a gift of his inheritance to any other of his subjects, then the change of ownership holds good only till "the year of liberty" (*שנת חירות*), after which the alienated property returns to its original possessor, the prince. This restriction upon the transfer of real property is applied to a greatly enlarged class of persons and cases in Lev. xxv. 8-55, which is by far the most important passage relating to this subject. It is again referred to in Lev. xxvii. 17-25, and the only other allusion to it in the Pentateuch occurs in Numb. xxxvi. 4. According to Lev. xxv. 8-12, at the completion of seven sabbaths of years, the trumpet of the jubilee (*שופר יוביל*) is to be sounded "throughout the land," on the tenth day of the seventh month, i.e., on the great day of atonement. The fiftieth year thus announced is to be "hallowed," i.e., liberty (*דור*) is to be proclaimed everywhere to every one, and the people are to return "every man unto his possession and unto his family." The year in other respects is to resemble the sabbatical year; there is to be no sowing, nor reaping that which grows of itself, nor gathering of grapes. Coming to fuller detail,—as regards real property (Lev. xxv. 13-34), the law is that if any Hebrew under pressure of necessity shall alienate his property he is to get for it a sum of money reckoned according to the number of harvests to be reaped between the date of alienation and the first jubilee year; should he or any relation desire to redeem the property before the jubilee, this can always be done by repaying the value of the harvests between the redemption and the jubilee. The fundamental principle is that "the land shall not be sold so as to be quite cut off; for it is mine, and ye are strangers and sojourners with me." The same rule applies to dwelling-houses of unwalled villages; the case is different, however, as regards dwelling-houses in walled cities. These may be redeemed within a year after transfer, but if not redeemed within that period they continue permanently in possession of the purchaser. An exception to this last rule is made for the houses of the Levites in the Levitical cities. As regards property in slaves (Lev. xxv. 35-55), the Hebrew whom necessity has compelled to sell himself into the service of his brother Hebrew is to be treated as a hired servant and a sojourner, and to be released absolutely at the jubilee; non-Hebrew bondmen on the other hand are to be bondmen for ever. But the Hebrew who has sold himself to a stranger or sojourner is entitled to freedom at the year of jubilee, and further is at any time redeemable by any of his kindred,—the redemption price being regulated by the number of years to run between the redemption and the jubilee, according to the ordinary wage of hired servants. So much for the Levitical law; as regards its observance, the evidence of history is not voluminous, but Jer. xxxiv. 14 seems to show conclusively that in his time at least the law acknowledged by the prophets was that described in Deut. xv., according to which the rights of Hebrew slave-holders over their compatriots were invariably to cease seven years after they had been acquired. After the exile the law of Lev. xxv. was also certainly disregarded, the Talmudists and Rabbins are unanimous that although the jubilee years were "reckoned" they were not observed.

As regards the meaning of the name "jubilee" (*שנת חירות*), or simply *יוביל*, *ελευθερίας* or *ἐλευθερία*, annus jubilee or julienus, authorities are not agreed. According to Josephus (*Ant.*, iii. 12, 3), it means *ἀνελευθερία*; but the use of the word *יוביל* in Exod. xix. 13, Josh. vi. 5, makes it probable that the name is derived from the trumpet sound with which the jubilee was to be proclaimed; and it is not impossible that the old Jewish traditional view is right

which states לֵבַי to mean a ram—for which there is a probable confirmation in Phœnician—and then, by abbreviation for לֵבַי יִצְחָק, a trumpet of ram's horn. See Dillmann on Exod. xix. 13. If the law of the jubilee is posterior to the time of Jeremiah and Ezekiel, and was not enforced after the exile, the practical difficulties of the institution, especially in its connection with the sabbatical year, call for no remark. Older theologians, by whom all the Pentateuchal laws were regarded as homogeneous parts of a single practical scheme, spent much ingenuity on the explanation of the year of jubilee. Thus Scaliger and many others sought to identify it with the seventh sabbatical year, and so to avoid a succession of two years in which agriculture was suspended. The most ingenious form of this attempt is the theory of Franke (*Nov. Syst. Chron. Fund.*, 1778), revived by Klostermann (*Stud. v. Kril.*, 1880, p. 720 sq.), which compares the jubilee period with the Egyptian twenty-five year period, and connects it with the intercalation necessary to re-establish the correspondence of the lunar and solar years.

JUBILEE YEAR, in the Roman Catholic Church, is observed every twenty-fifth year, from Christmas to Christmas. During its continuance plenary indulgence is obtainable by all Catholics, on condition of their penitently confessing their sins and visiting certain churches a stated number of times, or doing an equivalent amount of meritorious work. The institution does not go farther back than to the time of Boniface VIII., whose bull is dated April 22, 1300. The circumstances in which it was promulgated are related by a contemporary authority, Jacobus Casetanus, according to whose account ("Relatio de centesimo jubileo anno" in the *Bibliotheca Patrum*) it had its origin in a wide-spread popular belief then prevalent, which had taken practical shape in an enormous influx of pilgrims to Rome from the 1st of January onwards. The advance upon the recently formulated doctrine of indulgences (see **INDULGENCE**) was indeed a natural one. Originally the churches of St Peter and St Paul in Rome were the only jubilee churches, but the privilege was afterwards extended to the Lateran Church and that of Sta Maria Maggiore, and it is now shared also for the year immediately following that of the Roman jubilee by a number of specified provincial churches. At the request of the Roman people, Clement VI. appointed that the jubilee should recur every fifty years instead of every hundred years as had been originally contemplated in the constitution of Boniface; Urban VI. reduced the interval still further to thirty-three years (the supposed duration of the earthly life of Christ); and by Paul II. it was finally fixed at twenty-five years. According to the special ritual prepared by Alexander VI. in 1500, the pope on the Christmas eve with which the jubilee commences goes in solemn procession to a particular walled-up door ("Porta aurea") of St Peter's and knock three times, using at the same time the words of Ps. cxviii. 19 ("Aperite mihi portas justitie"). The doors are then opened and sprinkled with holy water, and the pope passes through. A similar ceremony is conducted by cardinals at the other jubilee churches of the city. At the close of the jubilee, the special doorway is again built up with appropriate solemnities. The last ordinary jubilee was observed in 1875. "Extraordinary" jubilees are sometimes appointed on special occasions.

JUBILEES, BOOK OF THE. See **APOCALYPTIC LITERATURE**, vol. ii. p. 176.

JUDEA. See **PALESTINE**.

JUDAH (יְהוּדָה, *Yehûda*, i.e., according to the etymology given in Gen. xxix. 35, "praised"), the name of one of the twelve tribes and of their eponymus the fourth son of Jacob by Leah. Except in the history of Joseph, the Biblical interest attaching to Judah belongs not to the individual but to the tribe; for in Gen. xxxviii. an ethnographical allegory appears transparently enough under the surface of the record. According to the usual form of such statements in the Old Testament, Judah's marriage

with the daughter of the Canaanite Shuah is to be referred to a union of the tribe with Canaanite elements. Er and Onan are extinct subdivisions of the mixed population, though a minor family of the former name appears as incorporated with Shelah, the third clan of this branch of the tribe (1 Chron. iv. 21). The details of the disappearance of these ancient stocks are obscure.¹ The stocks of Pharez and Zerah are represented as secondary. They are children of Judah and Tamar, but the former is their father in virtue of an extension of the levirate principle. As the author represents Tamar's conduct as justifiable under the circumstances, the narrative must have taken shape before the levirate law assumed the narrower form given in Deuteronomy.² An ingenious explanation of Tamar, Pharez, and Zerah is given by Lagarde, *Orientalia*, ii. (1880). He identifies Tamar (palm tree) with Phœnicia, and regards Zerah (זֶרַח—זֶרַח, *indigena*) as the old Canaanite element of the union which had to yield precedence to the younger Hebrew invaders (Pharez). In any case the narrative of Gen. xxxviii., with all its obscurities, indicates two of the most notable features in the early history of Judah, its mixed character and its long separation from the rest of Israel (ver. 1). The latter point receives further illustration in the book of Judges. Judah and Simeon seem to have broken off from Israel at Gihgal, and taken a separate course. In the song of Deborah the tribe is not named among the rest, and even in the time of David Judah and Israel are still more conscious of their separation than of their original unity. Indeed the two soon fell apart again at the division of the kingdom, but after the time of David the idea of unity was never lost; and, while the prophets look for a restoration of the realm of the house of Jesse, Deut. xxxiii. 7 (the work of a poet of Ephraim) prays for victory to Judah against his enemies and his ultimate restoration to his people, the greater Israel of the north. The blessing of Jacob, on the other hand, views Judah in the light of the Davidic sovereignty as holding the hegemony over his brethren until the coming of the Messiah.³ Our most detailed information as to the tribal history of Judah is derived from 1 Chron. ii. 1–iv. 23. It appears that the tribe absorbed a large element of non-Israelite origin, the Hezronites, or, as the Arabs would now say, the *hadjar*, original nomads who had settled down in villages and towns. To these belonged not only the Jerahmeelites but the Calibites in Hebron and the southern steppes. It appears to have been the incorporation of these elements that raised Judah to the eminent place which it maintained from the time of David. The details of this important piece of history have been analysed by Wellhausen, *De gentibus et familiis Judæarum* (Göttingen, 1870).

JUDAS ISCARIOT (Ἰούδας Ἰσκαριώτης or Ἰσκαριώθ), the son of Simon Iscariot (John. vi. 71, xiii. 26), and one of the twelve apostles; he is always enumerated last, with special mention of the fact that he was the betrayer of Jesus. If the now generally accepted explanation of his surname (יְהוּדָה בֶּן יִשְׁכָּרְיָהוּ, i.e., "man of Kerioth"; see Josh. xv. 25) be correct, he was the only original member of the apostolic band who was not a Galilean. (For other

¹ Compare the Arabic **جذ**, *Sahib*, Bulak ed. vi. 147; *Mowaffa*, Cairo ed. in. 77.

² Compare Hupfeld, *Ueber die heilige theosophische Theologie*, 1881.

³ The oldest interpretation of Shiloh, as if it were pointed **שִׁלֹה** (for **שִׁלֹה**) is perhaps the best, especially if with Wellhausen (*Gesch.*, p. 375) we delete the following **וְיָלַד**. The sense then is, "till he comes to whom the people's obedience is due." Another explanation is given by Lagarde (*Onom.*, ii. 95), who takes the word as equivalent to **שְׁאִילָה**, "he whom Judah prays for." At all events the context demands a Messianic interpretation.

suggested etymologies of the name see Winer's *Bibl. Realwörterb.*, s. u.) The circumstances which led to his admission into the apostolic circle are not stated; according to the Fourth Gospel (vi. 64), his treachery had been foreseen by Jesus from the very first, but this is not suggested by the synoptists. The motives by which he was actuated in rendering to the Jewish authorities the petty and base service of enabling them to arrest his Master without tumult have been analysed by scholars with very various degrees of subtlety and insight. According to some his sole object was to place Jesus in a position in which He should be compelled to make what had seemed to His followers the too tardy display of His Messianic power; according to others (and their view seems the best supported by the narrative of the Gospels) he was simply an avaricious and dishonest man, who felt that his opportunities for petty speculation—as keeper of the common purse, John xii. 6, xiii. 29—were rapidly disappearing. As regards the effects of his subsequent remorse and the use to which his ill-gotten gains were put, the strikingly apparent discrepancies between the narratives of Matt. xxvii. 3–10 and Acts i. 18, 19 have continually attracted the attention of Biblical scholars ever since Papias, in his fourth book, of which a fragment has been preserved, discussed the subject; and the probability is that they simply represent divergent traditions, one of which has possibly been coloured by the history of Abithophel. In ecclesiastical legend and in sacred art Judas Iscariot has taken a prominent place, being generally treated as the very incarnation of treachery, ingratitude, and impiety. The Middle Ages, after their fashion, have supplied the lacunæ in what they deemed his too meagre biography. According to the common form of their story, he belonged to the tribe of Reuben: before he was born his mother Cyborea had a dream that he was destined to murder his father, commit incest with his mother, and sell his God. The attempts made by her and her husband to avert this curse simply led to its accomplishment. At his birth he was enclosed in a chest and flung into the sea; picked up on a foreign shore, he was educated at the court until an act of murder committed in a moment of passion compelled his flight. Coming to Judea, he entered the service of Pontius Pilate as page, and during this period committed the first two of the crimes which had been expressly foretold. Learning the secret of his birth, he, full of remorse, seeks the prophet who, he has heard, has power on earth to forgive sins. He is accepted as a disciple and promoted to a position of trust, where avarice, the only vice in which he has hitherto been unpractised, gradually takes possession of his soul, and leads to the complete fulfilment of his evil destiny. This Judas legend, as given by Jacobus a Voragine, obtained no small popularity; and it is to be found in various shapes in every important literature of Europe. For the history of its genesis and its diffusion the reader may consult D'Ancona, *La leggenda di Vergogna e la leggenda di Giuda*, Bologna, 1869, and papers by W. Creizenach in Paul and Braune's *Beitr. zur Gesch. der deutschen Sprache und Literatur*, vol. ii., Halle, 1876, and Victor Diederich in *Russische Revue*, St Petersburg, 1880. Cholevius, in his *Geschichte der deutschen Poesie nach ihren antiken Elementen* (Leipzig, 1854), pointed out the connexion of the legend with the Œdipus story. The popular hatred of Judas has found strange symbolical expression in various parts of Christendom. In Corfu, for instance, the people at a given signal on Easter eve throw vast quantities of crockery from their windows and roofs into the streets, and thus execute an imaginary stoning of Judas (see Kirkwall, *Ionian Islands*,

vol. ii. p. 47). At one time (according to Mustoxidi, *Delle cose corciresi*) the tradition prevailed that the traitor's house and country villa existed in the island, and that his descendants were to be found among the local Jews. Details in regard to some Judas legends and superstitions are given in *Notes and Queries*, 2d series, v., vi., and vii.; 3d ser., vii.; 5th ser., vi.

JUDAS MACCABEUS. See ISRAEL and MACCABEES. **JUDAS TREE**, the *Cercis Siliquastrum* of botanists, belongs to the section *Casalpinea* of the natural family *Leguminosæ*. It is a native of the south of France, Spain, Portugal, Italy, Greece, and Asia Minor, and forms a handsome low tree with a flat spreading head. In spring it is covered with a profusion of purplish pink flowers, which appear before the leaves. The flowers have an agreeable acid taste, and are eaten mixed with salad or made into fritters. The tree was one frequently figured by the older herbalists. One woodcut by Castor Durante is a copy of Lobel's cut, with the addition of the figure of Judas suspended from one of the branches, illustrating the popular tradition regarding this tree. A second species, *C. canadensis*, is common in North America from Canada to Virginia, and differs from the European species in its smaller size and pointed leaves. The flowers are also used in salads and for making pickles, while the branches are used to dye wool a nankeen colour.

JUDE. The writer of the epistle of St Jude (*Ιούδας*) calls himself (ver. 1) "the brother of James." In primitive Christian times, among the Judæo-Christians to whom this epistle, from the nature of its contents, must have been addressed, there was but one James who could be thus spoken of without any further description, viz., James "the Lord's brother" (see JAMES). The writer of this epistle, then, claims to be the Judas named among the brethren of the Lord in Matt. xiii. 55, Mark vi. 3. He seems himself to declare by implication that he was not an apostle (ver. 17), and with this agrees the statement (John vii. 5) that at a time not long before the crucifixion the brethren of Jesus did not believe on Him. And it is some confirmation of this position that the writer of the epistle of St James in like manner does not claim to be an apostle. The brethren of the Lord are spoken of in Acts i. 14 as distinct from the apostolic body, and are placed last in the enumeration, as though latest included among the believers; and that their feeling towards Jesus should have been changed since His death and resurrection has been thought to be sufficiently explained by the assertion of St Paul (1 Cor. xv. 7) that the Lord had been "seen of James" on one special occasion after he had risen from the dead. We conclude therefore that the writer of the epistle was a different person from Jude the apostle, who appears also to have had the names Lebbaeus and Thaddæus (comp. Matt. x. 3, Mark iii. 18, with Luke vi. 16, Acts i. 13).

When we consider the brevity of St Jude's epistle we can hardly wonder that it did not receive more recognition from the early Christian writers than it has met with. Clemens Alexandrinus (165–220) quotes from this epistle or alludes to its language more than once, as does Tertullian (200), making express mention that the book of Enoch is quoted in it.² Origen (186–253) gives several notices of it, and in the Latin translation of some portions of his works, of which the original has been lost, Jude is called an apostle. Nevertheless Eusebius classes the epistle amongst the *ἀποκρύφια*, and its omission from the Syriac version shows us that in one branch of the Christian church it was either not known, or not received for canonical, when that version was made. Jerome in the 4th century

² Other forms make him a Danite, and consider the passage in Genesis (xlix. 17) a prophecy of the traitor.

³ The book of Enoch (see vol. ii. p. 175) is cited in Jude 14, and allusions to it occur in 4, 6, 13. Another apocalyptic work, the Assumption of Moses, is the source of Jude 9.

gives a reason for its non-acceptance, which perhaps operated with many of the early Christians. He says (*Catholic, Ser. Eccl., 4*), "Because in it Jude derives a testimony from the book of Enoch, which is apocryphal, it is rejected by most." Yet the canon of Muratori, the date of which is judged to be about 170 A.D., includes the epistle of St Jude among the canonical books, though Justin Martyr (140), Theophilus of Antioch (180), and Irenæus (135-200) make no mention of it. It was early included among the acknowledged Christian writings, and was placed without question among the canonical books by the council of Laodicea.¹

The persons to whom the epistle was addressed must have been for the most part Judeo-Christians. This is the reason why the writer styles himself "brother of James," and the same is apparent from all the illustrations contained in the letter. The deliverance from Egypt, the fallen angels, the cities of the plain, the legend of Michael's contention with Satan, the references to Cain, Balaam, and Korah, as well as to the prophecy ascribed to Enoch, are all found in so brief a space, and are so touched upon in a manner that could be edifying to none save those who were familiar, not only with Old Testament Scripture, but also with Jewish traditions, that we cannot but conclude that we have here the work of a Jew writing for Jews, although the epistle is included among those called "catholic."

From the notices of the descendants of Jude, the brother of the Lord, preserved by Eusebius (*H. E.*, iii. 19, 20) from Hegesippus, we should conclude that they were resident in Palestine. It seems natural therefore to suppose that the epistle was written in Palestine, and, it may be, for the Jewish converts in some district of that country. But of this we can have no certainty. If, as seems to be intimated by Hegesippus, Jude was dead in the time of Domitian, we perhaps shall not be far wrong in assigning the composition of the epistle to about 80 A.D. All arguments for an earlier date, based on the assumption that in a letter of this character the writer would not have failed to mention the destruction of Jerusalem as an illustration, had that event already taken place, must be disregarded. For the brevity of the letter is such as to deprive this reasoning of all force, while the very recentness of the overthrow of Jerusalem would prevent its destruction from entering as yet into such history as might be used for pointing a moral.

The epistle of St Jude appears to have been written after the second epistle of St Peter. Of those corrupt teachers about whom St Peter spoke in the future tense, "there shall be false teachers among you," St Jude speaks in the past, "certain men are crept in unawares;" and the like difference is observable throughout the respective letters wherever verbs occur to which it is possible to attach a definite notion of time. But, beside this, St Peter's letter represents all the corruption which he sees likely to break forth among the Christian community as the outcome of false teaching. Destructive heresies are abroad, and through them many shall be induced to follow lascivious doings, and the way of truth shall be evil spoken of. With a promise of liberty which sounds like a perverse employment of some of St Paul's language they will lead their followers astray. But in St Jude's picture the colours seem much darker, and all allusions to teaching, and to the idea that, by lessons such as we know from other sources

the Gnostics did give, these men were being beguiled into evil courses through what appeared to be the gate of greater knowledge, have disappeared. The sinners against whom this epistle is directed were avowed libertines and practical unbelievers; they mocked at all sacred things; they were sensual, and had not the Spirit. But stronger than any other reason for believing in the later date of the present epistle is the direct quotation which is made in it from the 2d epistle of St Peter. In verses 17-18 St Jude writes, "But ye, beloved, remember ye the words which have been spoken before by the apostles of our Lord Jesus Christ, how that they said to you, In the last time there shall be mockers (*ἐμπαίοντες*) walking after their own ungodly lusts." The whole of what is here given as apostolic teaching corresponds very closely indeed with the words of 2 Peter iii. 2, while the word *ἐμπαίοντες* is one that is found nowhere else in the New Testament until it is here quoted by St Jude.

Attempts have been made to prove that St Jude's epistle originally appeared in Aramaic, from which the Greek that we have is a translation. But there seems no sufficient evidence for such a conclusion. No doubt a Jew when writing Greek would not unfrequently give expression to his thoughts in a form more or less moulded after his mother tongue, but there are far more points in the epistle which are satisfactory Greek of the date of the New Testament than are the instances which, even after much ingenuity, can be shown to be renderings of Aramaic.

See Semler, *Paraphrasis epp. Jacobi, Petri, et Jude,* 1781; Augusti, *Die Katholischen Briefe*, 1801; Jessen, *De authenticis ep. Jude*, 1821; Stier, *Der Brief Judas*, 1850; Wiesinger (in Olshausen's *Bibelwerk*), 1854; Hoffmann, *Die Briefe Petri, Jude, und Jacobi*, 1875; Reuss, *Les Épîtres Catholiques*, 1878. (J. R. L.)

JUDGE, an officer appointed by the sovereign power in a state to administer the law. The duties of the judicial office, whether in a civil or a criminal matter, are to hear the statements on both sides in open court, to arrive at a conclusion as to the truth of the facts submitted to him, or when a jury is engaged to direct the jury to find such a conclusion, to apply to the facts so found the appropriate rules of law, and to certify by his judgment the relief to which the parties are entitled or the obligations or penalties which they have incurred. With the judgment the office of the judge is at an end, but the judgment sets in motion the executive forces of the state, whose duty it is to carry it into execution. Such is the type of a judicial officer recognized by mature systems of law, but it is not to be accepted as the universal type, and the following qualifying circumstances should be noticed. 1. In primitive systems of law the judicial is not separated from the legislative and other governing functions. 2. Although the judge is assumed to take the law from the legislative authority, yet, as the existing law never at any time contains provision for all cases, the judge may be obliged to invent or create principles applicable to the case. This is called by Bentham and the English jurists judge-made and judiciary law. 3. The separation of the function of judge and jury, and the exclusive charge of questions of law given to the judge, are more particularly characteristic of the English judicial system. During a considerable period in the history of Roman law an entirely different distribution of parts was observed. The adjudication of a case was divided between the *magistratus* and the *judex*, neither of whom corresponds to the English judge. The former was a public officer charged with the execution of the law; the latter was an arbitrator whom the magistrates commissioned to hear and report upon a particular case. The following are points more specially characteristic of the English system and its kindred judicial systems. 1. Judges are absolutely protected from action for anything that they may do in the discharge of their judicial duties. This is true in the fullest sense of judges of the supreme

¹ Many modern critics, following Luther, have questioned the genuineness of the epistle. The libertines against whom it is directed display close affinity to the Carpocratians of the 2d century, of whose heresy Clement Alexandrinus makes it a prophecy. Mayerhoff, Schenkel, and Mangold suppose that it was written against that heresy not long before the middle of the 2d century. It is also argued that the Muratorian canon seems to regard the epistle as pseudonymous in the same sense as the Wisdom of Solomon.

courts. "It is a principle of English law that no action will lie against a judge of one of the superior courts for a judicial act, though it be alleged to have been done maliciously and corruptly." Other judicial officers are also protected, though not to the same extent, against actions.

2. The highest class of judges are irremovable except by what is in effect a special Act of Parliament, viz., a resolution passed by both Houses and assented to by the sovereign. The inferior judges and magistrates are removable for misconduct by the Lord Chancellor. 3. The judiciary in England is not a separate profession. The judges are chosen from the class of advocates, and almost entirely according to their eminence at the bar. 4. Judges are in England appointed for the most part by the crown. In a few cases municipal corporations may appoint their own judicial officer, and the coroner is elected by the freeholders of the county.

In the United States judges of the supreme courts, as well as ambassadors and other public functionaries, are nominated and appointed by the president with the consent of the Senate, and hold their offices during good behaviour. In the separate States the practice varies, but the tendency is in favour of electing the judges and limiting their tenure of office. In the revised constitution of New York of 1846, the principle was established that all public officers, inclusive of the judges, should be chosen by popular election. "The constitutional provision for making judges elective for short periods by universal suffrage is contagious, and every now constitutional reform or establishment tends that way" (*Kent's Commentaries*, i. 295, where a summary of the practice will be found).

JUDGES, THE BOOK OF, as we now read it, constitutes a sequel to the book of Joshua, covering the period of history between the death of the son of Nun and the birth of Sammel. But it is well known that the present adjustment of the older historical books of the Old Testament to form a continuous record of events from the creation to the Babylonian exile is due to an editor, or rather to successive redactors, who pieced together and reduced to a certain unity older memoirs of very different dates; and closer examination shows that the continuity of many parts of the narrative is more apparent than real. This is very clearly the case in the book of Judges.

We observe in the first place that the book has two commencements, each of which connects it directly with the book of Joshua (chap. i. 1; ii. 6). But in i. 1 the connexion is merely apparent. The events related in chap. i. are there said to have taken place after the death of Joshua, but in reality the chapter covers the same ground with the book of Joshua, giving a brief account of the conquest of Canaan, which in some particulars repeats the statements of the previous book, while in others it is quite independent. It is impossible to regard the warlike expeditions described in this chapter as supplementary campaigns undertaken after Joshua's death; they are plainly represented as the first efforts of the Israelites to gain a firm footing in the centre of the land (at Hebron, Debir, Bethel), in the very cities which Joshua in the book that bears his name is related to have subdued (*Josh. x. 39*). And this is confirmed by the circumstance that in *Judges* ii. 1 the "angel of Jehovah," who, according to *Exod. xiv. 24*, *xxiii. 20*, *xxxii. 34*, *xxxiii. 2*, *7 sq.*, must be viewed as having his local manifestation at the headquarters of the host of Israel, is still found at Gilgal and not at Shiloh (*Josh. xvii. 1*). Here then we have an account of the first settlement of Israel west of the Jordan which is parallel to the book of Joshua, but makes no mention of Joshua himself, and places the tribe of Judah in the front. The author of the chapter cannot have had Joshua or his history in his eye at all, and the passage,

Josh. xv. 13-19, which corresponds to *Judg. i. 10-15, 20*, is either derived from our chapter or from an earlier source common to both. It follows from these considerations that the words "Now after the days of Joshua" in *Judg. i. 1* are from the hand of the editor, who desired to make the whole book of Judges, including chap. i., read continuously with that which now precedes it in the canon of the earlier prophets.

There are other signs of more than one pen having been engaged on *Judges* i. Compare, for example, ver. 8 with ver. 21, and see for the details, which are too complicated to be discussed here, *Graf, Der Stamm Simeon*, 1866; Wellhausen-Bleek, *Einleitung*, p. 182; Wellhausen, *Geschichte*, i. 366; Meyer, "Die Eroberung Palästinas" in *Stade's Zeitschrift*, 1881, Hft. 1. The chapter was written after Israel had become strong enough to make the Canaanite cities tributary (ver. 28), that is, in the time of the kingdom. Meyer, following hints by Wellhausen, brings arguments to show that the original author is the Jahwist of the Pentateuch, of whose work there is but little trace among the sources of Joshua, though it cannot have closed without speaking of the conquest.

The second and main section of our book (chap. ii. 6-xvi.) stands on quite another footing. The opening verses ii. 6-9 repeat the closing words of Joshua's history (*Josh. xxiv. 28-31*), and so link what follows to the book of Joshua as strictly as the first words of Ezra connect that book with the last verses of Chronicles. According to *Josh. xxiv.* the people "served Jehovah" during the lifetime of the great conqueror and his contemporaries. In *Judg. ii.* this statement is repeated, and the writer proceeds to explain that subsequent generations fell away from the faith, and served the gods of the nations among which they dwelt. The worship of other gods is represented, not as something which went on side by side with Jehovah worship (compare x. 6), but as a revolt against Jehovah, periodically repeated and regularly chastised by foreign invasion. The history, therefore, falls into recurring cycles, each of which begins with religious corruption, followed by chastisement, which continues till Jehovah in answer to the groans of His oppressed people raises up a judge to deliver Israel, and recall them to the true faith. On the death of the judge, if not sooner, the corruption spreads anew and the same vicissitudes follow. This religious explanation of the course of the history, formally expounded at the outset and repeated in more or less detail from chapter to chapter (most fully in chap. x.), determines the form of the whole narrative, which is grouped round six principal judges, Othniel, Ehud, Deborah, Gideon, Jephthah, and Samson. The intervals between the great judges are filled up by the history of Gideon's son Abimelech and of six minor heroes—Shamgar (following Ehud), Tola and Jair (following Abimelech), Ibzan, Elon, and Abdon (between Jephthah and Samson). The minor judges are not represented as having any immediate religious importance. The cycles of revolt, chastisement, and deliverance are six, not twelve.

To the unity of religious pragmatism in the main sketch of the book of Judges corresponds a unity of chronological scheme. The judges, in spite of the fact that most of them had clearly no more than a local influence, are all represented as successive rulers, and the history is dated by the years of each judgeship and those of the intervening periods of oppression. Here, however, a difficulty arises. The fourth year of Solomon is, according to 1 Kings vi. 1, the 480th from the exodus. These 480 years are 12 generations of 40 years each. The larger numbers which make up this total are also mainly reckoned by forties. Moses, Othniel, Ehud, Deborah, Gideon, and the Philistine oppression, in which, according to *Judg. xv. 20*, Samson's judgeship was but an incident, make up together 7 × 40 years. Again, David has 40 years, and Samuel (who arose to close the Philistine interregnum twenty years after the death of Eli, and continued in office till he was quite old) cannot have ruled much less than a normal generation. Finally Joshua,

who died at the age of 110, ruled 30 years, if in point of age he was a man of the same standing with Caleb (Josh. xiv. 10). Add to these 30 years 6 for Jephthah and 4 for Solomon and we get 10×40 . There remain but 80 years for the elders who outlived Joshua, the interregna or times of oppression previous to the Philistine period, the minor judges, and Saul. But the interregna alone are 71 years, and the minor judges 70, or with Abimelech 73 or 74. It is plain that there is no room for both in the chronological scheme, and the two series correspond so nearly that they must be held to be alternative items in the reckoning, leaving a slightly different length for Saul's brief reign. But as a matter of fact the minor judges are not so placed in the narrative as to coincide with the periods of oppression. Thus the apparent consecutiveness of the narrative breaks down. The minor judges really lie outside of the chronological scheme of the history as well as of the system of religious cycles; and we infer that even the main stock of the book of Judges is not all constructed by one hand or on a uniform plan.¹

The religious interpretation of the history corresponds with the prophetic teaching of the 8th century B.C. The use of Baal as a title peculiar to false deities as opposed to Jehovah hardly fits an earlier date than the time of Hosea, and the hostile attitude taken up towards the *asherah* (sacred tree or pole) was not shared by the religious leaders of the period of Jehu. Critics have spoken of chaps. ii. and x as Deuteronomical, and no doubt the last hand that touched all the earlier historical books and reduced them to unity may be so named; but the main ideas are not necessarily so late, and are rather akin to the non-Levitical Elohist, the author of Josh. xxiv. In particular the worship of the high places is not condemned, nor is it excused as is done in 1 Kings ii. 2.

But the sources of the narrative are obviously much older than the theological exposition of its lessons. The composer of the book has generally transcribed them with little change, so that in reading the story of each great deliverance vouchsafed to Israel we feel ourselves in living contact with the earliest strain of Hebrew patriotism and religion. In this respect the book of Judges is one of the most valuable and interesting in the Old Testament. The song of Deborah and the history of Abimelech carry us back to the beginnings of national life in Israel, when Judah lived outside the main current of the history—the tribe is not even named by Deborah—and when Israelite and Canaanite populations existed side by side and struggled together for supremacy. In these chapters Israel is still in some sense a nation foreign to Canaan, and Jehovah Himself has His seat not on the mountains of Israel but beyond the fields of Edom on the southern heights of Sinai. The importance of such documents for the scientific historian lies not so much in the events they record as in the unconscious witness they bear to the state of things in which the narrator or poet lived. From this point of view all parts of the book are by no means of equal value, and in some instances, particularly in the histories of Deborah and Gideon, critical analysis appears to show that two narratives of different age have been fused together, the older story giving more prominence to ordinary human motives and combinations, while the later version is coloured by religious reflexion, and shows the characteristic tendency of the Old Testament to retell the fortunes of Israel in a form that lays ever increasing weight on the work of Jehovah for His people. The history of the minor judges is plainly not related from such lively and detailed remin-

iscence as gives charm to the longer episodes of the book; and some of the names, as Noldke (*op. cit.*) and others have shown, are those of personified families or communities rather than of individuals. This indeed is a characteristic feature of the earlier Hebrew history, which older expositors failed to recognize, but which modern science can no longer ignore.

The third and last part of the book embraces chaps. xvii.—xxi., and consists of two narratives independent of one another and of the main stock of the book, with which they are not brought into any chronological connexion. The first narrative, that of Micah and the Danites, belongs to the most primitive strata of the Old Testament history, and is of the highest interest both as a record of the state of religion and for the accurate picture it gives of the way in which one tribe passed from the condition of an invading band into settled possession of land and city. The history of the Levite and the Benjamites is of quite another character, and presupposes a degree of unity of feeling and action among the tribes of Israel which it is not easy to reconcile with the rest of the book. In its present form this episode appears to be not very ancient; it resembles the book of Ruth in giving a good deal of curious archaeological detail (the feast at Shiloh) in a form which suggests that the usages referred to were already obsolete when the narrative was composed.

Literature.—On questions of introduction the latest and best investigations are those of Wellhausen in Bleek's *Einführung*, 4th ed., Berlin, 1878, and in his *Geschichte*, chap. vii. For the historical questions compare also Ewald's *Geschichte*, vol. ii. The most useful modern commentary is that of Sander, Bern, 1885. Later works are those of Bertheau, Leipzig, 1845; Keil, Leipzig, 1869, English translation, 1885; Cussel, in Lange's *Biblewerk*, Bielefeld, 1868, in the *Speaker's Commentary*; and in Reuss's Bible. On the song of Deborah see Ewald, *Dichter*, i. 1, p. 178. Böttcher, *Altliche Buhnendichtungen*, Leipzig, 1850; Kemnik, *De Carm Deb.*, Utrecht, 1840; Meier, *Deborahslied*, Tübingen, 1850. (W. R. S.)

JUDGMENT is the last stage in an action, being the definitive order or sentence of the court or judge, enforceable by the appropriate mode of "execution" appointed by law. In English law the writ of execution remains in force only for one year unless renewed, but a writ of execution may be obtained at any time within six years of the judgment, and after six years the application may be made to the court by any person entitled to execution, and execution may issue accordingly. Judgments by courts of an alien jurisdiction are not immediately enforceable as judgments in England, but they constitute a cause of action, and may be sued upon. They are in fact conclusive as between the parties, although objections going to deny the jurisdiction of the court, or showing that the defendant had not been summoned and had never really been before it, would be a good defence. It has lately been held no defence to an action in a foreign judgment that it disclosed on the face of it a manifest misapprehension by the foreign court of a rule of English law.

JUDICATURE, JUDICATURE ACTS. The Judicature Acts are an important series of English statutes having for their object to simplify the system of judicature in its higher branches. They are the following:—36 & 37 Vict. c. 66; 37 & 38 Vict. c. 83; 38 & 39 Vict. c. 77; 39 & 40 Vict. c. 59 (the Appellate Jurisdiction Act); 40 & 41 Vict. c. 9.

The movement which ended in the Judicature Acts has been promoted by all the recent holders of the office of Lord Chancellor and by most of the leading judges, but it required a long time to bring it to a successful issue, on account of the difficulty always experienced in creating a sufficient amount of public interest in legal reform to overcome the obstacles to legislation. The principal Judicature Act is framed on the basis of a report by a commission which was appointed in 1867. It was carried in the

¹ The minor details of the chronology appear not to be derived throughout from tradition, but to be got by subdividing the round number 40. See Wellhausen, *op. cit.*, and Noldke, *Untersuchungen*, p. 173 sq.

chancellorship of Lord Selborne, but his predecessor Lord Hatherley had in 1870 introduced a measure of the same character. The objects of the Act are threefold—first, to reduce the historically independent courts of common law and equity to one supreme court of judicature, consisting of two branches, a High Court of Justice and a Court of Appeal; secondly, to establish for all divisions of the court a uniform system of pleading and procedure; and, thirdly, to provide for the enforcement of the same rule of law in those cases where chancery and common law had hitherto recognized different rules. The Act does not fuse common law and equity in the sense in which that phrase has generally been employed. The chancery division still remains distinct from the common law division, having a certain range of legal questions under its exclusive control, and possessing to a certain extent a peculiar machinery of its own for carrying its decrees into execution. But all actions may now be brought in the High Court of Justice, and, subject to such special assignments of business as that alluded to, may be tried in any division thereof; and all divisions must recognize the same principles. Further, the difficulties occasioned by mere technicalities of procedure have been to a great extent removed by a system of pleading, the inspiring principle of which is that each party should state his case in the simplest possible manner. It is in respect of the last point that the operation of the Judicature Act has been least satisfactory, and it is certain that a further simplification of pleading, possibly based on the practice of the Scotch courts, will follow very soon.¹

The appellate part of the judicature has after some hesitation been finally settled thus. The House of Lords remains the last court of appeal, as before the first Judicature Act. That Act abolished the appellate jurisdiction of the Lords so far as the new court of judicature was concerned, leaving it still the appeals from Scotland and Ireland. A temporary Act allowed appeals to be brought from the new court, and the Act 39 & 40 Vict. c. 59 made provisions for the permanent hearing of appeals from all courts to the Lords. The judicial functions of the House of Lords have been virtually transferred to an appeal committee, consisting of the Lord Chancellor and other peers who have held high judicial office, and certain lords of appeal in ordinary created by the Act. No appeal is to be heard unless three of such persons shall be present, and the lords of appeal may sit for the despatch of judicial business during a prorogation of parliament, and even by order of the queen during a dissolution. The lords of appeal in ordinary are an entirely new creation. They hold office on the same conditions as other judges; they take rank as barons for life; but they are entitled to a writ of summons to attend and vote in the House only so long as they hold office, and their dignity does not descend to their heirs. Two are appointed in the first instance, but an arrangement is provided for by which the four head judges of the privy council may ultimately be the four lords of appeal in ordinary. When two of the privy council judges die or resign, a third lord of appeal may be appointed, and a fourth when the remaining two judges of the privy council cease to hold office. The judicial committee of the House of Lords and the judicial committee of the privy council will then be the same, and the two jurisdictions will be fused. The Court of Appeal, created by the Judicature Act of 1873, with intention of making it a final court, is now subject to an appeal to the House of Lords. It now consists of six judges, and sits in two divisions, which, roughly speaking, take respectively the chancery and common law

business of the divisional courts, but the lords justices of appeal sit in either division according to convenience. This part of the rearrangement of the judicature may be pronounced entirely successful. A strong and stable court of appeal has been created, instead of the fluctuating tribunal of former times. The same is true generally of the redistribution of judicial strength effected by the Acts, which has led to a marked improvement in the despatch of business.

The Irish Judicature Act (40 & 41 Vict. c. 57) follows the same lines as the English Acts. The pre-existing courts are consolidated into a supreme court of judicature, consisting of a High Court of Justice and a Court of Appeal. The Judicature Acts do not affect Scotch judicature, but the Appellate Jurisdiction Act includes the Court of Session among the courts from which an appeal lies to the House of Lords under the new conditions. (E. R.)

JUDITH, THE BOOK OF, one of the books of the Old Testament ΑΠΟΚΡΥΦΤΑ (*g.v.*), takes its name from the heroine Judith (*Ἰουδῖθ*, *Ἰουδῖθ*, *i.e.*, "Jewess"), to whom the last nine of its sixteen chapters relate. In the Septuagint and Vulgate it immediately precedes Esther, and along with Tobit comes after Nehemiah; in the English Apocrypha it is placed between Tobit and the apocryphal additions to Esther. The argument of the book is briefly as follows. In the twelfth year of his reign Nebuchadnezzar, who is described as king of Assyria, having his capital in Nineveh, makes war against Arphaxad (*i.e.*, the district Arrhaphacitis), king of Media, and overcomes him in his seventeenth year. He then despatches his chief general Holofernes to take vengeance on the nations of the west who had withheld their assistance. This expedition has already succeeded in its main objects when Holofernes proceeds to attack Judea. The children of Israel, who are described as having newly returned from captivity, are apprehensive of a desecration of their sanctuary, and resolve on resistance to the uttermost. The inhabitants of Bethulia (Betulia) and Betomestham in particular (neither place can be identified), directed by Joachim the high priest, guard the mountain passes near Dethaim, and place themselves under God's protection. Holofernes now inquires of the chiefs who are with him about the Israelites, and is answered by Achior the leader of the Ammonites, who enters upon a long historical narrative showing the Israelites to be invincible except when they have offended God. For this Achior is punished by being handed over to the Israelites, who lead him to the governor of Bethulia. Next day the siege begins, and after forty days the famished inhabitants urge the governor Ozias to surrender, which he consents to do unless relieved in five days. Judith, a beautiful and pious widow of the tribe of Simeon, now appears on the scene with a plan of deliverance. Wearing her rich attire, and accompanied by her maid, who carries a bag of provisions, she goes over to the hostile camp, where she is at once conducted to the general, whose suspicions are disarmed by the tales she invents. After four days Holofernes, smitten with her charms, at the close of a sumptuous entertainment invites her to remain within his tent over night. No sooner is he overcome with sleep than Judith, seizing his sword, strikes off his head and gives it to her maid; both now leave the camp (as they had previously been accustomed to do, ostensibly for prayer) and return to Bethulia, where the trophy is displayed amid great rejoicings and thanksgivings. Achior now publicly professes Judaism, and at the instance of Judith the Israelites make a sudden onslaught on the enemy, who at once give way, leaving immense spoil in the hands of the victors. Judith now sings a song of praise, and all go up to Jerusalem to worship with sacrifice and rejoicing. The book concludes with a brief

¹ Pleading, it should be stated, to prevent a possible confusion, means the written statements of complaint and defence made by the parties before the case comes to trial.

notice of the closing years of the heroine, who returned to her native place and lived to the age of one hundred and five years.

Formerly the majority of interpreters were inclined to assign a strictly historical character to the foregoing narrative, although its historical, chronological, and even geographical difficulties were not overlooked; but this view has to a large extent been superseded by that of most recent critics, who, following Budeus, regard it as a romance written with a patriotic and moral purpose by some imperfectly informed Jew of the Maccabæan period who wished to raise the zeal of his compatriots to the fighting point on behalf of their religion and worship against an overbearing enemy. Volkmar stands alone in treating it as a veiled account of the campaigns of Trajan and his generals against the Parthians and Jews.

According to Origen the book was unknown to the Jews, and did not exist in Hebrew. The extant Greek text, however, which exists in three divergent recensions, shows unmistakable traces of a Hebrew original, even apart from certain expressions which can only be explained as ignorant mistranslations. But that original must have differed considerably from the Chaldee text which lay before Jerome, and was used by him for his new Latin version.

The first express reference to Judith occurs in Clement of Rome (*1 Ad Cor.*, cap. 55); it is cited as Scripture by Clement of Alexandria, Tertullian, Ambrose, and Augustine, and was recognized as canonical by the council of Carthage, and by Innocent I. of Rome.

See Schurer, *NTliche Zeitgesch.*, and De Wette-Schmider, *Einleitung*; in both works full bibliographies are given. The most important commentary is that of Fritzsche in the *Exegetisches Handbuch* (1858).

JUDSON, ADONIRAM (1788–1850), was born at Malden, Massachusetts, August 9, 1788. During his education at Andover theological seminary he formed the resolution to become a missionary, and in 1812 he was ordained a missionary to Burmah under the auspices of the Congregational Board of Foreign Missions. Having after his arrival in India adopted Baptist views, he was appointed to labour in Burmah by the American Baptist Missionary Union in 1814. His translations of the Bible into Burmese appeared in 1835, and his *Burmese and English Dictionary* in 1852. He died April 12, 1850. Both in his literary and his missionary labours he was greatly assisted by the three ladies whom he successively married, of whom as well as of Judson biographies have been published.

JUGURTHA. After the final conquest of Carthage by the Romans in 146 B.C., the larger part of the north of Africa was practically under Roman control. The so-called province, indeed, of Africa, as then constituted, was but a small strip of territory, comprising the possessions retained by Carthage during the few years previous to her downfall. It coincided with the north-eastern portion of Tunis. Around it, to the west, south, and east, was the region to which the Romans gave the name of Numidia, the country of the "Nomads," which stretched westwards to Mauretania, the river Malucha (Malūwi), which flows into the gulf of Mellilah, being here roughly its boundary, and eastwards to the Great Syrtis, thus bordering on Cyrene and Egypt. We may say that Numidia corresponds with what is now Algiers, the south of Tunis, and Tripoli, including in addition a region of indefinite extent to the south. Over this extensive territory, parts of which were rich and populous, Masinissa had ruled for many years, and had rendered Rome substantial aid in her war with Carthage. On his death in 149 B.C. his sovereign power was divided under the direction of Scipio Africanus the younger, the conqueror of Carthage, between his three sons Micipsa, Gulussa, and Mastanabal. The actual government, how-

ever, was chiefly in the hands of an illegitimate son of Mastanabal, Jugurtha. The Numidian princes were by no means mere barbarous chiefs. Micipsa, though too weak to be a king, is said to have been imbued with a considerable tincture of Greek philosophy, and Jugurtha's father too was a man of some literary culture. Jugurtha himself had many of the qualities which command success. He was strong and active; he had a handsome face and keen intelligence; he was a skillful rider, and was a thorough adept in all warlike exercises. In fact, he was in many respects a very worthy grandson of Masinissa, and he inherited much of his political ability and adroitness. Micipsa was naturally rather afraid of him, and knowing his military tastes he sent him to Spain in command of a Numidian force, to serve under Scipio, who was then engaged in the war with Numantia. Jugurtha soon won Scipio's good opinion, and he became a favourite with the Roman nobles serving in the camp, some of whom put into his head the idea of making himself the sole king of Numidia, hinting that at Rome anything could be done for money. There was truth in the hint, as subsequent events proved.

In 118 B.C. Micipsa died. He had thought it politic to adopt Jugurtha, and to provide by his will that he should be associated with his own two sons, Adherbal and Hiempsal, in the government of Numidia. Scipio had written to Micipsa a strong letter of recommendation in favour of Jugurtha; and to Scipio, accordingly, Micipsa entrusted the execution of his will. His testamentary arrangements thus had the Roman guarantee, but they utterly failed. The princes soon quarrelled; and Jugurtha, who was thoroughly unscrupulous, claimed the entire kingdom. His cousin Hiempsal he contrived to have assassinated; and Adherbal he quickly drove out of Numidia by force of arms, compelling him to take refuge in the Roman province of Africa. He had next the audacity to send envoys to Rome to defend his usurpation. Hiempsal, they were to say, had been murdered by his subjects for his cruelty, and Adherbal, who was now at Rome to get redress, had been himself the aggressor. The senate decided that Numidia was to be divided between the two princes, and the division, which was arranged under the superintendence of Roman commissioners, gave the western, the richest and most populous half of the country, to Jugurtha, while the sands and deserts of the eastern half were left to Adherbal. Jugurtha's envoys appear to have found several of the Roman nobles and senators accessible to judicious bribery. So far, however, was he from being satisfied with having secured the best of the bargain that he at once began to molest Adherbal's dominions and to provoke him to a war of self-defence. He so completely defeated him, somewhere near, it would seem, the modern Philippeville, that Adherbal sought safety in Cirta (Constantina), the chief town of Numidia, and a very strong fortress. Here he was besieged by Jugurtha, who, notwithstanding the interposition of a Roman embassy headed by Marcus Scaurus, a leading Roman senator, ultimately forced the place to capitulate, and then treacherously massacred all the inhabitants, his cousin Adherbal among them, and a number of Italian merchants who had settled in the town. There was great wrath at Rome and throughout all Italy; and the senate, a majority of which still clung to Jugurtha in spite of the proof they had just had of his atrocious treachery and cruelty, were persuaded in the same year, 111 B.C., on the motion of the tribune Caius Memmius, to allow a declaration of war against the Numidians. An army was despatched to Africa under the command of the newly elected consul, Calpurnius Bestia, and several of the Numidian towns voluntarily surrendered, while Bocchus, the king of Mauretania, and Jugurtha's father-in-law, offered the Romans his alliance.

Jugurtha was alarmed, but, having plenty of money at his command out of the accumulated treasures of his grandfather Masinissa, he again acted on his experience of Roman venality, and he was successful in arranging for himself with the Roman general a peace which left him in undisturbed possession of the whole of Numidia. When the facts were known at Rome, the tribune Memmius insisted that Jugurtha should appear in person and be questioned as to the precise nature of the negotiations. Jugurtha indeed appeared under a safe conduct, but he had partisans who took care that his mouth should be closed. The treaty, however, was set aside, and war was again declared, Spurius Albinus, the new consul, having the command. The Roman army in Africa was thoroughly demoralized, and quite unfit to take the field. An unsuccessful attempt was made on a fortified town, Sutthul, in which the royal treasures were deposited. Worse followed: the army was surprised by the enemy in a night attack, and the camp was taken and plundered. Jugurtha was master of the situation, and every Roman was driven out of Numidia.

By this time the feeling at Rome and in Italy against the corruption and incapacity of the nobles had become so strong that prosecutions on a wholesale scale struck down a number of the senators, and Bestia and Albinus were sentenced to exile. The Numidian war was now entrusted to Quintus Metellus, an aristocrat indeed in sentiment, but at the same time an able soldier and a stern disciplinarian. With him was associated the famous Cains Marius, who had risen from the rank of a centurion. The army was soon in a condition to face the enemy, and from the year 109 B.C. to the close of the war in 106 the contest was carried on with credit to the Roman arms. Jugurtha was defeated in an action on the river Muthal, after an obstinate resistance and a display of much military skill. Once again he even succeeded in surprising the Roman camp and forcing Metellus into winter quarters. There were fresh negotiations, but Metellus insisted on the surrender of the king's person, and this Jugurtha refused. Numidia on the whole seemed disposed to assert its independence, and Rome had before her an indefinite prospect of a long and troublesome guerrilla war. The country was a particularly trying one for a regular army, and a victory seemed to lead to no substantial result. Nothing could be really accomplished unless Jugurtha himself could be secured; and to this end negotiations, reflecting little credit on the Romans, were set on foot with Boecchus, who for a time, as his interest seemed to dictate, played fast and loose with both parties. The war dragged on till in 106 B.C. Marius was called on by the vote of the Roman people to supersede Metellus. Marius found that he had a difficult work, and his army was once seriously imperilled on the borders of Mauretania, whither he had led them to overawe Boecchus, who had just made a friendly treaty with Jugurtha. Shortly afterwards this cunning and treacherous prince again offered his friendship to the Romans, and it was through his perfidy and not by Roman skill or valour that the war with Jugurtha was ended. In the final negotiations Lucius Sulla, who was Marius's questor and commanded the cavalry, had the honour, such as it was, of winning over to the Roman side the king of Mauretania, and prevailing on him to sacrifice Jugurtha. The Numidian fell into an ambush through his father-in-law's treachery, and was conveyed a prisoner to Rome. Two years afterwards, in 104 B.C., he figured with his two sons in Marius's triumph, and in the subterranean prison beneath the Capitol, "the bath of ice," as he called it, he was either strangled or starved to death. The war had been an inglorious one for Rome, and its end with all its attendant circumstances was deplorably disgraceful.

Jugurtha, though doubtless for a time regarded by his African and Numidian countrymen as their deliverer from the yoke of Rome, mainly owes his historical importance to the very full and minute account of him which we have from the hand of Sallust, himself afterwards governor of Numidia. The Jugurthine war too happened to coincide with a period of considerable political interest at Rome. The symptoms of revolution were beginning to make themselves visible. The weakness and corruption of the government of the senate was forcing itself on the notice of all men, and popular opinion was becoming too strong to be disregarded. One general after another had been superseded and disgraced, and Marius, a man of the humblest origin, had been summoned by the public voice to put an end to a war in which the incapacity and disloyalty of consuls and senators had been grievously exposed. The names of both Marius and Sulla became famous for the first time in a struggle with a Numidian chief. The time was clearly at hand when the old system of Rome's government could sustain itself no longer.

The best modern account of Jugurtha and the Jugurthine war is to be found in Mommsen, *Hist. of Rome*, book iv. chap. v. (W. J. B.)

JUJUBE. Under this name the fruits of at least two species of *Zizyphus* are usually described, namely, *Z. vulgaris* of Lamarck and *Z. Jujuba* of the same author. The species of *Zizyphus* are for the most part small trees or shrubs, armed with sharp, straight, or hooked spines, having alternate leaves and fruits, which are in most of the species edible, and have an agreeable acid taste; this is especially the case with those of the two species mentioned above.

Z. vulgaris is a tree about 20 feet high, extensively cultivated in many parts of southern Europe, Asia, Spain, the south of France, and Italy, also in western Asia, China, and Japan. In India it extends from the Punjab to the western frontier, ascending in the Punjab Himalaya to a height of 6500 feet, and is found both in the wild and cultivated state. The plant is grown almost exclusively for the sake of its fruit, which both in size and shape resembles a moderate sized plum; at first the fruits are green, but as they ripen they become of a reddish-brown colour on the outside and yellow within. They ripen in September, when they are gathered and preserved by storing in a dry place; after a time the pulp becomes much softer and sweeter than when fresh. Jujube fruits when carefully dried will keep for a long time, and retain their agreeable refreshing acid flavour, on account of which they are much valued in the countries of the Mediterranean region as a winter dessert fruit; and, besides, they are nutritive and demulcent. At one time a decoction was prepared from them and recommended in pectoral complaints. A kind of thick paste, known as jujube paste, was also made of a composition of gum arabic and sugar dissolved in a decoction of jujube fruit evaporated to the proper consistency. The fruits of the *Zizyphus* do not enter into the composition of the lozenges now known as jujubes.

The second species of *Zizyphus* referred to above, viz., *Z. Jujuba*, is a tree averaging from 30 to 50 feet high, found both wild and cultivated in many parts of the tropics, as in China, Australia, the Malay archipelago, Ceylon, throughout India, and in tropical Africa. Many varieties of this tree are known to and cultivated by the Chinese, who distinguish them by the shape and size of their fruits, which are produced in abundance, and are not only much valued as desert fruit in China, but are also occasionally exported to England.

As seen in commerce jujube fruits are about the size of a small filbert, having a reddish-brown, shining, somewhat wrinkled exterior, and a yellow or gingerbread coloured pulp enclosing a hard elongated stone.

JUKES, JOSEPH BEETE (1811-1869), geologist, was born near Birmingham, October 10, 1811. Educated first at Wolverhampton grammar-school and afterwards at King Edward's School, Birmingham, he passed in 1830 to St John's College, Cambridge, where he graduated in 1836. At Cambridge he began the study of geology under Sedgwick, and in 1839, after three years of study, lecturing, and writing, he was appointed geological surveyor of Newfoundland. He returned to England at the end of 1840, and in April 1842 sailed as naturalist on board H.M.S. "Fly," despatched to survey Torres Strait, New Guinea, and the east coast of Australia. Jukes landed in England again in June 1846, and in August received an appointment to the geological survey of Great Britain. The district to which he was sent was North Wales. In 1850 he accepted the post of local director of the geological survey of Ireland. The exhausting nature of his work slowly but surely wore out even his robust constitution, and on July 29, 1869, he died. Immediately on leaving college, Jukes became a member of the London Geological Society, and in 1852 he was admitted to the Dublin Geological Society, of which he was president in 1853 and 1854. He was also a Fellow of the Royal Society. For many years he lectured as professor of geology, first at the Royal Dublin Society's Museum of Irish Industry, and afterwards at the Royal College of Science in Dublin.

In addition to the reports of his various appointments, Jukes wrote very many papers and memoirs, to be found in the London and Dublin geological journals and other periodicals. While in Ireland he edited, and in great measure wrote, forty-two memoirs explanatory of the maps of the south, east, and west of Ireland, and prepared a geological map of Ireland on a scale of 8 miles to an inch. He was also the author of *Excursions in and about Newfoundland*, 2 vols., 1842; *Narrative of the Surveying Voyage of H.M.S. "Fly," 2 vols., 1847*; *A Sketch of the Physical Structure of Australia*, 1848; *Popular Physical Geology*, 1853; *On the Geology of Australia*, 1853; *Student's Manual of Geology*, 1857 (later editions, 1862, 1872); the article *Geology*, in the 8th edition of the *Encyclopædia Britannica*, 1858; and *School Manual of Geology*, 1868. See *Letters, &c., of J. Beete Jukes*, edited, with connecting memorial notes, by his sister (C. A. Browne), 1871, to which is added a chronological list of Jukes's writings.

JULIAN (331-363), commonly called Julian the Apostle, was Roman emperor for about a year and eight months (361-363). His full name was Flavius Claudius Julianus. He was born at Constantinople in 331, being the son of Julius Constantius and his wife Basilina, and nephew of Constantine the Great. He was thus a member of the dynasty under whose auspices Christianity became the established religion of Rome.

Julian lost his mother not many months after he was born. He was only six when his imperial uncle Constantine died; and one of his earliest memories must have been the fearful massacre of his father and kinsfolk, in the interest and more or less at the instigation of the sons of Constantine. Only Julian and his elder brother Gallus were spared, as they were too young to excite the fear or justify the cruelty of the murderers. From this period till his twenty-fifth year Julian passed his life in the closest retirement, jealously watched by the reigning emperor, often under immediate fear of death. He was carefully educated, however, under the supervision of the family eunuch Mardonius, and of Eusebius, bishop of Nicomedia, at Constantinople itself and at various places in Ionia and Bithynia, and afterwards for six years at Maecellum, a remote and lonely castle in Cappadocia. He was trained to the profession of the Christian religion; but he became early attracted to the old faith, or rather to the idealized amalgam of paganism and philosophy which was current among his teachers, the rhetoricians. Cut off from all sympathy with the reigning belief by the terrible fate of his family, and with no prospect of a public career, he turned with all the eagerness of an enthusiastic temperament to the literary

and philosophic studies of the time. The old Hellenic world had an irresistible attraction for him. Love for its culture was in Julian's mind intimately associated with loyalty to its religion.

In the meantime the course of events had left as sole autocrat of the Roman empire his cousin Constantius, who felt himself unequal to the enormous task, and called Julian's brother Gallus to a share of power. The same turn of affairs brought a great improvement in the condition of Julian, who was permitted to pursue his studies at Nicomedia. Here he made the acquaintance of some of the most eminent rhetoricians of the time, and here it was that he became confirmed in his secret devotion to the pagan faith. But the downfall of Gallus (354) yet again exposed Julian to the greatest danger. By his rash and headstrong conduct Gallus had incurred the enmity of Constantius and the eunuchs, his confidential ministers, and was put to death. Julian fell under a like suspicion, and narrowly escaped the same fate. For some months he was confined at Milan, till at the intercession of the empress Eusebia, who always had a kindness for him, he was permitted to retire to Athens (355). The few months he spent here were probably the happiest of his life. Living at the ancient hearth of Grecian culture, and amid the companionship of congenial friends, he found his dearest ambition realized in the enthusiastic study of literature and philosophy.

But a member of the Roman imperial house could not thus be allowed to escape the public responsibilities connected with his birth. The emperor Constantius and he were now the sole surviving male members of the family of Constantine; and, as the emperor again felt himself oppressed by the cares of government, there was no alternative but to call Julian to his assistance. At the instance of the empress he was summoned to Milan; and there from Constantius, who had been chiefly concerned in the murder of his family, he received the hand of Helena, sister of the emperor, as also the title of Cæsar and the government of Gaul. It was with extreme reluctance that Julian entered on his new dignities. Accustomed to a life of quiet study and retirement, he felt timid and awkward in the world of ceremony, suspicion, and intrigue to which he was now introduced. He knew well the danger to which he was exposed from the dark temper of the emperor and the arts of the eunuchs who were all-powerful at the court.

A task of extreme difficulty also awaited him beyond the Alps. During recent troubles the Alemanni and other German tribes had crossed the Rhine; they had burned Cologne, Treves, Strasburg, and many other flourishing cities, and extended their ravages far into the interior of Gaul. The internal government of the province had also fallen into great confusion. In spite of his inexperience, and by virtue of his native energy and ability, Julian quickly brought affairs into order. He completely overthrew the Alemanni in the great battle of Strasburg (357). The Frankish tribes which had settled on the western bank of the lower Rhine were reduced to submission. Five times in all he crossed the river to overaw the restless tribes beyond. In Gaul he rebuilt the cities which had been laid waste, re-established the administration on a just and secure footing, and as far as possible lightened the taxes, which weighed so heavily on the poor provincials. Paris was the usual residence of Julian during his government of Gaul, and his name has become inseparably associated with the early history of the city.

The position and reputation of Julian were now established. He was general of a victorious army enthusiastically attached to him, and governor of a province which he had saved from ruin; but he had also become an object of fear and jealousy at the imperial court. It was accordingly

resolved to weaken his power. A threatened invasion of the Persians was made an excuse for withdrawing some of the best legions from the Gallic army. Julian recognized the covert purpose of this, yet proceeded to fulfil the commands of the emperor. A sudden movement of the legions themselves decided otherwise. At Paris, on the night of the parting banquet, they forced their way into Julian's tent, and, proclaiming him emperor, offered him the alternative either of accepting the lofty title or of instant death. Julian accepted the empire, and sent an embassy with a deferential message to Constantius. The message being contemptuously disregarded, both sides prepared for a decisive struggle. After a march of unexampled rapidity through the Black Forest and down the Danube, Julian reached Sirmium, and was on the way to Constantinople, when he received news of the death of Constantius at Mompsoene in Cilicia (361). Without further trouble Julian found himself everywhere acknowledged the sole ruler of the Roman empire.

Julian had already made a public avowal of paganism, of which he had been a secret adherent from the age of twenty. It was no ordinary profession, but the expression of a strong and even enthusiastic conviction; the restoration of the pagan worship was to be the great aim and controlling principle of his government. His reign was too short to show what precise form the pagan revival might ultimately have taken, how far his feelings might have become embittered by his conflict with the Christian faith, whether persecution, violence, and civil war might not have taken the place of the moral suasion which was the method he originally affected. He issued an edict of universal toleration; but in many respects he used his imperial influence unfairly to advance the work of restoration. In order to deprive the Christians of the advantages of culture, and discredit them as an ignorant sect, he forbade them to teach rhetoric. The symbols of paganism and of the imperial dignity were so artfully interwoven on the standards of the legions that they could not pay the usual homage to the emperor without seeming to offer worship to the gods; and, when the soldiers came forward to receive the customary donative, they were required to throw a handful of incense on the altar. Without directly excluding Christians from the high offices of state, he held that the worshippers of the gods ought to have the preference. In short, though there was no direct persecution, he exerted much more than a moral pressure to restore the power and prestige of the old faith.

Having spent the winter of 361-2 at Constantinople, Julian proceeded to Antioch to prepare for his great expedition against Persia. His stay there was a curious episode in his life. Strange to say, it is doubtful whether his pagan convictions or his ascetic life, after the fashion of an antique philosopher, gave most offence to the so-called Christians of the dissolute city. They soon grew heartily tired of each other, and Julian took up his winter quarters at Tarsus, from which in early spring he marched against Persia. At the head of a powerful and well-appointed army he advanced through Mesopotamia and Assyria as far as Ctesiphon, near which he crossed the Tigris, in face of a Persian army which he defeated. Misled by the treacherous advice of a Persian nobleman, he desisted from the siege of that great city, and set out to seek the main army of the enemy under King Sapor. After a long and useless march into the interior he was forced to retreat, when he found himself enveloped and harassed by the whole Persian army, in a waterless and desolate country, and at the hottest season of the year. The Romans repulsed the enemy in many an obstinate battle. In one of these, however, on the 26th of June 363, Julian, who was ever in the front, was mortally wounded. The same night he

died in his tent. In the most authentic historian of his reign, Ammianus Marcellinus, we find a noble speech, which, like Socrates in the prison, he is said to have addressed to his afflicted officers. Jovianus was chosen emperor by the army, which was extricated from its perilous situation only by a very disadvantageous treaty.

From Julian's unique position as the last champion of a dying polytheism, his character has ever excited interest and been the subject of debate. Authors such as Gregory of Nazianzus have heaped the fiercest anathemas upon him; but a just and sympathetic criticism, like Neaders', has found many noble qualities in his character and ample excuse for his leanings to a philosophic paganism. In his childhood he had seen his nearest kinsmen massacred by the heads of the new Christian state; till the age of twenty-five he held his life on sufferance, and passed it in obscurity under the most rigid and suspicious surveillance. The only sympathetic friends he met were among the heathen rhetoricians and philosophers; and he found a suitable outlet for his restless and inquiring mind only in the studies of ancient Greece. In this way he was attracted to the old paganism; but it was a paganism idealized by the philosophy of the time, and still further purified by the moral influence of the Christianity which it rejected.

In other respects Julian was no unworthy successor of the Antonines. Though brought up in a studious and pedantic solitude, he was no sooner called to the government of Gaul than he displayed all the energy, the hardihood, and the practical sagacity of an old Roman. In temperance, self-control, and zeal for the public good, as he understood it, he was unsurpassed. To these Roman qualities he added the culture, literary instincts, and speculative curiosity of a Greek. One of the most remarkable features of his public life was the perfect ease and mastery with which he associated the cares of war and statesmanship with the assiduous cultivation of literature and philosophy. Yet even his devotion to culture was not free from pedantry and dilettantism. His contemporaries observed in him a want of naturalness. He had not the moral health or the composed and reticent manhood of a Roman, or the unself-conscious spontaneity of a Greek. He could never be at rest; he never could hold his tongue; in the rapid torrent of his conversation he was apt to run himself out of breath; his manner was jerky and spasmodic. He showed quite a deferential regard for the sophists and rhetoricians of the time, and advanced them to high offices of state; there was real cause for fear that he would introduce the government of pedants in the Roman empire. Last of all, his love for the old philosophy was sadly disfigured by his devotion to the old superstitions, and in this respect he little pleased the taste of a judge like Gibbon. He was greatly given to divination; he was noted for the number of his sacrificial victims. Wits applied to him the joke that had been passed on Marcus Aurelius: "The white cattle to Marcus Cæsar, greeting. If you conquer, there is an end of us."

Julian wrote several works, including—(1) *Letters*, eighty-three of which are preserved in the edition of Heyler, Mainz, 1838 (most of these addressed to men of letters); (2) *Orations*, nine in number; (3) *Kabalapies* or *Συναγωγαι*, a satirical composition, in which the dead Cæsars appear at a banquet prepared in the heavens, and have to endure the caustic wit of old Silenus; (4) *Ἀνακρίσεις* or *Μικροδρῶναι*, a *jeu d'esprit* on the inhabitants of Antioch, in which also his own person and mode of life are jocularly handled. The most important of his works, the *Κατὰ Ἀποκρίσεων*, has been lost, except the fragments preserved in the refutation by Cyril, latest edition by Neumann, 1881. The best edition of his entire works used to be that of Spanheim, Leipzig, 1696; the most recent is that of Hertlein in the Tenbner series, Leipzig, vol. i. in 1875.

Of the primary sources for Julian's life and character the most important are his own works, the trustworthy and impartial history of the period, Ammianus Marcellinus, v. 3-13-17; the letters and orations of Julian's much esteemed friend Libanius; and the serious of his severest critic, Gregory of Nazianzus. The impression which Julian's career produced on the Christians of the East is

reflected in two Syriac romances published by J. G. Hoffmann (*Julianus der Abt von Sura*, Leyden, 1880) Compare Noldeke, in *Z. D. M. G.*, 1874, vol. XXVIII, p. 301, q. 1061 q. 1062. Modern authorities are—Gibbon's *Decline and Fall*, Xander, *Der Kaiser Julian und sein Zeitalter*, Leipzig, 1813; English translation by G. V. Coxe, D. P. Strauss, *Der Romantiker auf dem Throne der Cäsaren oder Julian der Apostata* (Göttingen, 1817), Bonn, 1870; Semich, *Julian der Abt von Sura*, Halle, Geschichte der Theologie, 2. Julian gegen die christliche Kirche, II. Adrien Nautile, *Julian à Ispahan*, Paris, 1877, and the Hulsean essay for 1876, by G. H. Rendall (T. K.)

JULICH (Fr., *Juliers*), the chief town of a circle in the government district of Aachen, Prussia, and capital of the former duchy of Julich, situated on the right bank of the Roer, about 16 miles north-east of Aachen (Aix-la-Chapelle). It contains three churches, a gymnasium, and a military school, and has manufactures of leather, paper, and wood. The population in 1875 was 5111.

Julich (formerly also Guleh, Gulehe) is the Juliaeum of the *Adantia Niterrivum*; some have attributed its origin to Julius Caesar. From the 9th century it appears several times in history generally as the scene of sieges. From 1794 till 1815 it was in the hands of the French. Till 1860, when its works were demolished, Julich ranked as a fortress of the second class.

JULIEN, NOËL (1797–1873), afterwards called STANISLAS-AIGNAN JULIEN, was born at Orleans April 13, 1797. His father, who was a mechanic, being desirous of improving the position of his son, destined the young Stanislas-Aignan for the priesthood, and in preparation for that calling sent him to the seminary in his native town. Here his extraordinary talent for the acquisition of languages first displayed itself, and with his knowledge increased his repugnance to the profession marked out for him. His favourite study at this time was Greek literature, and so recognized did his scholarship become that, when he went to Paris in 1821, he received the appointment of assistant professor of Greek at the Collège de France. In the same year he published a translation of the *Ἑλένης ἀπαρχή* of Coluthus, of which work he subsequently brought out a new edition, with a Latin version and notes. In later years he was in the habit of saying that it was as the author of this work that he would be best known by posterity,—another instance of the common inability of authors to judge correctly of the relative merits of their works. At this period his attention was drawn to the lectures being delivered by Abel Rémusat on the Chinese language, and being attracted to the study he placed himself under the tuition of that professor. In this new pursuit his progress was as marked and as rapid as formerly in Greek. From the first he, as if by intuition, thoroughly mastered the genius of the language; and the complexity of the characters and the peculiarities of construction, which to others have always presented serious difficulties, at once yielded to his ability and diligence. In 1823 he published a translation in Latin of a part of the works of Mencius, one of the nine classical books of the Chinese, and, though this volume appeared within two years of his having taken up the study of the language, it justified its publication by its success. A year later he produced a translation of the modern Greek odes of Kalvos under the title of *La Lyre patriotique de la Grèce*. But such works were not profitable in a commercial sense, and, being without any patrimony, Julien was glad to accept the assistance of Sir William Drummond and others, until in 1827 he was appointed sub-librarian to the French Institute. In 1831 he was elected a member of L'Académie des Inscriptions et Belles-Lettres de l'Institut de France in the place of Saint-Martin, and in the following year he succeeded Rémusat as professor of Chinese at the Collège de France. For some years his studies had been directed towards the dramatic and lighter literature of the Chinese, and in rapid succession he now brought out translations of the *Hoei-tan-ki*, or "L'histoire du cercle de craie," a drama in which occurs a curiously analogous scene to the judgment of Solomon; the *Pik shay teing ki*; *Blanche et Bleue*, ou les deux couleuvres fées; and the *Tchia-chi kou eu*, upon

which Voltaire subsequently founded his *Orphelin de la Chine*. With the versatility which belonged to his genius, he next turned, apparently without difficulty, to the very different style common to Taoist writings, and translated in 1835, for the Oriental Translation Fund, *Le Livre des Récompenses et des Peines* of Laou-tsze. About this time the cultivation of silk-worms was beginning to attract attention in France, and by order of the minister of agriculture Julien compiled, in 1837, a *Résumé des principaux traités Chinois sur la culture des mûriers*, et l'éducation des vers-à-soie, which was speedily translated into English, German, Italian, and Russian.

Nothing was more characteristic of his method of studying Chinese than his habit of collecting every peculiarity of idiom and expression which he met with in his reading; and, in order that others might reap the benefit of his experiences, he published in 1841 a work entitled *Discussions grammaticales sur certaines règles de position qui, en Chinois, jouent la même rôle que les inflexions dans les autres langues*, which he followed in 1842 by *Exercices pratiques d'analyse, de syntaxe, et de lexicographie Chinoise*. Meanwhile in 1839 he had been appointed joint keeper of the Bibliothèque Royal, with the especial superintendence of the Chinese books, and shortly afterwards he was made Administrateur du Collège de France.

The facility with which he had learned Chinese, and the success which his proficiency commanded, naturally inclined other less gifted scholars to resent the impatience with which he regarded the mistakes into which they fell in their translations from this most difficult language, and at different times bitter controversies arose between Julien and his fellow Sinologues on the one subject which they had in common. How envenomed were the disputes which thus arose may be gathered from the following title of a work published in 1842 by Julien, *Simple exposé d'un fait honorable odieusement dénaturé dans un libelle récent de M. Pauthier, suivi de la réfutation de sa dernière réponse, du résumé analytique de plus de 600 fautes qu'il n'a pas eu justifier, et de l'examen de certains passages à l'aide desquels il a prétendu prouver que des Égyptiens ont porté en Chine l'invention de l'écriture 2353 ans avant J. C.* In the same year appeared from his busy pen a translation of the *Tao te King*, the celebrated work in which Laou-tsze attempted to explain his idea of the relation existing between the universe and something which he called *Tauu*, and on which the religion of Taoism is based. From Taoism to Buddhism was a natural transition, and about this time Julien turned his attention to the Buddhist literature of China, and more especially to the travels of Buddhist pilgrims to India. In order that he might better understand the references to Indian institutions, and the transcriptions in Chinese of Sanskrit words and proper names, he began the study of Sanskrit, and in 1853 brought out his *Voyages des Pèlerins Bouddhistes*, the value of which work is much enhanced by the fruits of this new instance of his extraordinary mental enterprise. The same remark applies to the work which he published six years later entitled *Les Avadânas, contes et apologues Indiens inconnus jusqu'à ce jour, suivis de poésies et de nouvelles Chinoises*. For the benefit of future students he disclosed his system of deciphering Sanskrit words occurring in Chinese books in his *Méthode pour déchiffrer et transcrire les noms Sanscrits qui se rencontrent dans les livres Chinois* (1861). This work, which contains much of interest and importance, falls short of the value which its author was accustomed to attach to it. It had escaped his observation that, since the translations of Sanskrit works into Chinese were undertaken in different parts of the empire, the same Sanskrit words were of necessity differently represented in Chinese characters in accordance with the

dialectal variations. No hard and fast rule can therefore possibly be laid down for the decipherment of Chinese transcriptions of Sanskrit words, and the effect of this impossibility was felt though not recognized by Julien, who in order to make good his rule was occasionally obliged to suppose that wrong characters had by mistake been introduced into the texts. His Indian studies led to a controversy with M. Reinaud, which was certainly not free from the gall of bitterness. Among the many subjects to which he turned his attention were the native industries of China, and his work on the *Histoire et fabrication de la porcelaine Chinoise* is still, and is likely to remain, a standard work on the subject. In another volume he also published an account of the *Industries anciennes et modernes de l'empire Chinois* (1869), translated from native authorities. In the intervals of more serious undertakings he translated the *San tsu King*, or "Le Livre des trois mots"; *Tshien tsu wen*, or "Le Livre de mille mots"; "Les deux cousines"; "Nouvelles Chinoises"; the *Ping chan ting yen*, "Les deux jeunes filles lettrées"; and the "Dialoghi Cinesi," *Ji-ch'ang Kou-tou-kou*. The last work of importance which proceeded from his pen was his *Syntaxe nouvelle de la langue Chinoise* (1869). In these volumes he gives the results of his study of the language, and has collected in them a vast array of facts and of idiomatic expressions. A more scientific arrangement and treatment of his subject would have added much to the value of this work, which, however, contains a mine of material which amply repays exploration. One great secret by which Julien acquired his grasp of the Chinese language was, as we have said, his methodical collection of phrases and idiomatic expressions. Whenever in the course of his reading he met with a new phrase or expression, he entered it on a card which took its place in regular order in a long series of boxes. At his death, which took place on the 20th February 1873, he left, it is said, 250,000 of such cards, about the fate of which, however, little seems to be known. In politics Julien was imperialist, and in 1863 he was made a commander of the legion of honour in recognition of the services he had rendered to literature during the empire. (R. K. D.)

JULIERS. See **JULIEN**.

JULIUS I., pope from 337 to 352, was a native of Rome, and was chosen as successor of Marcus after the Roman see had been vacant four months. He is chiefly known by the part which he took in the Arian controversy. After the Eusebians had, at a synod held in Antioch in 341, renewed their deposition of Athanasius, they resolved to send delegates to Constant, emperor of the West, and also to Julius, setting forth the grounds on which they had proceeded. The latter, after expressing an opinion favourable to Athanasius, adroitly invited both parties to lay the case before a synod to be presided over by himself. This proposal, however, the Eastern bishops declined to accept. On his second banishment from Alexandria, Athanasius came to Rome, and was recognized as a regular bishop by the synod held in 342. It was through the influence of Julius that, at a later date, the council of Sardica in Illyria was held, which was attended only by seventy-six Eastern bishops, who speedily withdrew to Philippopolis and deposed Julius, along with Athanasius and others. The three hundred Western bishops who remained confirmed the previous decisions of the Roman synod; and by its 3d, 4th and 5th decrees relating to the rights of revision claimed by Julius the council of Sardica perceptibly helped forward the pretensions of the papacy. Julius on his death in April 352 was succeeded by Liberius.

JULIUS II., pope from 1503 to 1513, was born at Savona in 1443. He was the son of a brother of Sixtus IV., his original name being Giallano della Rovere. By his

uncle, who took him under his special charge, he was educated among the Franciscans, and latterly sent to a convent in La Pérouse with the special purpose of obtaining a knowledge of the sciences. He does not appear, however, to have joined the order of St Francis, but to have remained one of the secular clergy until his elevation in 1471 to be bishop of Carpentras, shortly after his uncle succeeded to the papal chair. In the same year he was promoted to be cardinal, taking the same title as that formerly held by his uncle, St Peter ad Vincula. With his uncle he obtained very great influence, and in addition to the archbishopric of Avignon he held no fewer than eight bishoprics. In the capacity of papal legate he was sent in 1480 to France, where he remained four years, and acquitted himself with such ability that he soon acquired a paramount influence in the college of cardinals, an influence which rather increased than diminished during the pontificate of Innocent VIII. A rivalry had, however, gradually grown up between him and Roderigo Borgia, and on the death of Innocent in 1492 Borgia by means of a secret agreement with Ascanio Sforza succeeded in being elected over Della Rovere by a large majority, under the name of Alexander VI. Della Rovere at once determined to take refuge at Ostia, and in a few months afterwards went to Paris, where he incited Charles VIII. to undertake the conquest of Naples. Accompanying the young king on his campaign, he entered Rome along with him, and endeavoured to instigate the convocation of a council to inquire into the conduct of the pope with a view to his deposition, but Alexander, having gained a friend in Charles's minister Briconnet, by the offer of a cardinal's hat succeeded in countervailing the machinations of his enemy. On the death of Alexander in 1503 Della Rovere supported the candidature of Cardinal Piccolomini of Milan, who was consecrated under the name of Pius III., but was then suffering from an incurable malady, of which he died in little more than a month afterwards. Della Rovere then succeeded by dexterous diplomacy in winning the support of Cesar Borgia, and was elected to the papal dignity by the unanimous vote of the cardinals. From the beginning Julius II. set himself with a courage and determination rarely equalled to rid himself of the various powers under which his temporal authority was almost overwhelmed. By a series of complicated stratagems he first succeeded in rendering it impossible for Borgia to remain in the papal states. He then used his influence to reconcile the two powerful houses of Orsini and Colonna, and, by decrees made in their interest, he also attached to himself the remainder of the nobility. Being thus secure in Rome and the surrounding country, he next set himself to oust the Venetians from Faenza, Rimini, and the other towns and fortresses of Italy which they occupied at the death of Alexander VI. Finding it impossible to succeed with the doge by remonstrance, he in 1504 brought about a union of the conflicting interests of France and Germany, and sacrificed temporarily to some extent the independence of Italy in order to conclude with them an offensive and defensive alliance against Venice. The combination was, however, at first little more than nominal, and was not immediately effective in compelling the Venetians to deliver up more than a few unimportant places in the Romagna; but by a brilliant campaign Julius in 1506 succeeded in freeing Perugia and Bologna from their despots, and raised himself to such a height of influence as to render his friendship of prime importance both to the king of France and the emperor. Events also in other respects so favoured his plans that in 1508 he was able to conclude with Louis XII., the emperor Maximilian, and Ferdinand of Aragon the famous league of Cambray against the Venetian republic. In the spring of the following year the republic was placed

under an interdict. The results of the league soon outstripped the primary intention of Julius. By the single battle of Agnadello the dominion of Venice in Italy was practically lost; but, as neither the king of France nor the emperor was satisfied with merely effecting the purposes of the pope, the latter found it necessary to enter into a combination with the Venetians to defend himself from those who immediately before had been his allies against them. The Venetians on making humble submission were absolved in the beginning of 1510, and shortly afterwards France was placed under the papal ban. Attempts to bring about a rupture between France and England proved unsuccessful; on the other hand, at a synod convened by Louis at Tours in September 1510 the French bishops withdrew from the papal obedience, and resolved, with Maximilian's co-operation, to seek the deposition of Julius. In November 1511 a council actually met for this object at Pisa. Julius hereupon entered into the Holy League with Ferdinand of Aragon and the Venetians against France, in which both Henry VIII. and the emperor ultimately joined. He also convened a general council (that afterwards known as the Fifth Lateran) to be held at Rome in 1512, which, according to an oath taken on his election, he had bound himself to summon, but which had been delayed, he affirmed, on account of the occupation of Italy by his enemies. In 1512 the French were driven across the Alps, but it was at the cost of the occupation of Italy by the other powers, and Julius, though he had securely established the papal authority in the states immediately around Rome, was practically as far as ever from realizing his dream of an independent Italian kingdom when he died of fever in February 1513.

The abilities and ambition of Julius were regal and military rather than in any sense ecclesiastical. He was more concerned for his own personal fame as a member of the family of Della Rovere than for the advancement of the influence and authority of the church. His dauntless spirit, his mastery of political stratagem, and his moral indifference in the choice of means rendered him the most prominent political figure of his time. While, however, his political and warlike achievements would alone entitle him to rank amongst the most remarkable of the occupants of the papal chair, his chief title to honour is to be found in his patronage of art and literature. He did much to improve and beautify the city; in 1506 he laid the foundation stone of St Peter's; and he was the friend and patron of Bramante, Raphael, and Michelangelo. He was succeeded by Leo X.

See Dumesnil, *Histoire de Jules II.*, Paris, 1873; Brosch, *Papst Julius II.*, Götting, 1878.

JULIUS III., pope from 1550 to 1555, was born at Rome in 1487. He was of good family, his original name being Gian Maria del Monte. After attaining the dignity of archbishop of Siponto, he was in 1536 created cardinal by Paul III., by whom he was employed on several important legations; he was one of the presidents of the council of Trent during its session at Bologna in April 1547. In 1550 he was unanimously chosen successor of Paul III. He consented, at the request of the emperor Charles V., to the reopening of the council of Trent (in 1551), and he also entered into a league with him against the duke of Parma and Henry II. of France; but soon afterwards he deemed it advisable to make terms with his enemies, and in 1552 he again suspended the meetings of the council. From this time pope Julius seems to have lost interest both in political and ecclesiastical affairs; formerly he had acquired a reputation for impetuous energy as well as austerity, but he now exchanged these qualities for a love of luxurious ease, comporting himself at the entertainments given by him in his palace

in a manner fitted to shock preconceived ideas of ecclesiastical propriety. He also aroused much scandal by creating as his first cardinal a youth of sixteen years of age, one of his pages, on account of the courage he had displayed when bitten by a monkey. The adornment of his palace and the laying out of its grounds occupied a large share of his attention, and have done more to make him remembered than his strictly pontifical procedure. Julius was a friend of the Jesuits, to whom he granted a fresh confirmation in 1550. He was succeeded by Marcellus II.

JULY, the seventh month in our present calendar, consists of thirty-one days. It was originally the fifth month of the year, and as such was called by the Romans *Quintilis*. The later name of Julius was given in honour of Julius Caesar (who was born in the month), and came into use in the year of his death. Our Anglo-Saxon ancestors called July *Mæd-mōnāð*, "mead month," from the meadows being then in their bloom; and *āftera Līða*, "the latter mild month," in contradistinction to June, which they named "the former mild month." The principal days now observed and noted in this month are the following:—July 3d, Dog Days begin; July 15th, St Swithin; and July 25th, St James.

JUMET, or **JUMETZ**, a town and commune of Belgium, in the arrondissement of Charleroi and the province of Hainault, is situated about 4 miles north-east of Charleroi. Its manufactures include glass-bottles, knives, nails, and hats; and there are extensive coal-mines in the neighbourhood. The population of the commune in 1876 was 20,102.

JUMIEGES, or **JUMIÈGES**, a village of France, in the department of Seine Inférieure and arrondissement of Rouen, about 16 miles south-west of Rouen, in one of the peninsulas formed by the winding of the Seine. The population was less than 2000 in 1876; but the place is famous for the imposing ruins of the abbey of Jumièges (Latinized as *Gemetium*, *Gemedium*, *Gimegie*, *Jumedio*, &c.), one of the great establishments of the Benedictine order. The principal remains are those of the Church of the Virgin, which had a central tower, the magnitude of which may be judged by one of the sustaining arches still extant. Among the minor relics are the stone which once covered the grave of Agnes Sorel, and two recumbent statues of the 13th century, popularly known as the *Éperviers*, and explained by a baseless legend which makes them represent two sons of Clovis II., who were punished for revolt against their father by having the tendons of their arms and legs cut through, and being set adrift in a boat on the Seine.

The foundation of the abbey of Jumièges is generally assigned to St Philbert, 664 A.D., whose name is still to be read on gold and silver coins obtained from the site. It was to Jumièges that abbot Sturm of Fulda was relegated (760–62), and thither it was that Charlemagne sent Thassilo, the captive duke of Bavaria, and his son Theodo. The 9th century was a period of pillage and disaster for the abbey, but the 11th and 12th centuries saw it raised to new splendour and greatness. One of its monks, Robert Chenuart, became, under Fulcard the Confessor, bishop of London and archbishop of Canterbury. Returning to die in his abbey (1052), he brought with him an Anglo-Saxon missal and pontifical, which are still preserved in the public library of Rouen. For further details see Mabillon, *Acta Sanct. ord. S. Benedicti*, tom. ii.; W. Calcutt (a monk of Jumièges), *Hist. Norm. apud Duchesne*; Deshayes, *Hist. de l'abbaye royale de Jumièges*, Rouen, 1829; Langlois, *Essai sur les Éperviers de Jumièges*, Rouen, 1838; Cochet, *La Seine Inférieure*, Paris, 1864.

JUMILLA, a town of Spain, in the province of Murcia, is situated 37 miles north-west of Murcia, at the foot of a hill whose summit is crowned by a citadel. The streets are regular, clean, and well-paved, and there are three squares. Jumilla possesses two parish churches of some architectural merit, the church of Santiago in the Corinthian

style being adorned with paintings of Rubens and other artists of fame, and with some beautiful frescoes. There is also a Franciscan convent and a hospital. The town is chiefly dependent on agriculture, but has corn and oil mills, brick-kilns, and manufactories of salt, coarse cloth, soap, and firearms. The population in 1877 was 13,886.

JUMNA, or JAMUNĀ, one of the large rivers of northern India, rises in the Himalayas in Garhwal state, about 5 miles north of Jammotri hot springs, in $31^{\circ} 3' \text{ N. lat.}$ and $78^{\circ} 30' \text{ E. long.}$ The stream first flows south for 7 miles, then south-west for 32 miles, and afterwards due south for 26 miles, receiving several small tributaries in its course. It afterwards turns sharply to the west for 14 miles, when it is joined by the large river Tons from the north. The Jumna here emerges from the Himalayas into the valley of the Dān, and flows in a south-westerly direction for 22 miles, dividing the Kiarda Dān on the west from the Dehra Dān on the east. It then, in the 95th mile of its course, forces its way through the Siwālik hills, and debouches upon the plains of India at Faizābād in Sahāranpur district. By this time a large river, it gives off, near Faizābād, both the eastern and western Jumna canals. From Faizābād the river flows for 65 miles in a south-south-west direction, receiving the Maskarra stream from the east. Near Bidhāuli, in Muzaffarnagar district, it turns due south for 80 miles to Delhi city; thence south-east for 27 miles to near Dankaur, receiving the waters of the Katha-nādī and Hindan river on the east, and of the Sabi-nādī on the east. From Dankaur it resumes its southerly course for 100 miles to Mahāban near Muttra, where it turns eastwards for nearly 200 miles, passing the towns of Agra, Firozābād, and Etāwāh, receiving on its left bank the Karwan-nādī, and on its right the Utaughan. From Etāwāh it flows 140 miles south-east to Hamīrpur, being joined by the Songon on its north bank, and on the south by the great river Chambal from the west, and by the Sind. From Hamīrpur, the Jumna flows nearly due east, until it enters Allāhābād district and passes Allāhābād city, 3 miles below which it falls into the Ganges in $25^{\circ} 25' \text{ N. lat.}$ and $81^{\circ} 55' \text{ E. long.}$ In this last part of its course it receives the waters of the Betwa and the Ken.

The Jumna, after issuing from the hills, has a longer course through the North-Western Provinces than the Ganges, but it is not so large nor so important a river; and above Agra in the hot weather it dwindles to a small stream. This is no doubt partly caused by the eastern and western Jumna canals,—of which the former was excavated in 1823-30, and in its course of 130 miles irrigated, in 1875-76, 195,846 acres of the districts of Sahāranpur, Muzaffarnagar, and Meerut, in the North-Western Provinces; while the latter, consisting of the reopened channels of two canals dating from about 1360 and 1628 respectively, extends for 405 miles through the districts of Ambāla, Karnāl, Delhi, and Rohitak in the Punjab, irrigating (1872-73) 351,820 acres.

The trade on the Jumna is not now very considerable; in its upper portion timber, and in the lower stone, grain, and cotton are the chief articles of commerce, carried in the clumsy barges which navigate its stream. Its waters are clear and blue, while those of the Ganges are yellow and muddy; the difference between the streams can be discerned for some distance below the point at which they unite. Its banks are high and rugged, often attaining the proportions of cliffs, and the ravines which run into it are deeper and larger than those of the Ganges. It traverses the extreme edge of the alluvial plain of Hindustān, and in the latter part of its course it almost touches the Bundelkhand offshoots of the Vindhya range of mountains. Its passage is therefore more tortuous, and

the scenery along its banks is more varied and pleasing, than is the case with the Ganges.

The Jumna at its source near Jammotri is 10,849 feet above the sea-level; at Kotnūr, 16 miles lower, it is only 5036 feet; so that, between these two places, it falls at the rate of 314 feet in a mile. At its junction with the Tons it is 1686 feet above the sea; at its junction with the Asan, 1470 feet; and at the point where it issues from the Siwālik hills into the plains, it is 1276 feet. The catchment area of the river is 118,000 square miles; its flood discharge at Allāhābād is estimated at 1,333,000 cubic feet per second. The Jumna is crossed by railway bridges at Delhi, Agra, and Allāhābād, while bridges of boats are stationed at Etāwāh, Kalpi, Hamīrpur, Muttra, Chhillāra, and many other places.

JUNĀGARH, a native state in Kāthiāwār, in the province of Guzerat, Bombay presidency, India, is situated between $20^{\circ} 48' \text{ and } 21^{\circ} 40' \text{ N. lat.}$ and between $69^{\circ} 55' \text{ and } 71^{\circ} 35' \text{ E. long.}$ The state, which comprises an estimated area of 3500 square miles, consists of a level plain, with the exception of the Girnar group of hills, sacred to Jainism, the highest peak of which rises to about 3500 feet above sea-level. The coast-line is well supplied with fair-weather harbours, of which the chief are Verawāl, Nawabandar, and Sutrapora. The ruined but famous temple of Somnāth is situated in the state. The estimated population in 1872 was 380,921, residing in eight hundred and ninety villages. The principal agricultural products are cotton (largely exported to Bombay for re-export), wheat, pulses and millets, oilseeds, and sugar-cane. The manufactures are oil and coarse cotton cloth. The estimated revenue is £200,000. Junāgarh town, the fortified capital of the state, situated in $21^{\circ} 31' \text{ N. lat.}$, $70^{\circ} 36' 30' \text{ E. long.}$, has an estimated population of 20,025.

Prior to 1746 Junāgarh was a Rājput state ruled by chiefs of the Chūrasāmā tribe, but in that year it was conquered by Sultān Muhammad Begira of Ahmadābād. In Akbar's reign it became a dependency of the court of Delhi, under the immediate authority of the Mughal viceroys of Guzerat. About 1735, when the representative of the Mughals had lost his authority in Guzerat, Sher Khān Bābi, a soldier of fortune under the viceroy, expelled the Mughal governor and established his own rule. Sher Khān's son, Salāhat Khān, appointed his heir chief of Junāgarh, assigning to his younger sons the lauds of Bāntwā. Though himself tributary to the ghalukwā of Deroda and the British Government, the nawāb of Junāgarh receives yearly contributions, called *zamlabāhi*, from a large number of the petty chiefs in Kāthiāwār. This levy, which is collected and paid to the nawāb by British officers of the Kāthiāwār agency, is a relic of the days of Mahomedan supremacy. Junāgarh ranks as a first class state among the many chieftains of Kāthiāwār, and its ruler first entered into engagements with the British in 1807.

JUNE, the sixth month in our present calendar, consists of thirty days. Ovid, in his *Fasts* (vi. 25), makes Juno assert that the name was expressly given in her honour:—

"No tamen ignores vulgūque errore traharis,
Junus a nostro nomine uomen habet."

In another part of the *Fasts* (vi. 87) he gives the derivation a *junioribus*, as May had been derived from *Maiores*. Others connect the term with the gentile name Junius, or with the consulate of Junius Brutus. Probably, however, it has an agricultural reference, and originally denoted the month in which crops grow to ripeness. In the old Latin calendar June was the fourth month, and in the so-called year of Romulus it is said to have had thirty days; but at the time of the Julian reform of the calendar its days were only twenty-nine. To these Cæsar added the thirtieth, which it still retains. The Anglo-Saxons had several names for the month of June. They called it "the dry month," "midsummer month," and, in contradistinction to July, "the earlier mild month." The summer solstice occurs in June. The principal days now observed in this month are the following:—

June 11th, St Barnabas; June 24th, Midsummer Day (Nativity of St John the Baptist); and June 29th, St Peter.

JUNG, JOHANN HEINRICH (1740-1817), best known by his assumed name of HEINRICH STILLING, charcoal-burner, tailor, village schoolmaster, oculist, professor of political science, and mystic, was born in the village of Grund in the duchy of Nassau on the 12th September 1740. His father, Wilhelm Jung, schoolmaster and tailor, was the son of Eberhard Jung, charcoal-burner, and his mother was Dorothea or Dorothy Moritz, daughter of a poor clergyman. In the best of his books Stilling gives a charming description of the patriarchal simplicity of his home, and draws the portrait of his grandfather especially with a loving and skilful hand. Stilling became, by his father's desire, schoolmaster and tailor, but "to be always sitting at the needle and making clothes for people was highly repugnant to me," and "to be everlastingly instructing boys and girls in A B C" was equally wearisome. Severe home discipline made Stilling glad to accept an appointment as schoolmaster in a neighbouring village, where, however, he taught not with pleasure but from a sense of duty. He afterwards became tutor in the family of a merchant, and in 1768 went with "half a French dollar," as he himself tells us, to study medicine at the university of Strasburg. What he wanted in money he possessed in confidence in Divine aid; and in after life he was wont to refute sceptical adversaries by recounting the many occasions on which his prayers were answered by providential messengers, for so he regarded them, who in the most unexpected way provided him with the money necessary not only for his studies but for his very existence. At Strasburg he met Goethe, who showed him much kindness, and introduced him to Herder. The acquaintance with Goethe ripened into friendship; and it was by his influence that Stilling's first and best work, *The Account of his Youth*, was in 1777 given to the world. In 1773 he settled at Elberfeld as physician and oculist, and soon became celebrated for operations in cases of cataract. Surgery, however, was not much more to his taste than tailoring or teaching; and in 1778 he was glad to accept the appointment of lecturer on "agriculture, technology, commerce, and the veterinary art" (!) in the newly established academy at Kaiserslautern. In 1784 the academy was transferred to Heidelberg and united with the university. In 1786, on the occasion of the anniversary of the fourth centenary of Heidelberg university, Stilling created immense enthusiasm by delivering his speech, the last of the day, in German. The other professors had used Latin. In 1787 Stilling was appointed professor of economical, financial, and statistical science in the university of Marburg. In 1803 he resigned his professorship and returned to Heidelberg, where he remained with no official appointment until 1806. In that year he received a pension from the grand-duke Charles Frederick of Baden, and removed to Karlsruhe, where he remained until his death on the 2d April 1817. He was married three times, and left a numerous family. Of his engagement to his first wife he tells a most amusing story in his autobiography. Of his works this autobiography *Heinrich Stillings Leben*, from which he came to be known as Stilling, is the only one now of any interest, and, with the supplement by his son-in-law Dr Schwarz, is the chief authority for his life. A believer in dreams and apparitions, he was superstitious rather than mystical. His piety was fervent, but not austere; and his chief delight was in seeing others happy. Modest and affable, he endeared himself to all who came in contact with him. He hated nothing except sects, which, he says, are due merely to pride under the mask of piety. He numbered among his many friends Goethe and Kant and Lavater, the first of whom pays

him high tribute in the second part of *Aus meinem Leben*.

A complete edition of his numerous works, in 14 vols. 8vo, was published at Stuttgart in 1835-38. There are English translations by Sam. Jackson of the *Leben*, London, 1836, and of the *Theorie der Geisterkunde*, London, 1834, and New York, 1851; and of the *Thesaurus*, or the *Fanatic*, a religious romance, by the Rev. Sam. Schaeffer, Philadelphia, 1846.

JUNIPER. The junipers, of which there are about twenty-five species, are evergreen bushy shrubs or low columnar trees, with a more or less aromatic odour, inhabiting the whole of the cold and temperate northern hemisphere, but attaining their maximum development in the temperate zone in North America and Europe. The leaves are usually articulated at the base, spreading, sharp-pointed, and needle-like in form, destitute of oil-glands, and arranged in alternating whorls of three; but in some the leaves are minute and scale-like, closely adhering to the branches, the apex only free, and furnished with an oil-gland on the back. Sometimes the same plant produces both kinds of leaves on different branches, or the young plants produce acicular leaves, while those of the older plants are squamiform. The male and female flowers are usually produced on separate plants; the occurrence of both on the same plant is rare. The male flowers are developed at the ends of short lateral branches, are rounded or oblong in form, and consist of several antheriferous scales in two or three rows, each scale bearing three or six almost spherical pollen-sacks on its under side. The female flower is a small bud-like cone situated at the apex of a small branch, and consists of two or three whorls of two or three scales. The scales of the upper or middle series each produce one lateral ovule. The mature cone is fleshy, with the succulent scales fused together and forming the fruit-like structure known to the older botanists as the galbulus, or berry of the juniper. The berries are red or purple in colour, varying in size from that of a pea to a nut. They differ considerably from the cones of other members of the order *Coniferales*, to which the junipers belong. The seeds are usually three in number, sometimes fewer (1), rarely more (8), and have the surface near the middle or base marked with large glands containing oil. The genus occurs in a fossil state, four species having been described from rocks of Tertiary age.

Bentham and Hooker divide the genus into three sections, viz., *Sabina*, *Oxycedrus*, and *Caryocedrus*. *Juniperus Sabina* is the savin, an irregularly spreading much-branched shrub with scale-like glandular leaves, and emitting a disagreeable odour when bruised. The flesh and dried tops of savin are official in the British and United States pharmacopoeias. The plant is poisonous, acting as a powerful local and general stimulant, diaphoretic, emmenagogue and anthelmintic; it is employed both internally and externally. *Juniperus bermudiana*, a tree about 40 or 50 feet in height, yields a fragrant red wood, which was used for the manufacture of "cedar" pencils. The tree is now very scarce in Bermuda, and the "red cedar," *Juniperus virginiana*, of North America is employed instead for pencils and cigar boxes. The red cedar is abundant in some parts of the United States, and in Virginia is a tree 50 feet in height. It is very widely distributed from the great lakes to Florida and round the Gulf of Mexico, and extends as far west as the Rocky Mountains. The wood is applied to many uses in the United States. The fine red fragrant heart-wood takes a high polish, and is much used in cabinet work and inlaying, but the small size of the planks prevents its more extended use. The tops of the young branches are official in the United States pharmacopoeia. The galls produced at the ends of the branches have also been used in medicine, and the wood yields cedar-camphor and oil of cedar wood.

The *Juniperus thurifera* is the incense juniper of Spain and Portugal, and *J. phœnicea* (*J. lycia*) from the Mediterranean district is stated by Loudon to be burned as incense.

Juniperus communis, the common juniper, and several other species, belong to the section *Oxycedrus*. The common juniper is a very widely distributed plant, occurring in the whole of northern Europe, central and northern Asia to Kamchatka, and North America. It grows at considerable elevations in southern Europe, in the Alps, Apennines, Pyrenees, and Sierra Nevada (4000 to 9000 feet). It also grows in Asia Minor, Persia, and at great elevations on the Himalayas. In former times the juniper seems to have been a very well known plant, the name occurring almost unaltered in many languages. The dialectal names, chiefly in European languages, have been collected by Prince L. L. Bonaparte, and published in *The Academy* (July 17, 1880, No. 428, p. 45). The common juniper is official in the British pharmacopœia and in that of the United States, yielding the oil of juniper, a powerful diuretic, distilled from the unripe fruits. The wood is very aromatic, and is used for ornamental purposes. In Lapland the bark is made into ropes. The fruits are used for flavouring gin (a name derived from *juniper*, through the French *genièvre*); and in some parts of France a kind of beer called *Genévrette* was made from them by the peasants. *Juniperus Oxycedrus*, from the Mediterranean district and Madeira, yields cedar oil which is official in most of the European pharmacopœias, but not in that of Britain.

The third section, *Caryocedrus*, consists of a single species, *Juniperus drupacea* of Asia Minor. The fruits are large and edible; they are known in the East by the name *Habel*.

JUNIUS. This is the signature of an unknown writer who, after exciting and baffling the curiosity of three or four generations of critics, has been allowed to take rank amongst English classics under a pseudonym. The first of the published letters with this signature was dated January 21, 1709; the last, January 21, 1772. The entire series appeared in the *Public Advertiser*, a popular newspaper edited by Woodfall, to whom a number of private letters were also addressed by the same writer. These are included in the collected and complete editions, as well as a number of letters attributed on varying grounds, more or less satisfactory, to Junius.

The first of the letters was a sweeping attack on the Government for the time being. Its spirit may be judged from the concluding sentence: "They (posterity) will not believe it possible that their ancestors could have survived or recovered from so desperate a condition while a duke of Grafton was prime minister, a Lord North chancellor of the exchequer, a Weymouth and a Hillsborough secretaries of state, a Granby commander-in-chief, and a Mansfield chief criminal judge of the kingdom." He does not condescend to particulars, and the letter might have passed unnoticed if Sir William Draper, a man of considerable note, had not undertaken the defence of Lord Granby in answer to it. A bitter controversy ensued, which rapidly degenerated into an exchange of personalities, much to the disadvantage of Sir William. Then came letters to the duke of Grafton, the prime minister, directed more against his private character and conduct than his policy, the main charge against his Grace being his abandonment of Wilkes, whom Junius treats throughout the letters as the champion of the constitution, to be supported against the ministry and the crown. He takes Blackstone, the author of the *Commentaries*, severely to task for justifying the expulsion of Wilkes, whose cause he also espouses in an altercation with Horne Tooke; and he omits no opportunity

of denouncing Luttrell, the elect of Middlesex. The address to the king, the most celebrated of Junius's compositions, after recapitulating the familiar charges of personal pique and favouritism, calls upon his Majesty to summon his whole council without consulting his minister: "Lay aside the wretched formality of a king, and speak to your subjects with the spirit of a man and in the language of a gentleman. Tell them you have been fatally deceived." Many of the letters turn on topics which have no longer the slightest interest. A long letter is addressed to Lord Mansfield for bailing a man named Eyra. In another, equally elaborate, this learned lord is accused of tampering with the common law by an admixture of the civil law, which is now regarded as his highest praise; Junius treats it as an attempt to undermine the liberties of England. He relies little on argument or proof. His force is in his style. He commonly assumes his victim to be what he wishes him to be thought, and produces the desired effect by irony, sarcasm, or polished invective. One of his happiest figures of speech is in the letter on the affair of the Falkland Islands: "Private credit is wealth; public honour is security; the feather that adorns the royal bird supports his flight; strip him of his plumage, and you fix him to the earth." Although an admirer of Lord Chatham, Junius agreed with Mr Grenville as to the right of England to tax the colonies; and, although an uncompromising supporter of popular rights, he was an advocate or apologist for rotten boroughs.

The sensation Junius created in the political world may be inferred from the manner in which the leading orators and statesmen of the day spoke of him. "How comes this Junius," exclaimed Burke, addressing the Speaker, "to have broke through the cobwebs of the law, and to range uncontrolled, unpunished, through the land? The myrmidons of the court have been long, and are still, pursuing him in vain. They will not spend their time upon me or you. No, sir, they disdain such vermin when the mighty boar of the forest who has broke through all their toils is before them. But what will all their efforts avail? No sooner has he wounded one than he lays down another dead at his feet. For my part, when I read his attack upon the king, I own my blood ran cold." . . . "Nor has he dreaded the terrors of your brow, but he has attacked even you—he has—and I believe you have no reason to triumph in the encounter. In short, after carrying away our royal eagle in his pounces and dashing him against a rock, he has laid you prostrate. King, lords, and commons are but the sport of his fury. Were he a member of this House, what might not be expected from his knowledge, his firmness, and integrity? He would be easily known by his contempt of all danger, by his pointed penetration and activity." Lord North spoke in the same strain: "Why should we wonder that the great boar of the wood, this mighty Junius, has broke through the toils and foiled the hunters? Though there may be at present no spear that will reach him, yet he may be some time or other caught."

What added signal to his influence was the general belief of his contemporaries that he was a man of rank and position, familiar with what was passing behind the scenes in high places; and this belief arose not simply from the intimate knowledge he showed of things and persons about the court and the principal departments of the state, but from the lofty and independent tone that was habitual and seemed natural to him,—as when he tells Sir William Draper, "I should have hoped that even my name might carry some authority with it if I had not seen how very little weight or consideration a printed paper receives even from the respectable signature of Sir William Draper"; or when in private letters to the publisher, after waiving all right to the profits of the publication, he says: "As for

myself, be assured that I am far above all pecuniary views." . . . "You, I think, sir, may be satisfied that my rank and fortune place me above a common bribe."

In the preface to the second volume of Bohn's edition of 1855, no less than thirty-seven persons are enumerated to whom the authorship has been attributed. Contemporary opinion strongly inclined to Burke, whose power of assuming or disguising style is proved by his *Vindication of Natural Society*; and, as his biographer Prior pointedly remarks, "contemporary opinion, as formed from a variety of minor circumstances which do not come within the knowledge of future inquirers, is perhaps, on such occasions, the truest." Dr Johnson, who had entered the lists against Junius, told Boswell: "I should have believed Burke to be Junius, because I know no man but Burke who is capable of writing these letters; but Burke spontaneously denied it to me." Burke, told Reynolds that he knew Junius, and uniformly spoke of him as he would hardly have spoken of himself. A very strong case was made out for Lord George Sackville, on whom, after Burke's denial, Sir William Draper's suspicions permanently fixed. Fox used to say that, although he would not take Single-speech Hamilton against the field, he would back him against any single horse. Boyd is another candidate who did not lack supporters. A plausible claim was advanced for the American General Lee, backed by three experts who pretended to detect him by the handwriting. A famous expert, Imbert, gave a written certificate on the same ground in favour of Horne Tooke; and another, Netherclift, declared that there was more of the Junius character in the handwriting of Mrs Dayrolles (the alleged amanuensis of Lord Chesterfield) than in any other specimen submitted to him as a possible performance by the great unknown. Other experts declared confidently for other claimants. But the identity remained an open question, and case after case was pronounced not proven, till the appearance of Mr Taylor's *Junius Identified* in 1816, when Sir Philip Francis immediately became the favourite, and during the next half century the problem was pretty generally considered at an end.

Prior to the publication, Mr Taylor called on Sir Philip to intimate what was intended, and came away with the impression that he was rather pleased than displeased with the intimation. In fact, he had been already playing Junius, and he continued playing the part till his death in 1818. "His first gift," writes his second wife, whom he married in 1814, two years before *Junius Identified*, "was an edition of Junius, which he bade me take to my room and not let it be seen or speak upon the subject; and his posthumous present, which his son found in his bureau, was *Junius Identified*, sealed up and directed to me." The real Junius might have bequeathed a much more conclusive legacy. He writes to Woodfall, December 17, 1771: "When the book is finished, let me have a sett (*sic*) bound in vellum, gilt, and lettered 'Junius I. II.' as handsomely as you can. The edges gilt, let the sheets be well dried before binding. I must also have two sets in blue paper covers. This is all the fee I shall ever require of you." These were duly sent, and it would have been something to the purpose had Francis bequeathed one of them to his wife. Neither of them has turned up. The surviving son (by the first wife) likewise claimed the authorship for the father as a source of pride to the family, so that no evidence in their possession would have been kept back.

Pitt told Lord Aberdeen (the fourth earl) that he knew who Junius was, and that it was not Francis. On its being objected that the Franciscan theory had not been started till after Pitt's death, Lord Aberdeen replied "that's stuff," and proceeded to relate that he himself had once dined in

company with Francis when proofs of his being Junius were adduced before him, that he had listened with evident pleasure, and at last exclaimed in a stilted theatrical manner, "God! if men force laurels on my head, I'll wear them." His immediate contemporaries remained unconvinced. Sir Fortunatus Dwaris states broadly that no one who knew, heard, or read Francis thought him capable of producing Junius. Lord Broughton confirmed this. Tierney said: "I know no better reason for believing the fellow to be Junius than that he was always confoundingly proud of something, and no one could ever guess what it could be."

Lord Stanhope, however, would admit no shadow of doubt upon the point, and Lord Macaulay declared that all reasoning from circumstantial evidence was at an end unless Francis were admitted to be Junius. Both these eminent authorities agree in resting their case on similarity of handwriting, on the internal evidence of style, and on five points which are summarily stated by Lord Macaulay in his essay on Warren Hastings. As regards similarity of handwriting, there is one plain test on which experts are agreed, namely, that "it is impossible for a man, in order to disguise his writing, to write better than he does habitually"; and the best penmanship of Junius is incomparably superior in fineness, delicacy, and grace to the best of Francis, who wrote a large, coarse, clerk-like hand. As regards style, the specimens culled from Francis's speeches and writings prove no more than that he, an assiduous imitator of Junius, succeeded occasionally in catching the mannerism, without any one of the distinctive merits, of his model. Lord Macaulay, not denying the inferiority, endeavours to weaken the argument drawn from it by remarking that it may be urged with at least equal force against every claimant that has ever been mentioned, with the single exception of Burke. "And what conclusion," he asks, "after all, can be drawn from mere inferiority? Every writer must produce his best work; and the interval between his best and his second best work may be very wide indeed." This undeniable truth might have been urged with equal force by any pretender to a disputed authorship,—for example, by Theophilus Swift, the dean's cousin, when he claimed the authorship of the *Tale of a Tub*. Surely the strongest argument in favour of any given candidate is that (tested by his known writings) he alone was equal to the authorship, and the strongest argument against any given candidate that (tested in the same manner) he was unequal to it. Francis put forth his full powers in his controversy with Hastings, and his friend D'Oyly writes to him in 1778 that the public who had followed the controversy allowed both to be good writers; "but, in their opinion, he (Hastings) takes the lead so decidedly as to admit of no comparison."

The five points (which have been logically resolved into three) remained untouched till the publication of the memoirs of Sir Philip Francis by Parkes and Merivale in 1867. This book entirely changed the aspect of the controversy by showing that Francis's position, opinions, interests, manner of life, and tone during the Junian period were the reverse of what those of Junius might be supposed to have been. During the whole of that period he was first clerk in the war office under Lord Barrington. Born in Dublin, October 22, 1740, he was in his thirtieth year when the famous letters commenced. He was the son of Dr Francis, the translator of Horace, but had married under his station, and was associating principally with his wife's relatives and connexions. The habits of his set may be collected from his letters, e.g.: "January 4, 1769: I am just returned from spending a riotous fortnight at Bath. Gravier and two others filled a post-coach, which was dragged with no small velocity by four horses. We

travelled like gentlemen, and lived like rakes." February 12, 1771: "Tilman dined with me yesterday, and swallowed a moiety of two bottles of claret." . . . "We lead a jolly kind of life. This night to a concert, on Thursday to a ridotto, on Saturday the opera, and on Tuesday following a grand private ball at the London Tavern." July 26, 1771: "To-morrow Godfrey, Tilman, another gent, and I set out upon a tour through Derbyshire, and propose to reach Manchester." They did not return till August 13, the day on which Junius's reply to Horne Tooke appeared. On June 25, 1771, in the very thick of the Junian correspondence, Francis writes to a friend abroad: "For the next three years I am likely enough to remain in my present state of uninteresting indolence."

There is no trace at this time of any connexion with the newspapers, nor of any earnest or sustained literary occupation. The only political personage we find him in communication with was Calcraft, to whom he occasionally supplied scraps of official news. By a startling coincidence, all the persons who had been kind or useful to him in promoting his advancement, including Wood (to whom he owed his clerkship), his chief (Lord Barrington), and Calcraft, were bitterly assailed by Junius. The predilections of the pair, the substance and the shadow, are as hard to reconcile as their antipathies. Junius had a high respect for Wilkes's judgment, and avows a liking for both the cause and the man. On November 8, 1771, he writes to Woodfall: "Show the dedication and preface of the letters to Mr Wilkes, and, if he has any material objection, let me know." Francis, in his private correspondence, uniformly expresses the most unmitigated contempt for Wilkes. He writes like one of the general public about Junius. Thus on June 12, 1770, to his brother-in-law: "Junius is not known, and that circumstance is perhaps as curious as any of his writtings. I have always suspected Burke; but, whoever he is, it is impossible he can ever discover himself." Sir William Draper, Junius's first victim, was an old friend of the Francis family, and in a letter dated Bath, January 28, 1769, Dr Francis writes to Philip: "Give my love to Mr Calcraft. Tell him to expect a very spirited and exceeding honourable defence of L. G—y (Granby) against the virulent Junius, by our friend Sir W. D—r. I truly honour him for it." Again, February 11, 1769: "Poor Sir William! I am glad he is gone to Clifton, where he may eat his own heart in peace. When he repeated to me some passages of his letter, I bid him prepare his best philosophy for an answer. But who is this devil Junius, or rather legion of devils? Is it not B—rke's pen dipped in the gall of Sa—lle's heart? Poor Sir William!"

One of Lord Maccaulay's five points is that Junius was "bound by some strong tie" to the first Lord Holland, the friend of Dr Francis and the early patron of Philip. Now, in a fragment of autobiography (included in the memoirs) it is stated that, long before the Junius letters, Dr Francis considered himself grossly ill used by Lord Holland, and "was stung with the idea of having been so long the dupe of a scoundrel." "In this," adds the son, "I concurred with him heartily." Another point, and a most important one, is that Francis bitterly resented the appointment (over his head) of Mr Chamier to the place of deputy secretary-at-war, and that to the resentment thus aroused was owing the downright ferocity, the brutal abuse (as Mr Merivale calls it), with which Lord Barrington was assailed by Junius under the signature of Veteran. Laying out the account the fact that Lord Barrington had been the object of Junius's unrelenting attacks for more than two years before the appointment of Chamier, it is sufficient to refer to Francis's letter of January 24, 1772, to Major Baggs,

in which he says: "You will have heard that Mr D'Oyly has resigned his employment (of deputy). He did it while I was at Bath. Immediately upon my return, my Lord Barrington was so good as to make me the offer with many obliging and friendly expressions. I had, however, solid reasons for declining the offer, and Mr Anthony Chamier is appointed." He was obviously looking out for an Indian appointment, and left the war office in the March following, relying on Lord Barrington's aid in procuring one. After relating in the autobiography how he accidentally heard that Cholwell, one of the intended commissioners for India, had declined the appointment, he proceeds: "It was the king's birthday, and Barrington was gone to court. I saw him the next morning; and, as soon as I had explained my views, he wrote the handsomest and strongest imaginable letter in my favour to Lord North. Other interests contributed, but I owe my success to Lord Barrington." After his arrival in India, Francis was in the habit of writing long and confidential letters to Lord Barrington, who, in 1777, writes to express his gratification at the good understanding between Francis and Clavering. "I love you both so much that I cannot wish you to continue long in a situation so painful though so creditable to you." One of the first visits Francis paid on his return was to Lord Barrington at his country house. "It is the imputed folly," urge the opponents of the Franciscan theory, "not merely the imputed baseness of Francis that startles us. He is represented systematically writing against every friend, benefactor, and patron in succession, without a rational motive or an intelligible cause."

As if the embarrassments of his position were not enough, he must have gone out of his way to multiply them. The terms on which Junius stood with Sir William Draper are well known. In a letter dated February 14, 1770, he describes Sir John Burgoyne as "sitting down for the remainder of his life infamous and contented." On December 11, 1787, when Francis was attacked in the House of Commons for having allowed himself to be included in the list of managers for the impeachment of Warren Hastings, his personal enemy, he rose and stated that the two persons whom he had consulted as the best judges of points of honour were Sir William Draper and Sir John Burgoyne. Draper was dead, but Burgoyne rose and handsomely responded to the appeal, which, if Francis was Junius, has been justly stigmatized as one of the strongest examples of gratuitous folly and brazen impudence on record.

That Earl Temple wrote or inspired Junius is a theory which has been maintained in two able essays, and it derives plausibility from Pitt's assertion that he knew who Junius was, as well as from the language of the Grenville family, which all points to Stowe as the seat of the mystery. The Right Hon. T. Grenville told the first duke of Buckingham, who thought he had discovered the secret, that it was no news to him, but for family reasons the secret must be kept. He also stated to other members of the family, subsequently to the publication of *Junius Identified*, that Junius was not either of the persons to whom the letters had been popularly ascribed. Lord Grenville told Lord Sidmouth that he (Lord G.) knew who Junius was. Lady Grenville told Sir Henry Holland and Dr James Ferguson that she had heard Lord Grenville state that he knew who Junius was, and that it was not Francis. The handwriting of Countess Temple (supposed to have acted as the amanuensis of her lord) comes far the nearest to the Junian hand of any that have been produced as similar to it, especially as regards powers of penmanship; but evidence is altogether wanting that Earl Temple, or any one about him, possessed the required literary qualifications and capacity. The authorship of the letters, therefore, remains a mystery, and

Stat Nominis Umbra is still the befitting motto for the title-page.

See John Wade, *Junius, including Letters by the same writer under other Signatures*, &c., 2 vols., 1860; Parkes and Merivale, *Memoirs of Sir Philip Francis, K.C.B., with Correspondence and Journals*, 2 vols., 1867; John Taylor, *Junius Identified*, 1816; A. Hayward, *More about Junius*, 1868; Charles Chabot, *The Handwriting of Junius Professionally Investigated*, with preface and collateral evidence by the Hon. E. Twissleton, 1871. (A. H.)

JUNIUS, FRANCIS (1545–1603), in French François du Jon, Huguenot divine and writer, was born of good family at Bourges, in France, May 1, 1545. He was a precocious child, and had studied law for two years under Donellus, when a place in the retinue of the French ambassador to Constantinople was procured for him in his fifteenth year. Before he reached Lyons, where he was to join the ambassador, the latter had departed; but Junius, scarcely disappointed, found ample consolation in the better opportunities for study to be found at Lyons. A religious tumult warned the young Huguenot back to Bourges, where the judicious piety of his father not only won him from certain atheistic principles that he had imbibed at Lyons, but also inspired him with the desire of entering the church. To that end he went to study at Geneva, where he was reduced to the direst straits of poverty by the failure of remittances from home, owing to civil war in France. His pride or independence allowed him to accept only the barest sustenance from a humble friend who had himself been a protégé of Junius's family at Bourges, and his health was permanently injured by the weakness to which he was reduced. The long-expected remittance from home was closely followed by the news of the brutal murder of his father at Issoudun; and Junius resolved to remain at Geneva, where his reputation for learning now enabled him to find support by teaching. In 1565, however, he was appointed minister of the Walloon congregation at Antwerp. His foreign birth excluded him from the privileges of the native Reformed pastors, and exposed him to the persecutions of Margaret of Parma, governess of the Netherlands. Several times he barely escaped arrest, and finally, after spending six months in preaching at Limburg, he was forced to retire to Heidelberg in 1567. There he was welcomed by the elector Frederick, and temporarily settled in charge of a church at Schönau; but in 1568 his patron sent him as chaplain with the prince of Orange in his unfortunate expedition to the Netherlands. Junius escaped as soon as he could from that post, and returning to his church remained there till 1573. From 1573 till 1578 he was at Heidelberg, assisting Tremellius in his Latin version of the Old Testament, which appeared at Frankfurt in 1579; and after two and a half years distributed between Neustadt and Otterburg he was appointed to the chair of divinity at Heidelberg. Thence in a short time he was taken to France by the duke of Bonillon, and after an interview with Henry IV. was sent again to Germany on a mission. As he was returning to France, he was named professor of theology at Leyden. In that office, which he filled with success and popularity, he died October 13, 1602. Junius was a learned and pious man, and in that age of illiberal theologians was distinguished for his liberality. He was several times married; "quatuor uxores," he naively expresses himself in his autobiography, "dixi haec enim."

He was a voluminous writer on theological subjects, and translated and composed many exegetical works. He is best known from his own edition of the Latin Old Testament, slightly altered from the former joint edition, and with a revision of the New Testament added (Geneva, 1590; Hanover, 1624). The *Opera Theologica Francisci Junii Biturigis* were published at Geneva, 2 vols., 1613, to which is prefixed his autobiography, written about 1592. The last had been published at Leyden, 1695, and is reprinted in the *Miscellanea Groningana* vol. i., along with a list of the author's other writings.

JUNIUS, FRANCIS (1589–1677), son of the foregoing, was born at Heidelberg in 1589. Brought up at Leyden, his attention was diverted from military to theological studies by the peace of 1609 between Spain and the Netherlands. In 1620 he went to England, where he became librarian to the earl of Arundel, and remained thirty years. He devoted himself to the study of Anglo-Saxon, and afterwards of the cognate old Teutonic languages,—a branch of study in which he has high claims to honour, not only from his own valuable labours in a hitherto almost completely neglected field, but also from having directed the scholarly attention of others to it. In 1650 Junius returned to Holland, where he continued to study as zealously as ever. For two years he lived in Friesland in order to study the peculiar old dialect. In 1675 he returned to England; in 1677 he went to live at Windsor with his nephew, Isaac Vossius, in whose house he died, November 19, 1677.

The uneventful life of Junius was eminently the life of a student; fourteen hours a day were spent at his desk; and the results are seen in his books, and in the rich collection of ancient MSS., edited and annotated by him, which he bequeathed to the university of Oxford. Junius published *De Picura Fotorum*, 1637 (in English by the author, 1638; enlarged and improved edition, edited by Greaves, who prefixed a life of Junius, and with an catalogue of architects, painters, &c., and their works, Rotterdam, 1694); *Observationes in Willielmum Abbatem Francicam Paraphrasin Cantica Canticozum*, Amst., 1655; *Annotiones in Harmoniam Latino-Francicam quatuor Evangelistarum, Latine a Tatiano confectam*, Amst., 1655; *Cædmonis Paraphrasin Poetica Genesice*, Amst., 1656; *Quatuor D. N. J. C. Evangeliorum Versiones Perantiquas Dux, Gothica selvet et Anglo-Saxonica*, Dort., 2 vols., 1665 (the Gothic version in this book Junius transcribed from the Silver Codex of Uffizi); the Anglo-Saxon version is from an edition by Thomas Marshall, whose notes to both versions are given, and a Gothic glossary by Junius); *Etymologicum Anglicanum*, edited by Edmund Lye, and preceded by a life of Junius and Hickes's Anglo-Saxon grammar, Oxford, 1743. Greaves gives a list of the MSS. presented by Junius to Oxford; the most important are a version of the *Ormulum*, the version of Cædmon, and 9 volumes containing *Glossarium V. Linguarum Septentrionalium*.

JUNO, one of the chief goddesses of the Roman state, was identified through the influence of Greek religion with the Hellenic goddess Hera. It is exceedingly unlikely that this identification is grounded on any real connexion between the two, as is the case with Zeus and Jupiter (see JUPITER); it was suggested solely by some superficial points of resemblance. There was a certain analogy in the relation which they respectively bore to the chief god; but it is probable that the marriage of Jupiter and Juno is not a native but a borrowed idea. In Latin and in modern literature the character of Juno is wholly that of the Greek Hera (see HERA). The opinion is general that Juno is not an Aryan goddess, but adopted from a non-Aryan race; if so, she must be Etruscan. One of the chief cults of Juno in Rome was that of Juno Regina on the Aventine. She had been brought thither by Camillus when Rome conquered the Etruscan city of Veii and adopted its patron goddess Juno. The Etruscan name is apparently Uni (see Deecke, *Das Templum von Piacenza*). Another great seat of the worship of Juno was Lanuvium. When that city was conquered, the cultus of Juno Sospita was carried to Rome and established on the Palatine hill. Had Juno been an Aryan goddess, we should certainly find a strong naturalistic element in her; but in fact her sphere is almost entirely limited to human life and action. She must, therefore, have been adopted from some civilized race, where the moral side of the divine conception had been developed, and the naturalistic element which originally belongs to all deities had lost prominence. At Veii, Lanuvium, and other places Juno was the protecting goddess of the state and of society, and in a similar way she had been worshipped at Rome from the earliest times under the epithets Curiaia and Populona.

The great cultus of Juno at Rome was on the Capitol, where Tarquin had established her beside Jupiter to share with him the sovereignty of the state. Though she has nothing to correspond to the naturalistic side of Jupiter, she is readily associated with him in his moral character. She is the patroness and guardian of women, as he is of men. She watches over women from their birth onward. As *Virginensis* she protects maidenhood; as *Prouba*, *Juga* or *Jugalis*, *Domiticia*, *Unxia*, *Cinxia*, she ushers them through all the rites of marriage; as *Matrona* she presides over their wedded life; as *Lucina* she helps them in childbirth. The Kalends were sacred to Juno, as the Ides belong to Jupiter; and thus the two divide the month and the year between them. Geese were her favourite birds, and those which were kept in the Capitoline temple gave the garrison timely warning of the Gallic attack. The chief feast of Juno was the *Matronalia*, on the Kalends of March. Only maidens and wives of stainless character could participate in the procession which was made to the temple of *Lucina* on the *Esquiline* hill. On this the first day of the year, the women received presents from their husbands and relatives, and gave presents to their slaves. The name *Junones* was also applied to the attendant spirits who belong to each woman, just as each man has his own genius. A woman swears by her *Juno*, a lover by the *Juno* of his mistress; hence the sarcasm of Juvenal, "per *Junonem domini jurant ministro*." When Rome began to coin money in order to compete with the currency of the Greek states on the south coast, the mint was the temple of *Juno Moneta*; but this was probably due to Greek influence. The coinage was modelled on that of the cities of *Magna Græcia*, which it was designed to supplant; and these cities had their religious centre in the temple of *Hera Lucina* (see *Curtius*, "Religious Character of Greek Gods," *Nunism. Chron.*, 1870, p. 103).

JUNOT, ANDOCHÉ (1771–1813), Duc d'Abrantès, was born at Bussy-le-Grand, 23d October 1771. He went to school at Chaillillon, and was known among his comrades as a blustering but lovable creature, with a jurgacious disposition. He came under the special notice of Napoleon during the siege of Toulon, while serving as his secretary. It is related that as he was taking down a despatch, a shell bursting hard by and covering the paper with sand, he exclaimed, "Bien! nous n'avions pas de sable pour s'échapper l'œuvre! on voici!" He accompanied Napoleon to Italy in the capacity of aide-de-camp, and distinguished himself so much at the battle of Millesimo that he was selected to carry back the captured colours to Paris. Returning to Italy he went through the campaign with honour, but was badly wounded in the head at Lonato. From the effects of the wound he never completely recovered, and many rash incidents in his career may be directly traced to it. During the expedition to Egypt he acted as general of brigade, and went through fourteen brilliant hours of fighting at Nazareth, putting 10,000 Turks to flight with 300 troopers. His devotion to Napoleon involved him in a duel with General Lanusse, in which he was again wounded. He had to be left in Egypt to recover, and in crossing to France was captured by English cruisers. On his return to France he was made commandant of Paris, and afterwards promoted general of division. His next served at Arras in command of the grenadiers of the army destined for the invasion of England, and made some alterations in the equipment of the troops which received the praise of the emperor. It was, however, a bitter mortification that he was not appointed a marshal of France when he received the cross of the legion of honour. He was sent to Lisbon instead, his entry into which city was something like a royal progress, though his vanity was disappointed by the mission. He was so restless and dissatisfied in the

Portuguese capital that he set out, without leave, for the army of Napoleon, and at Ansterlitz behaved with conspicuous courage and zeal. But he soon offended the emperor by his manner and his demands, and was sent to Parma to put down an insurrection and to be out of the way. In 1806 he was recalled and became governor of Paris. His extravagance and prodigality shocked the Government, and some rumours of an intrigue with Joséphine made it desirable again to send him away. He was, therefore, appointed to lead an invading force into Portugal. For the first time Junot had a great task to perform, and only his own resources to fall back upon for its achievement. Early in November 1807 he set out from Salamanca, crossed the mountains of Beira, rallied his broken forces at Abrantès, and, with 1500 men, dashed upon Lisbon. The whole movement only took a month; he was then invested with the governorship. Administration was his weak point, and in a short time, instead of consolidating the results of his victory, he had squandered them by a course of conduct like that of an Eastern monarch. After Wellesley encountered him at Vimiera he was obliged to withdraw from Portugal with all his forces. Napoleon disapproved, but sent him back to Spain, where, acting under Massena, he was once more seriously wounded. His last campaign was made in Russia, and he got more than a just share of the discredit which attached to it. Napoleon next appointed him to govern Illyria. On the 29th July 1813 he threw himself from a window at Montbard, in a fit of insanity.

JUNOT, LAURE PERMON (1784–1838), Duchesse d'Abrantès, was born at Montpellier, 6th November 1784. Her father was an army contractor, who allowed his wife to take his daughters to Paris in order that they might make good matches. They were lively, witty young ladies, and soon attracted to their hotel a mixed society of officers. Madame Junot declared that Napoleon wished to marry her mother; but there is no evidence for the truth of the story. But he gave Laure Permon 100,000 francs when she married Junot, and after the birth of her first child a house in the *Champs-Élysées*, with 100,000 francs to furnish it. Her husband had extravagant tastes; but she was extravagant to recklessness, contracting debts as rapidly as tradesmen would allow her to run them up. In 1805 she went with her husband to Lisbon, and, as she took it on her to represent "female France," her train was more expensive than that of a queen. After she returned to Paris, she renewed her extravagance, and, opening her drawing-room to the older families as well as to the new men of the empire, she fell under suspicion. With Junot she went through the Spanish campaign, and contrived to give pleasant balls and to hold drawing-rooms all along the route. After her husband's death she was forbidden to return to Paris, but she ignored Napoleon's order, returned, opened her house again, and attracted to it all the celebrities of the day. Her poverty compelled her to retire to *L'Abbaye-aux-Bois* when the empire ended; but she devoted herself to literature with much zeal. She made social recollections from her own life her chief subject; her style was free and flowing; and her articles, memoirs, and romances were widely read. She died at Paris, 7th June 1838.

JUPITER was the chief god of the Roman state. The great and constantly growing influence exerted from a very early period on Rome by the superior civilization of Greece not only caused a modification of the Roman god after the analogy of Zeus, the supreme deity of the Greeks, but led the Latin writers to identify the one with the other, and to attribute to Jupiter myths which were purely Greek and never belonged to actual Roman religion. The Jupiter of actual worship was a Roman god; the Jupiter of Latin

literature was more than half Greek. From the Latin this composite deity has passed into modern literature, and under the name of Jupiter is understood a god whose character is half Roman half Greek; while the legends, family history, and posterity attributed to him are wholly Greek. The identification was facilitated by the community of character which really belonged to Jupiter and Zeus as the Roman and Greek developments of the original Aryan conception of God; whereas the analogy between the non-Aryan Juno of Rome and the Aryan Hera of Greece was very slight. As we have in the two gods one original form differently developed by Roman and Greek genius, it is impossible to treat the one without frequent reference to the other; but it is equally necessary to treat them separately. The highest religious conceptions of each race are summed up in the characters of Jupiter and Zeus, and an account of them must be in reality an outline of the growth of religious thought among Romans and Greeks.

Every influence which affected the growth of the Roman state affected also the religion; and along with the development of Rome out of many elements we have a development of the state god Jupiter out of the original Aryan deity. The state, beginning with a mixture of Latin and Sabine population, soon acquired also Etruscan colonists, who were for a time the ruling element in the state; and, although the dynasty was expelled, yet the Etruscan civilization exerted an immense influence on Roman religion. Jupiter, the Vedic *dyauṣ pitar*, invoked by the Greeks as Ζεύς πάτερ, was the god both of Latins and Sabines. He was identified with the Etruscan Tina, and acquired something of his character. But another influence was felt at an early period. Greek civilization, spreading from Cumæ, revolutionized Etruscan art and modified Etruscan thought. The influence was strongly exerted in Rome also. Under such various influences grew the Roman religion, and it was completed as a national institution when Tarquin, the same king that received into Rome the prophetic books of the Cumæan Sibyl, enthroned Jupiter Optimus Maximus on the Capitoline hill as the guardian and protector of the fully formed Roman state. Many separate cults of Jupiter, originating from different sections of the mixed state, still continued, but were quite overshadowed by the great worship. Several of these worships puzzled the antiquarians of later Rome, and it became a question how far their objects were identical with or distinct from Jupiter. The ceremonial of these ancient cults, of Vejovis the Asylum-god on the Capitol, of Jupiter Stator on the Palatine, of Deus Fidius or Semo Sancus on the Aventine, of Consus the god of good counsel who ruled in the lower world in the Circus, and of many others, would throw much light on the beginnings of the Roman state; but our information on the subject is very scanty. This being the case, we cannot assign to each influence its exact share in developing the Roman conception, though certain elements may be distinguished as more primitive than others. It is also impossible to distinguish accurately the different cults of Jupiter.

The original naturalistic element, the Græco-Italian god whose power is embodied in the phenomena and the cyclic changes of the heavens, never disappeared. Jupiter or Diespiter is under various epithets, Lucetius, Pluvius, &c., the god of clear and clouded sky, of light and darkness, of thunder and rain. By the proper ceremonies he can be drawn down in lightning to the earth, as Eliacus and Indiges, to supply it with rain and springs. Every place which he strikes with the lightning is marked as his own, and is surrounded with a wall to keep off the profane from holy ground. As Averuncus and Depulsor, Jupiter protects men from the effects of the portents that he himself sends from heaven. Through such portents he also reveals

his will to men, and proper interpretation of them will enable men to walk securely before heaven. There can be little doubt that this character as revealer of fate is almost wholly Etruscan, as all the rules of interpretation came from that people. A stone, the symbol of the thunderbolt, was the old symbol of the god, and never became wholly obsolete; hence the phrase *per Jovem lapidem jurare*. Among trees the oak, among birds the woodpecker, were originally sacred to him; but afterwards the eagle and other symbols were, under Greek influence, associated with Jupiter Capitolinus. The identity of many of these attributes with those of the Greek Zeus is obvious. Equally striking is the double character of god both among the dead and among the living which originally belonged to both gods, and was from different causes lost sight of in both cases. In Rome Etruscan influence changed the old views about the nature of the future world; and only some ceremonies, understood by neither priests nor people, preserved the original idea. In nothing was Etruscan influence more conspicuous at Rome than in the gloomy views of the future world that it introduced. The priest of Jupiter, *flamen Dialis*, might not touch a corpse; if his wife, the *flaminica*, died he lost his office. His life was complicated by a multitude of prohibitions: he must not touch a dog or a she-goat, nor see an army, nor take off his pointed cap, nor leave the city for a night, and so on. Violation of any rule, even by accident, entailed impurity on himself and on the whole state, and in some cases made him forfeit his office.

A moral side in the Roman conception of God is apparent at a very early period, and probably was never wholly wanting. Jupiter is the fatherly ruler of mankind: he protects all the higher elements of human society, guards the sanctity of oaths, the rights of strangers and suppliants, the unity of the state, and the intercourse with other peoples. When a foreign state had injured Rome, it was forbidden to begin war without a formal declaration by the fetiales or heralds, the ministers of Jupiter. Iteaded by the *pater patratus populi Romani*, they appealed to Jupiter to witness that they had been wronged, and denounced ruin on the wrong-doers. Having thus through his representative on earth solemnly warned the guilty, the god as Victor led his people to conquest. When the army returned, their entry was a religious ceremonial in honour of Jupiter. The general, as representative of Jove, was borne on a gilded chariot drawn by four white horses through the Porta Triumphalis to the temple on the capitol, where he offered a solemn sacrifice to the god, and laid on his knees the victor's laurels. In the ceremony the victorious general was invested with the purple toga, the tunica palmata, the sceptre and crown of gold, which belong to a god not to a man; while the four-horse chariot itself is the symbol of apotheosis. So the *spolia opima* were dedicated by the general who won them to Jupiter Foretrius in the Capitol. Also to Jupiter, as supreme god of the state, the consuls sacrificed when they assumed office, and the young men when they put on the toga virilis. The Ides of the month were always sacred to Jupiter.

The chief festivals celebrated in honour of Jupiter were the Ludi Romani and the Ludi Magni, the Ludi Capitolini instituted in honour of the deliverance of Rome from the Gauls, and the Ludi Plebei instituted to commemorate the reconciliation between the two orders in the state. In all of them there was included a feast of the magistrates and senators in the Capitol, to which the three deities, Jupiter, Juno, and Minerva, were invited, and places were left for them. Outside of Rome the chief cultus of Jupiter was that on the Alban mount, where Jupiter Latiaris had been the god who guarded the league of the thirty Latin cities. When Rome destroyed, or rather absorbed, this

league, she kept up the worship that had hallowed it. The *Feria Latina* were celebrated every year by the consuls on a day appointed by themselves before they went forth to war. Accompanied by representatives of the Latin cities, they offered a sacrifice of white oxen to Jupiter. Other festivals of Jupiter show his old character as patron of agriculture, especially the different *festas* called *Vinalia*; in this character *Liber*, who was once only a form of Jupiter, had almost entirely supplanted him. The word *liber*, originally an epithet of the chief god, gradually acquired distinct personality, and became the name of a god who was assimilated to the Greek *Dionysus*.

The Romans had in themselves none of the anthropomorphic Greek spirit: while Greek gods were concrete personal beings, Roman gods were almost pure abstractions. The personal element was not wholly wanting, for the gods were conceived as distinguished by sex, and as possessing names which must be concealed lest enemies should know and use them. But to the Roman the gods were little more than spiritual principles of earthly things; each man had his *genius*, the wood had its *Silvanus*. There was no mythology,—no marriages and births of gods, no family relationships. But when Greek influence became powerful, and the Italian deities *Saturnus* and *Ops* had been identified with *Cronos* and *Rhea*, Jupiter like *Zeus* was called their son, and the Greek tales about the conduct of *Zeus* to his parents were applied to the Latin god. On the Capitol Jupiter was enthroned between *Junio* on the left and *Minerva* on the right. The two goddesses now became his wife and his daughter. In like manner the Roman poets attributed to Jupiter all the legends about *Zeus*, and invented new tales and new amours on Italian soil after the analogy of the Greek. The artistic rendering of the conception of Jupiter is wholly borrowed from the Greek, and can be dealt with only in treating of the Greek deity. The first temple on the Capitol was built after the Etruscan model; but, when it was destroyed in 83 B.C., it was rebuilt in Greek style. (W. M. R.A.)

JURA. This range may be roughly described as the block of mountains rising between the Rhine and the Rhone, and forming the frontier between France and Switzerland. The gorges by which these two rivers force their way to the plains cut off the Jura from the Swabian and Franconian ranges to the north and those of Dauphiné to the south. But in very early days, before these gorges had been carved out, there were no openings in the Jura at all, and even now its three chief rivers—the Doubs, the Loue, and the Ain—flow down the western slope, which is both much longer and but half as steep as the eastern. Some geographers extend the name Jura to the Swabian and Franconian ranges between the Danube and the Neckar and the Main; but, though those are similar in point of composition and direction to the range to the south, it is most convenient to limit the name to the mountain ridges lying between France and Switzerland, and this narrower sense will be adopted here.

The Jura has been aptly described as a huge plateau about 166 miles long and 38 miles broad, hewn into an oblong shape, and raised by internal forces to an average height of from 1950 to 2600 feet above the surrounding plains. The shock by which it was raised, and the vibration caused by the elevation of the great chain of the Alps, produced many transverse gorges or "cluses," while on the plateaus between these subaerial agencies have exercised their ordinary influence.

Geologically, the sedimentary rocks of the Jura belong to the Mesozoic age, and were deposited in a sea of variable depth, traces of which survive in the vast salt mines from which Salins and Lons-le-Saunier derive their names. The special name of these fossiliferous strata is *Oolitic*;

they are also called *Jurassic*, from the fact that the Jura is entirely made up of such layers. They include sands, sandstones, marls, clays, and limestones; and the water that deposited these strata must have been highly charged with carbonate of lime, since calcareous rocks abound in the Jura. The action on these rocks of the carbonic acid gas discharged by all animals has been to transform them into bicarbonate of lime, a very soluble body, and hence the work of erosion has been much facilitated. The countless blocks of gneiss, granite, and other crystalline formations which are found in such numbers on the slopes of the Jura, and go by the name of "erratic blocks" (of which the best known instance—the *Pierre à Bot*—is 40 feet in diameter, and rests on the side of a hill 900 feet above the Lake of Neuchâtel), have been transported thither from the Alps by ancient glaciers, which have left their mark on the Jura range itself in the shape of striations and moraines.

The general direction of the chain is from north-east to south-west, but a careful study reveals the fact that there were in reality two main lines of upheaval, viz., north to south and east to west, the former best seen in the southern part of the range and the latter in the northern; and it was by the union of these two forces that the lines north-east to south-west (seen in the greater part of the chain), and north-west to south-east (seen in the *Villebois* range at the south-west extremity of the chain), were produced. This is best realized if we take *Besançon* as a centre; to the north the ridges run east and west; to the south, north and south, while to the east the direction is north-east to south-west.

Before considering the topography of the interior of the Jura, it may be convenient to take a brief survey of its outer slopes.

1. The northern face dominates on one side the famous "Trouée" (or Tronch) of Belfort, one of the great geographical centres of Europe, whence routes run north down the Rhine to the North Sea, south-east to the Danube and the Black Sea, and south-west into France and so to the Mediterranean basin. It is now so strongly fortified that it becomes a question of great strategical importance to prevent its being turned by means of the great central plateau of the Jura, which, as we shall see, is a network of roads and railways. On the other side it overhangs the "Trouée" of the Black Forest towns on the Rhine (Rheinfelden, Säckingen, Laufenburg, and Waldshut) through which the central plain of Switzerland is easily gained. On this north slope two openings offer routes into the interior of the chain,—the valley of the Doubs belonging to France, and the valley of the Birs belonging to Switzerland. Belfort is the military, Mülhausen the industrial, and Basel the commercial centre of this slope.

2. The eastern and western faces offer many striking parallels. The plains through which flow the Aar and the Saône have each been the bed of an ancient lake, traces of which remain in the lakes of Neuchâtel, Brenne, and Morn. The west face runs mainly north and south like its great river, and for a similar reason the east face runs north-east to south-west. Again, both slopes are pierced by many transverse gorges or "cluses" (due to fracture and not to erosion), by which access is gained to the great central plateau of Pontarlier, though these are seen more plainly on the east face than on the west; thus the gorges at the exit from which *Lons le Saunier*, *Poligny*, *Arbois*, and *Salins* are built balance those of the *Suz*, of the *Val de Ruz*, of the *Val de Travers*, and of the *Val d'Orbe*, though on the east face there is but one city which commands all these important routes—Neuchâtel. This town is thus marked out by nature as a great military and industrial centre, just as *Besançon* on the west, which has besides to defend the route from Belfort down the Doubs. These easy means of communicating with the Free County of Burgundy or Franche Comté accounts for the fact that the dialect of Neuchâtel is Burgundian, and that it was held generally by Burgundian nobles, though most of the country near it was in the hands of the houses of Savoy until gradually annexed by Bern. The *Chasseron* (5266 feet) is the central point of the eastern face, commanding the two great railways which join Neuchâtel and Pontarlier. It is in a certain sense parallel to the valley of the Loue on the west face, which flows into the Doubs a little to the south of *Dôle*, the only important town of the central portion of the Saône basin. South of the *Val d'Orbe* the east face becomes a rocky wall crowned by all the highest summits of the chain—the *Mont Tendre* (5612 feet), the *Dôle* (5507 feet), the *Raclet* (5643 feet), the *Crêt de la Neige* (5653 feet), and the *Grand Crêt* (5276

feet), the uniformity of level being as striking as on the west edge of the Jura, though there the absolute height is far less. The position of the Dôle is similar to that of the Chasseron, as along the sides of it run the great roads of the *Col de St Cergues* (4159 feet) and the *Col de la Feuillée* (4341 feet), the latter leading through the Vallée des Dappes, which was divided in 1862 between France and Switzerland, after many negotiations. The height of these roads shows that they are passages across the chain, rather than through natural depressions.

3. The southern face is supported by two great pillars—from the east by the *Grand Crêt* and on the west by the ridge of *Revermont* (2529 feet) above Bourg en Bresse, between these a huge bastion (the district of *Bugey*) stretches away to the south, forcing the Rhone to make a long détour. On the two sides of this bastion the plains in which Ambérieu and Culoz stand balance one another, and are the meeting points of the routes which cut through the bastion by means of deep gorges. On the eastern side this great wedge is steep and rugged, ending in the *Grand Colombier* (5093 feet) above Culoz, and it sinks on the western side to the valley of the Ain, the district of Bresse, and the plateau of Dombes. The junction of the Ain and the Suranci at Pont d'Ain on the west balances that of the Valserne and the Rhone at Bellegarde on the east.

The Jura thus dominates on the north one of the great highways of Europe, on the east and west divides the valleys of the Saône and the Aar, and stretches out to the south so as nearly to join hands with the great mass of the Dauphiné Alps. It therefore commands the routes from France into Germany, Switzerland, and Italy, and hence its enormous historical importance.

Let us now examine the topography of the interior of the range. This naturally falls into three divisions, each traversed by one of the three great rivers of the Jura—the Doubs, the Loue, and the Ain.

1. In the northern division it is the east and west line which prevails—the *Lemoine*, the *Perrille*, the dells of the Dombes from St Ursanne to St Hippolyte, and the "Tronche" of the Black Forest towns. It thus bars access to the central plateau from the north, and this natural wall does away with the necessity of artificial fortifications. This division falls again into two distinct portions.

(a) The first is the part east of the deep gorge of the Doubs after it turns south at St Hippolyte; it is thus quite cut off on this side, and is naturally Swiss territory. It includes the basin of the river Birs and the great plateau between the Dombes and the Aar, on which, at an average height of 2800 feet, are situated a number of towns, one of the most striking features of the Jura. These include Locle and Le Chaux de Fonds, and are mainly occupied with watchmaking, an industry which does not require bulky machinery, and is therefore well fitted for a mountain district.

(b) The part west of the "Cluse" of the Doubs.—Of this, the district east of the river Desoubre, isolated in the interior of the range (unlike the Locle plateau), is called the "*Haute Montagne*," and is given up to cheese making, curing of hams, saw mills, &c. But little watchmaking is carried on there, Besançon being the chief French centre of this industry, and being connected with Geneva by a chain of places similarly occupied, which fringe the west plateau of the Jura. The part west of the Desoubre, or the *Moyen et Montagne*, a huge plateau north of the Loue, is more especially devoted to agriculture, while along its north edge metal working and manufacture of hardware are carried on, particularly at Besançon and Andignourt.

2. The central division is remarkable for being without the deep gorges which are found so frequently in other parts of the range. It consists of the basin of which Pontarlier is the centre, through notches in the rim of which routes converge from every direction; this is the great characteristic of the middle region of the Jura. Hence its immense strategical and commercial importance. On the north-east roads run to Morteau and Locle, on the north-west to Besançon, on the west to Valence, on the south-west to Dôle and Lons-le-Saunier, on the east to the Swiss plain. The Pontarlier plateau is nearly horizontal, the slight indentations in it being due to erosion, e.g., by the river Dragoon. The keys to this important plateau are to the east the *Forêt de Joux*, under the walls of which meet the two lines of railway from Neuchâtel, and to the west *Sâles*, the meeting place of the routes from the Col de la Feuillée, from Besançon, and from the French plain.

The Ain runs on the south edge of this plateau, and on a lower shelf or step, which it waters, are situated two points of great military importance—Novey and Champagnole. The latter is specially important, since the road leading thence to Geneva traverses one after another, not far from their head, the chief valleys which run down into the South Jura, and thus commands the southern routes as well as those by St Cergues and the Col de la Feuillée from the Geneva region, and a branch route along the Orbe river from Jougne. The fort of *Les Noives*, near the foot of the Dôle, serves as an advanced post to Champagnole, just as the Fort de Joux does to Pontarlier.

This above sketch will serve to show the character of the central Jura as the meeting place of routes from all sides, and the import-

ance to France of its being strongly fortified, lest an enemy approaching from the north-east should try to turn the fortresses of the "Tronche de Belfort." It is in the western part of the central Jura that the north and south lines first appear strongly marked. There are said to be in this district no less than fifteen ridges running parallel to each other, and it is these which force the Loue to the north, and thereby occasion its very eccentric course. The cultivation of wormwood wherewith to make the tonic "absinthie" has its headquarters at Pontarlier.

3. The southern division is by far the most complicated and entangled part of the Jura. The lofty ridge which bounds it to the east forces all its drainage to the west, and the result is a number of valleys of erosion (of which that of the Ain is the chief instance), quite distinct from the natural "cluses" or fissures of those of the Doubs and of the Loue. Another point of interest is the number of roads which intersect it, despite its extreme irregularity. This is due to the great "cluses" of Nantua and Yver, which traverse it from east to west. The north and south line is very clearly seen in the eastern part of this division; the north-east and south-west is entirely wanting, but in the Villebois range south of Ambérieu we have the principal example of the north-west to south-east line. The plateaux west of the Ain are cut through by the valleys of the Valouse and of the Suranci, and like all the lowest terraces on the west slope do not possess any considerable towns. The Ain receives three tributaries from the east—

(a) The *Doune*, which flows from the fort of Les Rousses by St Claude, the industrial centre of the South Jura, famous for the manufacture of wooden toys, owing to the large quantity of boxwood in the neighbourhood. Septmoncel is busied with cutting of gems, and Morez with watch and spectacle making. Cut off to the east by the great chain, the industrial prosperity of this valley is of recent origin.

(b) The *Ognon*, which flows from south to north. It receives the drainage of the lake of Nantua, a town noted for combs and silk weaving, and which communicates by the "cluse" of the Lac de Silan with the Valserne valley, and so with the Rhone at Bellegarde, and again with the various routes which meet under the walls of the fort of Les Rousses, while by the Val Romey and the Sâran Culoz is easily gained.

(c) The *Albaine*, connected with Culoz by the "cluse" of Virieu, and by the Furva flowing south with Belley, the capital of the district of *Bugey* (the old name for the South Jura). The "cluse" of Nantua and Virieu are now both traversed by important railways; and it is even truer than of old that the keys of the South Jura are Lyons and Geneva. But of course the strategic importance of these gorges is less than appears at first sight, because they can be turned by following the Rhone in its great bend to the south.

The name Jura, which occurs in Caesar and in Strabo, is a form of a word which appears under many forms (e.g., Joux, Jorat, Jorasse, Juriens), and is a synonym for a wood or forest. The German name is *Leberberg*, *Leber* being a provincial word for a hill.

Politically the Jura is French (departments of the Doubs, Jura, and Ain) and Swiss (parts of the cantons of Geneva, Vaud, Neuchâtel, Bern, Solothurn, and Basel); but at its north extremity it takes in a small bit of Alsace (Pfirt or Ferrette). In the Middle Ages the southern, western, and northern sides were parcelled out into a number of districts, all of which were gradually absorbed by the French crown, viz., Gex, Val Romey, Bresse, and Bugey (exchanged in 1601 by Savoy for the marquisate of Saluzzo), Franche Comté, or the Free County of Burgundy, an imperial fief till annexed in 1674, the county of Montbéliard (Alsémpelgard), acquired in 1793, and the county of Ferrette (French 1648-1871). The northern part of the eastern side was held by the bishop of Basel as a fief of the empire, but was given to Bern in 1815 (as a recompense for its loss of Vaud), and now forms the Bernese Jura, a French-speaking district. The centre of the eastern slope formed the principality of Neuchâtel and the county of Valangin, which were generally held by Burgundian nobles, came by succession to the kings of Prussia in 1707, and were formed into a Swiss canton in 1815, though they did not become free from formal Prussian claims until 1837. The southern part of the eastern slope originally belonged to the house of Savoy, but was conquered bit by bit by Bern, which was forced in 1815 to accept its subject district Vaud as a colleague and equal

in the Swiss Confederation. It was Charles the Bold's defeats at Grandson and Morat which led to the annexation by the Confederates of these portions of Savoyard territory.

See E. F. Berlioux, *Le Jura*, Paris, 1880; Adolphe Joanne, *Jura et Alpes Françaises*, Paris, 1877; *Id.*, *Géographies Départementales* (the Doubs, Jura, and Ain volumes); Charles Sanna, *Le Jura pittoresque*. (W. A. B. C.)

JURA, an eastern frontier department of France, formed of the southern portion of the old province of Franche-Comté, owes its name to the offshoots and plateaus of the Jura mountains, which occupy more than half its area. It is bounded N. by Doubs, Haute-Saône, and Côte-d'Or; E. by Doubs, Ain, and Switzerland; S. by Ain; and W. by Saône-et-Loire and Côte-d'Or. Lying between 46° 15' and 47° 17' N. lat., and between 5° 15' 39" and 6° 8' 9" E. long., its greatest length from north to south is 143 miles, and its greatest breadth from east to west 83 miles. The department is divided by a not very broad zone of hills into a region of plain in the north and north-west, and a region of mountains in the south-east, increasing in height towards the Swiss frontier. The highest summit is Noir Mont (5085 feet). Jura belongs almost entirely to the basin of the Rhone,—its chief streams being the Oignon, Doubs, and Saône, alluents of the Saône, and the Ain and Valserine, direct tributaries of the Rhone. The Doubs and Ain are navigable. There are numerous lakes; those of Rousses, Châlin, Chumby, and of the abbey of Grandvaux are noteworthy. The climate is, on the whole, cold; the temperature is subject to sudden and violent changes, and among the mountains winter lingers for nearly six months. The plain called the Dresse is rich in fruit trees, and in fields of wheat, rye, maize, and buckwheat; the hill-region grows vines, barley, oats, maize, rape, walnuts, and fruits; the mountains, which exhibit some of the grandest scenery of looping torrent and silent tarn, are covered with forests or pastures. Jura is one of the most thickly wooded departments of France; a third of its surface is covered with forests, of which that of Chaux, with an area of about 75 square miles, is the largest. The commonest trees are oaks, beeches, hornbeams, aspens, birches, box-trees, and firs. Wolves and foxes are numerous in Jura; wild boars and deer lurk in the forests. The principal minerals are iron, salt, limestone, marble, sandstone, millstone, and clay. Peats are very abundant. Agriculture employs about three-fourths of the inhabitants, though the manufactures extend to wine, cheese (made in the mountain dairies), watches, files, stationary, toys and fancy wooden-ware, machinery, candles, porcelain, basket-work, &c.; while some industry is maintained in wool-spinning, silk-weaving, and in brass, pottery, and tanning works. The trade is mainly in wines, cheese, and wooden goods. The first are full-bodied, stout, and rather coarse-flavoured; their chief market is Paris, where they form the basis of the *vin ordinaire* of the wine-shops. The department of Jura embraces the arrondissements of Lons-le-Saunier, Dôle, Poligny, and St Claude, with 32 cantons and 533 communes. Lons-le-Saunier is the chief town. The total area is about 1928 square miles; the population in 1866 was 298,477; in 1876, 288,823.

JURA, an island of the inner Hebrides, on the west coast of Argyllshire, Scotland, the fourth largest of the group, is situated between 55° 52' and 56° 9' N. lat., and 5° 43' and 6° 8' W. long. On the north it is separated from the island of Scarba by the whirlpool of Corryvreckan, on the east from the mainland by Jura Sound, which is 10 miles broad, and on the south and south-west from Islay by Islay Sound. The area is about 160 square miles, the greatest length about 27 miles, and the breadth about 6. A chain of rugged hills, rising into

eminences called the Paps of Jura, the highest summit of which is 2500 feet, traverses the whole extent of the island, interrupted only by Tarbert Loch, an arm of the sea, which forms an indentation into the island of nearly 6 miles, and almost cuts it in two. Jura derived its name, meaning "deer island," from the red deer which abounded on it. On the pasturage a considerable number of black cattle are raised; and some corn and potatoes are cultivated along the eastern shore. Fishing is prosecuted to a small extent. The population, which in 1851 was 1064, was 781 in 1881.

JURIEU, PIERRE (1637–1713), a French Protestant theologian, was born in 1637 at Mer, in Orléanais, where his father was a Protestant pastor. He studied at Saumur and afterwards at Sedan under his maternal grandfather the famed theologian Pierre Dumoulin, who died about the time that Jurieu left Sedan. After completing his studies in England under his maternal uncle Dumoulin, Jurieu received episcopal ordination there, and returning to France succeeded his father as pastor of the church at Mer. In 1674 he accepted the chair of theology and Hebrew at Sedan, where he soon afterwards became also pastor. Both as preacher and professor he obtained a very high reputation, but much of the legitimate influence of his talents was destroyed by the extreme warmth of his controversial temper, which frequently developed into an irritated fanaticism verging on insanity. On the suppression of the university of Sedan in 1681, Jurieu received an invitation to a church at Rouen, but, dreading persecution on account of a work he was about to publish, entitled *La Politique du Clergé de France*, he went to Holland and became soon after pastor of the Walloon church of Rotterdam, an office which he occupied till his death, 11th January 1713.

Deeply pained by the revocation of the Edict of Nantes Jurieu turned for consolation to the prophecies of the Apocalypse, and succeeded in persuading himself that the overthrow of Antichrist would take place in 1689, and afterwards, when that year had passed without the fulfilment of the prophecy, in 1715. Jurieu defended the doctrines of Protestantism with great ability against the attacks of Arnauld and Bossuet, but was equally ready to enter into dispute with his fellow Protestant divines when their opinions differed from his own even on minor matters. The bitterness and persistency of his attacks on his colleague Bayle led to the latter being deprived of his chair in 1693. In his favour it must, however, be mentioned that he was actuated in his controversies not by a mean jealousy of his opponents but by a sincere anxiety for truth. One of the most important works of Jurieu is *Lettres Pastorales adressées aux Fidèles de France*, 3 vols., Rotterdam, 1686 and 1687, which found its way into France notwithstanding the vigilance of the police, and produced a deep impression on the Protestant population. Besides his numerous other controversial writings, which deal with nearly every topic in regard to which difference of opinion was possible, Jurieu was the author of a *Traité de la Dévotion*, Rouen, 1679.

JURISPRUDENCE. See LAW.

JURY. The essential features of trial by jury as practised in England and countries influenced by English ideas are the following. The jury are a body of laymen selected by lot to ascertain, under the guidance of a judge, the truth in questions of fact arising either in a civil litigation or in a criminal process. They are generally twelve in number, and their verdict, as a general rule, must be unanimous. Their province is strictly limited to questions of fact, and within that province they are still further restricted to the exclusive consideration of matters that have been proved by evidence in the course of the

trial. They must submit to the direction of the judge as to any rule or principle of law that may be applicable to the case; and, even in deliberating on the facts, they receive, although they need not be bound by, the directions of the judge as to the weight, value, and materiality of the evidence submitted to them. Further, according to the general practice, they are selected from the inhabitants of the locality, whether county or city, within which the cause of action has arisen or the crime has been committed, so that they bring to the discharge of their duties a certain amount of independent local knowledge, an element in the institution which is by no means to be ignored. Such in general terms is the famous judicial institution the development of which is generally regarded as one of the greatest achievements of English jurisprudence.

What is the origin of this very remarkable and characteristic system? That is a question which has engaged the attention of many learned men. The fullest discussion of the subject is contained in Forsyth's *Trial by Jury*, published in 1859, and more concise notices of the various theories that have been advanced will be found in Stubbs's *Constitutional History*, vol. i., and in Freeman's *Norman Conquest*, vol. v. Until quite recently this, like all other institutions, was popularly regarded as the work of a single legislator, and in England it is one of the achievements usually assigned to Alfred. It is needless to say that there is no historical foundation whatever for such a supposition, nor is it much more correct to regard it as "copied from this or that kindred institution to be found in this or that German or Scandinavian land," or brought over ready made by Hengist or by William.¹ "Many writers of authority," says Canon Stubbs, "have maintained that the entire jury system is indigenous in England, some deriving it from Celtic tradition based on the principles of Roman law, and adopted by the Anglo-Saxons and Normans from the people they had conquered. Others have regarded it as a product of that legal genius of the Anglo-Saxons of which Alfred is the mythic impersonation, or as derived by that nation from the customs of primitive Germany or from their intercourse with the Danes. Nor even when it is admitted that the system of recognition was introduced from Normandy have legal writers agreed as to the source from which the Normans themselves derived it. One scholar maintains that it was brought by the Norsemen from Scandinavia; another that it was derived from the processes of the canon law; another that it was developed on Gallic soil from Roman principles; another that it came from Asia through the crusades," or was borrowed by the Angles and Saxons from their Slavonic neighbours in northern Europe. The true answer is that forms of trial resembling the jury system in various particulars are to be found in the primitive institutions of all nations. That which comes nearest in time and character to trial by jury is the system of recognition by sworn inquest, introduced into England by the Normans. "That inquest," says Mr Stubbs, "is directly derived from the Frank capitularies, into which it may have been adopted from the fiscal regulations of the Theodosian code, and thus own some distant relationship with the Roman jurisprudence." However that may be, the system of recognition consisted in questions of fact, relating to fiscal or judicial business, being submitted by the officers of the crown to sworn witnesses in the local courts. It is pointed out by Mr Freeman that the Norman rulers of England were obliged, more than native rulers would have been, to rely on this system for accurate information. They needed to have a clear and truthful account of disputed points set before them, and such an account was sought for in the oaths of

the recognitors.² The Norman Conquest, therefore, fostered the growth of those native germs common to England with other countries out of which the institution of juries grew. Recognition, as introduced by the Normans, is only, in this point of view, another form of the same principle which shows itself in the compurgators, in the *frithbock*, in every detail of the action of the popular courts before the Conquest. Admitting with Mr Stubbs that the Norman recognition was the instrument which the lawyers in England ultimately shaped into trial by jury, Mr Freeman maintains none the less that the latter is a distinctively English thing. Mr Forsyth comes to substantially the same conclusion. Noting the jury germs of the Anglo-Saxon period, he shows how out of those elements, which continued in full force under the Anglo-Normans, was produced at last the institution of the jury. "As yet it was only implied in the requirement that disputed questions should be determined by the voice of sworn witnesses taken from the neighbourhood, and deposing to the truth of what they had seen or heard." What was wanting was to mould the procedure into shape, and that it did not attain until a century after the Conquest.

The inquest by recognition, which was employed generally for the ascertainment of facts, as for example in assessing taxation, is exemplified in legal matters by the process known as the assize or the great assize, applicable to questions affecting freehold or status. Defendant in such an action was enabled by an enactment of Henry II. to decline the trial by combat and choose the trial by assize, which was conducted as follows. The sheriff summoned four knights of the neighbourhood, who being sworn chose twelve lawful knights who were most cognizant of the facts, who should determine on their oaths which had the better right to the land. If they all knew the facts and were agreed as to their verdict, well and good; if some or all were ignorant, the fact was certified in court, and new knights were named, until twelve were found to be agreed. The same course was followed when the twelve were not unanimous. New jurors, as they may be called, were added until the twelve were agreed. This was called affording the assize. At this point the knowledge on which the jurors acted was their own personal knowledge, acquired independently of the trial. "So entirely," says Forsyth, "did they proceed upon their own previously formed view of the facts in dispute that they seem to have considered themselves at liberty to pay no attention to evidence offered in court, however clearly it might disprove the case which they were prepared to support." The use of recognition is prescribed by the constitutions of Clarendon for cases of dispute as to lay or clerical tenure. See Forsyth, p. 131; Stubbs, vol. i. p. 617.

In criminal cases there appears to be a more complete approximation to the jury in Anglo-Saxon times in the twelve senior thegns, who, according to an ordinance of Æthelred II. were sworn in the county court that they would accuse no innocent man and acquit no guilty one. The twelve thegns were a jury of presentment or accusation, like the grand jury of later times, and the absolute guilt or innocence of those accused by them had to be determined by subsequent proceedings—by compurgation or the ordeal. Whether this is the actual origin of the grand jury or not, the assizes of Clarendon and Northampton establish the criminal jury on a definite basis. By the articles of visitation of 1194, four knights are to be chosen from the county who by their oath shall choose two lawful knights of each hundred or wapintake, or, if knights be wanting, free and legal men, so that the twelve may answer for all

¹ Freeman, *Norman Conquest*, vol. v. p. 451.

² This fact would account for the remarkable development of the system on English ground, as contrasted with its decay and extinction in France.

matters within the hundred, including, says Stubbs, "all the pleas of the crown, the trial of malefactors and their receivers, as well as a vast amount of civil business." This is the historical grand jury. The petty jury, as it is called, which is the real jury of trial, appears to have arisen as an alternative to the trial by ordeal. A person accused by the inquest of the hundred was allowed to have the truth of the charge tried by another and different jury.¹ "There is," says Forsyth, "no possibility of assigning a date to this alteration." "In the time of Bracton (middle of the 13th century) the usual mode of determining innocence or guilt was by combat or appeal. But in most cases the appellant had the option of either fighting with his adversary or putting himself on his county for trial"—the exceptions being murder by secret poisoning, and certain circumstances presumed by the law to be conclusive of guilt. Some doubt has been expressed whether the twelve jurors who tried the crime were not identical with the accusing jurors, but the separation between the two juries was at any rate complete in the reign of Edward III. (Forsyth, p. 206).²

So far we have arrived at the establishment of the jury system in its modern form, alike in civil and in criminal proceedings; and, whatever differences may be traceable in the history of the civil and criminal jury respectively, their subsequent development is one. And there is one great feature by which the jury at the stage we have now reached is distinguished from the jury of modern times. The jury still certify to the truth from their knowledge of the facts, however acquired. In other words, they still retain the character of witnesses. The complete withdrawal of that character from the jury is connected by Forsyth with the ancient rules of law as to proof of written instruments, and a peculiar mode of trial *per sectam*. When a deed is attested by witnesses, you have a difference between the testimony of the witness, who deposes to the execution of the deed, and the verdict of the jury as to the fact of execution. It has been contended with much plausibility that in such cases the attesting witnesses formed part of the jury. Forsyth doubts that conclusion, although he admits that, as the jurors themselves were originally mere witnesses, there was no distinction in principle between them and the attesting witnesses, and that the attesting witnesses might be associated with the jury in the discharge of the function of giving a verdict. However that may be, in the reign of Edward III., although the witnesses are spoken of "as joined to the assize," they are distinguished from the jurors. The trial *per sectam* was used as an alternative to the assize or jury, and resembled in principle the system of compurgation. The claimant proved his case by vouching a certain number of witnesses (*secta*), who had seen the transaction in question, and the defendant rebutted the presumption thus created by vouching a larger number of witnesses on his own side. In cases in which this was allowed, the jury did not interpose at all, but in course of time the practice arose of the witnesses of the *secta* telling

their story to the jury. In these two instances we have the jury as judges of the facts sharply contrasted with the witnesses who testify to the facts; and, with the increasing use of juries and the development of rules of evidence, this was gradually established as the true principle of the system. In the reign of Henry IV. we find the judges declaring that the jury after they have been sworn should not see or take with them any other evidence than that which has been offered in open court. But the personal knowledge of the jurors was not as yet regarded as outside the evidence on which they might found a verdict, and the stress laid upon the selection of jurymen from the neighbourhood of the cause of the action shows that this element was counted on, and, in fact, deemed essential to a just consideration of the case. Other examples of the same theory of the duties of the jury may be found in the language used by legal writers. Thus it has been said that the jury may return a verdict although no evidence at all be offered, and again, that the evidence given in court is not binding on the jury, because they are assumed from their local connexion to be sufficiently informed of the facts to give a verdict without or in opposition to the oral evidence. A recorder of London, *temp.* Edward VI., says that, "if the witnesses at a trial do not agree with the jurors, the verdict of the twelve shall be taken and the witnesses shall be rejected." Forsyth suggests as a reason for the continuance of this theory that it allowed the jury an escape from the *attaint*, by which penalties might be imposed on them for delivering a false verdict. They could suggest that the verdict was according to the fact, though not according to the evidence. With the disuse of *attaints*, the contrary rule came in, and it was established that where a jurymen is acquainted with material facts he should tell the court in order that he may be sworn as a witness; and it was clearly laid down by Lord Ellenborough that, if a judge directed the jury that they might be guided by their own knowledge of the facts independently of the evidence, such a direction would be wrong.

The ordinary jury in civil and criminal trials has now been traced down to the point at which its constitution became stereotyped. An important point still wants some historical explanation. The rule requiring a unanimous verdict has been variously accounted for, but Mr Forsyth's explanation appears conclusive. He regards the rule as intimately connected with the original character of the jury as a body of witnesses, and with the conception common in primitive society that safety is to be found in the number of witnesses, rather than the character of their testimony. The affording of the jury above described marks an intermediate stage in the development. Where the juries were not unanimous new jurors were added until twelve were found to be of the same opinion. From the unanimous twelve selected out of a larger number to the unanimous twelve constituting the whole jury was a natural step, which, however, was not taken without some hesitation. In some old cases we find that the verdict of eleven jurors out of twelve was accepted, but it was decided in the reign of Edward III. that the verdict must be the unanimous opinion of the whole jury. Diversity of opinion was taken to imply perversity of judgment, and the law sanctioned the application of the harshest methods to produce unanimity. The jurors were not allowed to eat or drink but by leave of the justices; and they might be carried round the circuit in carts until they agreed. These rough enforcements of an unanimous verdict have been softened by later practice, but the rule itself remains.

We may now turn to the jury in actual operation. And let us notice first the various kinds of jury known to English law.

1. *The Grand Jury.*—The origin of this has been ex-

¹ The distinction between the functions of the grand jury, which presents or accuses criminals, and the petty jury, which tries them, has suggested the theory that the system of compurgation is the origin of the jury system—the first jury representing the compurgators of the accuser, the second the compurgators of the accused.

² The number of the jury (twelve) is responsible for some unfounded theories of the origin of the system. "This use of twelve is not confined to England, nor in England or elsewhere to judicial institutions. 'Its general prevalence,' says Hallam (*Middle Ages*, chap. vii.), 'shows that in searching for the origin of trial by jury we cannot rely for a moment upon any analogy which the mere number affords.'" In a *Guide to English Juris*, by a *Person of Quality*, 1682 (attributed to Lord Somers), the following passage occurs: "In analogy of late the jury is reduced to the number of twelve, like as the prophets were twelve to foretell the truth; the apostles twelve to preach the truth; the discoverers twelve, sent into Canaan to seek and report the truth; and the stones twelve that the heavenly Hierusalem is built on." Lord Coke indulged in similar speculations.

plained above. This is the jury which presents indictments for trial by the petty or ordinary jury. The sheriff is directed to summon twenty-four or more persons, out of whom the jury may be chosen; but not more than twenty-three are to be chosen, so that twelve may be a majority.¹ The verdict of less than twelve, although a majority of the whole body, cannot be accepted, but the verdict of twelve is sufficient although the others may dissent. The grand jury, after a general charge from the judge, consider the bills of indictment in private, hearing such of the witnesses as they think fit. If they consider that a *prima facie* case is made out against the accused, they return the indictment into court as a true bill, which then becomes the foundation of the process before the petty jury. If they think otherwise they *ignore* the bill, or send it back into court torn up. They have thus a kind of veto on the cases submitted for trial. As these for the most part have been previously investigated by magistrates who have committed the accused for trial, the utility of the grand jury depends very much on the character of the justices' courts. As a review of the discretion of stipendiary magistrates in committing cases for trial, the judgment of the grand jury is admittedly superfluous; and even when the committing justice is an unlearned magistrate, it seems very doubtful if much is gained by subjecting his open decisions to the control of a secret tribunal. It used to be urged by the defenders of the system that it secures the attendance of the landed gentry and the county justices at the assizes—a kind of argument which is no longer so cogent as it once was. Mr Forsyth thinks that the grand jury will often baffle "the attempts of malevolence" by ignoring a malicious and unfounded prosecution, but they may also defeat the ends of justice, and they have done so ere now, by shielding a criminal with whom they have strong political or social sympathies. The qualification of the grand jurymen is that they should be freeholders of the county,—to what amount appears to be uncertain.

2. The *Crown's Jury* is undeterminate in number, but the finding must be that of twelve at least of the jurymen. Persons found guilty on this inquest may be put on trial before a petty jury at assizes.

3. *Special and Common Juries*.—This distinction belongs properly to civil trials. The practice of selecting special jurors to try important cases appears to have sprung up, without legislative enactment, in the procedure of the courts. Forsyth says that the first statutory recognition of it is so late as 3 Geo. II. c. 25, and that in the oldest book of practice in existence (Powell's *Attorney's Academy*, 1623) there is no allusion to two classes of jurymen. The Acts, however, which regulate the practice allude to it as well established. The statute now in force (33 & 34 Vict. c. 7) defines the class of persons entitled and liable to serve on special juries thus:—every man whose name shall be on the juror's book for any county, &c., and who shall be legally entitled to be called an esquire, or shall be a person of higher degree, or a banker or merchant, or who shall occupy a house of a certain rateable value (*e.g.*, £100 in a town of 20,000 inhabitants, £50 elsewhere), or a farm of £300, or other premises at £100. A special jurymen receives a fee of a guinea for each cause. Either party may obtain a special jury, but must pay the additional expenses created thereby unless the judge certifies that it was a proper case to be so tried. For the common jury any man is qualified and liable to serve who has £10 by the year in land or tenements of freehold, copyhold, or customary tenure; or £20 on lands or tenement held by lease for twenty-one years or longer, or who being a house-

holder is rated at £30 in Middlesex or £20 in any other county. See 6 Geo. IV. c. 50; and 33 & 34 Vict. c. 77 (the Juries Act). A schedule to the last-cited Act contains a list of the numerous classes of persons exempted from service, which include members of the legislature and judges, ministers of various denominations, and practising lawyers of all grades. These are juries invariably employed in the superior courts. In the county court the jury consists of five.

Formerly aliens were entitled to be tried by a jury *de mediata lingua*—half being Englishmen and half foreigners, not necessarily of the same country as the accused. This privilege has been abolished by the Naturalization Act.

A jury of *matrons* is resorted to, in a writ *de ventre inspiciendo*, or when a female prisoner, condemned to death, pleads pregnancy in stay of execution.

From the beginning parties have been allowed to *challenge* the jury. In civil and criminal cases a challenge *for cause* is allowed; in criminal cases only, a peremptory challenge is also allowed. In the former case the challenge may be either to the *array*, *i.e.*, to the whole number of jurors returned, or to the *polls*, *i.e.*, to the jurors individually. A challenge to the array is either a *principal* challenge (on the ground that the sheriff is a party to the cause, or related to one of the parties), or a challenge *for favour* (on the ground of circumstances implying "at least a probability of bias or favour in the sheriff"). A challenge to the polls is an exception to one or more jurymen on either of the following grounds:—(1) *propter honoris respectum*, as when a lord of parliament is summoned; (2) *propter defectum*, for want of qualification; (3) *propter affectum*, on suspicion of bias or partiality; and (4) *propter delictum*, when the juror has been convicted of an infamous offence. The challenge *propter affectum* is, like the challenge to the array, either principal challenge or "to the favour." Prisoners in criminal trials were by common law entitled to a peremptory challenge without cause shown to the number of thirty-five jurors; and so the law remains, after some fluctuation, in the case of treason. In other cases it is limited to twenty. The crown is no longer entitled to a peremptory challenge as at common law; but the cause of challenge need not be assigned by the crown until the whole list has been gone through, or unless there remain no longer twelve jurors left to try the case, exclusive of those challenged—an arrangement which practically amounts to giving the crown the benefit of a peremptory challenge.

One other special point remains to be mentioned. The province of the jury is to judge of facts; they have nothing to do with the law—which they must take from the presiding judge at the trial. The old *decanatum* assigns to each his own independent function:—"Ad questionem legis iudices respondent, ad questionem facti juratores." But, while the jury are supposed in legal theory to be absolute masters of the questions of fact, in practice they are largely controlled by the judges. Not only does the judge at the trial decide as to the admissibility of questions, but he advises the jury as to the logical bearing of the answers on the issue. Further, after a jury has given its verdict, it may be challenged in the courts on the ground that it is against the evidence, or on the ground that there was no evidence to go before the jury. A verdict is said to be against the evidence when the jury have completely misapprehended the facts proved,—when the logical conclusion to be drawn from the facts is the opposite of that which the jury have drawn. The court will not disturb the verdict of a jury on this ground when the judge who presided at the trial is not dissatisfied with the verdict. And it has been ruled emphatically that, when there is conflicting testimony as to the point at issue, it is exclusively

¹ Blackstone puts the principle as being that no man shall be convicted except by the unanimous voice of twenty-four of his equals or neighbours—twelve on the grand, and twelve on the petty jury.

for the jury to say which side is to be believed, and the court will not interfere with the verdict. To upset a verdict on the ground that "there was no evidence to go to the jury" implies that the judge at the trial ought to have withdrawn the case. The meaning of the phrase "evidence to go before the jury" is nowhere definitely ascertained, and a consideration of decided cases makes the difficulty more apparent. The question arises most frequently perhaps in cases involving an imputation of negligence—e.g., in an action of damages against a railway company for injuries sustained in a collision. Juries are apt to infer negligence very easily, and the court has to say whether, on the facts proved, there was any evidence of the defendant's being guilty of negligence. This is by no means the same thing as saying whether, in the opinion of the court, they were so guilty. The court may be of opinion that on the facts they were not guilty, yet the facts themselves may be of such a nature as to be evidence of guilt to go before a jury. When the facts proved are such that a reasonable man might have come to the conclusion that there was negligence, then, although the court may wholly reject the conclusion in its own mind, it must admit that there is evidence to go before the jury. That perhaps is as near as we have yet got to an understanding of a phrase in daily use in the superior courts; but it scarcely determines what relation between the facts proved and the conclusion to be established is necessary to make the facts evidence from which a jury may infer the conclusion. The true explanation is to be found in the principle of relevancy. Any fact which is relevant to the issue constitutes evidence to go before the jury, and any fact, roughly speaking, is relevant between which and the fact to be proved there may be a connexion as cause and effect. See EVIDENCE. When the question is what damages the plaintiff has sustained, the court openly undertakes to review their decision on its merits—although this is as much a question of fact as any other. If the court deems the damages excessive, it will order a new trial to take place,—generally adding the condition that the verdict may stand if the plaintiff will accept a reduced sum for damages, which in effect amounts to the court itself finding a verdict.

The function of the jury in libel cases was in the last century the subject of a celebrated controversy which ended in the passing of Fox's Libel Act in 1792. Lord Mansfield and the judges held that the criminality or innocence of an act done, including any paper written, is matter of law and not matter of fact, an undeniable proposition then and since. They had also been in the habit of directing the jury to consider only the question of publication, telling them that its guilt or innocence was not for them to decide. Fox's Act declares and enacts that the jury may give a general verdict of guilty or not guilty in libel cases, and shall not be required or directed by the court or judge to find a verdict of guilty on proof of publication and of the sense ascribed to it by the prosecution.

Of the merits of the institution little space is left to speak. The present English jury has at least one conspicuous defect in the requirement of unanimity; yet, so far as that is concerned, in practice it produces hardly any appreciable evil. All that Bentham and others have urged against it—the application of a kind of torture to force conviction on the minds of jurors, the indifference to veracity which the concurrence of unconvinced minds must produce in the public mind, the probability that jurors will disagree and trials be rendered abortive, and the absence of any reasonable security in the unanimous verdict that would not exist in the verdict of a majority—all this is undeniably true. Yet we rarely hear of juries disagreeing or of jurors agreeing under compulsion. When civil juries were established in Scotland, this was one

of the arguments used against the experiment, but it has been stated by the judge, Mr Commissioner Adam, under whom the system was started, that he only knew of one instance of disagreement during a period of twenty years. English experience is much the same, and a reform which twenty or thirty years ago was pronounced absolutely necessary by conservative jurists is now hardly ever heard of. Practically juries have no difficulty in coming to a unanimous verdict; and, if a guess may be hazarded on so wide a subject, they have probably less difficulty now than ever. One cause of that result may be the deference which juries invariably pay to the carefully suggested opinion of the judge—arising no doubt from such perfect confidence in the bench as did not always exist, and would not always have been deserved if it had existed.

But, apart from any incidental defects, it may be doubted whether, as an instrument for the investigation of truth, the jury deserves all the encomiums which have been passed upon it. In criminal cases, especially of the graver kind, it is perhaps the best tribunal that could be devised. There the element of moral doubt enters largely into the consideration of the case, and that can best be measured by a popular tribunal. Opinion in England is unanimously against subjecting a man to serious punishment as a result of conviction before a judge sitting without a jury, and the judges themselves would be the first to deprecate so great a responsibility. But in civil causes, where the issue must be determined one way or the other on the balance of probabilities, a single judge would probably be a better tribunal than the present combination of judge and jury. Even if it be assumed that he would on the whole come to the same conclusion as a jury deliberating under his directions, he would come to it more quickly. Time would be saved in taking evidence, summing up would be unnecessary, and the addresses of counsel would inevitably be shortened and concentrated on the real points at issue.

The Jury in Scotland.—According to the *Regium Majestatem*, which is identical with the treatise of Glanvill on the law of England (but whether the original or only a copy of that work is a question which need not delay us), trial by jury existed in Scotland for civil and criminal cases from as early a date as in England, and there is reason to believe that at all events the system became established at a very early date. Its history was very different from that of the English jury system. In Scotland trial by jury survived for criminal trials, but became extinct in civil cases. In the criminal assize the jury has always consisted of fifteen persons chosen from the jury lists, general and special, drawn up by the sheriff,—one-third of the jury being chosen from the special, and two-thirds from the general list. The verdict is to be that of the majority of the jury, and formerly it had to be expressed in writing, but may now be delivered *ad viva voce* by the chancellor or foreman. Besides the "guilty" or "not guilty," to which the English jury is restricted, a Scottish jury may bring in a verdict of "not proven," which has legally the same effect as "not guilty" in releasing the accused from further charge, while it practically inflicts upon him the stigma of moral guilt for the rest of his life.

The civil jury was reintroduced in Scotland by the Act 55 Geo. III. c. 42, mainly on account of the difficulty which Scotch appeals turning on questions of fact presented to the House of Lords. Originally the juries were appointed to try issues sent from the Court of Session under the direction of three lords commissioners, but afterwards the procedure by jury was united with the ordinary business of the court, and the special tribunal of commissioners was abolished. The jury was copied strictly from the English practice—the jurors are twelve in number, and their verdict must be unanimous. If they fail to agree within twelve (now six) hours, they must be discharged. This experiment was not at first popular, and it is doubtful if it has even now become assimilated to Scotch practice.

United States.—Trial by jury according to the English system has been incorporated into the constitution of the United States. There was at one time some controversy as to whether the civil jury was included or not. The three articles (III., V., and VI.) in which allusion to trial by jury is made refer to criminal proceedings only, and, moreover, the supreme court is declared to have appellate jurisdiction both as to law and fact. It has accordingly been provided by one of the amendments to the constitution that, in suits at common law where the value in controversy shall exceed twenty dollars, the right of trial by jury shall be preserved;

and no fact tried by a jury shall be otherwise re-examined in any court of the United States than according to the rules of the common law. "Throughout the Union in all trials, whether civil or criminal, unanimity in the jury is essential" (Forsyth, 344).

In France there is no grand jury, and no civil jury. The jury in a criminal case find their verdict by a majority. (E. R.)

JUSSIEU, DE, the name of a distinguished French family, which came into prominent notice towards the close of the 16th century, and for a century and a half was illustrious for the botanists it produced. The following are its more eminent members.

I. ANTOINE DE JUSSIEU (1686-1758), born at Lyons in 1686, was the earliest in point of time of the line of distinguished botanists of his name. He was the son of Christophe de Jussieu (or Dejussieu), an apothecary of some repute, who published a *Nouveau traité de la thériaque*, Trévoux, 1708. Antoine studied at the university of Montpellier, and travelled with his brother Bernard through Spain, Portugal, and southern France. He came to Paris in 1708, Tournefort, whom he succeeded, dying in that year. His own original publications are not of marked importance, but he edited an edition of Tournefort's *Institutiones rei herbariae*, Paris, 1719, 3 vols. He performed a similar office for a posthumous work of Barrelier, *Plantae per Galliam, Hispaniam, et Italiam observatae*, &c., Paris, 1714. He practised medicine, chiefly devoting himself to the very poor. He died at Paris, 22d April 1758.

II. BERNARD DE JUSSIEU (1699-1777), a younger brother of the above, was also born at Lyons, in 1699. He was educated for the medical profession, took his doctor's degree at Montpellier, and commenced practice in 1720, but his sensitive temperament hindered his prosecution of it, and on his brother's invitation he gladly joined him in Paris in 1722. He succeeded Vaillant as sub-demonstrator of plants in the Jardin du Roi, and his principal duties consisted in superintending the herborizations of the students. His knowledge of plants and even of non-botanical subjects was so great that he readily detected and named the component parts of made-up plants which were sometimes submitted to him. It is reported that at one of these excursions, whilst Linnaeus was his guest, the students having brought some such counterfeit to be named by the young Swede, his reply was "Aut Deus, aut D. de Jussieu." In 1725 he brought out a new edition of Tournefort's *Histoire des plantes qui naissent aux environs de Paris*, in 2 vols., which was afterwards translated into English by John Martyn,—the original work being incomplete. In the same year he was admitted into the Académie des Sciences, and communicated several papers to that body. Long before Tremblay published his *Histoire des polypes d'eau douce*, he maintained the doctrine that these organisms were animals, and not the flowers of marine plants, then the current notion; and to confirm his views he made three journeys to the coast of Normandy. Singularly modest and retiring, he published very little, but in 1759 he arranged the plants in the royal garden of the Trianon at Versailles, according to his own scheme of classification. This arrangement is printed in his nephew's *Genera*, pp. lxiii-lxx., and formed the basis of that work. He cared little for the credit of enunciating new discoveries, so long as the facts themselves were made public. On the death of his brother Antoine, he could not be induced to succeed him in his office, but prevailed upon Lemoultier to assume the higher position. He died at Paris, 6th November 1777.

III. JOSEPH DE JUSSIEU (1704-1779), brother of Antoine and Bernard, was born at Lyons 3d September 1704. Educated like the rest of the family for the medical profession, he accompanied La Condamine to Peru, in the expedition for measuring an arc of meridian,

and remained in South America for thirty-six years, returning to France in 1771. His health having previously failed, his works were never printed, and remain in manuscript. During his long absence, he was a member of the Académie des Sciences, although for thirty-five years he never came near the place where that body held its deliberations. Amongst the seeds he sent to Bernard were those of *Heliotropium peruvianum*, Linn., then first introduced into Europe. He died at Paris, 11th April 1779.

IV. ANTOINE LAURENT DE JUSSIEU (1748-1836), nephew of the three preceding, was born at Lyons on 12th April 1748. Called to Paris by his uncle Bernard, and carefully trained by him for the pursuits of medicine and botany, he largely profited by the opportunities afforded him. Gifted with a tenacious memory, and the power of quickly grasping the salient points of subjects under observation, he steadily worked at the improvement of that system of plant-arrangement which had been sketched out by his uncle. In 1789 was issued his *Genera plantarum secundum ordines naturales disposita, juxta methodum in horto regio Parisiensis exaratum, anno MDCCLXXXIV*, Paris, 8vo. The influence of this volume is briefly noticed in the article BOTANY, vol. iv. p. 80; it formed the foundation on which modern classification was afterwards built; more than this, it is certain that Cuvier derived much help in his zoological classification from its perusal. Hardly had the last sheet passed through the press, when the French Revolution broke out, and the author was installed in charge of the hospitals of Paris. The Muséum d'Histoire Naturelle was organized on its present footing mainly by him in 1793, and he selected for its library everything relating to natural history from the vast materials obtained from the convents then broken up. He continued as professor of botany there from 1770 to 1826, when his son Adrien succeeded him. Besides the *Genera*, he produced nearly sixty memoirs on botanical topics. He died at Paris, 17th September 1836.

V. ADRIEN (LAURENT HENRI) DE JUSSIEU (1797-1853), son of Antoine Laurent, was born at Paris 23d December 1797. Although his youth was delicate, he displayed the qualities of his family in his thesis for the degree of M.D., *De Euphorbiacearum generibus medicis ac earundem viribus tentamen*, Paris, 1824. He was also the author of valuable contributions to botanical literature on the *Rutaceae*, *Meliaceae*, and *Malpigiaceae* respectively, of "Taxonomie" in the *Dictionnaire universelle d'Histoire naturelle*, and of an introductory work styled simply *Botanique*, which reached nine editions, and has been translated into the principal languages of Europe. He also edited his father's *Introductio in historiam plantarum*, issued at Paris, without imprint or date, it being a fragment of the intended second edition of the *Genera*, which Antoine Laurent did not live to complete. He died at Paris, 29th June 1853, leaving two daughters, but no son, so that with him closed the brilliant botanical dynasty.

VI. LAURENT (PIERRE) DE JUSSIEU (1792-1866). This miscellaneous writer, nephew of Antoine Laurent, was born at Villeurbanne, 7th February 1792. *Simon de Nantua, ou le marchand forain*, Paris, 1818, reached fifteen editions, and has been translated into seven languages. He also wrote *Simple notions de physique et d'histoire naturelle*, Paris, 1857, and a few geological papers. He died in 1866.

JUSTICE, in law, has long been the official title of the judges of two of the English superior courts of common law, and it is now extended to all the judges in the Supreme Court of Judicature—a judge in the High Court of Justice being styled Mr Justice, and in the Court of Appeal Lord Justice. Before the Judicature Act the Queen's Bench and the Common Pleas were each presided over by a lord chief

justice, and the lord chief justice of the Queen's Bench was nominal head of all the three courts, and held the title of Lord Chief Justice of England. The titles of Lord Chief Justice of the Common Pleas and Lord Chief Baron have recently been abolished, and all the common law divisions of the High Court are united into the Queen's Bench division, the president of which is the lord chief justice of England.

The lord chief justice of England or of the Queen's Bench traces his descent from the justiciar of the Norman kings. This officer appears first as the lieutenant or deputy of the king, exercising all the functions of the regal office in the absence of the sovereign. "In this capacity William Fitz-Osbern, the steward of Normandy, and Odo of Bayeux, acted during the Conqueror's visit to the Continent in 1067; they were left, according to William of Poitiers, the former to govern the north of England, the latter to hold rule in Kent, *vice sua*; Florence of Worcester describes them as "custodes Angliæ," and Odo of Bayeux gives to their office the name of "prefectura." It would seem most probable that William Fitz-Osbern at least was left in his character of steward, and that the Norman seneschalship was thus the origin of the English justiciarship," Stubbs's *Constitutional History*, vol. i. p. 346. The same authority observes that William of Warenne and Richard of Bienfaite, who were left in charge of England in 1074, are named by a writer in the next generation "precipui Angliæ justitiiarii"; but he considers the name to have not yet been definitely attached to any particular office, and that there is no evidence to show that officers appointed to this trust exercised any functions at all when the king was at home, or in his absence exercised supreme judicial authority to the exclusion of other high officers of the court. The office became permanent in the reign of William Rufus, and in the hands of Ranulf Flambard it became coextensive with the supreme powers of government. For some time, however, the title of justiciar seems not to have been definitely appropriated to this high minister. Judges of the curia regis were occasionally so named, and it was not till the reign of Henry II. that the chief officer of the crown acquired the exclusive right to the title of *capitalis* or *totius Angliæ justitiiarius*. Canon Stubbs considers that the English form of the office is to be accounted for by the king's desire to prevent the administration falling into the hands of an hereditary noble. The early justiciars were clerics, in whom the possession of power could not become hereditary. The justiciar continued to be the chief officer of state, next to the king, until the fall of Hubert de Burgh (in the reign of King John), described by Mr Stubbs as the last of the great justiciars. Henceforward, according to Mr Stubbs, the office may be regarded as virtually extinct, or it may be said to have survived only in the judicial functions, which were merely part of the official character of the chief justiciar. He was at the head of the curia regis, which was separating itself into the three historical courts of common law about the time when the justiciarship was falling from the supreme place. The chancellor took the place of the justiciar in council, the treasurer in the exchequer, while the two *offshoots* from the curia regis, the Common Pleas and the Exchequer, received chiefs of their own. The Queen's Bench represented the original stock of the curia regis, and its chief justice the great justiciar. The justiciar may, therefore, be said to have become from a political a purely judicial officer. A similar development awaited his successful rival the chancellor.

The lord chief justice is, next to the lord chancellor, the highest judicial dignitary in the kingdom. The office is generally the prize of the chief law officer of the Government, and political considerations, therefore, enter largely into the appointment. But the chief justices have been

generally worthy of their great position. The list of them contains the names of some of the greatest masters of the common law, among whom pre-eminent rank must be assigned to Hale, Coke, Holt, Mansfield, and Cockburn. Lord Campbell has written the *Lives of the Chief Justices*, in 3 vols. A list of the lords chief justices will be found in Haydn's *Book of Dignities*, 1851. Robert de Brus, said by Fox to be the first judge who took the distinctive title of lord chief justice of the King's Bench (1268), was the grandfather of Robert the Bruce, king of Scotland.

In the United States the supreme court consists of a chief justice and eight associate justices, any five of whom make a quorum. The salary of the chief justice is \$10,500, and that of the associates \$10,000.

JUSTICE OF THE PEACE is an inferior magistrate appointed in England by special commission under the great seal to keep the peace within the county for which he is appointed. "The whole Christian world," said Lord Coke, "hath not the like office as justice of the peace if duly executed." Lord Cowper, on the other hand, describes them as "men sometimes illiterate and frequently bigoted and prejudiced." The truth is that the justices of the peace perform without any other reward than the consequence they acquire from their office a large amount of work indispensable to the administration of the law, and for the most part they discharge their duties with becoming good sense and impartiality. But being chosen from the limited class of country gentlemen in counties, they are sometimes exposed to the suspicion of the general public, particularly when they have to administer laws which are considered to confer special privileges on their own class. Further, as they do not generally possess a professional knowledge of the law, their decisions are occasionally inconsiderate and ill-informed. In great centres of population, when the judicial business of justices is heavy, it has been found necessary to appoint paid justices or stipendiary magistrates to do the work, and an extension of the system to the country districts has been often advocated.

The commission of the peace is addressed to all the justices of the county, and assigns to them the duty of keeping and causing to be kept all ordinances and statutes for the good of the peace and for preservation of the same, and for the quiet rule and government of the people, and further assigns "to you and every two or more of you (of whom any one of the aforesaid A, B, C, D, &c., we will, shall be one) to inquire the truth more fully by the oath of good and lawful men of the county of all and all manner of felonies, poisonings, enchantments, sorceries, arts, magic, trespasses, forestallings, regratings, engrossings, and extortions whatever." This part of the commission is the authority for the jurisdiction of the justices in *sessions*. Justices named specially in the parenthetical clause are said to be on the *quorum*. Justices cannot act beyond the limits of the county for which they are appointed, and the warrant of a justice cannot be executed out of his county unless it be backed, that is, endorsed by a justice of the county in which it is to be carried into execution. A justice improperly refusing to act on his office, or acting partially and corruptly, may be proceeded against by a criminal information, and a justice refusing to act may be compelled to do so by the High Court of Justice. An action will lie against a justice for any act done by him in excess of his jurisdiction, and for any act within his jurisdiction which has been done wrongfully and with malice, and without reasonable or probable cause. But no action can be brought against a justice for a wrongful conviction until it has been quashed. By 18 Geo. II. c. 20 every justice for a county must have an estate of freehold, copyhold, or customary tenure in fee, for life or a given term, of the

yearly value of £100. The vast and multifarious duties of the justices cover some portion of every important head of the criminal law, and extend to a considerable number of matters relating to the civil law. A complete guide thereto is Burr's *Justice of the Peace*, in 5 large volumes, the thirtieth edition of which was published in 1869.

In the United States these officers are sometimes appointed by the executive, sometimes elected. "In some, perhaps all, of the United States, justices of the peace have jurisdiction in civil cases given to them by local regulations" (Bouvier's *Law Dictionary*).

JUSTICIARY, *HIGH COURT OF*, in Scotland, is the supreme criminal court, and consists of five of the lords of session together with the lord justice-general and the lord justice-clerk as president and vice-president respectively. The constitution of the court is settled by the Act 1673 c. 16. The lords of justiciary hold circuits regularly twice a year according to the ancient practice, which, however, had been allowed to fall into disuse until revived in 1748. The circuits are—the south, at the towns of Jedburgh, Dumfries, and Ayr; west (three times a year), at Glasgow, Inverary, and Stirling; and north, Perth, Aberdeen, Dundee, and Inverness. By a recent order in council the number of circuit courts in future is to be doubled. Two judges generally go on circuit, and in Glasgow they are by special statute authorized to sit in separate courts. The High Court, sitting in Edinburgh, has, in addition to its general jurisdiction, an exclusive jurisdiction for districts not within the jurisdiction of the circuits—the three Lothians, and Orkney and Shetland. The High Court also takes up points of difficulty arising before the special courts, like the court for crown cases reserved in England. The court of justiciary has authority to try all crimes, unless when its jurisdiction has been excluded by special enactment of the legislature. It is also stated to have an inherent jurisdiction to punish all criminal acts, even if they have never before been treated as crimes. Its judgments are believed to be not subject to any appeal or review, but it may be doubted whether an appeal on a point of law would not lie to the House of Lords. The following crimes must be prosecuted in the court of justiciary—treason, murder, robbery, rape, fire-raising, deforcement of messengers, breach of duty by magistrates, and all offences for which a statutory punishment higher than imprisonment is imposed.

JUSTIN, Martyr and Apologist as he is usually called, was an able and eloquent advocate of Christianity in the 2d century. Almost all we know about him is told us in his own writings. He was born in Palestine, at Flavia Neapolis (*Apol.*, i. 1), the ancient Shechem, now Nablus. The names of his father Priscus and grandfather Bacchius suggest that he was of Latin descent, and some passages in his writings seem to say that his parents were heathens. He relates his own conversion in two passages. In the one he says that he was drawn to Christianity because he saw the Christians dauntless in death (*Apol.*, ii. 12); in the other he tells how chance intercourse with an aged stranger brought him to know the truth (*Dial. c. Tryph.*, c. 2), but this passage may be allegorical. In the introduction to the dialogue with Trypho, Justin describes various systems of pagan philosophy and his relation to them. At first he associated with the Stoics; from them he went to a Peripatetic, then to a Pythagorean; and at length he embraced the doctrines of Platonism. His Platonism clung to him through life, and curiously coloured many of his Christian speculations. We know little about Justin's life after his conversion. It is very probable that he retained his philosopher's cloak, the distinctive badge of the wandering and professional teacher of philosophy, and went about from place to place discussing the truths of Christianity in the hope of bringing educated

pagans, as he himself had been brought, through philosophy to Christ. At Ephesus he held the famous disputation with Trypho the Jew, and in Rome he argued with Crescens the Cynic. If the *Cohortatio* be genuine, he also visited Alexandria and Cumæ. His martyrdom is well authenticated. In his second *Apology* Justin declares that he expected martyrdom, and that he believed that his opponent Crescens, silenced in public by his arguments, would do his best to get him thrown into prison and condemned to death; and this declaration is probably the reason why Eusebius, who often manufactures facts out of suppositions, asserts that Justin was slain through the plots of Crescens. An old martyrdom, of unknown authorship, records the trial and death of a Justin, who is probably Justin Martyr, though there is no corroborative historical evidence. If the account can be accepted, Justin was brought before Rusticus, a Roman magistrate who was a Stoic; during his trial he was brave, quiet, and dignified; he professed his faith in the God of heaven and earth, and in His Son "the Master of Truth," and confidently expressed the conviction that after death he would share a blessed immortality. He was condemned and put to death on the same day. We cannot fix with any certainty the dates of Justin's birth and death. He was probably born near the beginning of the 2d century, and was martyred somewhere between 148 and 165.

Justin was one of the earliest and ablest of the Christian Apologists, and it is as an apologist rather than as a theologian that he must be criticized, for his *Apologies* did not lead him directly to exhibit and defend the truths of Christianity. He was defending Christians not Christianity. Trajan had formally authorized the persecution of the Christians. Hadrian and Antoninus Pius had done nothing to put this decree in operation, but it hung over the Christian church, and might have been put in force at any moment. The Christians were legally proscribed. This was the state of matters which gave rise to Justin's *Apologies*. He wrote like a man full of Christianity; it was his philosophy, his religion, his rule of daily life. And he wrote boldly, having nothing to fear and nothing to conceal. The argument of his first *Apology*, addressed to the emperor Antoninus Pius, may be thus condensed. "In the name of these unjustly hated and much abused men, I, Justin, one of themselves, present to you this discourse and petition. You are everywhere called the Pious, the guardian of justice, the friend of truth; your acts shall show whether you merit these titles. My design is neither to flatter you by this letter nor to win your favour. Judge us by a scrupulous and enlightened equity, not by mere presumption, nor in the name of superstition, nor by the persuasion of calumny; . . . we fear no harm if we are not guilty of any crime. You can kill, you cannot injure us. All that we ask for is investigation; if the charges made against us are true, let us be punished. . . . Our duty is to make our deeds and doctrines fully known; yours is to investigate our cause and to act as good judges." Justin then proceeds to set forth the iniquity of the summary modes of trial in use against the Christians, and goes on to state and deal with the charges brought against his brethren. These were three: the Christians were denounced as atheists, as rebels, and as evil-doers—faithless to God, the emperor, and society. Justin answers, "We are atheists, if it be atheism not to acknowledge your gods; but we hold this glorious atheism in common with Socrates, who was martyred for it as we are; we are no atheists, for we worship the God of truth, the Father of righteousness, of wisdom, and of all virtues. We are no rebels: the kingdom founded by Jesus is purely spiritual, and need be no cause of alarm to the emperors; we worship God only, but with this exception we joyfully obey you and acknow-

ledge you as our princes and governors. So far from our being rebels, our religion helps true and good government; men may always hope to elude human law, but they cannot hope to escape God, who sees and knows all things. We are no criminals: the Crucified One whom we worship is the Divine Word, living truth, and has enjoined us to live holy and pure lives." Justin contrasts pagan morals and the Christian life, the pagan deities and Jesus of Nazareth. The empire and Christianity were at war because of the persecuting edicts of the emperors, and Justin has no doubt that Christianity must in the end win the day. The *Apology* ends with solemn dignity: "If this doctrine appears true and reasonable give heed to it; if not, treat it as of no value. But do not condemn men to death who have done you no wrong; for we declare to you that you will not escape the judgment of God if you persist in injustice. For ourselves, we have but one cry—"The will of God be done." In the dialogue with Trypho, Justin endeavoured to show the truth of Christianity from the Old Testament Scriptures, and he described the New Testament as the new law which superseded, while it fulfilled, the old. It is not possible to construct a scheme of Christian dogmatic from the writings of Justin, but some ideas may be gathered from his *Apologies*. Christ is the centre of religion, and the exposition of Christian doctrine is to be grouped around a description of Christ. God is the God and Father of Jesus Christ. He is the *only* and the *one* God in opposition to the polytheism of the heathen; the *unbegotten* God, not born and reared like Dionysus the son of Semele or Apollo son of Leto; the *unspeakable* God, because every thinking man knows that God's existence cannot be thought of or described. God is spiritual; He has indescribable glory and shape; He is omniscient and almighty; He is creator; He has made the world for man, and cares for His creatures; He is full of mercy and goodness. With Justin the great fact in Christianity is that Jesus Christ is the Son of God; he does not spend much time in thinking out what this means, but he is one of the earliest writers who unconsciously tries to explain the incarnation by the Platonic thought of the Logos. Justin, however, thinks of this Logos as a personal being. The begetting of the Logos is an act of the Father's; but we cannot say when the Logos was begotten, because He was before all creation, and so before all time. The Logos is the instrument through whom God created and preserves the universe; He is the instrument in the miraculous history of the Jews; He inspired the heathen sages; He is God; He became incarnate. Justin does not seem to distinguish between the divine and human natures of Christ, but he believes Christ to be man and to be God. And so on with other doctrines. In Justin we see the earnest living Christianity of the 2d century firmly centred on Jesus Christ, very God and very man, trying to live again His life, taught by His Spirit. The faith rested in the great central facts of Christianity, but the power of defining doctrine had not become vigorous.

No ancient writer gives a complete list of Justin's writings; the fullest is that of Eusebius (*Eck. Hist.*, iv. 18). The following, now extant, have been ascribed to him:—The two *Apologies*; *Dialogue with the Jew Trypho*; *A Speech to the Greeks*; *An Address to the Greeks*; *On the Sole Government of God*; *An Epistle to Diognetus*; *Fragments on the Resurrection*; and other fragments. The following, now extant, and attributed to Justin, are deemed spurious:—*The Exposition of the True Faith*; *Epistle to Zenas and Serenus*; *A Refutation of Certain Doctrines of Aristotle*; *Questions and Answers to the Orthodox*; *Questions of Christians to Heathens*; *Questions of Heathens to Christians*.

The *First Apology* is undoubtedly genuine. It refers to the Jewish rebellion, 131–136, and was probably written 138–140 A.D. The *Second Apology* which has come down to us is probably not the second apology mentioned by Eusebius, which has been lost, but a portion of the first. The authenticity of the *Dialogue with Trypho* has been disputed by Lange, Koch, Wetstein, &c.,

but their arguments are not convincing; more interest attaches to the question whether it is historical or written in imitation of the dialogues of Plato; the greater weight of evidence lies on the side that it is historical. The *Speech to the Greeks* is probably Justin's; but the weight of evidence is against the authenticity of the remaining writings.

Editions.—Robert Stephanus, Paris, 1551; Sylburg, Heidelberg, 1593; Morell, Paris, 1615; Maran, Paris, 1742. The best edition is Otto's, 3d ed., Jena, 1878 and following years.

Good translations of Justin have appeared in the Oxford Library of the Fathers, and in Clarke's *Ante-Nicene Library*.

Full information about Justin's history and views may be had from Otto, *De Justinii Maxima Scriptis et Doctrina*, Jena, 1841; and from Donaldson's *History of Christian Literature and Doctrine*, London, 1866, vol. ii. For information about MSS., see Donaldson, p. 144, and Otto's preface. Otto refers, ii. p. xxvi., to a *Collectio Glasviensis*, but this is a mistake; the MS. referred to contains the orations of an Italian humanist Justinian. (T. M. L.)

JUSTIN, Latin historian, called in one MS. Justinus Frontinus, in another M. Junianus Justinus, in others simply Justinus, is known from his *Historiarum Philippicarum Libri XLIV.*, a work described by himself in his preface as a collection of the most important and interesting passages from the voluminous *Historia Philippica et totius Mundi Origines et Terrarum Situs*, written in the time of Augustus by Trogus Pompeius. Of Justin's personal history absolutely nothing is known. The passage in his preface on which was based the belief that he lived under Antoninus Pius is spurious; but a reference to him by St Jerome fixes his date at some point before the 5th century. The work of Trogus is lost, probably helped into oblivion by the shorter compilation; but the *prologi*, or arguments, of the forty-four books are extant, and a few fragments of the text are preserved by Pliny and other writers. From the *prologi* we gather that, although the main theme of Trogus was the rise and history of the Macedonian monarchy, he yet permitted himself a freedom of digression that extended very considerably the field of description, and makes it all the more to be regretted that Justinus chose to write a capricious anthology (*breve veluti florum corpusculum*) instead of a regular epitome of the work. As it stands, however, Justin's history contains a large amount of valuable information, which but for it we might never have possessed. The style, though far from perfect, has the merit of clearness, occasionally even of elegance.

The edition of Justinus appeared at Venice, 1470, folio, from Jenson's press. An edition, folio, Rome, is referred to 1470 or 1471. The other chief editions are those of Sabellius, Venice, folio, 1490, 1497, and 1507; Aldus, Venice, 8vo, 1522; Bongarsus, Paris, 8vo, 1531; Grævius, Leyden, 8vo, 1638; Isaac, Oxford, 8vo, 1705; Gronovius, Leyden, 1719 and 1760 (2d ed. in "Variorum" Classics); Fretschler, Leipzig, 8vo, 3 vols., 1827–30; Dübner, Leipzig, 8vo, 1831; and Dübner and Johannean, Paris, 2 vols., 1838. Translations appeared very early in the chief European languages. There are English versions by Golding, 1554, Holland, 1606; Codrington, 1654; Brown, 1712, Bailey, 1782; Clarke, 1782; Turnbull, 1746; and Watson, 1853.

JUSTIN I., the elder, Roman emperor of the East from 518 to 527, was originally a Dacian peasant; but, enlisting under Leo I. he rose by his size and strength to be commander of the imperial guards of Anastasius. On the death of that emperor in 518, the wily Dacian, aged sixty-eight, used for his own election to the throne a sum of money that he had received for the support of another candidate. Though ignorant even of the rudiments of letters, Justin was sufficiently acute, and he was sensible enough to entrust the administration of state to his wise and faithful questor Proclus, though his own experience dictated several improvements in military affairs. An orthodox churchman himself, he effected in 519 a reconciliation of the Eastern and Western Churches, after a schism of thirty-five years (see HORMISDAS). The assassination of the orthodox general Vitellian, and the virulence of the bloody conflicts of the "blue" and "green" factions that convulsed the capital towards the end of Justin's reign,

are attributed to the jealousy and intrigues of the emperor's nephew and successor Justinian. In 522 a war broke out with Persia, in which Belsharius made his first historical appearance; it continued for some years without any definite results. In 522 also Justin ceded to Theodoric, the Gothic king of Italy, the right of naming the consuls, and in 525 he received from that Arrian monarch a deputation, of which the pope, John I., was compelled to be the leader, to deprecate an edict issued by Justin in 523 against all heretics. On April 1, 527, Justin, at the request of the senate, assumed Justinian as his colleague, and on the 1st of the following August he died. Justin bestowed much care on the repairing of public buildings throughout his empire, and contributed large sums to repair the damage caused by a destructive earthquake at Antioch.

JUSTIN II, the younger, Roman emperor of the East from 565 to 578, was the nephew and successor of Justinian I. He availed himself of his influence as master of the palace, and as husband of Sophia, the niece of the late empress Theodora, to secure a peaceful election. The first few days of his reign—when he paid his uncle's debts, administered justice in person, and proclaimed universal religious toleration—gave bright promise, realization of which was prevented either by his feebleness or his caprice. The most important event of his reign was the invasion of Italy by the Lombards, who, entering in 568 under Alboin, in a few years made themselves masters of nearly the entire country. The common story that they were invited by the superseded and insulted exarch Narses, besides being inherently improbable, has but slender historical foundation. Modern historians see in the event only an evidence of the indifference of the Byzantine court to Italy, whence little revenue could be drawn. Justin's arrogance had insulted the embassies from the Persians and Avars, who had come to him in the first year of his reign; and in 572 war broke out with the former, and in 573 with the latter. Although he formed alliances with the Turks of Central Asia and with the Ethiopians of Arabia in the one case, and with the Austrasian Franks in the other, the emperor's arms were unsuccessful in both wars. The temporary fits of insanity into which he fell warned him to name a colleague. Passing over his own relatives, he raised, on the advice of Sophia, the brave general Tiberius to be Cæsar in December 574, and withdrew for his remaining years into retirement. Tiberius was advanced to the dignity of Augustus on September 26, 578, and Justin died on the 5th of the following month.

JUSTINIAN I. (483-565). Flavius Anicius Justinianus, surnamed the Great, the most famous of all the emperors of the Eastern Roman empire, was by birth a barbarian, native of a place called Tauresium in the district of Dardania, a region of Illyricum,¹ and was born, most probably, on May 11, 483. His family has been variously conjectured, on the strength of the proper names which its members are stated to have borne, to have been Teutonic or Slavonic. The latter seems the more probable view. His own name was originally Uprauda. Justinianus was a Roman name which he took from his uncle Justin who adopted him, and to whom his advancement in life was due.² Of his early life we know nothing except that he came to Constantinople while still a young man, and received there an excellent education. Doubtless he knew Latin before Greek; it is alleged that he always spoke Greek with a barbarian accent. When Justin

ascended the throne in 518 A.D., Justinian became at once a person of the first consequence, guiding, especially in church matters, the policy of his aged, childless, and ignorant uncle, receiving high rank and office at his hands, and soon coming to be regarded as his destined successor. On Justin's death in 527, having been a few months earlier associated with him as co-emperor, he succeeded without opposition to the throne.

His reign was filled with great events, both at home and abroad, both in peace and in war. They may be classed under four heads:—(1) his legal reforms; (2) his administration of the empire; (3) his ecclesiastical policy; and (4) his wars and foreign policy generally.

1. It is as a legislator and codifier of the law that Justinian's name is most familiar to the modern world; and it is therefore this department of his action that requires to be most fully dealt with here. He found the law of the Roman empire in a state of great confusion. It consisted of two masses, which were usually distinguished as old law (*jus vetus*) and new law (*jus novum*). The first of these comprised—(1) all such of the statutes (*leges*) passed under the republic and early empire as had not become obsolete; (2) the decrees of the senate (*senatus consulta*) passed at the end of the republic and during the first two centuries of the empire; (3) the writings of the jurists of the later republic and of the empire, and more particularly of those jurists to whom the right of declaring the law with authority (*jus respondendi*) had been committed by the emperors. As these jurists had in their commentaries upon the *leges*, *senatus consulta*, and edicts of the magistrates practically incorporated all that was of importance in those documents, the books of the jurists may substantially be taken as including (1) and (2). These writings were of course very numerous, and formed a vast mass of literature. Many of them had become exceedingly scarce,—many having of course been altogether lost. Some were of doubtful authenticity. They were so costly that no person of moderate means could hope to possess any large number; even the public libraries had nothing approaching to a complete collection. Moreover, as they proceeded from a large number of independent authors, who wrote expressing their own opinions, they contained many discrepancies and contradictions, the dicta of one writer being controverted by another, while yet both writers might enjoy the same formal authority. A remedy had been attempted to be applied to this evil by a law of the emperors Theodosius II. and Valentinian III., which gave special weight to the writings of five eminent jurists (Papinian, Paulus, Ulpian, Modestinus, Gaius); but it was very far from removing it. As regards the *jus vetus*, therefore, the judges and practitioners of Justinian's time had two terrible difficulties to contend with,—first, the bulk of the law, which made it impossible for any one to be sure that he possessed any thing like the whole of the authorities bearing on the point in question, so that he was always liable to find his opponent quoting against him some authority for which he could not be prepared; and, secondly, the uncertainty of the law, there being a great many important points on which differing opinions of equal legal validity might be cited, so that the practising counsel could not advise, nor the judge decide, with any confidence that he was right, or that a superior court would uphold his view.

The new law (*jus novum*), which consisted of the ordinances of the emperors promulgated during the middle and later empire (*edicta, rescripta, mandata, decreta*, usually called by the general name of *constitutiones*), was in a condition not much better. These ordinances or constitutions were extremely numerous. No complete collection of them existed, for although two collections (*Codea Gregorianus*

¹ It is commonly identified with the modern Giustendil, but Uskub (the ancient Skupi) has also been suggested. See Tozer, *Highlands of European Turkey*, II, p. 870.

² The name "Uprauda" itself is said to be derived from the word "prauda," which in Old Slavic means "just," "justitia," the prefix being simply a breathing frequently attached to Slavonic names.

and *Codex Hermogenianus*) had been made by two jurists in the 4th century, and a large supplementary collection published by the emperor Theodosius II. in 438 (*Codex Theodosianus*), these collections did not include all the constitutions, there were others which it was necessary to obtain separately, but many whereof it must have been impossible for a private person to procure. In this branch too of the law there existed some, though a less formidable, uncertainty; for there were constitutions which practically, if not formally, repealed or superseded others without expressly mentioning them, so that a man who relied on the words of one constitution might find that it had been varied or abrogated by another he had never heard of or on whose sense he had not put such a construction. It was therefore clearly necessary with regard to both the older and the newer law to take some steps to collect into one or more bodies or masses so much of the law as was to be regarded as binding, reducing it within a reasonable compass, and purging away the contradictions or inconsistencies which it contained. The evil had been long felt, and reforms apparently often proposed, but nothing (except by the compilation of the *Codex Theodosianus*) had been done till Justinian's time. Immediately after his accession, in 528, he appointed a commission to deal with the imperial constitutions (*jus novum*), this being the easier part of the problem. The commissioners, ten in number, were directed to go through all the constitutions of which copies existed, to select such as were of practical value, to cut these down by retrenching all unnecessary matter, and gather them, arranged in order of date, into one volume, getting rid of any contradictions by omitting one or other of the conflicting passages.¹ These statute law commissioners, as one may call them, set to work forthwith, and completed their task in fourteen months, distributing the constitutions which they placed in the new collection into ten books, in general conformity with the order of the Perpetual Edict as settled by Salvius Julianus and enacted by Hadrian. By this means the bulk of the statute law was immensely reduced, its obscurities and internal discrepancies in great measure removed, its provisions adapted, by the abrogation of what was obsolete, to the circumstances of Justinian's own time. This *Codex Constitutionum* was formally promulgated and enacted as one great consolidating statute in 529, all imperial ordinances not included in it being repealed at one stroke.

The success of this first experiment encouraged the emperor to attempt the more difficult enterprise of simplifying and digesting the older law contained in the treatises of the jurists. Before entering on this, however, he wisely took the preliminary step of settling the more important of the legal questions as to which the older jurists had been divided in opinion, and which had therefore remained sources of difficulty, a difficulty aggravated by the general decline, during the last two centuries, of the level of forensic and judicial learning. This was accomplished by a series of constitutions known as the "Fifty Decisions" (*Quingenta Decisiones*), along with which there were published other ordinances amending the law in a variety of points, in which old and now inconvenient rules had been suffered to subsist. Then in December 530 a new commission was appointed, consisting of sixteen eminent lawyers, of whom the president, the famous Tribonian (who had already served on the previous commission), was an exalted official (*questor*), four were professors of law, and the remaining eleven practising advocates. The instructions given to them by the emperor were as follows:—they were to procure and peruse all the writings of all the authorized jurists

(those who had enjoyed the *jus respondendi*); were to extract from these writings whatever was of most permanent and substantial value, with power to change the expressions of the author wherever conciseness or clearness would be thereby promoted, or wherever such a change was needed in order to adapt his language to the condition of the law as it stood in Justinian's time; were to avoid repetitions and contradictions by giving only one statement of the law upon each point; were to insert nothing at variance with any provision contained in the *Codex Constitutionum*; and were to distribute the results of their labours into fifty books, subdividing each book into titles, and following generally the order of the Perpetual Edict.²

These directions were carried out with a speed which is surprising when we remember not only that the work was interrupted by the terrible insurrection which broke out in Constantinople in January 532, and which led to the temporary retirement from office of Tribonian, but also that the mass of literature which had to be read through consisted of no less than two thousand treatises, comprising three millions of sentences. The commissioners, who had for greater despatch divided themselves into several committees, presented their selection of extracts to the emperor in 533, and he published it as an imperial statute on December 16th of that year, with two prefatory constitutions (those known as *Omneum reipublice et Dedit nobis*). It is the volume which we now call the *Digest* (*Digesta*) or *Pandects* (*Πανδέκται*), and which is by far the most precious monument of the legal genius of the Romans, and indeed, whether one regards the intrinsic merits of its substance or the prodigious influence it has exerted and still exerts, the most remarkable law-book that the world has seen. The extracts comprised in it are 9123 in number, taken from thirty-nine authors, and are of greatly varying length, mostly only a few lines long. About one-third (in quantity) come from Ulpian, a very copious writer; Paulus stands next. To each extract there is prefixed the name of the author, and of the treatise whence it is taken.³ The worst thing about the *Digest* is its highly unscientific arrangement. The order of the Perpetual Edict, which appears to have been taken as a sort of model for the general scheme of books and titles, was doubtless convenient to the Roman lawyers from their familiarity with it, but was in itself rather accidental and historical than logical. The disposition of the extracts inside each title was still less rational; it has been shown by a modern jurist to have been the result of the way in which the committees of the commissioners worked through the books they had to peruse.⁴ In enacting the *Digest* as a law book, Justinian repealed all the other law contained in the treatises of the jurists (that *jus vetus* which has been already mentioned), and directed that those treatises should never be cited in future even by way of illustration; and he of course at the same time abrogated all the older statutes, from the Twelve Tables downwards, which had formed a part of the *jus vetus*. This was a necessary incident of his scheme of reform. But he went too far, and indeed attempted what was impossible, when he forbade all commentaries upon the *Digest*. He was obliged to allow a Greek translation to be made of it, but directed this translation to be exactly literal.

These two great enterprises had substantially despatched

¹ See the constitution *Deo Auctore* (Cod. i. 17, 1).

² In the Middle Ages people used to cite passages by the initial words; and the Germans do so still, giving, however, the number of the paragraph in the extract (if there are more paragraphs than one), and appending the number of the book and title. We in Britain and America usually cite by the numbers of the books, the title, and the paragraph, without referring to the initial words.

⁴ See, for an account of the instructions given to the commission, the constitution *Ille Quae*, prefixed to the revised *Codex* in the *Corpus Juris Civilis*.

Justinian's work; however, he, or rather Tribonian, who seems to have acted both as his adviser and as his chief executive officer in all legal affairs, conceived that a third book was needed, viz., an elementary manual for beginners which should present an outline of the law in a clear and simple form. The little work of Gaius, most of which we now possess under the title of *Commentarii Institutionum*, had served this purpose for nearly four centuries; but much of it had, owing to changes in the law, become inapplicable, so that a new manual seemed to be required. Justinian accordingly directed Tribonian, with two coadjutors, Theophilus, professor of law in the university of Constantinople, and Dorotheus, professor in the great law school at Beyrout, to prepare an elementary text-book on the lines of Gaius. This they did while the *Digest* was in progress, and produced the useful little treatise which has ever since been the book with which students commonly begin their studies of Roman law, the *Institutes of Justinian*. It was published as a statute with full legal validity shortly before the *Digest*. Such merits as it possesses—simplicity of arrangement, clearness and conciseness of expression—belong rather to Gaius, who has been closely followed wherever the alterations in the law had not made him obsolete, than to Tribonian. However, the spirit of that great legal classic seems to have in a measure dwelt with and inspired the inferior men who were recasting his work; the *Institutes* is better both in Latin and in substance than we should have expected from the condition of Latin letters at that epoch, better than the other laws which emanate from Justinian.

In the four years and a half which elapsed between the publication of the *Codex* and that of the *Digest*, many important changes had been made in the law, notably by the publication of the "Fifty Decisions," which settled many questions that had exercised the legal mind and given occasion to intricate statutory provisions. It was therefore natural that the idea should present itself of revising the *Codex*, so as to introduce these changes into it, for by so doing, not only would it be simplified, but the one volume would again be made to contain the whole statute law, whereas now it was necessary to read along with it the ordinances issued since its publication. Accordingly another commission was appointed, consisting of Tribonian with four other coadjutors, full power being given them not only to incorporate the new constitutions with the *Codex* and make in it the requisite changes, but also to revise the *Codex* generally, cutting down or filling in wherever they thought it necessary to do so. This work was completed in a few months; and in November 529, the revised *Codex* (*Codex repetita praelectionis*) was promulgated with the force of law, prefaced by a constitution (*Cordi nobis*) which sets forth its history, and declares it to be alone authoritative, the former *Codex* being abrogated. It is this revised *Codex* which has come down to the modern world, all copies of the earlier edition having disappeared.

The constitutions contained in it number 4652, the earliest dating from Hadrian, the latest being of course Justinian's own. A few thus belong to the period to which the greater part of the *Digest* belongs, i. e., the so-called classical period of Roman law down to the time of Alexander Severus (244); but the great majority are later, and belong to one or other of the four great eras of imperial legislation, the eras of Diocletian, of Constantine, of Theodosius II., and of Justinian himself. Although this *Codex* is said to have the same general order as that of the *Digest*, viz., the order of the Perpetual Edict, there are considerable differences of arrangement between the two. It is divided into twelve books. Its contents, although of course of the utmost practical importance to the lawyers of that time, and of much value still, historical as well as legal, are far less interesting and scientifically admirable than the extracts preserved in the *Digest*. The difference is even greater than that between the English Reports of Cases decided since the days of Lord Holt and the English Acts of Parliament for the same two centuries.

The emperor's scheme was now complete. All the Roman law had been gathered into two volumes of not immoderate size, and a satisfactory manual for beginners added. But, as the appetite created by eating, Justinian and Tribonian had grown so fond of legislating that they found it hard to leave off. Moreover, the very simplifications that had been so far effected brought into view with more clearness such anomalies or pieces of injustice as still continued to deform the law. Thus no sooner had the work been rounded off than fresh excrescences began to be created by the publication of new laws. Between 534 and 565 Justinian issued a great number of ordinances, dealing with all sorts of subjects, and seriously altering the law on many points,—the majority appearing before the death of Tribonian, which happened in 545. These ordinances are called, by way of distinction, new constitutions, *Novellae constitutiones post Codicem* (vepal biardætes), *Novels*. Although the emperor had stated in publishing the *Codex* that all further statutes (if any) would be officially collected, this promise does not seem to have been redeemed. The three collections of the *Novels* which we possess are apparently private collections, nor do we even know how many such constitutions were promulgated. One of the three contains 168 (together with 13 Edicts), but some of these are by the emperors Justin II. and Tiberius II. Another, the so-called *Epitome of Julian*, contains 125 Novels in Latin; and the third, the *Liber Authentiarum* or *Viulgata Versio*, has 134, also in Latin. This last was the collection first known and chiefly used in the West during the Middle Ages, and of its 134 only 97 have been written on by the glossators or medieval commentators; these therefore alone have been received as binding in those countries which recognize and obey the Roman law,—according to the maxim *Quicquid non agnoscit glossæ, nec agnoscit curia*. And, whereas Justinian's constitutions contained in the *Codex* were all issued in Latin, the rest of the book being in that tongue, these *Novels* were nearly all published in Greek, Latin translations being of course made for the use of the western provinces. They are very bulky, and with the exception of a few, particularly the 116th and 118th, which introduce the most sweeping and laudable reforms into the law of intestate succession, are much more interesting as supplying materials for the history of the time, social, economical, and ecclesiastical, than in respect of any purely legal merits. They may be found printed in any edition of the *Corpus Juris Civilis*.

This *Corpus Juris*, which bears and immortalizes Justinian's name, consists of the four books described above—(1) the authorized collection of imperial ordinances (*Codex Constitutionum*); (2) the authorized collection of extracts from the great jurists (*Digesta* or *Prædicta*); (3) the elementary handbook (*Institutiones*); (4) the unauthorized collection of constitutions subsequent to the *Codex* (*Novellæ*).

From what has been already stated, the reader will perceive that Justinian did not, according to a strict use of terms, codify the Roman law. By a codification, we understand the reduction of the whole pre-existing body of law to a new form, the restating it in a series of propositions, scientifically ordered, which may or may not contain some new substance, but are at any rate new in form. If he had, so to speak, thrown into one furnace all the law contained in the treatises of the jurists and in the imperial ordinances, fused them down, the gold of the one and the silver of the other, and run them out into new moulds, this would have been codification. What he did do was something quite different. It was not codification but consolidation, not remoulding but abridging. He made extracts from the existing law, preserving the old words, and merely cutting out repetitions, removing contradictions, retrenching superfluities, so as immensely to reduce the bulk of the whole. And he made not one set of such extracts but two, one for the jurist law, the other for the statute law. He gave to posterity not one code but two digests or collections of extracts, which are now only to this extent that they are arranged in a new order, having been previously altogether unconnected with one another, and that here and there their words have been modified in order to bring one extract into harmony with some other. Except for this, the matter is old in expression as well as in substance.

Thus regarded, and even omitting to remark that the *Novels*, never having been officially collected, much less incorporated with the *Codex*, mar the symmetry of the structure, Justinian's work may appear to entitle him and Tribonian to much less credit than they have usually

received for it. But let it be observed, first, that to reduce the huge and confused mass of pre-existing law into the compass of these two collections was an immense practical benefit to the empire; secondly, that, whereas the work which he undertook was accomplished in seven years, the infinitely more difficult task of codification might probably have been left unfinished at Tribonian's death, or even at Justinian's own, and been abandoned by his successor; thirdly, that in the extracts preserved in the *Digest* we have the opinions of the greatest legal luminaries given in their own admirably lucid, philosophical, and concise language, while in the extracts of which the *Codex* is composed we find valuable historical evidence bearing on the administration and social condition of the later pagan and earlier Christian empire; fourthly, that Justinian's age, that is to say, the intellect of the men whose services he commanded, was quite unequal to so vast an undertaking as the fusing upon scientific principles into one new organic whole of the entire law of the empire. With sufficient time and labour, the work might no doubt have been done; but what we possess of Justinian's own legislation, and still more what we know of the general condition of literary and legal capacity in his time, makes it certain that it would not have been well done, and that the result would have been not more valuable to the Romans of that age, and much less valuable to the modern world, than are the results, preserved in the *Digest* and the *Codex*, of what he and Tribonian actually did.

To the merits of the work as actually performed some reference has already been made. The chief defect of the *Digest* is in point of scientific arrangement, a matter about which the Roman lawyers, perhaps one may say the ancients generally, cared very little. There are some repetitions and some inconsistencies, but not more than may fairly be allowed for in a compilation of such magnitude executed so rapidly. Tribonian has been blamed for the insertions the compilers made in the sentences of the old jurists (the so-called *Amblenatu Tribonian*); but it was a part of Justinian's plan that such insertions should be made, so as to adapt those sentences to the law as settled in the emperor's time. On Justinian's own laws, contained in the *Codex* and in his *Novels*, a somewhat less favourable judgment must be pronounced. They, and especially the latter, are diffuse and often lax in expression, needlessly prolix, and pompously rhetorical. The policy of many, particularly of those which deal with ecclesiastical matters, may also be condemned; yet some gratitude is due to the legislator who put the law of intestate succession on that plain and rational footing whereon it has ever since continued to stand. It is somewhat remarkable that, although Justinian is so much more familiar to us by his legislation than by anything else, this sphere of his imperial labour is hardly referred to by any of the contemporary historians, and then only with censure. Procopius complains that he and Tribonian were always repealing old laws and enacting new ones, and accuses them of venal motives for doing so.

The *Corpus Juris* of Justinian continued to be, with of course a few additions in the ordinances of succeeding emperors, the chief law-book of the Roman world till the time of the Macedonian dynasty, when, towards the end of the 9th century, a new system was prepared and issued by those sovereigns, which we know as the *Basilica*. It is of course written in Greek, and consists of parts of the substance of the *Codex* and the *Digest*, thrown together and often altered in expression, together with some matter from the *Novels* and imperial ordinances posterior to Justinian. In the western provinces, which had been wholly severed from the empire before the publication of the *Basilica*, the law as settled by Justinian held its ground; but copies of the *Corpus Juris* were extremely rare, nor did the study of it revive until the end of the 11th century.

The best edition of the *Digest* is that of Mommsen, Berlin, 1868-70, and of the *Codex* that of Kraeger, Berlin, 1875-77.

2. In his financial administration of the empire, Justinian is represented to us as being at once rapacious and extravagant. His unwearied activity and inordinate vanity led him to form all kinds of expensive projects, and undertake a great many costly public works, many of them, such as the erection of palaces and churches, unremunerative. The money needed for these, for his wars, and for buying off the barbarians who threatened the frontiers, had to be obtained by increasing the burdens of the people. They suffered, not only from the regular taxes, which were seldom remitted even after bad seasons, but also from monopolies; and Procopius goes so far as to allege that the emperor made a practice of further recruiting his treasury by confiscating on slight or fictitious pretexts the property of persons who had displeased Theodora or himself. Fiscal severities were no doubt one cause of the insurrections which now and then broke out, and in the gravest of which, 532 A.D., thirty thousand persons are said to have perished in the capital. It is not always easy to discover, putting together the trustworthy evidence of Justinian's own laws and the angry complaints of Procopius, what was the nature and justification of the changes made in the civil administration. But the general conclusion seems to be that those changes were always in the direction of further centralization, increasing the power of the chief ministers and their offices, bringing all more directly under the control of the crown, and in some cases limiting the powers and appropriating the funds of local municipalities. Financial necessities compelled retrenchment, so that a certain number of offices were suppressed altogether, much to the disgust of the office-holding class, which was numerous and wealthy, and had almost come to look on the civil service as its hereditary possession. The most remarkable instance of this policy was the discontinuance of the consularship. This great office had remained a dignity centuries after it had ceased to be a power; but it was a very costly dignity, the holder being expected to spend large sums in public displays. As these sums were provided by the state, Justinian saved something considerable by stopping the payment. He named no consul after Basiliscus, who was the name-giving consul of the year 541 A.D.

In a bureaucratic despotism the greatest merit of a sovereign is to choose capable and honest ministers. Justinian's selections were usually capable, but not so often honest; probably it was hard to find thoroughly upright people; possibly they were not the people who would have been most serviceable in carrying out the imperial will, and especially in replenishing the imperial treasury. Even the great Tribonian labours under the reproach of corruption, while the fact that Justinian maintained John of Cappadocia in power long after his greed, his unscrupulousness, and the excesses of his private life had excited the anger of the whole empire, reflects little credit on his own principles of government and sense of duty to his subjects. The department of administration in which he seems to have felt most personal interest was that of public works. He spent immense sums on buildings of all sorts, on quays and harbours, on fortifications, repairing the walls of cities and erecting castles in Thrace to check the inroads of the barbarians, on aqueducts, on monasteries, above all, upon churches. Of these works only two remain perfect, St Sophia in Constantinople, now a mosque, and one of the architectural wonders of the world, and the church of SS. Sergius and Bacchus, now commonly called Little St Sophia, which stands about half a mile from the great church, and is in its way a very delicate and beautiful piece of work. The church of San Vitale at Ravenna, though built in Justinian's reign, and containing mosaic pictures of him and Theodora, does not appear to have owed anything to his mind or purse.

3 Justinian's ecclesiastical policy was so complex and varying that it is impossible within the limits of this article to do more than indicate its bare outlines. For many years before the accession of his uncle Justin, the Eastern world had been vexed by the struggles of the Monophysite party, who recognized only one nature in Christ, against the view which then and ever since has maintained itself as orthodox, that the divine and human natures coexisted in Him. The latter doctrine had triumphed at the council of Chalcedon, and was held by the whole Western Church, but Egypt, great part of Syria and Asia Minor, and a considerable minority even in Constantinople clung to Monophysitism. The emperors Zeno and Anastasius had been strongly suspected of it, and the Roman bishops had refused to communicate with the patriarchs of Constantinople since 484, when they had condemned Acacius for accepting the formula of conciliation issued by Zeno. One of Justinian's first public acts was to put an end to this schism by inducing Justin to make the then patriarch renounce this formula and declare his full adhesion to the creed of Chalcedon. When he himself came to the throne he endeavoured to persuade the Monophysites to come in by summoning some of their leaders to a conference. This failing, he ejected suspected prelates, and occasionally persecuted them, though with far less severity than that applied to the heretics of a deeper dye, such as Montanists or even Arians. Not long afterwards, his attention having been called to the spread of Origenistic opinions in Syria, he issued an edict condemning fourteen propositions drawn from the writings of the great Alexandrian, and caused a synod to be held under the presidency of Mennas (whom he had named patriarch of Constantinople), which renewed the condemnation of the impugned doctrines and anathematized Origen himself. Still later, he was induced by the machinations of some of the prelates who haunted his court, and by the influence of Theodora, herself much interested in theological questions, and more than suspected of Monophysitism, to raise a needless, mischievous, and protracted controversy. The Monophysites sometimes alleged that they could not accept the decrees of the council of Chalcedon because that council had not condemned, but (as they argued) virtually approved, three writers tainted with Nestorian principles, viz., Theodore of Mopsuestia, Theodoret, and Ibas, bishop of Edessa. It was represented to the emperor, who was still pursued by the desire to bring back the schismatics, that a great step would have been taken towards reconciliation if a condemnation of these teachers, or rather of such of their books as were complained of, could be brought about, since then the Chalcedonian party would be purged from any appearance of sympathy with the errors of Nestorius. Not stopping to reflect that in the angry and suspicious state of men's minds he was sure to lose as much in one direction as he would gain in the other, Justinian entered into the idea, and put forth an edict exposing and denouncing the errors contained in the writings of Theodore generally, in the treatise of Theodoret against Cyril of Alexandria, and in a letter of Bishop Ibas (a letter whose authenticity was doubted, but which passed under his name) to the Persian bishop Maris. This edict was circulated through the Christian world to be subscribed by the bishops. The four Eastern patriarchs, and the great majority of the Eastern prelates generally, subscribed, though reluctantly, for it was felt that a dangerous precedent was being set when dead authors were anathematized, and that this new movement could hardly fail to weaken the authority of the council of Chalcedon. Among the Western bishops, who were less disposed both to Monophysitism and to subservience, and especially by those of Africa, the edict was earnestly resisted. When it was found that Pope Vigilius did not

forthwith comply, he was summoned to Constantinople. Even there he resisted, not so much, it would seem, from any scruples of his own, for he was not a high-minded man, as because he knew that he dared not return to Italy if he gave way. Long disputes and negotiations followed, the end of which was that Justinian summoned a general council of the church, that which we reckon the Fifth, which condemned the impugned writings, and anathematized several other heretical authors. Its decrees were received in the East, but long contested in the Western Church, where a schism arose that lasted for seventy years. This is the controversy known as that of the Three Chapters (*Tria capitula*, τρία κεφάλαια), apparently from the three propositions or condemnations contained in Justinian's original edict, one relating to Theodore's writings and person, the second to the incriminated treatise of Theodoret (whose person was not attacked), the third to the letter (if genuine) of Ibas (see *Hefele, Conciliengeschichte*, ii, 177).

At the very end of his long career of theological discussion, Justinian himself lapsed into heresy, by accepting the doctrine that the earthly body of Christ was incorruptible, insensible to the weaknesses of the flesh, a doctrine which had been advanced by Julian, bishop of Halicarnassus, and went by the name of Aphthartodocetism. According to his usual practice, he issued an edict enforcing this view, and requiring all patriarchs, metropolitans, and bishops to subscribe to it. Some, who not unreasonably held that it was rank Monophysitism, refused at once, and were deprived of their sees, among them Eutychius the eminent patriarch of Constantinople. Others submitted or temporized; but, before there had been time enough for the matter to be carried through, the emperor died, having tarnished if not utterly forfeited by this last error the reputation won by a life devoted to the service of orthodoxy.

As no preceding sovereign had been so much interested in church affairs, so none seems to have shown so much activity as a persecutor both of heathens and of heretics. He renewed with additional stringency the laws against both these classes. The former embraced a large part of the rural population in certain secluded districts, such as parts of Asia Minor and Peloponnesus; and we are told that the efforts directed against them resulted in the forcible baptism of seventy thousand persons in Asia Minor alone. Heathenism, however, survived; we find it in Laconia in the end of the 9th century, and in northern Syria it has lasted till our own times. There were also a good many crypto-pagans among the educated population of the capital. Procopius, for instance, if he was not actually a pagan, was certainly very little of a Christian. Inquiries made in the third year of Justinian's reign drove nearly all of these persons into an outward conformity, and their offspring seem to have become ordinary Christians. At Athens, the philosophers who taught in the schools hallowed by memories of Plato still openly professed what passed for heathenism, though it was really a body of moral doctrine, strongly tinged with mysticism, in which there was far more of Christianity and of the speculative metaphysics of the East than of the old Olympian religion. Justinian, partly from religious motives, partly because he discountenanced all rivals to the imperial university of Constantinople, closed these Athenian schools (529). The professors sought refuge at the court of Chosroes, king of Persia, but were soon so much disgusted by the ideas and practices of the fire-worshippers that they returned to the empire, Chosroes having magnanimously obtained from Justinian a promise that they should be suffered to pass the rest of their days unmolested. Heresy proved more obstinate. The severities directed against the Montanists of Phrygia led to a furious war, in which most of the sectaries perished, while the doctrine was not extinguished. Harsh

laws provoked the Samaritans to a revolt, from whose effects Palestine had not recovered when conquered by the Arabs in the following century. The Nestorians and the Eutychean Monophysites were not threatened with such severe civil penalties, although their worship was interdicted, and their bishops were sometimes banished; but this vexatious treatment was quite enough to keep them disaffected, and the rapidity of the Mahometan conquests may be partly traced to that alienation of the bulk of the Egyptian and a large part of the Syrian population which dates from Justinian's persecutions.¹

4. Justinian was engaged in three great foreign wars, two of them of his own seeking, the third a legacy which nearly every emperor had come into for three centuries, the secular strife of Rome and Persia. The Sassanid kings of Persia ruled a dominion which extended from the confines of Syria to those of India, and from the straits of Oman to the Caucasus. The martial character of their population made them formidable enemies to the Romans, whose troops were at this epoch mainly barbarians, the settled and civilized subjects of the empire being as a rule averse to war. When Justinian came to the throne, his troops were maintaining an unequal struggle on the Euphrates against the armies of Kobad. After some campaigns, in which the skill of Belisarius obtained considerable successes, a peace was concluded in 533 with Chosroes Anushirvan, who had succeeded Kobad two years before. This lasted till 539, when Chosroes declared war, alleging that Justinian had been secretly intriguing against him with the Ephthalite Huns, and doubtless moved by alarm and envy at the victories which the Romans had been gaining in Italy. The emperor was too much occupied in the West to be able adequately to defend his eastern frontier. Chosroes advanced into Syria with little resistance, and in 540 captured Antioch, then the greatest city in Asia, carrying off its inhabitants into captivity. The war continued with varying fortunes for four years more in this quarter; while in the meantime an even fiercer struggle had begun in the mountainous region inhabited by the Lazæ at the south-eastern corner of the Black Sea. When after two and twenty years of fighting no substantial advantage had been gained by either party, Chosroes agreed in 562 to a peace which left Lazica to the Romans, but under the dishonourable condition of their paying thirty thousand pieces of gold annually to the Persian king. Thus no result of permanent importance flowed from these Persian wars, except that they greatly weakened the Roman empire, increased Justinian's financial embarrassments, and prevented him from prosecuting with sufficient vigour his enterprises in the West.

These enterprises had begun in 533 with an attack on the Vandals, who were then reigning in Africa. Belisarius, despatched from Constantinople with a large fleet and army, landed without opposition, and destroyed the barbarian power in two engagements. North Africa from beyond the straits of Gibraltar to the Syrtis became again a Roman province, although the Moorish tribes of the interior maintained a species of independence; and part of southern Spain was also recovered for the empire. The ease with which so important a conquest had been effected encouraged Justinian to attack the Ostrogoths of Italy, whose kingdom, though vast in extent, for it included part of south-eastern Gaul, Rhaetia, Dalmatia, and part of Pannonia, as well as Italy, Sicily, Sardinia, and Corsica, had been grievously weakened by the death first of the great Theodoric, and some years later of his grandson Athalaric, so that the Gothic nation was practically without

a head. Justinian began the war in 535, taking as his pretext the murder of Queen Amalasontha, daughter of Theodoric, who had placed herself under his protection, and alleging that the Ostrogothic kingdom had always owned a species of allegiance to the emperor at Constantinople. There was some foundation for this claim, although of course it could not have been made effective against Theodoric, who was more powerful than his supposed suzerain. Belisarius, who had been made commander of the Italian expedition, overran Sicily, reduced southern Italy, and in 536 occupied Rome. Here he was attacked in the following year by Vitigis, who had been chosen king by the Goths, with a greatly superior force. After a siege of more than a year, the energy, skill, and courage of Belisarius, and the sickness which was preying on his troops, obliged Vitigis to retire. Belisarius pursued his diminished army northwards, shut him up in Ravenna, and ultimately received the surrender of that impregnable city. Vitigis was sent prisoner to Constantinople, where Justinian treated him, as he had previously treated the captive Vandal king, with clemency. The imperial administration was established through Italy, but its rapacity soon began to excite discontent, and the kernel of the Gothic nation had not submitted. After two short and unfortunate reigns, the crown had been bestowed on Totila or Baduila, a warrior of distinguished abilities, who by degrees drove the imperial generals and governors out of Italy. Belisarius was sent against him, but with forces too small for the gravity of the situation. He moved from place to place during several years, but saw city after city captured by or open its gates to Totila, till only Ravenna, Otranto, and Ancona remained. Justinian was occupied by the ecclesiastical controversy of the Three Chapters, and had not the money to fit out a proper army and fleet; indeed, it may be doubted whether he would ever have roused himself to the necessary exertions but for the presence at Constantinople of a knot of Roman exiles, who kept urging him to reconquer Italy, representing that with their help and the sympathy of the people it would not be a difficult enterprise. The emperor at last complied, and in 552 a powerful army was despatched under Narses, an Armenian eunuch now advanced in life, but reputed the most skillful general of the age, as Belisarius was the hottest soldier. He marched along the coast of the Gulf of Venice, and encountered the army of Totila at Taginae, not far from Cesena. Totila was slain, and the Gothic cause irretrievably lost. The valiant remains of the nation made another stand under Teiason the Lactarian hill in Campania; after that they disappear from history. Italy was recovered for the empire, but it was an Italy terribly impoverished and depopulated, whose possession carried little strength with it. Justinian's policy both in the Vandalic and in the Gothic war stands condemned by the result. The resources of the state, which might better have been spent in defending the northern frontier against Slavs and Huns and the eastern frontier against Persians, were consumed in the conquest of two countries which had suffered too much to be of any substantial value, and which, separated by language as well as by intervening seas, could not be permanently retained. However, Justinian must have been almost preternaturally wise to have foreseen this: his conduct was in the circumstances only what might have been expected from an ambitious prince who perceived an opportunity of recovering territories that had formerly belonged to the empire, and over which its rights were conceived to be only suspended.

Besides these three great foreign wars, Justinian's reign was troubled by a constant succession of border incursions, especially on the northern frontier, where the various Slavonic and Hunnish tribes who were established along

¹ For a fuller account of the ecclesiastical policy of Justinian and its results the present writer ventures to refer to the article "Justinian" which he has contributed to the third volume of Dr Smith's *Dictionary of Christian Biography*.

the lower Danube and on the north coast of the Black Sea made frequent marauding expeditions into Thrace and Macedonia, sometimes penetrating as far as the walls of Constantinople in one direction and the isthmus of Corinth in another. Immense damage was inflicted by these marauders on the subjects of the empire, who seem to have been mostly too peaceable to defend themselves, and whom the emperor could not spare troops enough to protect. Fields were laid waste, villages burnt, large numbers of people carried into captivity; and on one occasion the capital was itself in danger.

It only remains to say something regarding Justinian's personal character and capacities, with regard to which a great diversity of opinion has existed among historians. The civilians, looking on him as a patriarch of their science, have as a rule extolled his wisdom and virtues; while ecclesiastics of the Roman Church, from Cardinal Baronius downwards, have been offended by his arbitrary conduct towards the popes, and by his last lapse into heresy, and have therefore been disposed to accept the stories which ascribe to him perfidy, cruelty, rapacity, and extravagance. The difficulty of arriving at a fair conclusion is increased by the fact that Procopius, who is our chief authority for the events of his reign, speaks with a very different vein in his secret memoirs (*Anecdota*) from that which he has used in his published history, and that some of the accusations contained in the former work are so rancorous and improbable that a certain measure of discredit attaches to everything which it contains. The truth seems to be that Justinian was not a great ruler in the higher sense of the word, that is to say, a man of large views, deep insight, a capacity for forming just such plans as the circumstances needed, and carrying them out by a skilful adaptation of means to ends. But he was a man of considerable abilities, wonderful activity of mind, and admirable industry. He was interested in many things, and threw himself with ardour into whatever he took up; he contrived schemes quickly, and pushed them on with an energy which usually made them succeed when no long time was needed, for, if a project was delayed, there was a risk of his tiring of it and dropping it. Although vain and full of self-confidence, he was easily led by those who knew how to get at him, and particularly by his wife. She exercised over him great influence, which a stronger character always exercises over a weaker, whatever their respective positions; and unfortunately it was seldom a good influence, for Theodora seems to have been a woman who, with all her brilliant gifts of intelligence and manner, had no principles and no pity. Justinian was rather quick than strong or profound; his policy does not strike one as the result of deliberate and well-considered views, but dictated by the hopes and fancies of the moment. His activity was in so far a misfortune as it led him to attempt too many things at once, and engage in undertakings so costly that oppression became necessary to provide the funds for them. Even his devotion to work, which excites our admiration in the centre of a luxurious court, was to a great extent unprofitable, for it was mainly given to theological controversies which neither he nor any one else could settle. Still, after making all deductions, it is plain that the man who accomplished so much, and kept the whole world so occupied, as Justinian did during the thirty-eight years of his reign, must have possessed no common abilities. He was affable and easy of approach to all his subjects, with a pleasant address, nor does he seem to have been, like his wife, either cruel or revengeful. We hear several times of his sparing those who had conspired against him. But he was not scrupulous in the means he employed, and he was willing to maintain in power detestable ministers if only they served him efficiently and filled his coffers. His chief passion, after that for his own fame and glory, seems to have been for theology and religion; it was in this field that his literary powers exerted themselves (for he wrote controversial treatises and hymns), and his taste also, for among his numerous buildings the churches are those which he spent most thought and money. Considering that his legal reforms are those by which his name is mainly known to posterity, it is curious that we should have hardly any information as to his legal knowledge, or the share which he took in those reforms. In person he was somewhat above the middle height, well-shaped, with plenty of fresh colour in his cheeks, and an extraordinary power of doing without food and sleep. He spent most of the night in reading or writing, and would sometimes go for a day with no food but a few green herbs. Two mosaic figures of him exist at Ravenna, one in the apse of the church of S. Vitale, the other in the church of S. Apollinare in Urbe; but of course one cannot be sure how far in such a stiff material the portrait fairly represents the original. He had no children by his marriage with Theodora, and did not marry after her decease. On his death, which took place November 14, 555, the crown passed to his nephew Justin II.

Authorities.—For the life of Justinian the chief authorities are Procopius (*Historia*, *De Edificiis*, *Anecdota*) and (from 552 A.D.)

the *History* of Agathias; the Chronicle of Johannes Malalas is also of value. Occasional references must be made to the writings of Jordanes and Marcellinus, and even to the late compilations of Cedrenus and Zonaras. The *Vita Justiniani* of Ludewig or Ludwig (Halle, 1731), a work of patient research, is frequently referred to by Gibbon in his important chapters relating to the reign of Justinian. There is a *Vie de Justinien* by Isambert (2 vols., Paris, 1856). (J. B.R.)

JUSTINIAN II., Rhinotmetus, Roman emperor of the East from 685 to 695, and from 704 to 711, succeeded his father Constantine IV., at the age of sixteen. His reign was unhappy both at home and abroad. He made a truce with the Arabs, which admitted them to the joint possession of Armenia, Iberia, and Cyprus, while by removing 10,000 Christian Maronites from their native Lebanon, he gave the Arabs a command over Asia Minor of which they took advantage in 692 by conquering all Armenia. In 688 Justinian was defeated by the Bulgarians. Meanwhile the bitter dissensions caused in the church by the emperor, his bloody persecution of the Manichæans, and the insatiable and cruel rapacity with which, through his creatures Stephanus and Theodatus, he extorted the means of gratifying his sumptuous tastes, maddened his subjects into rebellion. In 695 they rose under Leontius, and, after cutting off the emperor's nose (whence his surname), banished him to Cherson in the Crimea. Leontius, after a reign of three years, was in turn dethroned and imprisoned by Tiberius Abdimarus, who next assumed the purple. Justinian meanwhile had escaped from Cherson and married Theodora, sister of Busrus, khan of the Khazars. Compelled, however, by the intrigues of Tiberius, to quit his new home, he fled to Terbelis, king of the Bulgarians. With an army of 15,000 horsemen Justinian suddenly pounced upon Constantinople, slew his rivals Leontius and Tiberius, with thousands of their partisans, and once more ascended the throne in 704. His second reign was marked by an unsuccessful war against Terbelis, by Arab victories in Asia Minor, by devastating expeditions sent against his own cities of Ravenna and Cherson, and by the same cruel rapacity towards his subjects. Conspiracies again broke out; Bardanes, surnamed Philipplus, assumed the purple; and Justinian, the last of the house of Heraclius, was assassinated in Asia Minor, December 711.

JUTE is a vegetable fibre which, notwithstanding the fact that it has come under the notice of manufacturing communities only within comparatively recent times, has advanced in importance with so rapid strides that it now occupies among vegetable fibres a position, in the manufacturing scale, inferior only to cotton and flax. The term jute appears to have been first used by Dr Roxburgh in 1795, when he sent to the directors of the East India Company a bale of the fibre which he described as "the jute of the natives." Importations of the substance had been made at earlier times under the name of *put*, an East Indian native term by which the fibre continued to be spoken of in England till the early years of the 19th century, when it was supplanted by the name it now bears. This modern name appears to be derived from *jhot* or *shout* (Sanskrit, *jhat*), the vernacular name by which the substance is known in the Cuttack district, where the East India Company had extensive roperies at the time Dr Roxburgh first used the term.

The fibre is obtained from two species of *Cordhorus* (nat. ord. *Tiliaceae*), *C. capsularis* and *C. obtusifolius*, the products of both being so essentially alike that neither in commerce nor agriculture is there any distinction made between them. These and various other species of *Cordhorus* are natives of Bengal, where they have been cultivated from very remote times for economic purposes, although there is reason to believe that the cultivation did

not originate in the northern parts of India. The two species cultivated for jute fibre are in all respects very similar to each other, except in their fructification and the relatively greater size attained by *C. capsularis*. The

FIG. 1.—Capsules of Jute Plants. a, *Corchorus capsularis*; b, *C. olitorius*.

capsules or seed-pods in the case of *C. capsularis* are globular, rough, and wrinkled, while in *C. olitorius* they are slender quill-like cylinders, a very marked distinction,

FIG. 2.—*Corchorus olitorius*.

as may be noted from fig. 1, in which a and b show the capsules of *C. capsularis* and *C. olitorius* respectively. Fig. 2 represents a flowering top of *C. olitorius*. The two plants are thus botanically defined:—

Corchorus capsularis.—Annual; 5-10 feet; calyx deeply 5-cleft; petals 5; leaves alternate, oblong, acuminate, serrate, two lower serratures terminating in narrow filaments; peduncles short; flowers whitish-yellow, in clusters opposite the leaves; capsules globose, truncated, wrinkled, and muricated, 5-celled; seeds few in each cell, without transverse partitions; in addition to the 5-partite cells, there are other 5 alternating, smaller and empty.

Corchorus olitorius.—Annual; 5-6 feet; erect; leaves alternate, ovate-acuminate, serrate, the two lower serratures terminated by a slender filament; peduncles 1-2 flowered; calyx 5-sepalled; petals 5; capsules nearly cylindrical, 10-ribbed, 5-celled, 5-valved; seeds numerous, with nearly perfect transverse septa; flowers small, yellow.

Both species are cultivated in India, not only on account of their fibre, but also for the sake of their leaves, which are there extensively used as a pot-herb. The use of *C. olitorius* for the latter purpose dates from very ancient times, if it may be identified, as some suppose, with the mallows (𑀧𑀺𑀢𑀺) mentioned in Job xxx. 4, "Who cut up mallows by the bushes." It is certain that the Greeks used this plant as a pot-herb; and by many other nations around the shores of the Mediterranean this use of it was, and is still, common. Throughout Bengal the name by which the plants when used as edible vegetables are recognized is *nalid*; when on the other hand they are spoken of as fibre-producers it is generally under the name *pât*. Both species are cultivated, on account of the fibre they yield, in the greater part of Bengal. The cultivation of *C. capsularis* is most prevalent in central and eastern Bengal, while in the neighbourhood of Calcutta, where, however, the area under cultivation is limited, *C. olitorius* is principally grown. In 1872, a year which showed an extraordinary development of the cultivation, there were returned 921,000 acres as under jute in Bengal, to which Pubna contributed 122,000, Dinajpur 117,000, and Rangpur 100,000 acres respectively.

Hitherto jute has not been cultivated to any considerable extent in localities other than Bengal. From remote times it has been grown in the Hankow district of China, but not largely. In the United States of America the cultivation of the plants has also been introduced, but it has not made much progress. Recently considerable attention has been given to the culture of the plant in Egypt, and in the Dundee trade report of the 23d March 1881 there occurs the following statement:—"Some samples of jute grown in Egypt are being shown here. Reports on quality are varied, but, considering it is a first attempt, on the whole satisfactory. It proves beyond a doubt that Egypt is capable of producing this material, and for the trade of the district this is a matter of great importance, as having the fibre grown near at hand will enable our manufacturers to compete more successfully in all markets with the Indian mills."

A hot moist climate with abundant rainfall and rich alluvial soil appear to be the conditions most favourable for the successful cultivation of the jute plants. The land requires to be well tilled and abundantly manured, and the ground being so prepared, the general time of sowing the seed throughout northern and eastern Bengal extends from about the middle of March to the end of May. The seed is sown broadcast on the prepared ground, the young plants are thinned out to 6 inches apart, and the ground carefully weeded. The stalks are ready for cutting down between the middle of August and the middle of October. As a rule the plants are cut down close to the root with a kind of bill-hook or sickle, and the fibre is obtained best in quality when the crop is secured in the flower. It is, however, common to allow the crop to run to seed and even to ripen seed before cutting, a practice which renders the resulting fibre hard and woody, thus intensifying one of the principal drawbacks of the jute fibre.

The fibre is separated from the stalks by the process

of retting practised in the case of flax, hemp, &c. (see FLAX, vol. ix. p. 294). In certain districts of Bengal it is the practice to stack the crop for a few days previous to retting, during which period the leaves drop off the stalks, and otherwise the stalks themselves are thereby brought into a condition for more rapid retting. The general practice, however, is to tie the crop into bundles sufficient for one man to carry, and to place these at once in water for the purpose of retting. Pools and ponds of stagnant water are preferred for retting where such are available, but the process is also carried on in the water of running streams. The period necessary for the completion of the retting process varies much according to the temperature and condition of the water, and may be said to occupy from two or three days up to a month. The stalks are examined periodically to test the progress of the retting operation, and when it is found that the fibres peel off and separate readily from the woody portion of the stalk, the operation is complete, and the bundles are withdrawn. The following is a description of the method generally practised for separating the fibre from the stalks. "The proper point being attained, the native operator, standing up to his middle in water, takes as many of the stalks in his hands as he can grasp, and, removing a small portion of the bark from the ends next to the roots, and grasping them together, he strips off the whole with a little management from end to end without either breaking stem or fibre. Having prepared a certain quantity into this half state, he next proceeds to wash off: this is done by taking a large handful; swinging it round his head he dashes it repeatedly against the surface of the water, drawing it through towards him so as to wash off the impurities, then with a dexterous throw he fans it out on the surface of the water and carefully picks off all remaining black spots. It is now wrung out so as to remove as much water as possible, and then hung up on lines prepared on the spot to dry in the sun." The separated fibre is then washed, sun-dried, and made up into hanks, and so is ready for the market. In favourable circumstances the produce of cleaned fibre amounts, on an average, to about 6 maunds per beegah (13½ cwt. per acre), but official returns from various districts show differences ranging from 5 to 26 or even 30 cwt. per acre. The cost of cultivation also varies much in different localities. According to the official report of Hem Chunder Kerr, it is as much as Rs. 17 per beegah (about £2, 12s. per acre) in Chittagong, and as low as R. 1 (or 3s. per acre) in Manbhum; but such estimates are obviously of little value, as the cultivation is carried on by the ryots without the aid of hired labour, and forms generally only one among the various cultivated products of the land by which a livelihood is obtained. Jute, however, is certainly one of the most cheaply raised and prepared of all fibres; and to this fact more than to any special excellency of character it possesses is due its now extensive employment as a manufacturing staple.

The characters by which qualities of jute are judged are principally colour, lustre, softness, strength, length, firmness, uniformity, and cleanness of fibre. The best qualities of jute are of a clear white yellowish colour, with a fine silky lustre, soft and smooth to the touch, and fine, long, and uniform in fibre. As a general rule the root ends are harsher and more woody than the middle and upper portions, but in fine jute this distinction is not so noticeable as in less valuable qualities. In length the fibre varies from 6 to 7 feet, but occasionally it is obtained to a length of 14 feet, and, generally speaking, in proportion to the length of the fibre is its fineness of quality. Inferior qualities of jute are brownish in colour and, especially at the root ends, harsh and woody, with much adhering dark cortical matter and other impurities. The fibre is decidedly

inferior to flax and hemp in strength and tenacity; and, owing to a peculiarity in its microscopic structure, by which the walls of the separate cells composing the fibre vary much in thickness at different points, the single strands of fibre are of unequal strength. Recently prepared fibre is always stronger, more lustrous, softer, and whiter than such as has been stored for some time,—age and exposure rendering it brown in colour and harsh and brittle in quality. Jute, indeed, is much more woody in texture than either flax or hemp, a circumstance which may be easily demonstrated by its behaviour under appropriate reagents; and to that fact is due the change in colour and character it undergoes on exposure to the air. The fibre bleaches with facility, up to a certain point, sufficient to enable it to take brilliant and delicate shades of dye colour, but it is with great difficulty brought to a pure white by bleaching. A very striking and remarkable fact, which has much practical interest, is its highly hygroscopic nature. While in a dry position and atmosphere it may not possess more than 10 per cent. of moisture, under damp conditions it will absorb up to 30 per cent. or thereby.

As already stated, its commercial distinction is based on the botanical species of plant from which the fibre is prepared; but in the Calcutta market a series of commercial staples are recognized based on the districts whence they are drawn, the values of which bear a pretty constant relation to each other. These classes, in the order of quality, are:—(1) *Uthariyá* or northern jute, coming from Rangpur, Goalpara, Bogra, and the districts north of Sirajganj;—for length, colour, and fineness, this is unequalled; (2) *Deswál* or Sirajganj jute, which is valued on account of its softness, bright colour, fineness, and strength,—in the last characteristic it is superior to *Uthariyá* jute; (3) *Deni* jute comes from Hooghly, Bardwan, Jessore, and the 24 Parganas; (4) *Deorá* jute is produced in Faridpur and Bakarganj,—it is a strong coarse dark and sooty fibre, used principally for rope-making. The other qualities recognized in Calcutta are:—(5) *Narainganji* jute from Dacca, a strong soft long fibre, of inferior colour; (6) *Bákrábadí* jute from Dacca, of fine colour and softness; (7) *Bhatial* jute from Dacca, very coarse but strong, and very suitable for rope-making; (8) *Kurimganji* jute from the Mymensing district, a long, strong, and well-coloured staple; (9) *Mirganji* jute, the produce of Tangpur, harsh and woody from over-ripeness of the stalks; and (10) *Jangipuri* jute of Patna, a short, weak, and fox-coloured fibre of very inferior quality. In the European markets these distinctions are not much remarked, traders' marks and classification being the accepted standards of quality and condition. Moreover, it is only the finer qualities that are exported, the lower class jute being used locally for gunny bags, ropes, &c.

At Calcutta and various other centres the jute received from local traders is sorted, packed, and pressed into bales of 400 lb for shipment to the English and other markets. Woody and hard root ends, which will not press into bales, are cut off and sold separately under the name of "cuttings." "Jute," "cuttings," and "rejections" (the last the name of the low-class fibre) are the three heads under which jute fibre is entered in the trade and import lists of Western countries.

The Jute Trade of Calcutta.—The importation of jute into Europe commenced about the end of the last century, but so recently as that period it was confused with hemp. During the earlier years of the present century the imports slowly increased, but, as Hem Chunder Kerr says, "the shipments were so insignificant that little or no notice was taken of them by the custom house authorities." Since that time a great revolution has taken place. In 1820 the custom house assigned to jute a separate heading, in which

year we find the exports amounted to 496 maunds (364 cwt.). From that time the growth of the trade has been upon the whole steady and continuous, and marked by extraordinary progress, as will be evident from the following table of exports, which is compiled from official sources :—

	Quantity	Value	Average of Five Years' Quantity	Average of Five Years' Value.
	cwt. lbs	£	cwt.	
1829	361 3 0	62		
1830	1,770 3 0	413		
1831	7,677 3 0	2,223		
1832	23,852 2 0	5,361		
1833	25,393 2 18	6,577		
1829-33	50,001 3 18	15,630	11,800	£3,127
1834-38	377,115 3 0	83,340	67,483	16,640
1839-43	583,338 0 0	119,161	117,047	23,620
1844-48	1,170,279 0 0	250,125	264,005	51,225
1849-53	1,106,750 0 0	600,165	448,530	129,833
1854-58	3,051,143 0 0	1,208,419	710,826	259,697
1859-63	4,818,626 0 0	2,688,862	980,721	421,773
1864-68	13,116,650 0 0	6,129,690	2,685,110	1,295,016
1869	3,613,820 0 0	2,028,436		
1870	3,438,175 0 0	2,060,173		
1871	3,761,228 0 0	2,585,670		
1872	6,218,570 0 0	4,170,435		
1873	7,356,083 0 0	4,324,093		
1869-73	31,906,806 0 0	15,060,110	4,868,161	3,010,022
1874	6,126,000 0 0	3,425,560		
1875	5,606,000 0 0	3,215,000		
1876	5,207,000 0 0	2,915,500		
1877	4,674,000 0 0	2,661,900		
1878	5,402,000 0 0	3,808,300		
1874-78	26,806,000 0 0	15,060,000	5,361,800	3,131,800
1879	6,755,000 0 0	3,626,500		
1880	6,916,000 0 0	4,112,200		

Excepting a comparatively insignificant fraction, the whole of these exports of raw jute have been consigned to Great Britain, the United States of America being the only other country which bulks at all largely in the returns. Occasional shipments were made to America from 1829 onwards; but the quantities were small and very fluctuating till about 1850, up to which year frequently the total imports for a year were under 1000 cwt. From 1850-51 onward a rapidly increasing but still fluctuating demand for raw jute has grown up in the United States, till in 1872-73 the American demand amounted to 307,718 cwts. of jute and 1,158,895 cwts. of cuttings and rejections. An importation of 3072 cwts. was made into France in 1836-37, but there was no steady demand for jute in that country till 1845-46, when 9708 cwts. were taken. Since that time there has been a varying but upon the whole increasing demand, and in 1872-73 there were imported 137,126 cwts. The only other considerable shipments are to East India ports, but, taken altogether, it may be said that quite nine-tenths of the raw jute which leaves Calcutta is primarily disposed of in the British market.

Jute Manufacture.—Long before jute came to be known and to occupy a prominent place amongst the textile fibres of Europe, it was in extensive use and formed the raw material of a large and important industry throughout the regions of eastern Bengal, in which the plant was cultivated. Among the native Hindu population the spinning and weaving of jute was, and still is, in various districts, the most important domestic industry. The forms into which the material is worked among the Hindu population—for the Mussulmans do not use jute—are cordage, cloth, and paper. The cordage is twisted into all sizes, from the fine thread used for weaving up to strong ropes for the hawsers of native boats and for tying bales. The more important native application of jute is, however, in the manufacture of gunny cloth and gunny bags, used in extraordinary quantity and number throughout the world, for packing and carrying all manner of goods and merchandise, and by

the natives themselves for clothing and numerous domestic purposes. The ordinary mode of weaving gunnies for bags and other coarse purposes is thus described :—“Seven sticks or chattle weaving-posts, called *tand pará* or *warp*, are fixed upon the ground, occupying the length equal to the measure of the piece to be woven, and a sufficient number of twine or thread is wound on them as warp called *tand*. The warp is taken up and removed to the weaving machine. Two pieces of wood are placed at two ends, which are tied to the *chari* and *okher* or roller, they are made fast to the *khoti*. The *belut* or treadle is put into the warp; next to that is the *arsaal*; a thin piece of wood is laid upon the warp, called *chapari* or regulator. There is no sley used in this, nor is a shuttle necessary; in the room of the latter a stick covered with thread called *singa* is thrown into the warp as woof, which is beaten in by a piece of plank called *beyno*, and as the cloth is woven it is wound up to the roller. Next to this is a piece of wood called *khetone*, which is used for smoothing and regulating the woof; a stick is fastened to the warp to keep the woof straight.” Gunny cloth is woven of numerous qualities, according to the purpose to which it is devoted. Some kinds are made close and dense in texture, for carrying such seed as poppy or rape and sugar; others less close are used for rice, pulses, and seeds of like size, and coarser and opener kinds again are woven for the outer cover of packages and for the sails of country boats. There is a thin close-woven cloth made and used as garments among the females of the aboriginal tribes near the foot of the Himalayas, and in various localities a cloth of pure jute or of jute mixed with cotton is used as a sheet to sleep on, as well as for wearing purposes. To indicate the variety of uses to which jute is applied, the following quotation may be cited from the official report of Hem Chunder Kerr as applying to Midnapur. “The articles manufactured from jute are principally (1) gunny bags; (2) string, rope, and cord; (3) *kampa*, a net-like bag for carrying wood or hay on bullocks; (4) *chat*, a strip of stuff for tying bales of cotton or cloth; (5) *dola*, a swing on which infants are rocked to sleep; (6) *shiku*, a kind of hanging shelf for little earthen pots, &c.; (7) *dubina*, a floor cloth; (8) *beera*, a small circular stand for wooden plates used particularly in *poajahs*; (9) painter's brush and brush for white-washing; (10) *ghansi*, a waist-band worn next to the skin; (11) *gochh-dari*, a hair-band worn by women; (12) *muktar*, a net bag used as muzzle for cattle; (13) *parchula*, false hair worn by players; (14) *rakhi-bandhan*, a slender arm-band worn at the Rakhi-poorima festival; and (15) *dhup*, small incense sticks burned at *poajahs*.” Raw jute fibre and old gunnies are also largely used throughout the presidency in the manufacture of paper.

The introduction of jute factories on the European system into Bengal has had a considerable influence on the domestic manufacture of jute, notwithstanding that a vast industry is still prosecuted in the ancient Hindu manner.

The following extracts from official tables will show the extent of this particular branch of industry.

The number of gunny bags imported into Calcutta amounted in 1877-78 to 21,446,000, in 1878-79 to 26,380,000, and in 1879-80 to 20,468,000.

The different districts which contributed chiefly to the trade during these three years are the following :—

Name of District.	1877-78	1878-79	1879-80
Dinajpur	2,780,000	8,641,000	6,132,000
Hoojaly	8,287,000	5,920,000	5,994,000
24 Parganas	2,180,000	3,238,000	4,020,000
Purnea	2,531,000	2,532,000	2,658,000
Bardwan		253,000	520,000
Patna	404,000	647,000	300,000
Jalpaiguri	381,000	484,000	304,000
Rangpur	117,000	512,000	512,000

The gunny bags exported from Calcutta in the year 1877-78 numbered 79,384,000; in 1878-79, 82,635,000, and in 1879-80, 92,284,000.

It will be seen that the exports of bags exceed the quantity sent into Calcutta by no less than 57,938,000 bags in 1877-78, 56,265,000 in 1878-79, and 71,796,000 in 1879-80. This is of course due to the large manufacture in Calcutta and the suburbs.

The import trade of Calcutta in gunny cloth during the three years referred to was in round numbers as follows.—57,000 pieces in 1877-78, 70,000 in 1878-79, and 88,000 in 1879-80.

Out of the total supply, that of power-loom manufacture was 49 000 pieces in 1878-80, as compared with 19,000 pieces in 1878-79. The hand-made pieces amounted to 45,000, as compared with 51,000 in 1878-79.

The export of gunny cloth by sea was consigned as follows—

	1878-79.			1879-80.		
	Power- Loom.	Hand- Loom.	Total.	Power- Loom.	Hand- Loom.	Total
To foreign ports	Yards 4,230,930	Yards 57,000	Yards 4,287,930	Yards 4,210,000	Yards 1,000	Yards 4,211,000
" Indian "	2,135,900	17,000	2,152,900	1,658,000	7,000	1,665,000
Total	6,365,830	74,000	7,730,000	6,868,000	8,000	6,876,000

Besides the registered supplies mentioned above, the returns show a large quantity of power-loom gunny cloth, amounting to 664,000 piece, sent up country from Calcutta mills without passing the port commissioners' wharves. The gross total of gunny cloth exported from Calcutta was 54,731,000 yds. in 1878-79, and 61,468,000 yds. in 1879-80.

Formerly America was the largest customer for Indian jute manufactures, very large quantities of gunny having been consigned to the United States for packing cotton and other merchandises. That demand has, however, very largely fallen off, and now the Australian colonies and Burmah and the various East Indian ports are the principal places to which the manufactured articles are sent from Calcutta.

European Trade and Manufacture.—The occasional parcels of jute which were sent to the European market by the East India Company previous to the year 1830 appear to have been principally used for the making of door mats

and similar purposes; but the whole quantity was at that date, and, as will be seen by the table, p. 801, for several years thereafter, quite insignificant. Some part of these imports found their way to Abingdon in Oxfordshire, a town in which the manufacture of carpets, sacking, and cordage was extensively prosecuted, and to the manufacturers of that town is due the credit of being the first in Great Britain to experiment with the fibre, making it into yarn and cloth. In 1833 a quantity of dyed yarn was sent from Abingdon to Dundee, then an important centre of the heavier flax manufactures, and there it attracted a good deal of attention. Consignments were soon thereafter received direct at Dundee and experimented with, but little or no real progress was made for a considerable time, for jute forms no exception to the general rule that the introduction of new textile fibres is attended with many difficulties before a successful issue is reached. The many unsuccessful attempts to convert it into yarn caused it to be disliked by the manufacturer, and the bad reputation it had acquired as to strength and durability made it no favourite in public estimation. Indeed, so far was prejudice carried against it that some of the manufacturers banished the fibre entirely from their works, fearing it might prove prejudicial to their interests. Among the circumstances which added materially to the rapid development of the jute trade, lying outside its natural growth owing to cheapness and other causes, were the war with Russia in 1854-56, which temporarily cut off the supplies of Russian flax and hemp, and the cotton famine which resulted from the civil war in America in 1861-63. Leaving these circumstances out of account, however, the growth of the jute trade has been remarkable and steady, as will be seen by the following table, embracing a period of fifteen years from 1865 to 1880, during which no such cause as those alluded to above affected the trade.

Details of Importation and Exportation of Jute into and from the United Kingdom, 1865-1879.

Manufacture.—In their general features the spinning and weaving of jute fabrics do not differ essentially as to machinery and processes from those employed in the manufacture of hemp and heavy flax goods. Owing, however, to the woody and brittle nature of the fibre, it has to undergo a preliminary treatment peculiar to itself. The pioneers of the jute industry, who did not understand this necessity, or rather who did not know how the woody and brittle character of the fibre could be remedied, were greatly perplexed by the difficulties they had to encounter, the fibre spinning badly into a hard, rough, and hairy yarn owing to the splitting and breaking of the fibre. This peculiarity of jute, coupled also with the fact that the machinery on which it was first spun, although quite suitable for the stronger and more elastic fibres for which it

was designed, required certain modifications to suit it to the weaker jute, was the cause of many annoyances and failures in the early days of the trade.

Batching or Softening.—The introduction of this preliminary process constituted the first important step in the practical solution of the difficulties of jute spinning. The process, in a great measure, supplies artificially that in which jute is naturally deficient. The mode of batching originally adopted was to divide the rolls or heads, taken from the bale, into four or five parts, each being about what a hand could grasp. These divisions, called stricks, were doubled up with a slight turn at the centre, and laid out in the floor in double rows, the roots and crop ends of the stricks overlapping each other, in the centre of the batch; each row when completed received a certain per-

centage of whale oil and water, and, according to the ideas of the person superintending, a mixture of ashes or other ingredients, supposed to have a softening tendency. These batches, which generally contained from 4 to 5 tons each, were allowed to lie from twenty-four to forty-eight hours, at the end of which time a slight fermentation caused by the oil and water was induced, and the batch was then considered ready for the preparation process. The hand process has now, however, been superseded by a more speedy and economical appliance. In order to get the fibre into that soft pliant condition so essential to the spinning operation, jute softeners or mangles have been introduced. Of these machines there are various types, but in their general outline and principle they are closely allied to each other. The machine consists of a double row of fluted rollers, generally from twelve to eighteen pairs, the one placed on the top of the other, so that the flutes longitudinally intersect each other. The rollers, when the machine is in motion, have a rippling reciprocating action, by which means the material passing through is rendered soft and pliant. In connexion with this machine, and with the view of dispensing with the more cumbersome and expensive mode of batching already described, an apparatus is attached, and is so adjusted that the jute on passing through the rollers receives with great precision a proper allowance of oil and water. The quantity of oil used varies from half a gallon to one gallon per 400 lb bale, and the quantity of water, according as the atmosphere is dry or damp, is from 12 to 18 per cent. of the weight of material operated on.

Such qualities of jute as retain rough and hard root ends or "butts" require to undergo another preliminary process termed "snipping," by which these "butts" are combed out, and separated from the remainder of the fibre; those, being torn and split up into the form of tow, may be so used in the subsequent preparing and spinning operations. A good deal of jute is now prepared at Calcutta by the snipping process instead of by cutting, the butts being thoroughly secured in a more useful and valuable condition.

The material, after being softened, and, if necessary, snipped, is passed on to the sorters, whose duty is to select the different qualities for the special uses to which they may be applied.

Spinning.—All the subsequent processes through which jute passes are essentially the same as those employed in the corresponding heavy manufactures of flax (see LINEN). As in the case of that fibre, there are two dis-

tinct processes of preparing yarn, viz., by "line" spinning and by "tow" spinning. If intended for line spinning, the long jute fibre is cut or rather broken into lengths of from 20 to 24 inches. It is then ready for hackling, spreading, drawing, and roving, just as in the parallel case of flax "line" spinning. Similarly in the tow spinning the fibre is first submitted to the breaker card, then the finishing card, after which it passes through the drawing frames and the roving frame, and then, as "rove" or rovings, it is ready for the spinning frame, but, in the case of some very heavy yarns, the material is spun direct on the roving frame.

The weights of jute yarn are estimated by the spindle of 14,400 yards, and the finest kinds spun are about "2 lb yarn," i.e., yarn weighing 2 lb per spindle. The minimum weight commonly found in the market is, however, 7 lb, from which the yarn lists rise in sizes up to 40 lb, or to very much heavier weights for special purposes. The ruling feature of jute is its cheapness, and the great demand for jute manufactures arises in connexion with rough and cheap fabrics, such as sackings and bagging, bale covers, hessians for upholstery purposes, &c., tarpaulings, linings, pocketings, and backing for floorcloths, for which purpose it is woven in webs from 6 to 8 yards wide. It takes dye colours readily, which, however, are fugitive, and as dyed yarn it is woven into carpets, rugs, &c.; and woven and printed curtain cloths and tapestries are also made from jute. The fibre, however, is not worthy of being woven into elaborate and somewhat costly fabrics; and it is not likely that as a tapestry material it will take any permanent place. Jute also lends itself readily to the sophistication of more expensive fibrous materials, and is said to be employed in the adulteration of woven silks, more especially in such as are used for cheap ribbons, scarfs, &c. It can also be prepared to imitate human hair with remarkable closeness, and advantage of this is largely taken in making stage wigs.

Although a few jute factories have sprung up in several localities other than Dundee throughout the United Kingdom, notably in Glasgow, Aberdeen, and Barrow-in-Furness, and also in various parts of the Continent, Dundee is still the headquarters and controlling centre of the jute trade, even many of the Bengal factories being owned by Dundee merchants. The following table shows the distribution of the trade and the number of persons finding employment in it for the United Kingdom at the respective dates mentioned:—

	Factories.			Spinning Spindles.			Doubling Spindles.		Power-Looms.			Persons Employed.

¹ Exclusive of number of power-loom in one factory in Antin.

Some of the Dundee factories are of enormous extent, that of Messrs Cox Brothers, for example, covering 22 acres, and giving employment to 5000 persons, while the annual output of jute fabrics measures as much as 15,500 miles. (J. P.A.)

JÜTERBOGK, JÜTERBOC, or JÜTERBOCK, the chief town of the circle Jüterbogk-Lucknowalde, in the government district of Potsdam and province of Brandenburg, Prussia, is situated on the Nuthe, 39 miles south-west of Berlin, with which it is connected by rail. It contains four Protestant churches, of which that of St Nicholas, dating from the close of the 14th century. Jüterbogk carries on

weaving and spinning both of flax and wool, and trades in the produce of those manufactures and in cattle. Vines are cultivated in the neighbourhood. Jüterbogk appears in history as the scene of religious discussions in 1548 and 1575, of a treaty between Brandenburg and Saxony in 1611, and of the victory of the Swedes under Torstenson over the imperial troops under Gallas in 1644. Two miles south-west is the battlefield of Dennewitz, where Bülow defeated Ney and Oudinot, September 6, 1813. The population, including the garrison, was 6852 in 1875; with the immediately adjacent villages of Damm and Neumarkt it was 8427.

JUVENAL (DECIMUS JUNIUS JUVENALIS) has been more read and admired in modern times than any other Latin poet, with the exception of Virgil, Horace, and perhaps Ovid. The attraction which he has had, not for scholars only, but for men of letters and men of the world, is probably due less to any intrinsic superiority of genius,—for in genius he is not the equal of Lucretius or Catullus,—but to a quality of his writing to which one of the most recent and best of his English editors has drawn attention. "In depicting character," says Mr Lewis,¹ "in drawing scenes, even in turns of expression, he is, of all ancient authors, the most distinctly modern." But besides this attraction, which is due to the fact that he wrote at a time when the interest in social life and manners had superseded that formerly felt in the commonwealth, he has his own peculiar value to students of antiquity. He closes the roll of the great writers of Rome, and is the last vital representative of her national spirit and genius. It is mainly from his representation that the picture of the social life of the imperial city during the first century of our era lives in the imagination of the world. He is the most effective satirist of Rome, not because he was the greatest writer who made satire his theme, but because the age in which he lived supplied the largest material for purely satiric representation, and because his eye was fixed on the more sombre aspects of his time to the exclusion of those happier or more genial aspects which are reflected in the pages of Statius, Martial, and Pliny. The first impression produced by the satire of Juvenal is more powerful than that produced by the satire of Horace, as the impression produced by the tragical and sensational incidents of life is greater than that produced by its ordinary course and its lighter humours. The final verdict as to their relative excellence need not be in accordance with the first impression, but will be determined by the abiding sense of truth and conformity with real life which each representation leaves upon us. But Juvenal does stand prominently out, not in ancient literature only, but in the literature of the world, as the typical example of a social satirist, writing with a serious purpose. The burning indignation to which he attributes the inspiration of his verse, and its not unfrequent accompaniment, the "censure of a sardonic laugh," are his distinguishing notes.

Not is it only in respect of subject-matter and the spirit in which that is treated, but also in respect of literary form and style, that poetical satire finds its typical representative in Juvenal. The systematic treatment of some special topic, the sustained rhetorical pitch, so unlike the natural conversational manner of Horace, at which the treatment is maintained, the strongly-drawn scenes and portraits illustrative of the theme, the effort to make every line effective by point and emphasis, which distinguish some of the great products of modern poetical satire, have their prototype in Juvenal. The frank communicativeness,—the impulse to establish a confidential relation with the reader,—which made the writings of Lucilius appear to a later generation like a "picture of his life" drawn by his own hand, and which gives to the satires of Horace all the charm of an autobiography, has altogether disappeared from the satire of Juvenal, and given place to an attitude almost as impersonal as that assumed in the letters of Junius. And this is the attitude which modern poetical satire for the most part maintains. It commands respect by the boldness and incisiveness of its assaults on classes and individuals, or it gains popularity by gratifying the natural love of detraction, but it leaves to the prose essayist and the novelist the humbler part of acting on the reader through his sympathies.

This absence from the writings of Juvenal of that personal element which played so large a part in the satires of Lucilius and Horace forces us to depend almost entirely on external evidence for our knowledge of his life. And our available external evidence is unfortunately very meagre and untrustworthy. After reviewing it all and reading it as far as possible by light derived from his own writings, we shall have to acknowledge that we know very little with certainty of his career, that the impression we form of his character and associations is indistinct and perhaps fallacious, and that even the indications which seem to fix the date of the composition of various satires may be misleading. Still, in order to read his writings with full profit and pleasure, we must try to bring ourselves in thought as near to the writer as our knowledge admits of. The ideal presentation of human life and character in an epic poem or drama bears its own evidence of its truth. It either conforms to, or fails to conform to, what the imagination conceives of the capabilities of human nature. In reading the realistic representation of an exceptional phase of society, we wish to know whether the painter of it was, from his position, likely to have seen and understood it, whether his object was to describe it as he saw it, and whether he was a man capable of judging it reasonably and candidly.

A brief account of Juvenal's life, varying considerably in some of its details, is prefixed to the different MSS. of his works. But the original on which these various versions of the life are founded cannot be traced to Suetonius or to any competent authority, and some of the statements contained in it are intrinsically improbable. According to the form prefixed to the most valuable of the MSS., "Juvenal was the son or ward of a wealthy freedman; he practised declamation till middle age, not as a professional teacher, but as an amateur, and made his first essay in satire by writing the lines on Paris, the actor and favourite of Domitian, now found in the seventh satire (line 90 sq.):—

'Quod non dant proceres, dabit ludibrio,' &c.

Encouraged by their success, he devoted himself diligently to this kind of composition, but refrained for a long time from either publicly reciting or publishing his verses. When at last he did come before the public, his recitations were attended by great crowds and received with the utmost favour. But the lines originally written on Paris, having been inserted in one of his new satires, excited the jealous anger of an actor of the time, who was a favourite of the emperor, and procured the poet's banishment under the form of a military appointment to the extremity of Egypt. Being then eighty years of age, he died shortly afterwards of grief and vexation." In one account the time of his banishment is said to have been the last years of Domitian; in another he is said to have been appointed to a command against the Scots by Trajan, in another to have died in exile in the reign of Antoninus Pius, and in another to have died of a broken heart on his return to Rome, because he found his friend Martial was no longer there. One account even makes Claudius the author of his banishment. In several Aquinum is mentioned as his birthplace, and in one he is said to have been born in the time of Claudius.

Some of these statements are so much in consonance with the indirect evidence afforded by the satires that they might almost be supposed to be a series of conjectures based upon them. The rare passages in which the poet speaks of his own position, as in satires xi. and xii., indicate that he was in comfortable but moderate circumstances. We should infer also that he was not dependent on any professional occupation, and that he was separated in social station, and probably too by tastes and manners, from the higher class to which Tacitus and Pliny belonged, as he

¹ *D. Junii Juvenalis Satiræ, with a literal English prose translation and notes*, by John Delaware Lewis, M.A.

was by character from the new men who rose to wealth by servility under the empire. Juvenal is no organ of the pride and dignity, still less of the urbanity, of the cultivated representatives of the great families of the republic. He is the champion of the more sober virtues and ideas, and perhaps the organ of the rancours and detraction, of an educated but depressed and embittered middle class. The literary representative of such a class might well be found in the heir of a well-to-do freedman, born and bred in a provincial town, too independent both in position and character to become permanently a hanger-on of the great, and perhaps too ungracious in manner and uncompromising in speech to mix easily with the class which inherited the aristocratic and courtly traditions of Roman literature. The statement that he was a trained and practised declaimer is confirmed both by his own words (i. 16) and by the rhetorical mould in which his thoughts and illustrations are cast. The allusions which fix the dates when his satires first appeared, and the large experience of life which they imply, agree with the statement that he did not come before the world as a professed satirist till after middle age.

The statement that he continued to write satires long before he gave them to the world accords well with the nature of their contents and the elaborate character of their composition. They are not the expression of some passing impulse, but seem to sum up the experience of a lifetime. They have indeed the freshness of immediate impressions, but they are so combined as to show that they have been long brooded over before assuming their final form. And that he was known as a writer of satires for years before the publication of any of them in their present form might almost be inferred from the emphatic but yet guarded statement of Quintilian in his short summary of Roman literature. After speaking of the merits of Lucilius, Horace, and Persius as satirists, he adds, "There are, too, in our own day, distinguished writers of satire whose names will be heard of hereafter" (*Inst. Or.* x. 1, 94). There is no Roman writer of satire who could be mentioned along with those others by so judicious a critic, and whose names have been heard of in after times, except Juvenal.

The motive which a writer of satire must have had for secrecy under Domitian is sufficiently obvious; and the necessity of concealment and self-suppression thus imposed upon the writer may have permanently affected his whole manner of composition.

So far the various authors of these lives have followed a probable and consistent tradition. But when we come to the story of the poet's exile, they are at variance both with probability and with one another. Some apparent confirmation is given to the tradition by the lines of a poet of the 5th century, Sidonius Apollinaris:—

"Nec qui consensu deinde casa
Ad vulgi tonitruum strepitus avarum
Irati fuit histriois exil"

There is no reason to doubt that these lines refer to Juvenal, but they only prove that the original story from which all the varying lives are derived was generally believed before the middle of the 5th century of our era. If Juvenal was banished at the age of eighty, the author of his banishment could not have been the "enraged actor" in reference to whom the original lines were written, as Paris was put to death in 83, and Juvenal was certainly writing satires long after 100 A.D. The satire in which the lines now appear was probably first published soon after the accession of Hadrian, when Juvenal was not an octogenarian but in the maturity of his powers. The cause of the poet's banishment at that advanced age could not therefore have been either the original composition or the first publication of the lines. But it has been conjectured that the anger of another actor, a favourite of the emperor, may have

been excited by a later application of them on some public occasion, and that the poet was punished for this unfortunate revival of lines which had never been intended for the person who resented them. Against this conjecture, based on a number of confused, uncertain, and contradictory traditions, we have to weigh the intrinsic improbability of the story. An expression in sat. xv. 45 is quoted as a proof that Juvenal had visited Egypt. He may have done so as an exile or in a military command; but it seems hardly consistent with the importance which the emperors attached to the security of Egypt, or with the concern which they took in the interests of the army, that these conditions were combined at an age so unfit for military employment. If any conjecture is warrantable on so obscure a subject, it is more likely that this temporary disgrace may have been inflicted on the poet by Domitian. Among the many victims of Juvenal's satire it is only against him and against one of the vilest instruments of his court, the Egyptian Crispinus, that the poet seems to be animated by personal hatred.¹ A sense of wrong suffered at their hands may perhaps have mingled with the detestation which he felt towards them on public grounds. But if he was banished under Domitian, it must have been either before or after the year 93 A.D., at which time, as we learn from an epigram of Martial, Juvenal was in Rome. The whole story may be ranked with the tradition of the love potion which is said to have maddened Lucretius, as one resting on such slight evidence as to admit neither of confirmation nor refutation.

More ancient and apparently more authentic evidence of the position filled by Juvenal during some period of his life has been recovered in recent times, in the form of an inscription found at Aquinum, recording, so far as it can be deciphered, the dedication of an altar to Ceres, by Junius Juvenalis, tribune of the first cohort of Dalmatians, "duumvir quinquennalis," and "flamen Divi Vespasiani." The terms of this inscription, when read along with one of the few passages in the satires in which Juvenal distinctly speaks of himself (iii. 318 sq.)—

"Et quotiens tu
Roma tuo refecti properantem iedidit Aquino,
Me quoque ad Helvianum Cereum vestrumque Dianam
Converte a Cumis: salutarum ego, nil pudet illas,
Auditor gelidos veniam caligatus in agros—"

leaves little doubt that the author of the inscription was either the poet himself or some member of his family, of whose existence we have no other indication. If then, as is most probable, Juvenal is himself the author of it, we learn that he did hold, at one period of his life, a post of military rank, one of municipal importance in his native town, and a priesthood of the deified Vespasian. But to what period of his life does this tablet bear evidence? The fact that he filled the position of "duumvir quinquennalis" shows that he was a man of influential position in the *municipium*, but the office was only held for a year,—the year apparently in which the census was taken at Rome,—and its tenure does not imply any prolonged absence from the metropolis. The satires, though they indicate an occasional preference for the simpler life of the country towns, are the product not of leisure in the provinces but of immediate and intimate familiarity with the life of the great city; and an epigram of Martial, written at the time when Juvenal was most vigorously employed in their composition, speaks of him as settled in Rome. It is possible, but not likely, that he may have retired to his native town in the latter years of his life, and that the last book of his satires (xiii.—xvi.), which contains no im-

¹ For the possible connexion of Crispinus with Juvenal's banishment compare Mayor, vol. ii. p. 421.

mediate references to Rome, and is written in a less angry mood than the earlier ones, may be the work of this retirement, and that it may have been during that time that he filled this office. On the other hand, it was by Domitian that the worship of Vespasian was established with especial sanctity, and it may be doubted whether a priesthood instituted in his honour would be recorded as a title of dignity late on in the reign of Hadrian. The lines already quoted from satire iii. imply that during his early career as a satirist Juvenal maintained his connexion with Aquinum, and that he had some special interest in the worship of the "Helvinian Ceres." Nor is the tribute to the national religion implied by the dedication of the altar to Ceres inconsistent with the beliefs and feelings expressed in the satires. While the fables of mythology are often treated contemptuously or humorously by him, other passages in the satires clearly imply a conformity to and even a respect for the observances of the national religion.¹ The spirit of Juvenal, which sought for a standard of right action rather in the old Roman and Italian traditions than in the tenets of philosophy, would incline him to sympathize with the revival of religious observance and also of a kind of belief in divine agency on human affairs, which accompanied the establishment of the empire. The evidence as to the military post filled by him is curious, when taken in connexion with the confused tradition of his exile in a position of military importance; and there appears to be some further evidence that the cohort of which he was tribune was quartered in Britain. But it cannot be said that the satires bear traces of military experience. The life described in them is such as would present itself to the eyes of a civilian, and would be talked about and commented on at the dinner tables and in the clubs, baths, theatres, and places of public resort in the great metropolis.²

The only other contemporary evidence which affords a glimpse of his actual life is contained in three epigrams of Martial. Two of these (vii. 24 and 91) were written in the time of Domitian, the other (xii. 18) early in the reign of Trajan, after Martial had retired to his native Bilbilis. The first of these epigrams, addressed to some backbiter who had endeavoured to embroil the two friends with one another, attests the strong regard which Martial felt for him; but the subject of the epigram seems to hint that there may have been something suspicious or uneasy in the temper of the satirist, which made the maintenance of a steady friendship with him difficult. In the second of these epigrams, addressed to Juvenal himself, the epithet "*facundus*" is applied to him, one which might equally be employed whether he was best known at the time as a writer of poetic satires or as an eloquent rhetorician. In the last Martial imagines his friend wandering about discontentedly (*inquietus*) through the crowded streets of Rome, and undergoing all the discomforts incident to attendance on the levees of the great:—

"*Dux per limina totipotens
Sudatrix toga ventilat.*"

Two lines in the poem (22-3) suggest that the satirist, who has inveighed with just severity against the worst corruptions of Roman morals, was not too rigid a censor of the morals of his friend. Indeed, his intimacy with Martial is a ground for not attributing to him exceptional strictness of life.

The additional information as to the poet's life and circumstances derivable from the satires themselves is not

important. He tells us what might easily be inferred from the number of allusions to the Greek and Latin poets contained in his satires, that he had enjoyed the training which all educated men received in his day (i. 15); he indicates, as was mentioned above, his connexion with the old Volscian town Aquinum; he speaks of his farm in the territory of Tibur (xi. 64), which furnished a young kid and mountain asparagus for a homely dinner to which he invites a friend during the festival of the Megalesia. In the satire in which this invitation is contained, and in one or two more of the later ones, he seems partially to remove the mask which he wears in the earlier and more directly aggressive satires. From it we are able to form an idea of the style in which he habitually lived, and to think of him as enjoying a hale and vigorous age (line 203), and also as a kindly master of a household (159 *sq.*). The negative evidence afforded in the account of his establishment, and the bitter tone in which his friend is reminded of his domestic unhappiness (186-9), suggest the inference that, like Lucilius and Horace, Juvenal had no personal experience of either the cares or the softening influence of family life. A comparison of this poem with the invitation of Horace to Torquatus (*Ep.*, i. 5) brings out strongly the differences not in urbanity only but in kindly feeling between the two satirists. It reminds us also of how much less we know of the one poet than of the other, and of how shadowy a personage the Persius of the one is as contrasted with the Torquatus of the other.

An excellent critic of Latin literature, M. Gaston Boissier, has drawn from the indications afforded of the career and character of the persons to whom the satires are addressed most unfavourable conclusions as to the social circumstances and associations of Juvenal. If we believe that the Trebians, Postumus, Pontius, Nevola, Persius, of the satires were real people, with whom Juvenal lived in intimacy, we should conclude that he was most unfortunate in his associates, and that his own relations to them were marked rather by outspoken frankness than civility. But these passages seem to be more "*nomina multa*" than real men, they serve the purpose of enabling the satirist to aim his blows at one particular object instead of declaiming at large. They have none of the individuality and traits of personal character discernible in the Danaëus or Trebatius of Horace's satires, or the Julius Florus, the Torquatus, the Celsus, the Pasetus, the Bullatius, &c., of the epistles. It is noticeable that, while Juvenal writes of the poets and men of letters, Statius, Sabinus Bassus, Quintilian, &c., of a somewhat earlier time, as if they were still living, he has no reference to the career or reputation of his friend Martial, and that he is equally silent about the two illustrious writers who wrote their works during the years of his own literary activity,—the younger Pliny and Tacitus. It is equally noticeable that among the many cultivated and estimable men and women who are brought before us in the correspondence of the former of these writers the name of Juvenal does not appear.

We feel on more certain ground in endeavouring to determine the times at which the satires were given to the world. But these do not in all cases coincide with those at which they were written and to which they immediately refer. Thus the manners and personages of the age of Domitian often supply the material of satiric representation, and are spoken of as if they belonged to the actual life of the present,³ while allusions even in the earliest show that, as a finished literary composition, it belongs to the age of Trajan. The most probable explanation of these discrepancies is that already hinted at, viz., that in their present form the satires are the work of the last thirty years of the poet's life, while the first nine at least, the most powerful and most characteristic among them, not only reproduce the impressions of his earlier manhood, but may have preserved with little change passages written and perhaps familiarly known in his own literary circles during this earlier time.

¹ See especially xiii. 8-16.

² Comp. i. 145, "It nova nec tristis per cunctas fabula cenat"; xi. 8 *sq.*

³ "Omnis convictus, thermæ, stationes, omne theatrum De Ratilo."

³ This is especially noticeable in the seventh satire, but it applies also to the mention of Crispinus, Latinus, the class of *delatores*, &c., in the first, to the notice of Volcento in the third, of Rutilius Blaesus in the eighth, of Gallius in the thirteenth, &c.

This seems more probable than that he should have used such famous names as those of Statius and Quintilian to signify some poet or rhetorical professor of a later time; although probably like Horace he may have availed himself either of false names, or names belonging to a former time, for his satiric nomenclature. The combination of the impressions, and, perhaps of the actual compositions, of different periods also explains a certain want of unity and continuity found in some of them.

There is no reason to doubt that the sixteen satires which we possess were given to the world in the order in which we find them, and that they were divided, as they are referred to in the ancient grammarians, into five books. A minute examination of the various satires composing these books enables us to form at least a probable conjecture as to the intervals at which they appeared, and to conceive the changes of mood through which the poet passed during these intervals. Book I, embracing the first five satires, is written in the freshest vigour of the author's powers, and is animated with the strongest hatred of Domitian. The publication of this book belongs to the early years of Trajan. The mention of the exile of Alarbus (49) shows that it was not published before the year 100 A.D. In the second satire, the lines 29 sq.,

"Quata eras, nuper tragice polluitis adulter
Concubitus,"

show that the memory of one of the foulest scandals of the reign of Domitian was still fresh in the minds of men. The third satire, imitated by Johnson in his *London*, presents such a picture as Rome may have offered to the satirist at any time in the 1st century of our era; but it was under the worst emperors, Nero and Domitian, that the arts of flatterers and foreign adventurers were most successful, and that such scenes of violence as that described at 277 sq. were most likely to occur; while the mention of Vindex (185) as still enjoying influence is a distinct reference to the court of Domitian. The fourth, which alone has any political significance, and reflects on the emperor as a frivolous trifler rather than as a monster of lust and cruelty, is the reproduction of a real or imaginary scene from the reign of Domitian, and is animated by the profoundest scorn and loathing both of the tyrant himself and of the worst instruments of his tyranny. The fifth is a social picture of the degradation to which poor guests were exposed at the banquets of the rich, but many of the details of Martial and the more sober evidence of one of Pliny's letters show that the picture painted by Juvenal, though perhaps exaggerated in colouring, was drawn from a state of society prevalent during and immediately subsequent to the times of Domitian.¹ The second book contains the most elaborate of the satires, that which by many critics is regarded as the people's masterpiece, the famous sixth satire, directed against the whole female sex, which shares with Domitian and his creatures the most cherished places in the poet's antipathies. It shows certainly no diminution of vigour either in its representation or its invective. If it is desirable that such a subject should be treated in the spirit in which Juvenal has treated it, it may be regarded as fortunate that it has been done once for all with such power, with such freedom from the restraints imposed either by modesty or humanity, and with, apparently, such intimate knowledge, that no writer of later ages has attempted to rival it. The time at which this satire was composed cannot be fixed with certainty, but some allusions (lines 692, 407-11, 208, 656?) render it highly probable that it was given to the world in the later years of Trajan, and before the accession of Hadrian. The date of the publication of Book III., containing the seventh, eighth, and ninth satires, seems to be fixed by its opening line "Et spes of ratio stultiorum in Cesare tantum," to the first years after the accession of Hadrian. If the seventh satire stood alone, we might, from the notices of Statius, Quintilian, &c., regard it as probably belonging to the age of Domitian; nor is it unlikely that much of it was written then, and that the condition of poets and men of letters there described, with more of fellow-feeling than is apparent in most of his satires, is drawn from the life at Rome with which the poet was first familiar. But it is inconceivable that the complimentary language applied to "Cæsar," in the opening lines could have been meant for Domitian; and the now hopes which are held out for the neglected race of poets would naturally be suggested by the change from the rule of a great soldier, whose thoughts were chiefly bent on foreign conquest, to that of an accomplished lover of art, like Hadrian. In the eighth satire another reference is made (line 120) to the misgovernment of Marius in Africa as a recent event (*nuper*), and at line 81 there may be an allusion to the Eastern wars that occupied the last years

of Trajan's reign. The myth has no allusion to determine its date, but it is written with the same outspoken freedom as the second and the sixth, and belongs to the period when the poet's power was most vigorous, and his exposure of vice most uncompromising. In the fourth book, comprising the famous tenth, the eleventh, and the twelfth satires, the author appears more as a moralist than as a pure satirist. In the tenth, the theme of the "vanity of human wishes" is illustrated by great historic instances, rather than by pictures of the men and manners of the age; and, although the declamatory vigour and power of expression in it are occasionally as great as in the earlier satires, and although touches of his satiric humour, and especially of his misogyne, appear in all the satires of this book, yet their general tone shows that the white heat of his indignation is abated; and the lines of the eleventh, already referred to (199 sq.),

"Spectent juvenes quos clamor et audax
Sporas, quos cæta decet assiduo pulchre;
Nostia libet venenum comitæta cunctis scdm,"

leave no doubt that he was well advanced in years when they were written.

Two important dates are found in the last book, compiling satires xxi.-xvi. At xxi 16 Juvenal speaks of his friend Calpurnius "as now past sixty years of age, having been born in the consulship of Fonteius." There was a C. Fonteius Capito consul in 59 A.D., and L. Fonteius Capito in 87. It is accepted that the different books of the satires appeared at different intervals, that the third book was given to the world after Hadrian's return to Rome (118 A.D.), and that some time must have elapsed between the appearance of the third and fourth books, and again between that of the fourth and fifth, the date referred to must be the latter of these, and thus the fifth and last book could not have been published till after the year 127 A.D. Again at xvi. 27 an event is said to have happened in Egypt "nuper consule Junco," for which some editions read "Junio." There was a Junius consul in 119 A.D. Even if he were the person referred to, the word *nuper* (as at li. 29, vii. 120) might well indicate a date of some ten or twelve years earlier than that of the composition of the satire. Recent investigations, however, make out that there was a L. Zmilis Junus consul *suffectus* in 127 A.D. (see Mayor's note on the passage). The fifth book must therefore have been published some time after this date. More than the fourth, this book bears the marks of age, both in the milder tone of the sentiments expressed, and in the feebler power of composition exhibited. The last satire is left incomplete, and the authenticity both of it and of the fifteenth has been questioned, though on insufficient grounds.

The general conclusion arrived at is that the satires were published at different intervals, and for the most part, composed, under Trajan and Hadrian, between the years 100 and 130 A.D., or a year or two later, but that the most powerful in feeling and vivid in conception among them deal with the experience and impressions of the reign of Domitian, occasionally recall the memories or traditions of the times of Nero and Claudius, and reproduce at least one startling page from the annals of Tiberius.² The same overmastering feeling which constrained Tacitus (*Agrie*, 2, 3), when the time of long endurance and silence was over, to recall the "memory of the former oppression," acted upon Juvenal. There is no evidence that these two great writers, who lived and wrote at the same time, who were animated by the same hatred of the tyrant under whom the best years of their manhood were spent, and who both felt most deeply the degradation of their times, were even known to one another. They belonged to different social circles, Tacitus to that of the highest official and senatorial class, Juvenal apparently to the middle class and to that of the struggling men of letters; and this difference in position had much influence in determining the different bent of their genius, and in forming one to be a great national historian, the other to be a great social satirist. If the view of the satirist is owing to this circumstance more limited in some directions, and his taste and temper less conformable to

¹ Friedländer supposes that, as Juvenal has hitherto addressed Calpurnius in the second person, the "hic" refers to himself, and that in the words "Fonteius Consule natus" we have the date of the poet's own birth. But elsewhere we find the poet changing suddenly from the second to the third person when there can be no doubt that they both refer to the same individual, e.g. (v. 18) —

"Votorum summi! quid ultra
Quæris? habet Treblius, propter quod," &c.

² s. 56-107.

¹ Cf. Tacitus, *Annals*, xii. 25.

² Pliny's remarks on the vulgarity as well as the ostentation of his host imply that he regarded such behaviour as exceptional, at least in the circle in which he himself lived (*Ep.*, ii. 6).

³ See Mr Lewis's edition, p. 317.

the best ancient standards of propriety, he is also saved by it from prejudices to which the traditions of his class exposed the historian. But both writers are thoroughly national in sentiment, thoroughly masculine in tone. No ancient authors express so strong a hatred of evil. None of the other contemporary writers share this feeling. Pliny has the natural repugnance of a gentleman and honourable man to coarseness and baseness; but he liked to live with people of tastes and manners congenial to his own, and to see as little as possible of the corruption which existed under the surface of society. Martial, as a foreigner living in Rome, endowed with a lively observation and a keen capacity for pleasure, enjoyed whatever was enjoyable in the life around him, found in its excesses and perversions materials for his wit, and, after flattering the worst of the emperors assiduously through all his career, was ready with impartial sycophancy to flatter one of the best. The peculiar greatness and value of both Juvenal and Tacitus is that they did not shut their eyes to the evil through which they had lived, but deeply resented it,—the one with a vehement and burning passion, like the "sæva indignatio" of Swift, the other with perhaps even deeper but more restrained emotions of mingled scorn and sorrow, like the scorn and sorrow of Milton when "fallen on evil days and evil tongues." The wickedness of the age brought out more strongly than at any previous time the opposition between good and evil. The idea of conscience, as the connecting bond between religion and morality, appears in greater prominence in Tacitus and Juvenal than in any other ancient writers.

There is a criticism of an eminent living writer¹ to the effect that the secret of Juvenal's concentrated power consisted in this, that he knew what he hated, and that what he did hate was despotism and democracy. But it would be hardly true to say that the animating motive of his satire was political. It is true that he finds the most typical examples of lust, cruelty, lewdity, and weakness in the emperors and their wives,—in Domitian, Otho, Nero, Claudius, and Messalina. It is true also that he shares in the traditional idolatry of Brutus, that he strikes at Augustus in his mention of the "three disciples of Sulla," and that he has no word of recognition for what even Tacitus acknowledges as the beneficent rule of Trajan. So too his scorn for the Roman populace of his time, who cared only for their dule of bread and the public games, is unqualified. But it is only in connexion with its indirect effects that he seems to think of despotism; and he has no thought of democracy at all. It is not for the loss of liberty and of the senatorian rule that he chafes, but for the loss of the old national manliness and self-respect, alike in the descendants of "the Latian boors"² and in the representatives of the *Æmili* and the *Fabii*. There is no more grandly imaginative passage in all his satires than that in which he evokes the ghosts of those who died at Cremera and Cannæ (ii. 153 sq.) to shame the degenerate debauchees of his own time. While we feel that we know little or nothing of his career, while we may imagine that personal disappointment may have supplied some of the gall in which his pen is dipped, and may doubt whether his own life and associations would have justified him in acting as a severer censor on what most Romans regarded as permitted indulgences than Lucilius and Horace, we cannot doubt that both his intellect and character were of a most masculine strength, and that his hatred for all that corrupted the old national character and enfeebled the national intellect was sincere and consistent. This feeling explains his detestation of foreign manners and superstitions, his loathing not only of inhuman crimes and

cruelties but of such derelictions from self-respect as the appearance of a Roman nobleman on the arena or even the more harmless indulgence of a taste for driving, his scorn of luxury and of art as ministering to luxury, his mockery of the poetry and of the staid and dilettante culture of his time, and perhaps, too, his indifference to the schools of philosophy and his readiness to identify all the professors of stoicism with the reserved and close-cropped puritans,—

"Rarus sermo illis et multa libido tacendi
Adque supercilio brevis coma,"—

who concealed the worst vices under an outward appearance of austerity. The great fault of his character, as it appears in his writings, is that he too exclusively indulged this mood. It is much more difficult to find what he loved and admired than what he hated. But it is characteristic of his strong nature that, where he does betray any sign of human sympathy or tenderness, it is for those who by their weakness and position are dependent on others for their protection,—as for "the peasant boy with the little dog, his playfellow,"³ or, for "the home-sick lad from the Sabine highlands, who sighs for his mother whom he has not seen for a long time, and for the little lust and the familiar kids."⁴

If Juvenal is to be ranked as a great moralist, it is not for his greatness and consistency as a thinker on moral questions. In the rhetorical exaggeration of the famous tenth satire, for instance, the highest energies of patriotism,—the gallant and desperate defence of great causes, by sword or speech,—are quoted as mere examples of disappointed ambition; and, in the indiscriminate condemnation of the arts by which men sought to gain a livelihood, he leaves no room for the legitimate pursuits of industry. His services to morals do not consist in any positive contributions to the notions of active duty, but in the strength with which he has realized and expressed the restraining influence of the old Roman and Italian ideal of character, and also of that religious conscience which was becoming a new power in the world. Though he disclaims any debt to philosophy (xiii. 121), yet he really owes more to the "Stoica dogmata," then prevalent, than he is aware of. But his highest and rarest literary quality is his power of painting characters, scenes, incidents, and actions, whether from past history or from contemporary life. In this power, which is also the great power of Tacitus, he has few equals and perhaps no superior among ancient writers. The difference between Tacitus and Juvenal in power of representation is that the prose historian is more of an imaginative poet, the satirist more of a realist and a grotesque humorist. He can paint great historical pictures in all their detail—as in the famous representation of the fall of Sejanus,—or call them up with all their imaginative associations in a line or two, as for instance in these—

"Atque ille postquam ad Cimbras stragemque volabant
Qui nunquam attigerant majora cula vera corvi;"

he can describe a character elaborately or hit it off with a single stroke; and in either case he fixes the impression which he desires to produce firmly in the mind. The picture drawn may be a caricature, or a misrepresentation of the fact,—as that of the father of Demosthenes, "blear-eyed with the soot of the glowing mass," &c.,—but it is, with rare exceptions, realistically conceived, and, as is well said by Mr Lewis, it is brought before us with the vivid touches of a Defoe or a Swift. Still more happily the same editor has illustrated Juvenal's power as a realistic painter of scenes from contemporary life,—and of scenes which generally combine grotesque and humorous features with serious

Cum matro et casulis et conluso catullo," &c.—ix. 60.
⁵ xi. 152, 153.

meaning,—by comparing him with the great pictorial satirist of the last century, Hogarth.¹ Yet even in this, his most characteristic talent, his proneness to exaggeration, the attraction which coarse and repulsive images have for his mind, and the tendency to sacrifice general effect to minuteness of detail not unfrequently mar his best effects.

The difficulty is often felt of distinguishing between a powerful rhetorician and a genuine poet,—and there is no writer about whom it is more difficult to determine to which of the two classes he belongs than about Juvenal. He himself knew and has well described (vii. 53 sq.) the conditions under which a great poet could flourish; and he felt that his own age was incapable of producing one. He has little sense of beauty either in human life or nature. Whenever such sense is evoked it is only as a momentary relief to his prevailing sense of the hideousness of contemporary life, or in protest to what he regarded as the enervating influences of art. Even his references to the great poets of the past indicate rather a *blasé* sense of indifference and weariness than a fresh enjoyment of them. Yet his power of touching the springs of tragic awe and horror is a genuine poetical gift, of the same kind as that which is displayed by some of the early English dramatists. But he is, on the whole, more essentially a great rhetorician than a great poet. His training, the practical bent of his understanding, his strong but morose character, the circumstances of his time, and the materials available for his art, all fitted him to rebuke his own age and all after times in the tones of a powerful preacher, rather than to charm them with the art of an accomplished poet. The composition of his various satires shows no negligence, but rather the excess of elaboration; but it produces the impression of mechanical contrivance rather than of organic growth. His movement is sustained and powerful, but there is no rise and fall in it. He seems to forget how much more telling indignation is when it is severely controlled, but allowed occasionally to break forth in blasting scorn and wrath, as it is in Tacitus, than when it shows itself as the habitual mood of the writer. The verse is most carefully constructed, and is also most effective, but it is so with the rhetorical effectiveness of Lucan, not with the musical charm of Virgil. It was calculated to bring down the applause of an excited audience, not to perpetuate its melody through all succeeding times. So, too, the diction is full, even to excess, of meaning, point, and emphasis. Few writers have added so much to the currency of quotation. But his style altogether wants the charm of ease and simplicity. It wears by the constant strain after effect, its mock-heroics, and allusive periphrasis. It excites distrust by its want of moderation. It makes us long to return to nature and to the apparently more careless but really truer art and the lighter touch of the satirist of the Augustan age—

“Parcatis viribus atque
Extenuatis cas consilio.”

On the whole no one of the ten or twelve really great writers whom ancient Rome produced leaves on the mind so mixed an impression, both as a writer and as a man, as Juvenal. He has little, if anything at all, of the high imaginative mood—the mood of reverence and noble admiration—which made Ennius, Lucretius, and Virgil the truest poetical representatives of the genius of Rome. He has nothing of the wide humanity of Cicero, of the urbanity of Horace, of the ease and grace of Catullus. Yet he represents another mood of ancient Rome, the mood natural to her before she was humanized by the lessons of Greek art and thought. If we could imagine the elder Cato living under Domitian, cut off from all share in public

life, and finding no sphere for his combative and censorious energy except that of literature, we should perhaps understand the motives of Juvenal's satire and the place which is his due as a representative of the genius of his country. As a man he shows many of the strong qualities of the old Roman plebeian,—the aggressive boldness, the intolerance of superiority and privilege, which animated the tribunes in their opposition to the senatorial rule. Even where we least like him we find nothing small or mean to alienate our respect from him. Though he loses no opportunity of being coarse, he is not licentious; though he is often truculent, he cannot be called malignant. It is, indeed, impossible to say what motives of personal chagrin, of love of detraction, of the mere literary passion for effective writing, may have contributed to the indignation which inspired his verse. But the prevailing impression we carry away after reading him is that, in all his early satires, he was animated by a sincere and manly detestation of the tyranny and cruelty, the debauchery and luxury, the levity and effeminacy, the crimes and frauds, which we know from other sources were rife in Rome in the century in which Christianity made its first converts there, and that a more serene wisdom and a happier frame of mind were attained by him when old age had somewhat allayed the fierce rage which vexed his manhood.

It would be impossible to enumerate the various editions and works forming the literature connected with Juvenal which have sprung up between the appearance of the *editio princeps* in 1470 and the present day. They occupy more than five pages of E. Huber's *Grundriss zu Vorlesungen über die Römische Literaturgeschichte*. Among the best critical editions of the text is that of O. Jahn, and among those which may be most recommended to students are the editions of Heinrich, Maclean, Mayor, and Lewis. The last is accompanied by a literal prose translation. The verse translations of Dryden and Gifford, and Johnson's imitations of the third and tenth satires in the *London and Vanity of Human Wishes*, will convey to readers ignorant of Latin a good impression of the power of the original. There is no better criticism of Juvenal as a writer than that contributed by the late Professor Ramsey to Dr Smith's *Dictionary of Ancient Biography and Mythology*. (W.Y.S.)

JUXON, WILLIAM (1582-1663), archbishop of Canterbury, was born at Chichester in 1582. Through the interest of his father with the Company of Merchant Taylors he received an appointment to their school, after which he entered St John's College, Oxford, where he was elected a fellow in 1598. In 1603 he became a student of Gray's Inn, but afterwards he took holy orders, and in 1609 had become vicar of St Giles, Oxford, an appointment which he resigned for the rectory of Somerton, Oxfordshire, in 1615. On the recommendation of Laud he succeeded him in November 1621 as president of St John's College; and in 1626 he became vice-chancellor of the university. Having by the continued favour of Laud been promoted successively dean of Worcester, prebendary of Chichester, bishop of Hereford, and bishop of London, he attained finally a dignity outside the ordinary sphere of ecclesiastical aspiration, by being appointed in 1625 to the office of lord high treasurer. The appointment, unusual in itself, was preposterously beyond Juxon's claims, but his strict probity, his prudence, and his quiet and conciliating behaviour won him the regard and goodwill even of those most opposed to him in politics. He resigned this office in 1641. Charles I. chose Juxon to administer to him the last consolations of religion. During the period of puritan ascendancy the bishop retired to his estate of Little Compton, Gloucestershire, where he kept a pack of hounds much famed in the district. At the Restoration he was, on September 20, 1660, promoted to the see of Canterbury. He died at Lambeth palace, June 4, 1663.

Juxon was the author of the *Subjects' Sorrows, or Lamentations upon the Death of Britain's Jewish King Charles, a Sermon*, 1660, and *Some Considerations upon the Act of Uniformity*, 1662. See *Memoirs of Archbishop Juxon and his Times*, Oxford, 1869.

¹ Lewis, *Introduction*, p. 215.

K

K. THE letter K has remained with singularly little change in form even from the Phœnician alphabet down to the present time. It represents the guttural momentary sound produced by raising the back of the tongue to the back of the palate; it is surd, corresponding to G, which is sonant; and it has this value and no other in all modern alphabets in which it is found. In many alphabets, however, it is supplanted wholly or to a great extent by the symbol C. The reason of this has been already explained under the letters C and G. The substitution of C for K took place in Italy,—the original character surviving only in a few well-understood abbreviations; and in consequence of this those alphabets which have been derived from Italy naturally have the C; while those derived directly from the Greek, *e.g.*, the Gothic, which came through Ulfilas, and the different alphabets which trace back to Cyril (see ALPHABET), have only the K. In German we find K, with the exception of some words borrowed from other languages, *e.g.*, Cabinet, Cardinal, Caprice, &c.; but even foreign words when thoroughly naturalized take the German spelling, *e.g.*, Karte, Kammer, Onkel, &c. In French, on the other hand, K is found only in a few foreign words, and even these are merely names of men or countries. In England the large admixture of French words in the Teutonic language has produced some irregularity in spelling; but the K is not found (as might have been expected) in the Teutonic words, because the Roman alphabet was introduced by missionaries into England, and therefore the oldest English (or Anglo-Saxon) writings regularly have C and not K. The letter was introduced probably first in words borrowed from the German (thus in Alfred's version of Gregory's *Pastoral* we find "kyrcgum," l. 297, i. 1, ed. Sweet), the dative of the German "Kirche," or through German influence, as for example in the *Blicking Homilies* of the 10th century, we find "kyning" (p. 163, l. 23, ed. Morris) beside the much more common "cynig." It would have been very convenient both in English and in other languages of modern Europe if K could have been kept as the sole symbol for the pure sound and C as the symbol for a common corruption of it, now to be described.

This corruption is due to palatization; the middle instead of the back of the tongue is raised against the palate, and the result is the difference of sound between, *e.g.*, "kirk" and "church." This corruption was common in Sanskrit, and a special symbol was assigned to the sound. It is found in late Latin, especially before an *i*; and so it passed into Italian, where *c* is regularly sounded as our *ch* before *e* and *i*; in the words where the sound remained unchanged the symbol *ch* is employed to represent it, *e.g.*, in "che." In French the change was much greater; here *c* passed into the *sh*-sound (denoted by *ch*) before *a*, *e.g.*, in "chambre" from "camera," "chaud" from "calidus"; observe that the symbol *ch* has just the opposite value to the Italian one; while before *e* and *i* the sound underwent a still greater change; it sank into the simple sibilant *s*, *e.g.*, "civitas"—pronounced in Latin "kivitas"—became "cité," whence our own sound; "certus" became "certain." In English, palatization has been very extensive; thus Old English "cæse" (sounded like German "kase") became "cheese," "cild" became "child" &c.; here dialectal variation may often be seen, *e.g.*, in Alnwick but Norwich, Caistor but Chester.

Another still greater change of K has been called "labialization"; this is the passage of the *k*-sound through an

intermediate *kw* into *p*. This was common in Greek, where, *e.g.*, we find *ἐπομαι, τρέπω*, of which the root form as shown by other languages was SAK, TARK; in Latin we have the transitional forms "sequ-or," "torqu-eo"; in the Italian dialects the change was complete, *e.g.*, Oscan "pid" corresponded to Latin "quid," and Umbrian "pumpe" to "quomque." This change arose from a slight rounding of the lips while the speech-organs were in the position for *k*-sound; this produced a more or less distinct *kw* according to the amount of the rounding, passing finally into *p*, when the rounding amounted to absolute closing of the lips. For the intermediate sound the Latin employed the symbol Q, which is a slightly turned form of the original *q* (Koppa) taken by the Greeks from the Phœnician, but not required by them, and therefore suffered to fall out except in numeration; the Latin took it on, and, if it had consistently employed it alone to denote the slightly labialized *k*, the result would have been good; but it regularly added *u* to it (QU), so that the Q might as well have been written K. The superfluous letter passed on to the French and English languages.

There is reason for believing that this labializing tendency is very old,—as old indeed as the Indo-European language itself. It is probable that that language had both the *k* pure and another with a slight *u* sound following it. This appears from the fact (first thoroughly ascertained by Fick) that in one set of cognate words which had an original *k*, we find *ch* in Sanskrit, *κ* or *π* in Greek, *c* or *qu* in Latin, *k* in Lithuanian and Slavonic; in another set we find *ç* in Sanskrit, *sz* (which is our *sh*-sound) in Lithuanian, *s* in Slavonic, but only *k* in Greek and *c* in Latin; that is, in one set we see the phenomenon of labialism, in the other assimilation but no touch of labialism; from which we infer that the assimilated *k* in the derived languages traces back to *k* pure, the labialized *k* to a sound which in the original language was at least slightly modified from *k*. An instance of the assimilation may be seen in the correspondence of Sanskrit "gātam," Lithuanian "szimtas," to Latin "centum," Greek *ἐκατόν*; neither in Greece nor in Italy is there any labialized form of this word.

KAABA, KA'BA, or KAABEH, the sacred shrine of Mahometanism, containing the "black stone," in the middle of the great mosque at Mecca. See ARABIA, vol. ii. p. 262, and MECCA.

KAADEN, chief town of a department in the circle of Eger, Bohemia, is situated on the Eger, about 60 miles north-west of Prague. The town lies about 2 miles E. of the station of Kaaden-Brunnersdorf, on the railway between Eger and Carlsbad, and consists of an old town, surrounded by a wall, and two suburbs. It contains two convents, a commercial school, and a school of agriculture. The chief buildings are the Late Gothic Franciscan church, and the town-house with a noteworthy tower. The manufactures include gloves and beet-root sugar; there is some trade in wood and grain; and mining for anthracite and a mineral colouring material, yielding *Kaulen green*, is carried on in the neighbourhood. Kaaden was founded about 820; in 1277 it became a free city; and in 1534 it saw the conclusion of a peace between Ferdinand I., king of the Romans, and Ulrich I., duke of Wurtemberg. The population in 1869 was 5057.

KABBAIAH is now used as the technical name for the system of theosophy which began to be developed among the Jews in the 10th century, and which has also played an important part in the Christian church since the Middle

Agos. The term primarily denotes "reception" and then "doctrines received by tradition." In the older Jewish literature the name is applied to the whole body of received religious doctrine with the exception of the Pentateuch, thus including the Prophets and Hagiographa as well as the oral traditions ultimately embodied in the Mishnah. It is only since the 11th or 12th century that Kabbalah has become the exclusive appellation for the renowned system of theosophy which claims to have been transmitted uninterruptedly by the mouths of the patriarchs and prophets ever since the creation of the first man.

The cardinal doctrines of the Kabbalah embrace the nature of the Deity, the Divine emanations or Sephiroth, the cosmogony, the creation of angels and man, their destiny, and the import of the revealed law. According to this esoteric doctrine, God, who is boundless and above everything, even above being and thinking, is called *En Soph* (ἄπειρος); He is the space of the universe containing *ro' p'nu*, but the universe is not his space. In this boundlessness He could not be comprehended by the intellect or described in words, and as such the *En Soph* was in a certain sense *Ayinu*, non-existent (*Zohar*, iii. 283). To make his existence known and comprehensible, the *En Soph* had to become active and creative. As creation involves intention, desire, thought, and work, and as these are properties which imply limit and belong to a finite being, and moreover as the imperfect and circumscribed nature of this creation precludes the idea of its being the direct work of the infinite and perfect, the *En Soph* had to become creative, through the medium of ten Sephiroth or intelligences, which emanated from him like rays proceeding from a luminary.

Now the wish to become manifest and known, and hence the idea of creation, is co-eternal with the inscrutable Deity, and the first manifestation of this primordial will is called the first *Sephiroth* emanation. This first *Sephiroth*, this spiritual substance which existed in the *En Soph* from all eternity, contained nine other intelligences or *Sephiroth*. These again emanated one from the other, the second from the first, the third from the second, and so on up to ten.

The ten *Sephiroth*, which form among themselves and with the *En Soph* a strict unity, and which simply represent different aspects of one and the same being, are respectively denominated (1) the Crown, (2) Wisdom, (3) Intelligence, (4) Love, (5) Justice, (6) Beauty, (7) Firmness, (8) Splendour, (9) Foundation, and (10) Kingdom. Their evolution was as follows: "When the Holy Aged, the concealed of all concealed, assumed a

form, he produced everything in the form of male and female, as things could not continue in any other form. Hence Wisdom, the second *Sephiroth*, and the beginning of development, when it proceeded from the Holy Aged (another name of the first *Sephiroth*) emanated in male and female, for Wisdom expanded, and Intelligence, the third *Sephiroth*, proceeded from it, and thus were obtained male and female, viz., Wisdom the father and Intelligence the mother, from whose union the other pairs of *Sephiroth* successively emanated" (*Zohar*, iii. 290). These two opposite potencies, viz., the masculine Wisdom or *Sephiroth* No. 2 and the feminine Intelligence or *Sephiroth* No. 3 are joined together by the first potency, the Crown or *Sephiroth* No. 1; they yield the first triad of the *Sephiric* decade, and constitute the divine head of the archetypal man, as will be seen in the accompanying figure.

From the junction of *Sephiroth* No. 2 and 3 emanated the masculine potency Love or Mercy (4) and the feminine potency Justice (5), and from the junction of the latter two emanated again the uniting potency Beauty (6). Beauty, the sixth *Sephiroth*, constitutes the chest in the archetypal man, and unites Love (4) and Justice (5), which constitute the divine arms, thus yielding the second triad of the *Sephiric* decade. From this second conjunction emanated again the masculine potency Firmness (7) and the feminine potency Splendour (8), which constitute the divine legs of the archetypal man; and these sent forth Foundation (9), which is the genital organ and medium of union between them, thus yielding the third triad in the *Sephiric* decade. Kingdom (10), which emanated from the ninth *Sephiroth*, encircles all the other nine, inasmuch as it is the Shechina, or divine halo, which encompasses the whole by its all-glorious presence.

In their totality and unity the ten *Sephiroth* are not only denominated the World of *Sephiroth*, or the World of Emanations, but, owing to the above representation, are called the primordial or archetypal man (= *prototypos*) and the heavenly man. It is this form which, as we are assured, the prophet Ezekiel saw in the mysterious chariot (*Ezek.* i. 1-28), and of which the earthly man is a faint copy.

As the three triads respectively represent intellectual, moral, and physical qualities, the first is called the Intellectual, the second the Moral or Sensuous, and the third the Material World. In the figure of the archetypal man it will be seen that the three *Sephiroth* on the right are masculine, and represent the principle of rigour, that the three on the left are feminine and represent the principle of mercy, and that the four central or uniting *Sephiroth* represent the principle of mildness. Hence the right is called "the Pillar of Judgment," the left "the Pillar of Mercy," and the centre "the Middle Pillar." The middle *Sephiroth* are synecdochically used to represent the worlds or triads of which they are the uniting potencies. Hence the Crown, the first *Sephiroth*, which unites Wisdom and Intelligence to constitute the first triad, is by itself denominated the Intellectual World. So Beauty is by itself described as the Sensuous World, and in this capacity is called the Sacred King or simply the King, whilst Kingdom, the tenth *Sephiroth*, which unites all the nine *Sephiroth*, is used to denote the Material World, and as such is denominated the Queen or the Matron. Thus a trinity of units, viz., the Crown, Beauty, and Kingdom, is obtained within the trinity of triads. But further, each *Sephiroth* is as it were a trinity in itself. It (1) has its own absolute character, (2) receives from above, and (3) communicates to what is below. "Just as the Sacred Aged is represented by the number three, so are all the other lights (*Sephiroth*) of a threefold nature" (*Zohar*, iii. 288). In this all-important doctrine of the *Sephiroth*, the Kabbalah

The Archetypal Man.

insists upon the fact that these potencies are not creations of the En Soph, which would be a diminution of strength; that they form among themselves and with the En Soph a strict unity, and simply represent different aspects of the same being, just as the different rays which proceed from the light, and which appear different things to the eye, are only different manifestations of one and the same light; that for this reason they all alike partake of the perfections of the En Soph; and that as emanations from the Infinite, the Sephiroth are infinite and perfect like the En Soph, and yet constitute the first finite things. They are infinite and perfect when the En Soph imparts his fullness to them, and finite and imperfect when that fullness is withdrawn from them.

The conjunction of the Sephiroth, or, according to the language of the Kabbalah, the union of the crowned King and Queen, produced the universe in their own image. Worlds came into existence before the En Soph manifested himself in the human form of emanations, but they could not continue, and necessarily perished because the conditions of development which obtained with the sexual opposites of the Sephiroth did not exist. These worlds which perished are compared to sparks which fly out from a red-hot iron beaten by a hammer, and which are extinguished according to the distance they are removed from the burning mass. Creation is not *ex nihilo*; it is simply a further expansion or evolution of the Sephiroth. The world reveals and makes visible the Boundless and the concealed of the concealed. And, though it exhibits the Deity in less splendour than its Sephiric parents exhibit the En Soph, because it is farther removed from the primordial source of light than the Sephiroth, still, as it is God manifested, all the multifarious forms in the world point out the unity which they represent. Hence nothing in the whole universe can be annihilated. Everything, spirit as well as body, must return to the source whence it emanated (Zohar, ii. 218). The universe consists of four different worlds, each of which forms a separate Sephiric system of a decade of emanations. They were evolved in the following order. (1) The World of Emanations, also called the Image and the Heavenly or Archetypal Man, is, as we have seen, a direct emanation from the En Soph. Hence it is most intimately allied to the Deity, and is perfect and immutable. From the conjunction of the King and Queen (i.e., these ten Sephiroth) is produced (2) the World of Creation, or the Briatic world, also called "the Throne." Its ten Sephiroth, being farther removed from the En Soph, are of a more limited and circumscribed potency, though the substances they comprise are of the purest nature and without any admixture of matter. The angel Metatron inhabits this world. He alone constitutes the world of pure spirit, and is the garment of Shaddai, i.e., the visible manifestation of the Deity. His name is numerically equivalent to that of the Lord (Zohar, iii. 231). He governs the visible world, preserves the harmony and guides the revolutions of all the spheres, and is the captain of all the myriads of angelic beings. This Briatic world again gave rise to (3) the World of Formation, or Yetziratic World. Its ten Sephiroth, being still farther removed from the Primordial Source, are of a less refined substance. Still they are yet without matter. It is the abode of the angels, who are wrapped in luminous garments, and who assume a sensuous form when they appear to men. The myriads of the angelic hosts who people this world are divided into ten ranks, answering to the ten Sephiroth, and each one of these numerous angels is set over a different part of the universe, and derives his name from the heavenly body or element which he guards (Zohar, i. 42). From this world finally emanated (4) the World of Action, also called the World of Matter. Its ten Sephiroth are made

up of the grosser elements of the former three worlds; they consist of material substance limited by space and perceptible to the senses in a multiplicity of forms. This world is subject to constant changes and corruption, and is the dwelling of the evil spirits. These, the grossest and most deficient of all forms, are also divided into ten degrees, each lower than the other. The first two are nothing more than the absence of all visible form and organization; the third degree is the abode of darkness; whilst the remaining seven are "the seven internal halls," occupied by the demons, who are the incarnation of all human vices. These seven halls are subdivided into innumerable compartments corresponding to every species of sin, where the demons torture the poor deluded human beings who have suffered themselves to be led astray whilst on earth. The prince of this region of darkness is Sāmāel, the evil spirit, the serpent who seduced Eve. His wife is the Harlot or the Woman of Whoredom. The two are treated as one person, and are called "the Beast" (Zohar, ii. 255-259, with i. 35).

The whole universe, however, was incomplete, and did not receive its finishing stroke till man was formed, who is the acme of the creation and the microcosm. "The heavenly Adam (i.e., the ten Sephiroth) who emanated from the highest primordial obscurity (i.e., the En Soph) created the earthly Adam" (Zohar, ii. 70). "Man is both the import and the highest degree of creation, for which reason he was formed on the sixth day. As soon as man was created everything was complete, including the upper and nether worlds, for everything is comprised in man. He unites in himself all forms" (Zohar, iii. 48). Each member of his body corresponds to a part of the visible universe. "Just as we see in the firmament above, covering all things, different signs which are formed of the stars and the planets, and which contain secret things and profound mysteries studied by those who are wise and expert in these things; so there are in the skin, which is the cover of the body of the son of man, and which is like the sky that covers all things above, signs and features which are the stars and planets of the skin, indicating secret things and profound mysteries whereby the wise are attracted who understand the reading of the mysteries in the human face" (Zohar, ii. 76). The human form is shaped after the four letters which constitute the Tetragrammaton. The head is in the shape of \aleph , the arms and the shoulders are like η , the breast like κ , and the two legs with the back again resemble η (Zohar, ii. 72). The souls of the whole human race pre-exist in the World of Emanations, and are all destined to inhabit human bodies. Like the Sephiroth from which it emanates, every soul has ten potencies, consisting of a trinity of triads. (1) The Spirit (\aleph), which is the highest degree of being, corresponds to and is operated upon by the Crown, which is the highest triad in the Sephiroth, and is called the Intellectual World; (2) the Soul (η), which is the seat of the moral qualities, corresponds to and is operated upon by Beauty, which is the second triad in the Sephiroth, and is called the Moral World; and (3) the Cruder Soul (κ), which is immediately connected with the body, and is the crure of its lower instincts and the animal life, corresponds to and is operated upon by Foundation, the third triad in the Sephiroth, called the Material World. Each soul, prior to its entering into this world, consists of male and female united into one being. When it descends on this earth the two parts are separated and animate two different bodies. "At the time of marriage the Holy One, blessed be he, who knows all souls and spirits, unites them again as they were before; and they again constitute one body and one soul, forming as it were the right and the left of the individual . . . This union, however, is influenced by the

deeds of the man and by the ways in which he walks. If the man is pure and his conduct is pleasing in the sight of God, he is united with that female part of the soul which was his component part prior to his birth" (*Zohar*, i. 91). The soul's destiny upon earth is to develop those perfections the germs of which are eternally implanted in it, and it ultimately must return to the infinite source from which it emanated. Hence, if, after assuming a body and sojourning upon earth, it becomes polluted by sin and fails to acquire the experience for which it descends from heaven, it must three times reinhabit a body, till it is able to ascend in a purified state through repeated trials. If, after its third residence in a human body, it is still too weak to withstand the contamination of sin, it is united with another soul, in order that by their combined efforts it may resist the pollution which by itself it was unable to conquer. When the whole pleroma of pre-existent souls in the world of the Sephiroth shall have descended and occupied human bodies and have passed their period of probation and have returned purified to the bosom of the infinite Source, then the soul of Messiah will descend from the region of souls; then the great Jubilee will commence. There shall be no more sin, no more temptation, no more suffering. Universal restoration will take place. Satan himself, "the venomous Beas," will be restored to his angelic nature. Life will be an everlasting feast, a Sabbath without end. All souls will be united with the Highest Soul, and will supplement each other in the Holy of Holies of the Seven Heals (*Zohar*, i. 45, 168; ii. 97).

According to the Kabbalah all these esoteric doctrines are contained in the Hebrew Scriptures. The uninitiated cannot perceive them; but they are plainly revealed to the spiritually minded, who discern the profound import of this theosophy beneath the surface of the letters and words of Holy Writ. "If the law simply consists of ordinary expressions and narratives, such as the words of Esau, Isaac, Laban, the ass of Balaam, or Balaam himself, why should it be called the law of truth, the perfect law, the true witness of God? Each word contains a sublime source, each narrative points, not only to the single instance in question, but also to general" (*Zohar*, iii. 149, cf. 152).

To obtain these heavenly mysteries, which alone make the Torah superior to profane codes, definite hermeneutical rules are employed, of which the following are the most important. (1) The words of several verses in the Hebrew Scriptures which are regarded as containing a reasonable sense are placed over each other, and the letters are formed into new words by reading them vertically. (2) The words of the text are ranged in squares in such a manner as to be read either vertically or horizontally. (3) The words are joined together and redivided. (4) The initials and final letters of several words are formed into separate words. (5) Every letter of a word is reduced to its numerical value, and the word is explained by another of the same quantity. (6) Every letter of a word is taken to be the initial or abbreviation of a word. (7) The twenty-two letters of the alphabet are divided into two halves; one half is placed above the other; and the two letters which thus become associated are interchanged. By this permutation, *Alpha*, the first letter of the alphabet, becomes *Lamed*, the twelfth letter; *Beth* becomes *Mem*, and so on. This cipher alphabet is called *Atbash*, from the first interchangeable pairs. (8) The commutation of the twenty-two letters is effected by the last letter of the alphabet taking the place of the first, the last but one the place of the second, and so forth. This cipher is called *Atbash*. These hermeneutical canons are much older than the Kabbalah. They obtained in the synagogue from time immemorial, and were used by the Christian fathers in the interpretation of Scripture. This Canon V., according to which a word is reduced to its numerical value and interpreted by another word of the same value, is recognized in the New Testament (*comp. Rev. xiii. 18*). Canon VI. is adopted by Irenæus, who tells us that, according to the learned among the Hebrews, the name Jesus contains two letters and a half, and signifies that Lord who contains heaven and earth (יֵשׁוּעַ=יְהוָה שְׁלֹשִׁים [יהוה שלשים] (*Agnostic Heresies*, ii. xxiv., vol. i. p. 205, ed. Clark). The cipher *Atbash* (Canon VIII.) is used in Jeremiah xxv. 26, ii. 41, where Sheeshach is written for Babel. In Jer. li. 1, כְּכִי, *Leb-Kamas* (A. V., "the midst of them that rise up against me"), is written for כְּשִׁים, *Chaldan*, by the same rule.

It is necessary to advert to the relation between the Kabbalah and Christianity in order to account for the extraordinary part which this theosophy played in the Christian church, especially at the time of the Renaissance. We have already seen that the Sephiric decade, or the archetypal man, like Christ, is considered to be of a double nature, both infinite and finite, perfect and imperfect. More distinct, however, is the doctrine of the Trinity. On Deut vi. 43, where Jehovah occurs first, then Elohean, and then again Jehovah, we are told "The voice though one, consists of three elements, fire (i.e., warmth), air (i.e., breath), and water (i.e., humidity), yet all three are one in the mystery of the voice and can only be one. Thus also Jehovah, Elohean, Jehovah, constitute one—three forms which are one" (*Zohar*, ii. 43; compare iii. 65). Discussing the thrice holy in Isaiah vi. 3, one codex of the *Zohar* had the following remark: "The first holy denotes the Holy Father, the second the Holy Son, and the third the Holy Ghost" (*comp. Galatinus, De Arcanis Cathol.*, lib. ii. c. 3, p. 31; Wolf, *Bibliotheca Hebraica*, i. 1136). Still more distinct is the doctrine of the atonement. "The Messiah invokes all the sufferings, pain, and afflictions of Israel to come upon Him. Now if He did not remove them thus and take them upon Himself, no man could endure the sufferings of Israel, due as their punishment for transgressing the law; as it is written (Isa. liii. 4), Surely He hath borne our griefs and carried our sorrows" (*Zohar*, ii. 12). These and similar statements favouring the doctrines of the New Testament have made many Kabbalists of the highest position in the synagogue embrace the Christian faith, and write elaborate books to win their Jewish brethren over to Christ. As early as 1480 a company of Jewish converts in Spain, at the head of which were Paul de Herodia, Vidal de Saragossa de Aragon, and Davila, published compilations of Kabbalistic treatises to prove from them the doctrines of Christianity. They were followed by Paul Ricci, professor at Pavia, and physician to the emperor Maximilian I. Sharing the conviction of his fellow converts that the doctrines of the Kabbalah are the doctrines of Christianity, this eminent Hebraist translated into Latin the Kabbalistic work entitled *The Gates of Light*, which he dedicated to the emperor (1516). It was from this work that Pico de Mirandola and John Reuchlin learnt the true secrets of the Kabbalah. Prominent among the "nine hundred theses" which Mirandola had placarded in Rome, and which he undertook to defend in the presence of all European scholars, whom he invited to the Eternal City, promising to defray their travelling expenses, was the following: "No science yields greater proof of the divinity of Christ than magic and the Kabbalah." Mirandola so convinced Pope Sixtus of the paramount importance of the Kabbalah as an auxiliary to Christianity that his holiness exerted himself to have Kabbalistic writings translated into Latin for the use of divinity students. With equal zeal did Reuchlin act as the apostle of the Kabbalah. His treatises exercised an almost magic influence upon the greatest thinkers of the time. Pope Leo X. and the early Reformers were alike captivated by the charms of the Kabbalah as propounded by Reuchlin, and not only divines, but statesmen and warriors, began to study the Oriental languages in order to be able to fathom the mysteries of Jewish theosophy.

Though the followers of this theosophy claim two works as their codes, viz., the *Book of Creation* and the *Zohar*, it is really only the latter which is the Bible of the Kabbalists. The renowned *Zohar* is written in Aramaic, and is a commentary on the Pentateuch, according to its division into fifty-two hebdomadal lessons. It derives its name זוהר, i.e., Light, from the words "Let there be light" (Gen. i. 4), with the exposition of which it begins. Interspersed

throughout the *Zohar*, either as parts of the text with distinct titles or in separate columns, are the following eleven dissertations—(1) "Additions and Supplements"; (2) "The Mansions and Abodes," describing the structure of paradise and hell; (3) "The Mysteries of the Pentateuch," describing the evolution of the Sephiroth, &c.; (4) "The Hidden Interpretation," deducing esoteric doctrine from the narratives in the Pentateuch; (5) "The Faithful Shepherd," recording discussions between Moses the faithful shepherd, the prophet Elijah, and R. Simon b. Yochi, the reputed compiler of the *Zohar*; (6) "The Secret of Secrets," a treatise on physiognomy and psychology; (7) "The Aged," i.e., the prophet Elijah, discoursing with R. Simon on the doctrine of transmigration as evolved from Exod. xxi. 1-xxiv. 18; (8) "The Book of Secrets," discourses on cosmogony and demonology; (9) "The Great Assembly," discourses of R. Simon to his numerous assembly of disciples on the form of the Deity and on pneumatology; (10) "The Young Man," discourses by young men of superhuman origin on the mysteries of ablutions; and (11) "The Small Assembly," containing the discourses on the Sephiroth which R. Simon delivered to the small congregation of six surviving disciples.

The *Zohar* pretends to be a compilation made by R. Simon b. Yochi, who flourished about 70-110 A.D., of doctrines which God communicated to Adam in Paradise, and which have been received uninterruptedly from the mouths of the patriarchs and prophets. Amongst the many facts, however, established by modern criticism which prove the *Zohar* to be a compilation of the 13th century, the following are the most prominent—(1) the *Zohar* itself praises most fulsomely R. Simon, its reputed author, and exalts him above Moses; (2) it mystically explains the Hebrew vowel points which did not obtain till 570; (3) the compiler borrows two verses from the celebrated hymn called "The Royal Diadem," written by Ibn Gebirol, who was born about 1021; (4) it mentions the capture of Jerusalem by the crusaders and the re-taking of the Holy City by the Saracens; (5) it speaks of the comet which appeared at Rome, July 15, 1264, under the pontificate of Urban IV.; (6) by a slip the *Zohar* assigns a reason why its contents were not revealed before 5060-66 A.M., i.e., 1300-1306 A.D.; (7) the doctrine of the En Soph and the Sephiroth was not known before the 13th century; and (8) the very existence of the *Zohar* itself was not known prior to the 13th century. Hence it is now believed that Moses de Leon (ob. 1305), who first circulated and sold the *Zohar* as the production of R. Simon, was himself the author. That eminent scholars both in the synagogue and in the church should have been induced to believe in its antiquity is owing to the fact that the *Zohar* embodies many opinions and doctrines which obtained among the Jews prior to the time of Christ. The undoubted antiquity of these has served as a lever in the minds of these scholars to raise the late speculations about the En Soph, the Sephiroth, &c., to the same age.

Literature.—The *Zohar*, frequently published in 3 vols., the pagination of which, like that of the Talmud, is always the same; Baron von Rosenroth's *Kabbala Denudata*, Sulzbach, 1777-78, Frankfurt, 1844; Awerst, *Commentary on the Doctrine of the Sephiroth*, Warsaw, 1798, Berlin, 1850; id., *Commentary on the Song of Songs*, Altona, 1768; Franck, *La Kabbalah*, Paris, 1843 (trans. by Jellinek, Leipzig, 1844); Gratz, *Geschichte der Juden*, vol. vii. 442-459; art. "Cabbalah," in Smith's *Dictionary of Christian Biography*, &c.; Ginsburg, *The Kabbalah, its Doctrines, Development, and Literature*, London, 1865. (C. D. G.)

KABUL. See CABUL.

KABYLES, or more correctly KABÁIL, a number of tribes in the Algerian region of northern Africa, of special interest to the politician from the peculiarity of their institutions and from the part they will probably play in the development of the French colony, and to the ethnologist as the best known branch of the great Berber race.

In 1864 it was estimated that they amounted to 2,200,000. The country which they inhabit is usually regarded as consisting of two divisions—Great Kabylia and Lesser Kabylia—the former being also known as the Kabylia of the Jurjura (also called Adrar Budfel, "Mountain of Snow"). It is admitted on all hands that the Berbers form the main aboriginal element in the population of northern Africa, that at one time or other they have occupied the whole tract of country from Egypt in the east to the Canary Islands in the west, and that they are still represented not only by the Tuáreg (Amashir, &c.), who retain their native speech, but by many tribes that have become altogether Arab in language. In regard to their real ethnic relations, however, there has been much discussion and theory: Kaltbrunner includes the Berbers in the Mediterranean race in which Haeckel places the Semites, Iberians, &c. M. G. Olivier¹ recognizes the Berbers as Aryans, and Faidherbe regards them as the indigenous Libyans mingled with a fair-skinned people of European origin; while Pruner Bey and Duveyrier maintain the close relation of the Berbers with the ancient Egyptians, and consider them as forming together the white African race.² Be this as it may, the Kabyles are a Berber stock, and more particularly correspond to that part of the race which was known to the Romans as Numidians. Physically they do not present any very prominent contrast to the Arabs of Algeria. Both Kabyle and Arab are white at birth, but rapidly grow brown through exposure to air and sunshine. Both have in general brown eyes and wavy hair of coarse quality, varying from dark brown to jet black. In stature there is perhaps a little difference in favour of the Kabyle, and he appears also to have a stouter trunk and bulkier muscles. Both are clearly dolichocephalic. Among the Kabyles, it is worthy of particular notice, there exists a varying proportion of individuals with fair skins, ruddy complexions, and blue or grey eyes. As to the ethnic origin of this peculiar element many conjectures have been hazarded,—one theorist seeing in them the Vandals, another the Gallic mercenaries of Rome, another an aboriginal fair-skinned race, another the dolmen-building people from Europe. In the whole domain of life and character the contrasts between Arab and Kabyle are of the most radical and striking kind. The Kabyle lives in a house of stone or clay, forming part of a fixed village or hamlet; the Arab's tent is moved from place to place. The Kabyle enjoys the individual proprietorship of his garden and his orchards; with the Arab the ownership of the soil is an attribute of the tribe. While cereals alone are cultivated by the Arab, the Kabyle has his fig trees, olives, and vines, vegetables and tobacco. Active, energetic, and enterprising, the Kabyle is to be found far from home—as a soldier in the French army, as a workman in the towns, as a field labourer, or as a pedler or trader earning by steady effort the means of purchasing his bit of ground in his native village. Nor, however insignificant they may appear when measured by a high European standard, are the native industries to be despised. Not only do they comprise the making of lime, tiles, woodwork for the houses, domestic utensils, and agricultural implements, but also the weaving and dyeing of several kinds of cloth, the tanning and dressing of leather, and the manufacture of oil and soap. Without the assistance of the wheel, the women turn out a variety of earthenware articles; before it became a sort of proscribed industry the production of gunpowder was

¹ "Recherches sur l'origine des Berbères," *Bull. de l'Acad. d'Algérie*, 1867, 1868.

² See Henri Duveyrier, "Les Progrès de la géographie en Algérie, 1868-71," *Bull. de la Soc. Khédiviale de Géogr.*, Cairo, 1876.

regularly carried on; the native jewellers make excellent ornaments in silver, coral, and enamel; in some places wood carving has been brought to considerable perfection; and native artists know how to engrave on metal both by etching and the burin. Like the Arabs of Algeria, the Kabyles are Mahometans of the Sunnite branch and the Malakite rite, looking to Morocco as the nearer centre of their religion; but, whereas the Arabs are fatalistic and superstitious, the Kabyles show a more independent and rationalistic turn of mind. In spite of the Koran and its administrators the Kabyles are essentially democratic. In the words of Renan,¹ "the people is everything and suffices for everything; government, police, administration of justice, cost nothing to the community. It is the ideal of democracy, the direct government of the people by the people." The political unit is the village or commune; so many villages constitute a fraction, so many fractions a tribe; and the tribes again are combined in the Kabala or confederation. The governing authority in the commune is the Jam'a or general gathering of the citizens, every man old enough to keep the fast of the Ramadhan having a right to take part in its proceedings. Its chief executive officer, the *amin*, is chosen by the goodwill of his fellows, receives no remuneration, and withdraws from his functions as soon as he loses the confidence of the electorate. Some of the Kabyles retain their vernacular speech, while others have more or less completely adopted Arabic. The best known dialect is that of the Igouanoun, or Zouaoua,² who, at least from the time of Ibn Khaldoun, have been settled on the northern side of the Jurjura; it is the principal basis of Hanoteau's *Essai de Grammaire Kabyle* (Paris, 1868). Unlike their southern brethren, the Kabyles have no alphabet, and their literature is still in the stage of oral transmission for the most part by professional reciters. Hanoteau's *Poésies populaires de la Kabylie du Jurjura* (Paris, 1867) gives the text and translation of a considerable number of historical pieces, proverbial couplets and quatrains, dancing songs, &c.

The best résumé of ascertained facts in regard to the Kabyles is the *Entrées sur l'ethnographie de l'Algérie*, by General Faidherbe and Dr Paul Tournay, Paris, 1874. See also Damas, *Le Sahara Algérien*, Paris, 1846; De Slane's translation of Ibn Khaldoun's *Etat des Berbères*, Algiers, 1852; Ancey, *Les Kabyles et la Colon. de l'Algérie*, Paris, 1884, and *Les Beni M'zab*, 1863; Hanoteau and Letourneux, *La Kabylie et les Conquêtes Kabyles*, Paris, 1878; a paper by Charnelant, the head of the Roumian Catholic mission, in *Jahrbuch der Verbreitung des Christen*, 1874; Dugas, *La Kabylie et la peuple Kabyle*, Paris, 1878; Hocoux, *La démographie de l'Algérie*, Paris, 1880.

KADOM, a town of Russia, in the Temnikoff district of the Tamboff government, 169 miles north-north-east from Tamboff, near the Moksia, a navigable sub-tributary of the Volga. It lies for the most part in a low sandy plain, but the principal church and the Sorova convent are situated on a hill. The public buildings are of no special note. The population was 7365 in 1861, and 7100 in 1870. A considerable trade is fostered by the local fairs and markets.

Kadon is an ancient place; it was purchased in 1381 along with the Melshtcher lordship by Demetrius of the Don. In modern times it has had a curious administrative history: incorporated with the Kazan government in 1708, it was assigned to the Azoff government in 1719, to the Smolensk province of the Voronezh government in 1726, and to Tamboff in 1779.

KADŪR, or CADŪR, a district of Mysore state, southern India, lying between 13° 12' and 13° 58' N. lat., and between 75° 8' and 76° 25' E. long., with an area of 2294 square miles. It is bounded on the N. by Shimoga, on the E. by Chitaldrug, on the S. of Hassan,—all Mysore districts; on the W. the Western Ghāts separate it from the Bombay district of South Kānara.

The larger portion of the district consists of the Malnad or hill country, which contains some of the wildest mountain scenery in southern India. The western frontier is formed by the chain of the Ghāts, of which the highest peaks are the Kuduremukh (6215 feet) and the Meruti Gudda (5451 feet). The centre of the district is occupied by the horse-shoe range of the Bāba Budans, containing the loftiest mountain in Mysore, Mulangiri, 6317 feet. The Maidan or plain country lying beneath the amphitheatre formed by the Bāba Budan hills is the most fertile portion of the district, well watered, and with the famous "black cotton soil." The principal rivers are the Tunga and Bhadra, which rise near each other in the Ghāts, and unite to form the Tungabhadra, a tributary of the Kistna. The eastern portion of the district is watered by the Vedavati. At the point where this river leaves the Bāba Budan hills, it is embanked to form two extensive tanks, which irrigate the lower valley. From all the rivers water is drawn off into irrigation channels by means of canals or weirs. The chief natural wealth of Kādūr is in its forests, which contain inexhaustible supplies of the finest timber, especially teak, and also furnish shelter for the coffee plantations. Iron is found and smelted at the foot of the hills, and corundum exists in certain localities. Wild beasts and game are numerous, and fish are abundant.

The censuses of 1871 returned the population of the district at 332,381 (Hindus, 318,480; Mahometans, 12,017; Jains, 1816; Christians, 568). Only one town, Tankero, contains over 5000 inhabitants, the population in 1871 being 5892. Chikmagalur, the headquarters of the district, has only 2027 inhabitants, and Kādi, the old civil station, only 2738. The staple crop of the district is rice, chiefly grown on the hill slopes, where the natural rainfall is sufficient, or in the river valleys, where the fields can be irrigated from tanks and artificial canals. The principal unirrigated crop is *rigi* (*Cynosurus orizaceus*), which is procured as food by the natives to rice, as affording more sustenance. The principal agricultural industry, however, is coffee cultivation. The berry is stated to have been first introduced by a Mahometan saint, Bāba Budan, about two centuries ago, on his return from a pilgrimage to Mecca. European capital was not attracted to the enterprise till about 1840, but there are now 60,000 acres under coffee. The cocoa-nut and areca-nut palms flourish in the moist and sheltered valleys in the west. A Government cinchona plantation has also been established on the Bāba Budan hills. The local manufactures include the production of cotton cloth, rough blankets, and sugar, as well as oil-pressing, spirit-distilling, and iron-smelting. The annual value of the district exports is estimated at £297,000, and the imports at £217,000. The revenue of the district in 1873-74, excluding forests, education, and public works, was £24,816. Government aided and inspected schools numbered 176 in 1874, attended by 8027 pupils; unaided schools, 121, with 1288 pupils. The mean annual temperature at Chikmagalur is about 78° F. During 1878 and 1879 the maximum recorded was 93°, and the lowest 69°. In the Malnad the temperatures fall much lower, and the cold at night in December and January is very sharp. The average rainfall at Chikmagalur during the four years ending 1874 was only 36 inches; while on certain coffee plantations on the Malnad from 100 to 170 inches have been registered. Jungle or malarious fevers are prevalent in the Malnad at certain seasons of the year, from which neither natives nor Europeans are exempt.

History.—As containing the hallowed sources of the Tungabhadra, Kādūr district abounds with scenes associated with the legends of the *Rātsadāna* Singera or Kishya-singera-giri, on the Tunga river; takes precedence of all other places in its claims to mythical antiquity. Here, in historical times, was the home of Sankara Acharya, the great Sivaite reformer of the 8th century; and here at the present day resides the *jagad-guru* or supreme high priest of the Smarta Brāhmins. The most ancient sites connected with local history are the ruins of Ratnāpuri and of Sak-rā-patā, both of which are described as the capitals of powerful kings before the rise of the Ballālā dynasty. On the overthrow of the Ballālās by the Mahometans, the Vījayanagar empire established its seat over southern India; but the feudatory chiefs were practically independent. Subsequently the greater part of the district was overrun by the Ikkeri or Bednūr *palays* from the neighbouring district of Hassan, who was in his turn defeated in 1694 by the conquering Hindu rājās of Mysore. It was not until 1763 that Hyder Ali finally incorporated the whole country in the Mysore dominions. In 1799, after the death of Tipu, Kādūr was restored to the Hindu kingdom then set up by the marquis of Wellesley. But in 1881 a general insurrection broke out, which overpowered the Mysore

¹ "La société berbère," *Revue des Deux Mondes*, 1878.

² The Arabic Zouaoua (to use the French transliteration) has given rise to the well-known "Zouaves" of the French army.

Government, and necessitated the use of British troops before it was suppressed. The inquiry that followed led to the assumption of the direct administration of the entire state of Mysore by the British. This administration was continued till March 1881, when the state was again handed over to its native rulers, on the representative of the ruling family attaining his majority.

KAEMPFER, ENGELBRECHT (1651-1716), traveller and physician, was born September 16, 1651, at Lemgo in Lippe-Deimold, Westphalia, where his father was a pastor. He studied at Hameln, Lüneburg, Hamburg, and Lübeck, and, after graduating as doctor of philosophy at Cracow, he spent four years at Königsberg in Prussia, in the study of medicine and the natural sciences. In 1681 he visited Upsala in Sweden, where he was offered inducements to settle; but his desire for foreign travel led him eagerly to accept the post of secretary to the embassy which Charles XI. sent through Russia to Persia in 1683. When after a stay of two years the Swedish embassy prepared to return from Ispahan, Kaempfer entered the service of the Dutch East India Company, as chief surgeon of the fleet then in the Persian Gulf. A malignant fever which seized him at Gamron on the Gulf prevented his further travels for a long while; and he did not arrive at Batavia till September 1689. The following winter was spent by Kaempfer in studying the natural history of Java; and in May 1690 he set out for Japan as physician to the embassy sent yearly to that country by the Dutch. The ship in which he sailed touched at Siam, and in September arrived at Nagasaki, the only Japanese port then open to foreigners. Kaempfer stayed two years in Japan, during which he twice visited Yedo (now Tōkiō), the capital of the shōgun. His adroitness, insinuating manners, and medical skill overcame the habitual jealousy and reticence of the natives, and enabled him to elicit much valuable information, which he has embodied in his *History of Japan*. In November 1692 Kaempfer left Japan, and in October 1693 he landed at Amsterdam. Receiving the degree of doctor of medicine at Leyden, he settled down in his native city to edit and publish his travels and scientific papers at his leisure; but his appointment as physician to the count of Lippe involved him in the cares of an extensive medical practice that hindered his literary labours. His health, already impaired by his travels, gave way under various domestic troubles; and he died at Lemgo, November 2, 1716, in his sixty-sixth year.

The only work Kaempfer lived to publish was *Ananatum Eastiarum Politico-physico-medicearum Fasciculi V.* (Lemgo, 1712), a selection from his papers giving most interesting results of his observations in Georgia, Persia, and Japan. At his death his unpublished manuscripts were purchased by Sir Hans Sloane, and conveyed to England. Among them was a *History of Japan*, which was translated from the manuscript into English by J. G. Scheuchzer and published at London in 2 vols., in 1728. The original German has never been published, the extant German version being taken from the English. The interest and value of the work are very great. It not only contains a history, strictly so called, but also a description of the political, social, and physical state of the country in the 17th century. For upwards of a hundred years it remained the chief, if not almost the only available source of information about Japan for the general reader, and is still not wholly obsolete. A life of the author is prefixed to the *History*.

KAFFA, a town in the Crimea. See **THEODOSIA**.

KAFFA, or **GOMARA**, a little-known region to the south of Abyssinia in Africa, forming a cool elevated tract between the basins of the Sobat on the west and the Juba on the east. Some of its mountain summits, among which is Mount Mata Gera, are believed to be over 12,000 feet high. Kaffa is held to be the native home of the coffee-plant, which grows in wild profusion on the mountain slopes. The chief town is Bonga, described as one of the largest towns in Ethiopia, in 7° 12' N. lat. The inhabitants, largely belonging to the race of black Gallas, are said by Beke to be Christians, and to speak a language cognate with the Gonga tongue, spoken in a portion of

Damat, on the northern side of the Abai. The French traveller Abbadié, who visited Kaffa in 1843, was the first European explorer. Dr Beke gives a description of the habits of the people in the *London Geographical Journal* for 1843; as also does Dr Krapf in his *Travels, &c., in Eastern Africa* (1860).

KAFFRARIA, KAFFRES. The name Kaffraria or Kaffreland properly means the country of the Kaffres, and in this sense would embrace the whole region extending from the river Keiskamma to Delagoa Bay, including at least British Kaffraria and Kaffraria Proper, Natal, Zululand, the Transvaal, and the Orange River Free State. The term, however, has usually been confined to the districts popularly known as British Kaffraria and Kaffraria Proper. Neither term is now used officially. British Kaffraria was incorporated with Cape Colony in 1866, and now forms the two official districts of King William's Town and East London; Kaffraria Proper is now known officially as the Transkeian Territories, or simply the Transkei. But, as the two designations are still in popular use, and as they are in several respects convenient, it will be useful here to give some account of the geography and the more important events in the history of the two districts under the general heading.

The physical characteristics of the two Kaffrias bear a general resemblance to those of the Cape Colony, of which they are the north-east continuation. The country generally rises from the sea-level in a series of terraces to the lofty mountains forming the north-west boundary. British Kaffraria culminates in the Amatola mountains, rising in one part to upwards of 6000 feet. The features of Kaffraria Proper are much more varied, and exhibit some of the most picturesque scenery in South Africa. The rugged range of the Drakenberg forms its north-west boundary, rising at its north-eastern point to a height of 9657 feet. Between that range and the coast-lands are many subsidiary ranges with fertile valleys through which the great rivers make their way to the Indian Ocean. The coast region is more broken than is the case farther south. The prevalent rock along the coast of Kaffraria is the Old Sandstone, nonfossiliferous rock, quartzite, intersected occasionally with veins of white quartz rock, and often capped with a dense mass of conglomerate; while the interior mountains are classed by Mr Dunn as the Stormberg coal-bearing fossiliferous beds of the Triassic period. Kaffraria is watered by hundreds of rivers, most of them rising at no great distance from the coast, but several of them of large dimensions. The chief, beginning at the south, are the Keiskamma, the Buffalo, the Kei, the Bashee, the Umata, the St John's or Unuzinwubu, with several large tributaries, and the Umtamvuna, which separates British Kaffraria from Natal. The rivers are of little use for navigation.

Kaffraria forms one of the most naturally fertile regions in S. Africa. In British Kaffraria most of the cereals grow, and in the cloofs, and scattered over the country, are forests and clumps of valuable timber. The Transkei shows even greater possibilities of culture. The mountain gorges abound in fine trees; thick forest and bush cover the banks of the rivers; grass grows luxuriantly in the lower regions; and the lowlands and valleys are favourable to almost any kind of fruit, field, and garden cultivation. In the occupied district cattle and sheep are numerous; lions are still found in the interior, and a fair amount of the game characteristic of the inland districts belonging to the Cape. The climate generally resembles that of the eastern province of Cape Colony, but with features more approaching to those of the tropics. The coast districts are extremely hot in summer, the temperature on an average varying from 70° to 90°, while in

winter the day temperature is seldom below 50°, though the nights are very cold. But the variation in altitude places climates of all grades within easy reach, from the burning coast to the snow-clad mountain. Thunderstorms are frequent in summer; rain mostly falls in spring and summer, and the winters are generally dry. On the whole the climate may be considered as extremely healthy.

British Kaffraria, on its incorporation with Cape Colony, was divided into King William's Town and East London, each with a capital of the same name, and forming the two most easterly divisions of the colony. King William's Town has an area of 1781 square miles, and a total population (1875) of 106,640, of whom 9012 are white; the population of the capital is 5169. The area of East London province is 1225 square miles, and the population 15,514, of whom 3773 are white. Its capital, East London (population, with the contiguous Panmure, 2134), at the mouth of the Buffalo river, is the port for British Kaffraria. The anchorage is exposed, but extensive harbour works are in operation (1881). In 1880, 135 foreign ships arrived of 134,753 tons, and coastwise 152 of 217,174 tons. It is connected by railway with King William's Town, the line going north-west as far as Queenstown, the capital of the province of that name. The imports of East London amounted in 1880 to £1,152,610, showing an increase of £72,488 over the previous year; and the exports to £303,991, being an increase over 1879 of £38,369. Sheep and goat rearing is extensively carried on; there are also large numbers of cattle. Wheat, maize, and millet are the staple agricultural products. The wool exported from East London in 1880 amounted to 5,253,650 lb. In both divisions are numerous German settlements.

Kaffraria Proper or the Transkeian Territories consist of the territories of various native tribes, most of which have been annexed (1875-80) to the Cape Colony, and are under the jurisdiction of magistrates. The area of Kaffraria Proper is about 18,000 square miles,—its extreme length being about 230 miles, and its breadth from the sea to the mountains bounding it on the north-west averaging about 120 miles. On the south-east it is washed by the Indian Ocean; the Drakenberg and Stormberg ranges bound it on the north-west; in the west and south-west are the Indwe and Koi rivers, and on the east and north-east the Umzinkulu and Umtamvuna. It is surrounded by Cape Colony, Basutoland, and Natal. The area and population of the various districts can only be given approximately; the following is an official estimate of the present population:—

Fingoland	45,000	Tambookieland	70,000
Idutwya Reserve	18,000	Griqualand East	100,000
Gaulekaland (Krell's)	60,000	Pondoland	230,000
Bouvauland	20,000		543,000

Fingoland, to which (with the Idutwya Reserve and Gaulekaland) the name Transkeian Territory, or the Transkei, is often confined, is about 40 miles square, and is the most advanced of the districts; it is suited both for pasture and for cultivation. According to the latest return it had 4976 horses, 37,298 calves, 182,869 sheep, and 50,240 goats, the total value of its stock being £321,784. The revenue in 1879 was £5047, the expenditure £3286. There are many trading stations, and wool is largely exported. The annual value of the imports and exports is estimated at £150,000. Tambookieland or Tembuland is divided into Tambookieland Proper, the district of the Emigrant Tambookies, and Bomvaniland. The first is about 75 miles long and from 30 to 40 broad. The population is probably about 30,000. There are many trading stations, and large numbers of sheep and cattle. A bill for the annexation of Tambookieland

Proper passed the Cape Parliament in 1880. The revenue of the whole of Tambookieland was estimated at £12,500 for 1880. The magistracy is at Umtata on the river of that name. West of Tambookieland and Fingoland is the district of the Emigrant Tambookies, removed some years ago from Tambookieland over the Indwe. It is 85 miles long and 20 broad; population about 40,000, with (in 1875) 5348 horses, 38,749 cattle, 84,201 sheep, 47,300 goats, and many trading stations. The Idutwya Reserve is about 28 miles square, with (in 1874) 2514 horses, 17,698 cattle, 51,302 sheep, 14,909 goats; revenue about £1380, expenditure £2976. Gaulekaland, the country of the Gaulekas, or Ama-Xosa Kaffres under Krell, is about 50 miles long and 30 broad. Traders are settling in the country, and a small trade in wool is done. All these territories lie mainly between the Kei and Bashee rivers. Bomvauland is about 30 miles by 20; it lies between the Bashee and Umtata rivers. On both sides of St John's river, and extending to the Natal boundary, is Pondoland; only that portion of it on the south side of the St John's river, known as St John's Territories (21,905 inhabitants), has been formally annexed, but the magistrate has jurisdiction on both sides. Pondoland is about 60 miles square. This district is noted for its fertility and beauty, and has much excellent pasture land. The district between Pondoland, Natal, Basutoland, Wodehouse division, and Tambookieland, is now known as Griqualand East, inhabited by various tribes (upwards of 100,000 souls), about 125 miles long and 40 to 75 miles wide. A great part of this territory formerly went by the name of Nomansland, in area about 6000 square miles, and lay at the foot of the Drakenberg, between the Umzinkulu and Kinira rivers. In 1862 it was handed over to Adam Kok's people, but in 1877 an Act of annexation was passed, which was promulgated in 1879. The boundaries of the new district were made to include what was known as the St John's River territory, including, however, British Pondoland. The Griquas themselves are not numerous, being found chiefly in the neighbourhood of Kolstadt, the station of the chief magistrate, 95 miles from the mouth of the St John's River. Their farms are rapidly passing into the hands of Europeans. Various other tribes have had land allotted them in the district. The whole district is said to be very fertile, and eminently adapted for the cultivation of various kinds of grain. In 1880 land was granted and sold in Griqualand East to the extent of about 300,000 acres. All these districts may be regarded as virtually annexed to the Cape, with which they will doubtless be gradually incorporated. Kaffraria is governed by ministers responsible to the Cape legislature, in which, however, it has no representatives. Mission stations and trading stations are scattered all over the region.

Kaffre Wars.—During the extension of the Dutch and English powers over South Africa, conflicts with the natives were of course inevitable; there are six contests which more especially came under the designation of Kaffre wars. In 1780 the Great Fish river was settled on as the boundary between the Kaffres and the colonists. For some time previous to 1811 the Kaffres in the Zuurveld broke the boundary, took possession of the neutral ground, and committed depredations on the colonists. In order to expel them from the Zuurveld, Colonel Graham took the field with a mixed force in December 1811, and in the end the Kaffres were driven beyond the Fish river. In 1817 Lord Charles Somerset, governor of the colony, entered into a treaty with a chief, Ngqika, in which he acknowledged that chief as head of all the Ama-Xosa Kaffres, and in which it was agreed that any kral to which stolen cattle could be traced should be held accountable for compensation. This was a serious blunder, Ngqika being merely a subordinate chief, the paramount chief of the Ama-Xosa being Hintza, the chief of the Ama-Gaulekas. Some stolen cattle having been traced to one of the kraals of a chief Ndilambe, Major Fraser, with a small force, was sent to enforce restitution. On this, Ndilambe and his fellow-chiefs attacked Ngqika, who claimed and obtained help from the colonial

Government. The Kaffres were completely routed in 1818 by a force under Lieutenant-Colonel Buxton. They rallied, however, and a great force suddenly poured into the colony in the early part of 1819, sweeping at first everything before them. On April 22 the prophet-chief, MaMama, attacked Grahamstown, which was taken by a mere handful of troops, under Colonel Wiltshire. Assistance arrived, however, and the Kaffres were defeated with great slaughter. The principal chiefs were outlawed, the country between Koonap and the Great Fish river was added to the colony, and that between the latter river and the Keiskamma declared to be neutral territory, on this some of the Kaffres were allowed to settle. Final peace, however, was far from being secured. One tribe or another was almost constantly on the move, causing disturbances in which the colonists could not but suffer. In 1828 the chief Ngqika or Gaika died, and during the minority of his infant son Sandili, the government of the tribe, now called Gaikas, devolved on Macono, his elder half-brother, who had been permitted to occupy the valleys of the Kat river. On account of an attack on the Ama-Tenbu Kaffres, he was removed from the settlement, as was also his brother Tyali (1833). Permitted to return, they were removed again, and this vacillating treatment had no doubt something to do with the next war. On December 11, 1834, another brother of Macono, a chief of high rank, was killed while resisting a commando party. This set the whole of the Kaffre tribes in a blaze. Under Macono, Tyali, and Xexo a force of 10,000 fighting men swept across the frontier, spread over the country, pillaged and burned the farms, and murdered the farmers and all who dared to resist. The fighting power of the colony was at the time scanty, but all available forces were mustered, under Colonel (afterwards Sir Harry) Smith, who reached Grahamstown on January 6, 1835, six days after news of the rising reached Cape Town. The enemy's territory was invaded, and after nine months' fighting the Kaffres were completely subdued, and a new treaty of peace concluded (September 17). By this treaty all the country as far as the river Kei was acknowledged to be British, and its inhabitants declared British subjects. A site for the seat of government was selected, and named King William's Town. All this, however, was undone by the home Government, the secretary of state for the colonies at the time being Lord Glenelg. A policy of conciliation and mildness towards the Kaffres was adopted, a policy distasteful to the colonists, although laudable efforts seem to have been made to carry it out. The next war, known as the "War of the Axe," arose from the murder of a Hottentot, to whom an old Kaffre chief was being conveyed to Grahamstown for trial for stealing an axe. The escort was attacked by a party of Kaffres and the Hottentot killed. The surrender of the murderer was refused, and war was declared on March 11, 1846. The Gaikas were the chief tribe engaged in the war, assisted during the course of it by the Tabaobies. After some reverses the Kaffres were signally defeated on June 7 by General Somerset on the Gwango, a few miles from Fort Poddie. Still the war went on, till at length Sandili, the chief of the Gaikas, surrendered, as also generally did the other chiefs; and by the beginning of 1848 the Kaffres were again subdued, after twenty-one months' fighting. The country was declared under British rule, and was formed into the division of Victoria East and British Kaffraria, between the new colonial boundary and the Kei river, the latter reserved for occupation by the Kaffres. The peace, however, was not to last long. About October 1850 it was reported that the Kaffres were preparing for war. Sir Harry Smith proceeded to the frontier, and summoned Sandili and the other chiefs to an interview. He withheld obedience, upon which, at an assembly of other chiefs, the governor declared him deposed from his chieftainship, and appointed an Englishman, Mr. Brownlee, a magistrate, to be chief of the Gaika tribe. This measure is said to have been the immediate cause of the ensuing outbreak; but there is no doubt that the Kaffres had already determined on war. On the 24th of December Colonel Mackinnon, being sent with a small force to capture Sandili, was compelled to retreat with some loss. This was the signal for a general rising of the Gaika tribe. The settlers in the military villages, assembled in fancied security to celebrate Christmas day, were surprised by the treacherous foe, many of them murdered, and their houses given to the flames. Other disasters followed in quick succession. A small party of military was cut off to a man. The greater part of the Kaffre police deserted, many of them carrying off their arms and accoutrements. Flushed with success, the Kaffres in immense force surrounded and attacked Fort Cox, where the governor was with an inconsiderable force. His situation was truly critical. More than one unsuccessful attempt was made to relieve him, but his dauntless spirit was equal to the occasion. At the head of one hundred and fifty mounted men, accompanied by Colonel Mackinnon, he dashed out of the fort, and, through a heavy fire of the enemy, rode to King William's Town, a distance of 12 miles. Meantime, a new enemy appeared. A large number of the Kat river Hottentots, who had in former years been firm allies of the British, rose in rebellion. This revolt was followed by that of the

Hottentots at other missionary stations; and part of the Hottentots of the Cape Mounted Rifles followed their example. We have only space to state the general results of the war. After the confusion caused by the sudden outbreak had subsided, and due preparations were made, Sir Harry Smith and his gallant force soon turned the tide of war against the Kaffres. The Amatola mountains were stormed; and the paramount chief Krelli, who all along covertly assisted the Gaikas, was severely wounded. In April 1853 Sir Harry Smith was recalled, and was succeeded by Lieutenant-General Cathcart. Krelli was again attacked, and reduced to submission. The Amatolas were finally cleared of Kaffres, and small forts erected among them to prevent their reoccupation. It was not till March 23, 1853, that martial law was revoked, and the most sanguinary of Kaffres was brought to a conclusion, with a loss of many hundred British soldiers. Shortly after, British Kaffraria was erected into a crown colony, which it remained till 1855, when it was incorporated with the Cape Colony. The terror of twenty-five years, once more, in 1877, the Kaffres (of Kaffraria Proper) interrupted the progress of the country and caused considerable destruction and distress. In September of that year the hereditary enmity between the Fingoes and Galekas broke out into open hostility, the Government taking the part of the former, who were under its protection. At first the Galekas were driven beyond the Bashee; but collecting in force again they recrossed, and got the Galekas to join them about the end of December. After several months the governor called for the aid of the imperial troops, and soon effectually broke up and defeated the rebels. The war with the Zulu Kaffres will be described under ZULULAND.

The Kaffres.

The Kaffres, or Kafirs, a large South African race, form ethnically a well-marked variety of the Negro type, and linguistically a distinct branch of the Bantu family. There are no general or collective national names, and the various tribal divisions are mostly designated by those of distinguished individuals, or legendary characters, founders of dynasties or hereditary chieftainships. The name *Kafir* (a form which in popular usage designates the African race less frequently than the inhabitants of Kalidhrast in Persia) is that applied by Mahometans to all who reject the faith of Islam. It was thus current along the east coast of Africa at the arrival of the Portuguese, and passed from them to the Dutch and English, and recently even to the natives themselves under the form *Kafirla*, as in the expression *be-mgama Kafirla-nye*, they are only Kafirs. Of this race there are two main divisions, jointly occupying the south-east corner of the continent from the Lower Limpopo to the Great Fish river north and south, and from the escarpments of the central plateau to the Indian Ocean west and east. They thus impinge southwards on the Hottentot domain, westwards on the kindred Basuto and Bechuana nations, northwards on the Tokomas, Makmas, and others also of kindred stock occupying the region stretching from the Limpopo to the Zambezi and even beyond it to Lakes Nyassa and Tanganyika. Politically the Kaffre domain comprises the Portuguese possessions, including Delagoa Bay, the semi-independent Zulu territory, the colony of Natal, and the whole of the territory of Zangwana, which included that part of Cape Colony till recently known as British and Independent Kaffraria. Of the two branches, each split up into a multiplicity of tribal divisions, the representative nations are the Ama-Zulu in the north, and the Ama-Xosas, Ama-Tembu, and Ama-Mponda or Kaffres Proper in the south, whence the compound term Zulu-Kaffro now commonly applied in a collective sense to the whole race. Intermediate between the two were the Ama-Tloka or Balaia of Natal, where they are still represented by the Ama-Nodosi, and several broken Ama-Zulu tribes now collectively known to the Kaffres as Ama-Pangpi, &c., "poor" or "needy" people, from *fenguzi*, to seek service.

¹ The Ama-Pengras are regarded both by the Ama-Zulu and Ama-Xosas as slaves or out-castes, without any right to the freedom and privileges of true-born Kaffres. They are met with everywhere, but only in small numbers, and the Great Kei and Bashee rivers south of the Ama-Xosa territory, but also in Natal, Zululand, and north of it, as well as in the highlands of the interior. Yet they are scarcely to be had as servants, and are not the property of their masters, or the intervention of the British they would have long been driven everywhere reduced to a state of serfdom by the dominant tribes. Those who were driven out of Zululand early in the present century fall into the hands of the Galekas, from whom they were delivered in 1836 by Sir Benjamin D'Urban, and by him removed to the Fort Poddie district between the Fish and Keiskamma rivers. Any tribes which become known and mixed would probably be regarded as Ama-Pengras by the other Kaffres. Hence the name of the Ama-Pengras, Ama-Bela, Ama-Sembotweni, Ama-Zizi, Ama-Mkizi, Ama-Sokuwene, Ama-Nokize, Ama-Tyeni, Ama-Shwama, &c., all of whom are collectively grouped as Ama-Pengras. Their position may be compared with that of the Leontian Holois, or the low-caste tribes of India.

The numerous and politically important ramifications of the Kaffres Proper cannot be understood without reference to the national genealogies, most of the tribal names, as already stated, being those of real or reputed founders of dynasties. Thus the term Ama-Xosa itself means simply the "people of Xosa," a somewhat mythical chief supposed to have flourished about the year 1530. Ninth in descent from his son Togah was Palo, who died about 1780, leaving two sons, Gealeka and Rambe (pronounced Khe-Khe-be), from whom came the Ama-Gealekas, Ama-Dilambes (T'slambe), and the Ama-Nguikas (Gaukas or Sandili's people). The Ama-Mpondas do not descend from Xosa, but probably from an elder brother, while the Ama-Tembus (Tambobooks), though apparently representing a younger branch, are regarded by all the Kaffre tribes as the royal race. Hence the Gealeka chief, who is lord paramount of all the Ama-Xosa tribes, always takes his first or "great wife" from the Ama-Tembu royal family, and her issue alone have any claim to the succession. The subjoined genealogical tree will help to place the mutual relations of all the Kaffre tribes in a clearer light.

Here it will be seen that, as representing the elder branch, the Gealekas stand quite apart from the rest of Xosa's descendants, whom they group collectively as Ama-Rambe (Ama-Khe-Khe-be), and whose genealogies, except in the case of the Gaukas and T'slambe, are very confused and uncertain. The Ama-Xosa country lies mainly between the Kotkama and Umtata rivers.

The Ama-Zulus, so named by their Basuto neighbours, call themselves Abantu ba-Kwa-Zulu, i.e., "people of Zulu's land," or briefly Bakwa-Zulu, from a legendary chief Zulu, founder of the royal dynasty. They were originally an obscure tribe between the Butaba and Outinika mountains, but rose suddenly to formidable power under Chaka, who had been brought up among the neighbouring and powerful Umtatas, and who succeeded the chiefs of that tribe and of his own in the beginning of the present century. But the true mother tribe seems to have been the extinct Ama-Nombele, whence the Ama-Togah, the Umtatwa, Umtelas, Umtetwas, and many others, all absorbed or claiming to be true Zulus. But they are only so by political subjection, and the gradual adoption of the Zulu dress, weapons, and speech. Hence in most cases the term Zulu implies a political rather than a blood relationship. This remark applies also to the followers of Umzotekela, who, after a force struggle with the Bochnanas, founded in 1830 a second Zulu state about the head waters of the Orange river. In 1837 most of them were driven northwards by the Boers, and have become dispersed amongst the Makana and Matebele tribes.

The origin of the Zulu-Kaffre race has given rise to much controversy. It is obvious that they are not the aborigines of their present domain, whence in comparatively recent times they have displaced the Hotentots and Boesmans of fundamentally distinct stock. On the other hand they are closely allied in speech and physique to the surrounding Basutos, Bechnanas, Matebeles, and other members of the great South African Negroid family. Hence no far-fetched theories are needed to account for their appearance in the south-east corner of the continent, where their presence is sufficiently explained by the gradual onward movement of the populations pressing southwards on the Hotentot and Boesman domain. The specific differences in speech and appearance by

which they are distinguished from the other branches of the family must in the same way be explained by the altered climatic and other outward conditions of their new habitat. Hence it is that the further they have penetrated southwards the further have they become differentiated from the pure Negro type, from which attempts have even been made to separate them altogether.¹ Thus the light and clear brown complexion prevalent amongst the southern Ama-Xosa becomes gradually darker as we proceed northwards, passing at last to the blue-black and sepia of the Ama-Swazis and T'okomas. Even many of the upland Fengu tribes are of a polished ebony colour, like that of the Jolofs and other pure Senegambian Negroes. The hair is uniformly of a woolly texture, not differing perceptibly from that of the ordinary native of Sudan, nor growing in separate tufts on the scalp, as is often erroneously asserted. This phenomenon of a tufted growth of hair, on which many anthropologists have based their classifications of the dark races, has absolutely no existence in nature. The Kaffre head also is dolichocephalic (index 72.54, as compared with the West African 73.40); but it is also high or long vertically under 195.3, as compared with Negro 149.5,² and it is in this feature of hypersthecephaly (height and length combined) that the Kaffre presents the most striking contrast with the pure Negro. But, the nose being generally rather broad³ and the lips thick, the Kaffre face, though somewhat oval, is never regular in the European sense, the deviations being normally in the direction of the Negro, with which race the nearer about of the skin again connects the Kaffres. In stature they rank next to the Patagonians, Polynesians and West Africans, averaging from 5 ft. 9 in. to 5 ft. 11 in., and even 8 feet.⁴ They are also slim, well-proportioned, and muscular; but Fritsch's measurements have shown that they are far from attaining the standard of almost ideal beauty with which early observers credited them. Owing to the hard life to which they are doomed, the women are generally inferior in appearance to the men, except amongst the Zulus, and especially the Tembus. Hence in the matrimonial market, while the Ama-Xosa girl receives no more than ten or twelve head of cattle, the Ama-Tembu belle fetches as many as forty, and if specially fine even eighty.

The symmetrical and manly figures of the more warlike tribes are usually arrayed in leopard or ox-skins, of late years often replaced by European blankets, with feather head-dresses, coral and metal ornaments, bead armlets, and necklaces. The Makana and a few others practise tattooing, and the Ama-Xosa are fond of painting or anointing their bodies with red ochre. Their weapons consist chiefly of ox-hide shields 4 to 6 feet long, the kerri or cith, and the assegai, of which there are two kinds, one long with 9-inch narrow blade, for throwing, the other short with broad blade 12 to 18 inches long, for stabbing. The dwellings, like those of the Hotentots, are simple conical huts grouped in kraals or villages, mostly of a temporary character. For all the Kaffres are still semi-nomadic, and easily break up their homes in search of fresh pastures. Dusk, although cattle form their chief wealth, and hunting and stock-rearing their main pursuits, many have in recent times turned to husbandry. The Zulus are regular growers of "mealies" (maize), and the Ama-Mpondas cultivate a species of millet, tobacco, water melons, yams, and other vegetables. Milk, millet, and maize form the staples of food, and meat is seldom eaten except in time of war. Amongst some tribes the order to kill and eat their cattle is in fact equivalent to an order to prepare for some warlike undertaking.

Mentally and morally the Kaffres are on the whole superior to the average Negro. In all their social and political relations they display great tact and intelligence; they are remarkably brave, warlike, and hospitable, and were naturally honest and truthful until through contact with the whites they become suspicious, revengeful, and thievish, besides acquiring most European vices. Of religion as ordinarily understood they have very little, and have certainly never developed any mythologies or dogmatic systems. It is more than doubtful whether they had originally formed any notion of a Supreme Being; and such is the realistic bent of their mind that all such abstract conceptions, when interpreted to them by the missionaries, are immediately reduced to the grossest materialism. At the same a belief in a future state is implied by a faintly developed worship of ancestry, accompanied by a few superstitious rites. There are no idols, sacrifices, or priests, but the prevalent belief in witchcraft has naturally led to the evolution

¹ Amongst others quite recently by Goud de Rialle, who, in *Les Peuples de l'Afrique de l'Est*, detaches the Kaffres from the Negroes, and treats them as an independent division of the African races. These he groups in five divisions, (1) Boesmans, (2) Hotentots, (3) Xeroses, (4) Enfers, (5) Nubians and Yellahs—a classification which even on linguistic grounds is untenable. J. Meyer also, notwithstanding their woolly hair, thick lips, high cheek bones, and dark complexion, maintains that their features are essentially "Asiatic."

² Fritsch, *Anthropology*, p. 274.
³ This feature varies considerably; "in the T'elamite tribes being broader and more of the Negro shape than in the Galla or when interpreted to them by the missionaries, are immediately reduced to the grossest materialism. At the same a belief in a future state is implied by a faintly developed worship of ancestry, accompanied by a few superstitious rites. There are no idols, sacrifices, or priests, but the prevalent belief in witchcraft has naturally led to the evolution

⁴ Seventh in descent from Zulu, through Kumedu, Makheba, Punga, N'daba, Yama, and Tsempokana (Bleek, *Zulu Legends*).

of the "witch-doctor" or medicine-man, who often becomes an instrument of cruel oppression and injustice in the hands of unscrupulous chiefs. Circumcision and polygamy are universal; the former is sometimes attributed to Malouinetan influences, but has really prevailed almost everywhere in East Africa from the remotest time.

Of the few industries the chief are copper and iron smelting practised by the Ama-Tembu, Zulus, and Swazis, who manufacture from the metal weapons, spoons, and agricultural implements, both for their own use and for trade. The Swazis display some taste in wood-carving, and others prepare a peculiar water-tight vessel of grass, somewhat like the wickerwork vases of the Siberian Yakuts. Characteristic of this race is their total ignorance or neglect of the art of navigation. Not the smallest boats are ever made for crossing the rivers, much less for venturing on the sea, except by the Makzanza of Delagoa Bay and by the Zambesi people, who have canoes and flat-bottomed boats made of planks.

The Kaffre race has developed a distinct and apparently very old political system, which may be described as a patriarchal monarchy limited by a powerful aristocracy. Although the tribal state still prevails, the organization has thus acquired almost a feudal character. The nation is grouped in tribes, each under an hereditary *nkosi* or chief, who administers his territory by means of officers chosen by himself, and who is supreme legislator with absolute jurisdiction and power of life and death. If his decisions are unjust, the nobles (that is, the foremost members of the tribe) protest in council, and their decisions form the traditional code of common law. A group of clans forms a nation, recognizing a common hereditary chief with the title of *umakomkasi* or *enkosi enkulu*, that is, "great chief," whose influence largely depends on his power and personal qualities. He possesses in theory unlimited authority, but in practice each clan retains a large share of self-government, the lord paramount seldom interfering except when appealed to. In Zululand this system rapidly developed under Chaka and his successors into a military despotism of an extremely arbitrary type. But with the fall of Oetwazy, followed by the division of the land amongst a number of semi-independent chiefs, an end was put to that absolute monarchy. While it lasted it was a distinct violation of the ancient liberties of the Zulu nation by the "great chief," who arrogated to himself almost divine honours, treated the people as his slaves, claimed all the land as his personal property, and made everything subservient to his dynastic interests.

The Zulu-Kaffre language is probably the most typical member of the wide-spread Bantu family, standing in much the same relation to the other branches of this stock as Sanskrit does to those of the Aryan group. It is spoken with considerable uniformity throughout the whole Kaffre domain, the Zulu or northern dialects differing rather in idiom and peculiar forms than in structure or phonetics from the Ama-Xosa and other southern varieties. In other respects Zulu is on the whole more primitive and conservative of the oldest forms, while Kaffre seems more to the original meaning of words. Marked Zulu dialects are the Tefula and Swazi, both widely current in Zululand, the latter forming a transition between Zulu-Kaffre and the northern Tekeza group. The Kaffre, which presents no well-defined dialects, is current from the Keiskamma river to the southern frontier of Natal, and from the Quethlamb mountains to the sea.

The Zulu-Kaffre differs in its phonetics from most other Bantu tongues by the presence of three "clicks" adopted from the Hottentots or Boesmans, the true aborigines of this region. These are the dental, usually represented by *c*, as in *Ama-Gaaka*, the palatal (*q*), as in *Ama-Gqika*, and the lateral (*x*), as in *Ama-Xosa*, uttered respectively by thrusting forward and then suddenly withdrawing the tongue from the front teeth, the palate, and the side teeth. Besides these there is a guttural, represented by *r*, as in *Xarabe*, to be pronounced *Khaxabe*.¹ The language is in other respects extremely harmonious, the accent falling generally on the penultimate, and all words ending in vowels, or occasionally the liquids *m* and *n*. In its structure it is very regular, with few exceptions or departures from the normal rules, which is the more surprising that its mechanism is extremely delicate and involved. The verb especially is highly inflected, presenting no less than two hundred and fifty different forms, temporal, modal, positive, negative, active, passive, causal, augmentative, &c. In this respect it is probably unsurpassed even by the intricate verbal systems of the Finno-Ugrian group.

But the characteristic feature of the Zulu-Kaffre and other Bantu languages is their peculiar aliterative structure, which finds no parallel in any other linguistic family, the Mande and Goid of West Africa alone excepted. This principle of "euphonic concord," as it has been called, is regulated by the pronominal prefix inseparable from every noun, and repeated in a more or less modified form with the following adjectives and other words in agreement with the subject. The nominal root itself is unchangeable, its various relations being expressed by modifications of the prefixed particle, or "infix," as Coleman calls it. Hence the inflexion in these languages

is mainly initial, not final, as in most other linguistic systems, on which account they have received the name of "Pronominal Prefix Languages." Of the inflecting prefixes, of which there were sixteen in the primitive Bantu speech, the chief function is concordance and relationship. Thus the proper inflex of *ntu* in the sense of man, person, being *um*, *pl. aba*, we get from *um-ntu*, man, *aba-ntu*, men.² The inflex of *kosi*, chief, is *in*, *pl. (arr.) ama*,³ whence *in-kosi*, a chief, *ama-kosi*, chiefs. Then, the adjective, "great" being *kulu*, "a great man" will be *um-ntu om-kulu*, where the inflex *um* is repeated in the modified form *om* with the adjective *kulu*. But "a great chief" will be *in-kosi en-kulu*, where the inflex *in* is in the same way repeated in the modified form *en* with the following adjective *kulu*. Here we see some resemblance both to the principle of progressive vocalic harmony as developed in the Ural-Altaic group, in which the vowel of the root regulates those of all the following agglutinated formative elements, and to such Latin agreements as *filius meus, filius tuus*, &c. In both cases, however, the resemblance is more apparent than real. This surprisingly complex and almost artificial principle of aliterative concordance pervading a vast number of languages spread over half a continent, and spoken exclusively by unlettered and barbarous races, is one of the most astonishing phenomena in the history of human culture. The perfection to which the system is carried in the Zulu-Kaffre group must always render that branch of the Bantu family specially interesting to the students of comparative philology.

KĀFRISTĀN. This Persian term, signifying "the country of Kāfirs," or unbelievers (in Islām), has within the last hundred years become established in geography as the name of a mountain tract on the north of Afghanistan, occupied by tribes which have resisted conversion to the faith which prevails on every side. This faith has no doubt continually gained upon these tribes more or less, and with this encroachment the limits of the Kaffir country have shrunk; but the encroachment does not appear to have been large since the name became recognized in geography. Thus Baber (c. 1504) speaks of a certain place (Chaghānāsārī, in recent maps "Chegaraserai") as in the very jaws of Kāfristan, and this continued to apply forty years ago, if not now. Only it is clear that in his time the Kāfirs occupied tracts about Bajaur, east of the Kuner river, which they do not pass now except on raids. The country has never been entered, and even the bordering Mahometan tracts have only here and there been touched, by any European, so that we know hardly anything of its internal geography, and not even the external geography with any precision. The northern boundary may be taken as that unvisited part of the watershed of Hindū Kūsh which lies between the Dorah Pass (71° 17' E. long.) and the Khāwak Pass (69° 53' E. long.) leading into the Andarāb valley of the province of Kunduz (see AFGHAN TURKISTAN, vol. ii. 242). On the east it is limited by Chitral or Kāshkar; on the south and west it is more difficult to define. But 35° N. lat. and 70° E. long. will mark these limits roughly, though the Kāfir tribes seem still to extend south of the former line above Jalālabād, whilst their limits are

¹ This word *Abantu* is generally used by the Kaffres in speaking of themselves as the "men" in a pro-eminent sense in opposition to the *Ama-hungu*, or inferior white people. On this ground *Abantu*, shortened to *Dantu*, has been proposed by Block and generally adopted as the collective name of all the races and languages belonging to this great linguistic system, which reaches from four or five degrees north of the equator southwards to Cape Colony, and stretches right across the continent from the Ogway delta to Zanzibar.

² The regular plural of the inflex *um* is *tin*, as in *in-khu*, house, *tan-khu*, houses. But *ama* is extensively used instead of *aba*, *tin*, &c., in forming the plural, especially of personal nouns, nations, tribes, &c. Hence *Ama-Xosa* for *Abu-Xosa* from *um-Xosa*, *Ama-Mpondo* from *u-Mpondo*, *Ama-Kose* from *in-Kose*, &c. The northern and western Bantu nations preserve the *aba* under the forms *ba*, *be*, *rea*, whence *Ba-suto*, *Be-chuana*, *Wa-nganyosi*, *Wa-ganda*, &c.

¹ The *r* sound does not occur, it is replaced, as in Chinese, by *l*.

retracted north of the same line above Laghmán. Indeed Kafir villages, though now deserted, exist within Darah Nár, only 20 miles from Jalálábád. It is believed that the Kafir settlements on some points also pass to the north of Hindu Kush.

Tribes of Kafir kindred, subdued and converted by the Mahometans in comparatively recent times are known as *Nimcha*, or "half-and-half." Many of these are on good terms with the Kafirs, and trade is carried on through their mediation. A most interesting account by Lieutenant-Colonel Tanner, of some tribes of this class, will be found in the *Proc. Roy. Geog. Soc.* quoted below.

The most important portion of the Kafir tribes apparently occupies the valleys which drain (by the Pech river) into the Kuner or Chitral river, below Chaghanaserai, in about 34° 40' N. lat. The most easterly occupy the valley running south from the Doral Pass, and joining the same river at Birkot, about 35° 15' N. lat. Others are on the headwaters of the Aingar and Alishang rivers, which join in Laghmán, and the most westerly on the sources of the river of Tagto.

Surrounded by people professing Islam and cherishing slavery, the Kafirs are naturally objects of kidnapping incursions, and these they revenge by sallies from their mountain fastnesses to plunder and kill. Wood, in 1838, found the valley of the Upper Kokcha in Badakhshan deserted on account of Kafir forays. The Lahori Pass from Dir into Chitral was within recent years so beset by Kafir robbers that many Mussulman wayfarers were annually killed, whose graves were marked by cairns and flags, and designated "The Tombs of the Martyrs." Hundreds of these dismal memorials lined the road and damped the traveller's spirits. Raverty mentions a savage invasion of Kafiristan made some thirty years ago by the chief of Bajaur from the south-east, in which villages were sacked and burnt, and the people carried off and sold. Faiz Bakshi speaks of a like invasion from the north in 1870 by the prince of Badakhshan, which penetrated by the Doznakh Darah or "Hill-glen" to Kafir (which he calls the Kafir capital), bringing back a large number of captives, whom he saw at Faizabad. Whatever difficulty from within prevents the exploration of the Kafir country is due apparently to this atrocious treatment at the hands of their Moslem neighbours.

But the Kafir wars are far from being all external. Some of the tribes wage war with one another, so constant and deadly that Biddulph says their fights with their Mussulman neighbours are comparatively desultory and harmless. Kafirs are said, however, never to kill men of their own village.

The country is, as far as can be gathered, a land of lofty mountains, dizzy paths, and hair-rope bridges swinging over torrents, of narrow valleys laboriously terraced, but of wine, milk, and honey rather than of agriculture; the valleys on the eastern side, however, are described as thickly wooded and very fertile. Though table-lands are spoken of, arable land is scanty. Over the greater part of the country the winter is severe; hence the people depend much on dairy-produce, and consume vast quantities of cheese and curd, besides meat, and fruit, fresh or dried.

The hill country of the Kafirs, and of kindred races long continuing in paganism, which extended from the north of Cabul to the borders of Kashmir, was known to medieval Asiatics, more or less loosely, as *Bilaur*, a name of ancient origin, which we find in Marco Polo as *Bolor*. *Pashai* also, from the name of one of those races now Mussulman, seems to have had a vague application to part of this region; this name also occurs both in Marco Polo and in Ibn Batuta. *Kafir* likewise has sometimes received a like vague extension.

The first distinct mention of Kafirs as a separate race seems to be in the history of Timur. When that prince, in March 1398, arrived at Andarab on his way to invade India, he was met with a cry for help against the Kafir and Siáh-posh (or "black-clothed")

Kafirs; and he entered the country of the Kafir from the upper part of the Paghur valley. It was still winter in the highlands, and the difficulties were great. Timur himself was let down the snows by *ghisade* in a basket guided by ropes. The chief of the Kafirs was called the ruler of Kafir, a title which is possibly preserved in the title of the king of Chitral (see KÁSHKÁN), besides surviving in the name of one of the greater Kafir tribes. Timur distinguishes between Kafir and Siáh-posh; for he speaks of detaching 10,000 horse against the Siáh-posh country, which lay to the left—therefore, it would seem, to the north of the country entered by him. This detachment met with great disaster. Timur himself claims decided success, but probably found the country quite impracticable, for he speedily emerged again at Kháwak. He speaks of the abundant fruit trees, of the vine, of the language "distinct from Turki, Persian, Hindi, and Kashmiri," of the weapons as arrows, swords, and slings. The ruler was styled *Aldishá*, his residence *Jorkal*, and another large place *Shokal*. Timur caused an inscription to be cut in the defiles of Kafir recording his invasion and its route. Masson tells us that in the Kafir country, on the Nejl or Alishang river, there is a structure still known as Timur's castle.

We hear of the Kafirs again in the *Memoirs* of Baber, of their raids in Panjhir, of their wine and fondness for it,—every man carrying slung round his neck a *khig* or leathern bottle. The occasional mentions of the Kafirs in the *Am-i-Akbari* seem borrowed from Baber, but this work contains another passage (Gladwin's translation, 1784, ii. 195) which probably originated a story about the Kafir descent from Greeks, not yet quite obsolete in Europe. In fact, however, the passage does not appear to refer to the "Kafirs" at all, but to the claim to descent from Alexander of the princes reigning in Swát before the present Yuzufzai,—a claim remarkable enough in itself, and maintained by many other princes of the hill states north of Hindu Kush.

Again, Benedict Goes, travelling from Peshawar to Cabul in 1603, heard of a city (or country) called *Copperstam*, into which no Mahometan might enter on pain of death. Hindu traders might enter, though not into the temples. The people were said never themselves to enter their temples except in black dresses. The country abounded in grapes; the natives drank wine, of which Goes tasted; and all this was so strange that he suspected the people might be Christians. Little or nothing is heard of the Kafirs after this till the publication of Rennell's *Memoir of a Map of Hindoostan* (1788),—followed twenty-six years later by Elphinstone's *Cabul*, in which a considerable amount of substantial information regarding the Kafirs was given by that admirable writer, of whom the Afghans believed, and with justice, that he had a telescope with which he could see what passed on the other side of a mountain.

The most favourable opportunity ever offered for the exploration of Kafiristan was during the British occupation of Cabul in 1839–40, and a Kafir deputation invited a visit from those whom they had been led to regard as kindred. But they were coldly received, owing to the great jealousy of such intercourse shown by the Afghans.

Colonel Tanner of the Artillery made a spirited attempt to reach the country from Jalálábád in 1879, and spent some time among the Mahometans of Darah Nár, whose language and customs indicate affinity to their heathen neighbours. But he was carried away dangerously ill, on the very day when a Kafir party arrived at the village to escort him into their country. Similar invitations were brought to Major Biddulph in Chitral in 1878. This officer was unable to avail himself of these, but he had unusual opportunities of seeing and gaining information about the people, and his chapter on the *Siáh-posh* is the most authentic account yet available. But there are no doubt local differences, and we must not assume that to be untrue which varies from Biddulph's statements.

The Kafirs are in fact only an aggregation of tribes, probably belonging to one general race, but whose present close juxtaposition is the result of various accidents and invasions which have driven them, in part at least, from the lower countries, and concentrated them in this highland region. They have themselves vague stories to this effect, and (like the Karens of Burma) one that they formerly possessed writing. Elphinstone heard a Kafir story that brought them from Kandahár. This may have been a dim tradition, not of the place now so called, but of the Kandahár of the older Arab geographers, *Gandarritis* of Ptolemy, and *Gandhára* of the Hindu books, viz., the region

of Peshawar and Yusufzai. A clan of the now Moslem tribe of Sâfis is called *Gandhara*. The *Kamos* tribe of Kafirs have been surmised to be living representatives of the Kambojas of early Sanskrit, whose name was borrowed by that region in the far East in whose forest depths religions of Indian origin reared weird and stupendous fanes, lately made known. In two other Kafir clans, Aspins and Ashkins, one is tempted to trace remnants of the *Aspasu* and *Issaceni* of Alexander's historians, whose seat was about Kuner, Bajaur, and Dir.

The people are recognized from outside as *Kâfirs* ("infidels") or *Sikh-pesh* ("black-clad")—compare the *Alaoudh* of ancient Seythia; but they use no collective term as applicable to themselves; in many cases different tribes are unable to converse with each other, and apparently they recognize no common tie of nationality. If hard pushed, or speaking with foreigners, they will thus employ the word *Kappia* (for *Kahi*), but so also a Hindu talking to an Englishman will sometimes use the term *Kâla dâni* ("black man") collectively of his countrymen.

The variations in the catalogue of tribes given are endless; indeed, Tanner says explicitly that he never found two people who agreed in the names of four out of five, and the variation in actual list is greater than this. Major Biddulph's information leads him to divide the whole body into three main tribes (or perhaps topographical divisions)—(1) *Dushyatils*, occupying the eastern valley adjoining Chitral, partially tributary to that state,—their principal clan being divided into Kimoos and Kamtoos; (2) *Walgatis*, occupying the Pesh valley and its upper waters; (3) *Kamapils* or *Lingpils*, on the upper waters of the streams descending towards Laghmân (formerly *Langhân*) and Cabul, and also apparently extending north of the great watershed. But these great tribes are subdivided into numerous clans, of which the *Walgatis* alone count eighteen. There are also broken clans, like the *Kaldshas*, adjoining Chitral, a degraded race who are claimed by the Bashgalis as their slaves, and the *Kidigatis*, a small tribe near the watershed who are subjects to Munjam, one of the highland cantons of Badkhashan.

More copious lists of tribes have been given by Elphinstone (three lists on different authorities), and by Raverty, Lumsden, Bellew, &c. We may notice that all lists give a prominent place to the *Katô* or *Katâr* (see above). Other names that appear in several lists are *Wâli* or *Wâligal* (already named from Biddulph); *Kâm*, in various forms; *Wânâh*, and *Sâm*, which, we learn from Tanner, are names for one great tribe; *Pashâ-gar* or *Pashâ-gâ*, suggestive of connection with the now Mahomedanized *Pashais* of the Cabul highlands, spoken of above; *Mandâ-gal*, *Parunî*, *Trategana*, *Gambôr* or *Gambôr*, *Ashkang* or *Ashkin*, *Ashkin* or *Ishpi*, *Nishâ* or *Nishai*, &c. The affix *gale* or *gali*, which attaches to several Kafir names of place and tribe, is to be ascribed to a word *gal* signifying "country." The characteristics of some tribes were given to Tanner by their (*nincho*) neighbours the Chugâils, and run thus: "In Kafir land are many languages, many tribes with different tongues. The *Katâras* (*Katôis*?) are horsemen. The *Parunis* have no guns, they kill men with clubs. The *Majgatis* are beautiful; they have guns and are marksmen; they are men of the chase, very active and swift. The *Wamas* are the nicest of all. But the *Katâras* (*Katôis*?) are chief before the *Wamas*. And the *Nishais* are fiercer than the *Wamas*."

In regard to the general aspect and complexion of the Kafirs, accounts have varied. Dr Trumpp, a learned missionary, who examined three Kafirs at Peshawar, declares them to have been in all respects like natives of Upper India, with dark hair and eyes and swarthy colour, tinged with ruddiness due to wine. On the other hand Burnes, Atkinson, Wood, and Masson all speak of their blue eyes, nearly all of their brown hair. Bellew describes Faramorz Khan, an officer of Kafir birth in the Afghan service, as of fair, almost florid complexion, and light brown hair, hardly to be distinguished from an Englishman. And, unless their fairness were a general characteristic, one hardly sees how the story current among themselves of their kin to us could have found vogue. The fact seems to be, as Biddulph states, and as the Chugâil characterization quoted above implies, that they differ considerably in complexion, some of those living at high elevations being very fair. In feature those whom he saw were pure Aryans of a high type,—the women handsome (as all native reports make them), with brown hair and eyes, sometimes very fair. Indeed, Sir H. Rawlinson, who repeatedly saw Kafirs at

Cabal in 1838–40, has stated that the most beautiful Oriental lady he ever had seen was a Kafir slave; by loosening her golden hair she could cover herself completely from head to foot as with a veil.

The current tale has always been like that told to Goes in 1603 that no Mussulman could enter their land and live. This is true of any one entering without warning; but, on the eastern side at least, they receive visitors when passed in by one of themselves. Thus pedlars with wares from Peshawar enter; and Mahometans from Chitral are occasionally allowed to enter the country for sport, and enjoy the hospitality for which the Kafirs are famed. The assurance that they would welcome the visits of Christians has been general, and the invitation often given. Two Afghans from Peshawar, Christian converts, on the invitation of a Kafir who had been a soldier in the Guides under Colonel (now Sir Harry) Lumsden, visited the Kafir country in 1864, and brought back a very interesting journal. They witnessed, soon after entering the country, the treacherous massacre by the Kafirs, in fulfilment of an old vendetta, of a large party of Mahometans who had been invited across the border, but were themselves well treated.

The language of the Kafir tribes belongs, like their physical type, to the Aryan class. On both northern and southern slopes of Hindu Kush are spoken a number of languages and dialects, all of which, with the striking exception of the *Khapua* or *Bushika* in Gilgit, belong to the class named, some of them leaning more to the Persian, some to the Indic (or Prakrit) type. To the first belong especially the dialects of the north known as *Ghâdala*, spoken in Sirikol, Wakhan, Shighnan, and other cantons of the upper Oxus. To the second belong the Shina language of Daristan, and other dialects, spoken on the Indus and west of it as far as Chitral. Major Biddulph considers the Kafir languages, of which the *Klowôr* or *Chitrali* is a type, to stand between the two classes, drawing on the whole nearest to the Indic side, but with a larger number of Persian roots than the Dard dialects. Vocabularies of Kafir or Sikh-pesh dialects have been published by various persons (e.g., Leech, Burnes, Raverty, Lumsden, Trumpp, Norris, Leitner, Tanner, Biddulph). The most ample are by no means the most valuable; and the data as yet, both as to copiousness and as to precision regarding the locality of the dialects represented, are scanty, though in these respects Major Biddulph's book makes a considerable step. The Hindi character of the words of numbers in some of the dialects is very striking. They all seem to confirm Elphinstone's statement that in all the Kafir dialects the numeration is by scores, as in the French "survival" of *quatrevingt*, *quatrevingt-dix*, &c.

Biddulph regards the religion of the Kafirs as a crude form of the old Vedic worship. *Imbra* is their chief god, a name suggestive of *Indra*. *Mani* is spoken of as mediating with Imbra on behalf of man. There are many inferior divinities, some acknowledged to have been mortals worshipped after death. Names of some of these are given by Elphinstone and by Biddulph, and a large part of the two lists agree. Stones are set up as emblems of Imbra, but carved idols are not used, says Biddulph; we must perhaps interpolate,—“as representations of Imbra,”—for there is much evidence that images are set up. *Deogan* is a name which several accounts give as that of a chief god,—perhaps a generic word connected with *dev*, *dév*, *deus*, &c. Colonel Tanner's informants told him of a temple of Deogan among the Wamas, hung about with bright-coloured cloths and ornaments, whilst Deogan was represented by a fierce image of wood, armed with club, knife, and gun. The temples are said to be stored with the accumulated spoils of ages. To all the deities cows are sacrificed, and cedar branches burned. On all occasions of slaughtering for food, some deity is invoked and sacrificial ceremonies observed. The Bashgalis showed Biddulph the sacrifice of a goat. The detail is most remarkable, as he points out, in its agreement, even in some of the minutiae (such as the ritual words used, *sâch* and *â-mach*), with the account given by Elphinstone after Mullah Najib,—thus attesting the authenticity of the latter's narrative.

Polygamy is practised, and according to the balance of

evidence woman's chastity is loose, and adultery slightly punished or easily compensated (but on these points the Afghan Christians give a strongly opposed statement). Female children are freely sold by the Bashgalis to their Mussulman neighbours, and the king of Chitral receives an annual tribute of children of both sexes (whom he sells doubtless). The black clothing, which has given the Kafirs a general name, varies in character. Tribes on the Cabul side wear entire goat's skins; the Bashgalis wear short-sleeved black tunics of woven goat's hair, with a broad red binding, and girt with a leather belt bearing a dagger. On their feet they wear rude sandals of wild-goat skin, with a tuft on the instep. The women wear long sack-like garments of black woven goat's hair, with long loose sleeves, girt loosely at the waist, and with a coloured cotton scarf tightly bound over the shoulders. It is a general characteristic that men shave the whole head except a circular 3-inch patch on the crown, from which the hair hangs often to the waist. The Bashgalis at least wear no head covering. Women wear the hair plaited in many long thin tresses, coiled under their head-dress. The head-dress of the Bashgalis woman is remarkable, consisting of a black cap with lappets and two horns about a foot long, made of wool wrapt with black cloth and fixed to the cap. Such a head-dress, with horns of greater length, is described by Chinese travellers of the 6th and 7th centuries as worn in the valley of the upper Oxus, then held by the Yetha or Epithalites, an indication probably of kindred with or influence over the ancestors of this Kafir tribe. Among the Sams, Wamas, or Red Kafirs, long, massive, silver chains presented by the tribe are worn over the shoulders by successful warriors. Their women tie up the hair with a silver band.

The Kafir arms are bows and arrows, battle-axe and dagger. The dagger is peculiar, of excellent fabric, with a deep Γ hilt of iron with brass studs, and slung in a triangular iron sheath. Their bows and arrows are short and weak-looking, but they make good practice up to 60 yards. Swords and matchlocks are spreading.

Among the notable and general customs are the copious use of wine, which at their feasts they drink from large silver cups which are among their most precious possessions; their sitting habitually upon stools of wicker-work, whilst they find it as difficult as we do to adopt the cramped postures usual among Asiatics; their use of slips of pine for candles; the custom of recording the deeds of a warrior by a post beside his coffin, in which a peg is driven for every man he has slain. The Islamized Chugani people of Darah N'ir also maintain this practice.

The people are fond of dancing. Men and women join. Biddulph witnessed a village dance, wild and strange, — the men brandishing arms, with whooping and whistling and discharge of guns. At times the whole would lock arms by pairs and revolve backwards and forwards in grotesque waltz, or following in order wind in figures of 8.

Their houses are neat and clean, generally of more than one story (communicating by rough ladder beams), and sometimes of five or six on the declivity of a hill. They are much embellished with wood carving. We may assume Tanner's striking description of a large Chugani village to give a fairer idea of the Kafir towns than we have yet any direct means of gaining —

"It is built on the face of a very steep slope, and the houses, of which there must be six hundred, are arranged in terraces one above another. From the roof of one of the lower ones I gazed with astonishment at a vast amphitheatre of carved wood—at thousands of carved veranda-posts, and at tens of thousands of carved panels, with which the upper story of each house is constructed. . . . The carving completely covered the woodwork of the upper story of every house. The lower story is of stone and wood, and double the extent of the upper, and this allows an open roof-space on which the inhabitants mostly pass their time in fine weather."

A newborn child is carried with its mother to a special house outside the village, where they remain secluded. After twenty days mother and child are bathed and brought back with music and dancing. The dead are placed in coffins, and, after much dancing and waking and sham fighting, are carried to some lofty spot and there deposited, but no grave is made.

The Siāh-posh dogs, cattle, sheep, fowls, and all their agricultural products are famous for quality, and much sought by their neighbours. Their cattle in appearance and size compare favourably with English breeds, but have large humps. The women are said to do much of the agricultural work.

On Kafirs, see Elphinstone's *Cabul*, ed. 1839, ii. 378 sq.; Burnes, *Cabool*, 1842, pp. 206 sq. and 281 sq.; Masson, *Journeys*, 1842, chap. xi.; Lumsden's *Mission to Kandahar*, Calcutta, 1860; Baryatyn, in *Journ. As. Soc. Bengal*, vols. xxviii. and xxxiii.; Bellow, "Lecture," in *Journ. U. S. Inst. Soc.*, May 1881; *Church Missionary Intelligencer* for 1865, reprinted in same for December 1878; also *Church Missionary Intelligencer* for September 1874; Wood's *Oxus*; Terentyof, *Russia and England in Central Asia*, translated by Daakes, Calcutta, 1876, i. 298 sq. (this has some amount of nonsense, deluding the Kafirs from a Slav migration through Byzantium, &c.); *Quarterly Review*, April 1873, p. 634 sq.; *Jour. Roy. As. Soc.*, vol. xix. p. 1 sq. (H. Y.)

KAHLŪR, also called BILASPUR, one of the petty hill states in the Punjab, India, lying between 31° 12' 30" and 31° 35' 45" N. lat., and between 76° 26' and 76° 58' E. long. The area is 448 square miles, and the estimated population 60,000. The principal products are opium and grain; woollen goods are manufactured. The estimated revenue is about £10,000. The Gurkhas overran the country in the early part of the century, and expelled the rājā, who was, however, reinstated by the British in 1815.

K'AI-FUNG FOO is the capital of the province of Honan in China, and is one of the most ancient cities in the empire. A city on the present site was first built by Duke Chwang (774-700 B.C.) to mark off (K'oi) the boundary of his fief (Yung); hence its name. It has, however, passed under several *aliases* in Chinese history. During the Chow, Suy, and Tang dynasties (557-907) it was known as P'een-chow. During the Woo-tai, or five dynasties (907-960), it was the Tang king, or eastern capital. Under the Sung and Kin dynasties (960-1260) it was called P'een-king. By the Yuen or Mongol dynasty (1260-1368), its name was again changed to P'een-leang, and on the return of the Chinese to power with the establishment of the Ming dynasty (1368-1644), it was rechristened by its original name of K'ai-fung. The city is situated at the point where the last spur of the Kwan-lun mountain system melts away in the eastern plain, and a few miles south of the Yellow river. Its position, therefore, lays it open to the destructive influences of the Hwang-ho. In 1642 it was totally destroyed by a flood caused by the dykes of that river bursting, and on several prior and subsequent occasions it has suffered injury from the same cause. The city is large and imposing-looking, with broad streets and handsome edifices, the most noticeable of which are a twelve-storied pagoda 600 feet high, and a watch tower from which, at a height of 200 feet, the inhabitants are able to observe the approach of the yellow waters of the river in times of flood. The city wall forms a substantial protection, and is pierced by five gates. The whole neighbourhood, which is the site of one of the earliest settlements of the Chinese in China, is full of historical associations, and it was in this city that the Jews who entered China in the reign of Ming-te (58-75 A.D.) first established a colony. For many centuries these people held themselves aloof from the natives, and practised the rites of their religion in a temple built and supported

by themselves. Of late years, however, they have fallen upon evil times, and in 1851, out of the seventy families which constituted the original colony, only seven remained. For fifty years no rabbi had ministered to the wants of this remnant. Their temple was in ruins, and the people themselves were reduced to the lowest extreme of poverty. In 1853 the city was attacked by the Tai-ping rebels, and, though at the first assault its defenders successfully resisted the enemy, it was subsequently taken. With the ruthlessness common to the Tai-pings the captors looted and partially destroyed the town, which still retains traces of this its latest misfortune. Of the population, which is probably not far short of 100,000, it is estimated that two-thirds of the tradesmen, tavern keepers, educated classes, and attendants at the Government offices are Mahometans. The city, which is situated in 34° 52' N. lat., and 114° 33' E. long., forms also the district city of Seang-foo.

KAIRA, a British district in the province of Guzerat, Bombay, India, lying between 22° 26' and 23° 6' N. lat., and between 73° 33' and 73° 21' E. long., bounded on the N. by Ahmadabad district, on the E. and S. by the river Mahi, and on the W. by Ahmadabad district and the state of Cambay, with an area of 1861 square miles. Except a small corner of hilly ground near its northern boundary, and in the south-east and south where the land along the Mahi is furrowed into deep ravines, Kaira district forms one unbroken plain, sloping gently towards the south-west. The north and north-east portions are dotted with patches of rich rice land, broken by uncultivated tracts of low brushwood. The centre of the district is very fertile and highly cultivated; the luxuriant fields are surrounded by high growing hedges, and the whole country is clothed with clusters of large, shapely trees. To the west this belt of rich vegetation passes into a bare though well-cultivated tract of rice land, growing more barren and open till it reaches the maritime belt, whitened by a salt-like crust, along the Gulf of Cambay. The chief rivers are the Mahi on the south-east and south, and the Sabarmati on the western boundary. The former, owing to its deeply cut bed and sandbanks, is impracticable for either navigation or irrigation; but the waters of the Sabarmati are largely utilized for the latter purpose. A smaller stream, the Khari, also waters a considerable area by means of canals and sluices.

The census of 1872 returned the population at 782,733 (419,142 males and 363,591 females). Hindus numbered 711,619; Muslims, 70,741; Parsis, 68; and Christians 305, of whom 248 are natives. Among the Hindus the most important classes are the Lewas and Kadwa Kumbha, numbering 144,039; they are the best cultivators in the district, sober, peaceable, and industrious. The Rajputs, with the exception of a few who with the title of thakur still retain landed estates, have sunk into the mass of ordinary peasant proprietors. The Kolis number 231,262; idle and turbulent under native rule, they are now quiet, hard-working, and prosperous. Among the Hindu low castes, numbering 61,834, the Dhes are distinguished for industry and good behaviour. They formerly lived in comfort by weaving coarse cotton cloth, but the competition of the Bombay and local steam mills is now shutting them out of the market. Of the Musalman population, about one-third represent the foreign conquerors of Guzerat; the remainder are the descendants of converted Hindus. The first class, employed chiefly as cultivators, or in Government service as police and messengers, are for the most part poor; the second class, who are artisans, chiefly weavers and oil-pressers, are hard-working and well-to-do. Thirteen towns contain more than 5000 inhabitants each. Agriculture forms the support of upwards of two-thirds of the population. In 1876-77, 869,321 acres, or 75 per cent. of the Government cultivable land, were under tillage, and 20,758 acres fallow or under grass. Food grains comprise upwards of 88 per cent. of the crops; pulses, 8 per cent.; oil-seeds, 1 per cent.; fibres, 1 per cent.; the remainder being taken up by miscellaneous crops, chiefly tobacco, which has the reputation of being the finest in western India. The manufactures comprise soapmaking, glassmaking, calico printing, and handloom weaving of coarse cloth. A steam spinning and weaving mill has been recently established. The exports are grain, tobacco, butter, oil, and the petals of the *malud* tree, the imports, piece-goods, groceries,

molasses, and dye-stuffs. About 40 miles of the Bombay, Baroda, and Central India Railway pass through the district.

The revenue administration of the district is conducted by a collector-magistrate and three assistants; for judicial purposes Kaira is included within the jurisdiction of the judge of Ahmadabad. The total imperial, local, and municipal revenue in 1875-76 was £249,314, of which £195,184 was derived from the land. Education was afforded in 1876-77 by 189 schools, attended by 14,720 pupils. Kaira possesses a public library, and in 1876 published three vernacular newspapers. The prevailing diseases consist of fevers of a malarious type. The average rainfall during the five years ending 1876 was 30 inches.

Kaira district has no independent history of its own. It is made up partly of lands acquired from the peshwa in 1802, and partly of territory acquired from the golkwar of Baroda in 1803 and 1817.

KAIRA, chief town and headquarters of the above district, situated 5 miles south-west of Mehmabad railway station, in 22° 44' 30" N. lat., and 72° 44' 30" E. long. It is a very ancient city, having a legendary connexion with the *Mahabharata*, and is proved by the evidence of copperplate grants to have been known as early as the 5th century. Early in the 18th century it passed to the Babi family, with whom it remained till 1763, when it was taken by the Marhattas; it was finally handed over to the British in 1803. It was a large military station till 1820, when the cantonment was removed to Deesa. Population (1872), 12,681.

KAIRWAN, KIRWAN, KERWAN (properly KAIRAWAN), the Mecca of northern Africa, is a city of the regency of Tunis, 30 miles inland from Susa, and about 80 miles due south from the capital. It is built in an open plain a little to the west of a stream which flows south to the Sidi el Heni lake. Of the luxuriant gardens and olive groves which form so prominent a feature in the early Arabic accounts of the place hardly a remnant has been left. The total circuit of the walls, according to Edward Rœ, is about 3500 yards; and the population is variously estimated from 10,000 to 15,000. A little modification of the eastern wall would make the plan an irregular hexagon. Kairwan is emphatically a religious city: no Jew is permitted to enter within its gates, and it is only at rare intervals that access has been obtained by Christian travellers, though for them in ordinary circumstances the real danger is reduced to a minimum. The more important mosques are only six in number, but the variety of the lesser religious structures is exceedingly great, and several parts of the city are crowded with the tombs of saints and warriors of the Mahometan faith. In the northern quarter stands the great mosque founded by 'Okba ibn Nâfi' el Fihri, and containing within its sacred precincts the shrine of this great defender of the faith and the tombs of the kings of Tunis. It has a length of 140 yards, and the south-east and north-east ends measure respectively 85 and 75 yards. To the outside it presents a heavy buttressed wall, with little of either grandeur or grace, but in the interior, in spite of whitewash and paint, it has that magnificence of marble columns which fitted it to be the prototype of the mosque of Cordova. As no European footstep has traversed its arcades, the number of the columns has not been ascertained, but there are at least upwards of 400 of them—a mingled spoil from the Roman ruins of the surrounding country. To the Mahometan mind the crowning distinction of the building is that through Divine inspiration the founder was enabled to set it absolutely true to Mecca. In the central aisle are two pillars between which the people believe that no person with the guilt of mortal sin upon him can by any possibility pass. A unique collection of ancient armour is preserved in one of the chambers. Of greater external beauty than the great mosque is the mosque of the Three Gates. The shrine of Sidi Ibn 'Isa is worthy of note for the peculiar conjuring performances carried on every Friday by the followers of its founder; and that of

the Campanian (*i.e.* of the Prophet) outside of the walls is specially sacred as possessing three hairs of the Prophet's beard. Formerly famous for its carpets and its oil of roses, Kairwan is now known in northern Africa rather for copper vessels, articles in morocco leather, potash, and saltpetre. In almost every respect it has greatly declined.

The Arabic historians relate the foundation of Kairwan by 'Okba with miraculous circumstances (Tabary, i. 63; Yâkût, iv. 213). The date is variously given (see Weil, *Gesch. d. Chalifen*, i. 283 sg.); according to Tabary it must have been before 670.

See Gruvillier T. Temple, *Excursions in the Mediterranean*, 1835; Edward Rice, *The Country of the Moors*, 1873; R. L. Playfair, *Treasures in the Zoolotropa of Brice*, 1877.

KAISARIEH. See **CASARRA**, vol. iv. p. 640.

KAISERSLAUTERN, the chief town of a circle in the government district of Rheinpfalz, Bavaria, is situated on the Lauter, in the hilly district of Westrich, about 40 miles west of Mannheim, and is one of the most important industrial towns of the Palatinate. It is the seat of the usual official bureaux, and counts among its educational institutions a gymnasium, a Protestant normal school, a commercial school, and an industrial museum. There are several churches, of which one owes its first foundation to Frederick Barbarossa, a hospital, and a large fruit-market. The house of correction occupies the site of Barbarossa's castle, built in 1153, and demolished by the French in 1713. The industries include cotton and wool spinning and weaving, iron-founding, and the manufacture of beer, tobacco, and numerous other articles. There is some trade in fruit and in timber. Population in 1875, 22,699.

Kaiserslautern takes its name from the emperor (Kaiser) Frederick I., who presented to the place a wood worth 50,000 marks annually. In 1270 it became a town, and in 1357 passed to the Palatinate. In 1621 it was taken by the Spanish, in 1631 by the Swedish, in 1635 by the imperial, and in 1713 by the French troops. During 1793 and 1794 it was the scene of active fighting; and in the Franco-Prussian war of 1870 it was the base of operations of the second German army, under Prince Frederick Charles. It was one of the early victims of the Reformation, and in 1849 was a focus for the revolutionary spirit in the Palatinate.

KAISERSWERTH, an ancient town in the circle and government district of Düsseldorf, Prussia, is situated on the right bank of the Rhine, 6 miles below Düsseldorf. It contains an old Romanesque church of the 12th or 13th century, and has several benevolent institutions, of which the chief is the training-school for Protestant sisters of charity. This institution, founded by Pastor Fliedner in 1836, has more than 100 branches, some even in Asia and America; the head establishment at Kaiserswerth includes an orphanage, a lunatic asylum, and a Magdalen institution. The Roman Catholic hospital occupies the former Franciscan convent. The population in 1875 was 2135, chiefly engaged in silk-weaving and tobacco manufacture.

In 710 Pippin of Hlorist presented the site of the town to Bishop Suithbert, who built the Benedictine monastery round which the town gradually formed. Until 1214 Kaiserswerth lay on an island, but in that year Count Adolphus V. of Berg, who was besieging it, dammed up effectually one arm of the Rhine. About the beginning of the 14th century Kaiserswerth was passed by the empire to Jülich, whence, after some vicissitudes, it finally passed into the possession of the princes of the Palatinate, whose rights, long disputed by the elector of Cologne, were legally settled in 1762. In 1792 the fortress was captured by the Austrians and Prussians, and the Kaiserburg, whence the young emperor Henry IV. was abducted by Archbishop Ilanno in 1062, blown up.

KAITHAL, or **KYTHAL**, an ancient town in Karnal district, Punjab, India, 29° 48' 7" N. lat., 76° 26' 26" E. long. It is said to have been founded by the mythical hero Tudishthira, and is connected by tradition with the monkey-god Hanuman. In 1767 it fell into the hands of the Sikh chieftain, Bhai Desu Singh, whose descendants, the Bhaits to Kaithal, ranked among the most important and powerful Cis-Sutlej chiefs. Their territories lapsed to the British in 1843. There is some trade in grain, sal-

ammonia, live stock, and blankets; and saltpetre and lac ornaments and toys are manufactured. Population in 1868, 14,490.

KAKAPO, the Maori name, signifying "Night-Parrot," and frequently adopted by English writers, of a bird, commonly called by British colonists in New Zealand the "Ground-Parrot" or "Owl-Parrot." The existence of this singular form was first made known in 1843 by Dieffenbach (*Travels in N. Zealand*, ii. p. 194), from some of its tail-feathers obtained by him in the interior of that country, and he suggested that it was one of the *Cuculidae*, possibly belonging to the genus *Centropus*, but he added that it was becoming scarce, and that no example had been seen for many years. The late Mr G. R. Gray, noticing it in June 1845 (*Zool. Voy. "Erebos" and "Terror,"* part ix. p. 9), was able to say little more of it, but very soon afterwards a skin was received at the British Museum, of which, in the following September, he published a figure (*Gen. Birds*, part xvii.), naming it *Strigops habroptilus*, and rightly placing it among the Parrots, but he did not describe it technically for another eighteen months (*Proc. Zool. Society*, 1847, p. 61), by which time some further information concerning it had been furnished by Sir George Grey (*Ann. Nat. History*, xviii. p. 427) and the late Mr Strange (*Proc. Zool. Society*, 1847, p. 50); while in the same year Jules Verreaux sent an example, with an account of its habits, to the museum of Paris, which was published by Dr Pucheran (*Rev. Zoologique*, 1847, p. 385). Various observers, among whom must be especially named Drs Lyall (*Proc. Zool. Society*, 1852, p. 31) and Haast (*Verh. zool.-bot. Gesellsch. Wien*, 1863, p. 1115) supplied other particulars, and many specimens have now been received in Europe, so that it is represented in most museums, and at least half a dozen examples have reached England alive. Yet, though much has been written about it, there is no detailed description of its internal structure, which fact is the more to be regretted since the bird is obviously doomed to early extinction, and the opportunity of solving several zoological problems of great interest, which a minute examination of its anatomy might afford, will be lost if some one does not speedily take the matter in hand. Few existing birds offer a better subject for a monograph, and it is to be hoped that, if perchance the genus and species must, posterity will not have to lament the want of an exhaustive treatise on its many and wonderful characteristics.

In habits the Kakapo is almost wholly nocturnal,¹ hiding in holes (which in some instances it seems to make for itself) under the roots of trees or rocks during the day-time, and only issuing forth about sunset to seek its food, which is solely vegetable in kind, and consists of the twigs, leaves, seeds, and fruits of trees, grass, and fern-roots—some observers say mosses also. It sometimes climbs trees, but generally remains on the ground, only using its comparatively short wings to balance itself in running, or to break its fall when it drops from a tree—though not always then—being apparently quite incapable of real flight. It thus becomes an easy prey to the marauding creatures—cats, rats, and so forth—which European colonists have let loose in New Zealand, so disastrously for its indigenous inhabitants. Sir G. Grey says it had been, within the memory of old people, abundant in every part of that country, but (writing in 1854) was then found only in the unsettled districts. But as the latter are continually suffering from encroachment, so are the haunts of the Kakapo, and it is

¹ This generic term was subsequently altered by Van der Hoeven, rather pedantically, to *Strigops*, a spelling now generally adopted.

² It has, however, been occasionally observed abroad by day; and, in captivity, one example at least is said to have been just as active by day as by night.

to be remarked that, from some cause unknown to us, there are localities which, though unsettled, it does not seem to inhabit, and thus little hope can be entertained of its surviving much longer.

The Kakapo is about the size of a Raven, of a green or brownish-green colour, thickly freckled and irregularly barred with dark brown, and dashed here and there with longitudinal stripes of light yellow. Examples are subject to much variation in colour¹ and shade, and in some the lower parts are deeply tinged with yellow. Externally the most striking feature of the bird is its head, armed with a powerful beak, that it well knows how to use, and its face clothed with hairs and elongated feathers that sufficiently resemble the physiognomy of an Owl to justify the generic name bestowed upon it. Of its internal structure little has been described, and that not always correctly. Its furcula has been said (*Proc. Zool. Society*, 1874, p. 594) to be "lost," whereas the clavicles, which in most birds unite to form that bone, are present, though they do not meet, while in like manner the bird has been declared (*op. cit.*, 1867, p. 624, note) to furnish among the *Carinatæ* "the only apparent exception to the presence of a keel" to the sternum. The keel, however, is undoubtedly there, as remarked by MM. Blanchard (*Ann. Nat. Sc. Zoologie*, ser. 4, xi. p. 83) and A. Milne Edwards (*Os. Foss. de la France*, ii. p. 516), and, though much reduced in size, is nearly as much developed as in the Dodo and the *Weka* (*qq.v.*). The aborted condition of this process can hardly be regarded but in connexion with the incapacity of the bird for flight, and may very likely be, as some have supposed, the result of disuse. There can be scarcely any doubt as to the propriety of considering this genus the type of a separate Family of *Psittaci*; but whether it stands alone, or some other forms (*Pezoporos* or *Geopsittacus*, for example, which in coloration and habits present some curious analogies) should be placed with it, must await future determination. In captivity the Kakapo is said to shew much intelligence, as well as an affectionate and playful disposition, soon attaching itself to its master and taking pleasure in caressing him and being caressed in turn. Unfortunately it does not seem to share the longevity characteristic of most Parrots, and none that have been held in confinement appear to have long survived, while many succumb speedily. For further details the reader may be referred to Gould's *Birds of Australia* (ii. p. 247) and *Handbook* (ii. p. 539), Dr Finsch's *Die Papageien* (i. p. 241), and Mr Buller's *Birds of New Zealand* (p. 26)—in which last work nearly all the information hitherto recorded is to be found. (A. N.)

KALABÁGH, or KULABÁGH, a town in Bannu district, Punjab, India, in 32° 57' 57" N. lat., 71° 35' 37" E. long., picturesquely situated at the foot of the Salt Range, on the right bank of the Indus, where the river debouches from the hills, 105 miles below Attock. The houses nestle against the side of a precipitous hill of solid rock-salt, piled one upon another in successive tiers, the roof of each tier forming the street which passes in front of the row immediately above, and a cliff, also of pure rock-salt, towers above the town. The salt is quarried (about 2700 tons in 1871-72) at Māri, opposite the town, where it stands out in huge cliffs, practically inexhaustible. The similar outcrop at Kalábágh itself is not quarried. Alum also occurs in the neighbouring hills, and forms a considerable item of local trade. Iron implements are manufactured. Population in 1865, 6419.

KALAMATA, chief town of the modern Greek nomarchy of Messenia in the Morea, is situated on the left bank of the Nedon, about a mile from the sea. There is a suburb on the right bank of the stream. On a hill behind the town are the ruins of a mediæval castle; but no ancient Greek remains have been discovered, although modern travellers have identified the site with that of the classical Phære or Phæra. It is the seat of a court of justice and of an archbishop. Kalamata is situated in a very fruitful district, of which it is the emporium. The roadsteads are safe in summer only; in the winter months the fishing craft take shelter in the haven of Ámyro. The value of the chief exports in 1879 and 1880 was as follows:—currants, £111,750 and £109,200; figs, £112,730 and £87,186; olive oil, £21,340 and £12,789; silk, £34,230 and £31,215. The population in 1870 was 6327.

Phære, Phere, or Phers was founded, according to Pausanias, by Pharis, son of Hermes; and the antiquity of its origin is still further attested by its mention in the *Iliad* (v. 543, ix. 161), and the *Odyssey* (iii. 490, xvi. 186). When Messene was captured (182 B.C.) by the Achæans, Phære became a distinct member of the Achæan league. During the Middle Ages it was for a time a fief of the Villehardouins. In 1685 Kalamata was captured by the Venetians; in 1770, and again in 1821, it was the revolutionary headquarters in the Morea. In 1925 it was sacked by Turkish Pasha.

KALAMAZOO, the county seat of Kalamazoo county, Michigan, U.S., 40 miles east of Lake Michigan, and equidistant from Chicago and Detroit, at the intersection of four railways, in the centre of one of the finest agricultural districts in the country. The public institutions include Kalamazoo College, the Michigan Female Seminary, and an asylum for the insane. About one-third of all the wind-mills in the United States are made here. Agricultural implements, carriages, steel springs, paper and milling machinery are among the chief manufactures; and there are also extensive planing mills and flour mills. The population of the township in 1880 was 13,562, including the village population of 12,012.

KALATCH, a town of Russia, in the country of the Don Cossacks, on the left bank of the Don above the confluence of the Karpovka, in 48° 43' N. lat. and 43° 30' E. long. Previous to the opening of the railway to Tsaritsin on the Volga, it was a place of only 500 inhabitants, but since that date (1862) it has increased to more than 12,000 inhabitants; and its transit trade has received a great development.

KALBE, or CALBE, AN DER SAALE, chief town of a circle in the government district of Magdeburg, Prussia, is situated on the Saale, 3 miles from the Saale (Grizhne) station on the Leipzig and Magdeburg Railway. It contains a local court, a middle school, and several benevolent institutions. The industries of the place include wool-spinning, and the manufacture of cloth, oil, paper, bricks, beet-root sugar, and tobacco. Cucumbers and onions are largely cultivated in the neighbourhood; and antimony is excavated. In 1875 the population was 7982; with the adjacent Bernburger and Schlossvorstadt it was 11,115.

KALEIDOSCOPE. This, as the name implies, is an instrument by means of which beautiful forms may be seen. It was invented by Sir David Brewster about 1815,—the idea of the instrument having occurred to him some time before while he was engaged with experiments on the polarization of light by reflexion. When it first appeared it attracted almost universal attention. This arose from the extreme beauty of the forms which it presented, their endless variety and perfect symmetry, as well as the readiness with which one beautiful form could be converted into another. The construction of the instrument was so simple, too, that almost any one could make it; and, in consequence, the patent originally taken out by Brewster was persistently evaded; kaleidoscopes were made by the hun-

¹ A specimen in the British Museum (*Zool. Voy. "Erébus" and "Terror,"* pl. xxii. pl. 7) has the prevailing green tint replaced by blue of several shades, and has been described as a distinct species, *S. greyi*; but it is obviously in an abnormal condition, and its specific distinctness cannot be maintained without further evidence.

dred, and sold in almost every toy-shop. Large cargoes of them were sent abroad; and it is stated that no fewer than two hundred thousand were sold in London and Paris in the space of three months. Besides being of essential service in the art of the designer, the kaleidoscope constitutes a very useful piece of philosophical apparatus, as it illustrates, in a very beautiful way, the optical problem of the multiplication of images produced by reflexion when the object is placed between two plane mirrors inclined to each other at a definite angle.

The general principle of the instrument will be easily understood from the following description and figures.

1. Let OA, OB (fig. 1) be the sections of two plane mirrors placed perpendicular to the plane of the paper and inclined to each other at a right angle. Let P be a luminous point, or object, placed between them. According to the general law of the reflexion of light from plane mirrors, the image of P formed by the mirror OA will be as far behind OA as P is in front of it; that is, the image of P is P_1 , where $PX = P_1X$, the line PP_1 being perpendicular to OA. Now P_1 may be regarded as a new object placed before the mirror OB, and hence the image of P_1 formed by OB will be P_2 , where $P_1Y_1 = P_2Y_1$. Similarly the image of P_2 formed by OA will be P_3 , where $P_2Y_2 = P_3Y_2$, and the image of P_3 formed by OB will also be at a point such that $P_3X_3 = P_4X_3$, that is, the two last formed images will coincide. Hence we have three images placed symmetrically about O, constituting, with the object P, a symmetrical pattern of four luminous points placed at the corners of a rectangle.

Fig. 1.

2. Let the mirrors OA and OB (fig. 2) be inclined to each other at any angle α , and let P be the object placed between them. With centre O and radius OP describe a circle. Evidently the images formed by successive reflexions from the mirrors will all lie on the circumference of this circle. We shall denote the images formed by a first reflexion at OA, second at OB, third at OA, and so on, by the symbols P_1, P_2, P_3, P_4 , respectively, and the images formed by a first reflexion at OB, second at OA, third at OB, and so on by P'_1, P'_2, P'_3, P'_4 , respectively. Draw PP_1 perpendicular to OA, P_1P_2 perpendicular to OB, P_2P_3 perpendicular to OA produced, and P_3P_4 perpendicular to OB produced. Then P_1, P_2, P_3, P_4 are the first set of images formed. Similarly draw the lines $PP'_1, P'_1P'_2, P'_2P'_3, P'_3P'_4$, then P'_1, P'_2, P'_3, P'_4 are the second set of images formed by a first reflexion at OB. Now, when any image falls within the angle vertically opposite to AOB, it is evident that no further reflexion can take place, as it is behind both mirrors. Hence the number of images formed depends upon the size of the angle AOB and also upon the position of the point P in relation to the mirrors.

Fig. 2.

When a symmetrical picture is required, it is essential that the two last formed images, that is, P_4 and P'_4 in the figure, should coincide, and we must determine when this will be the case. We shall measure the distances of the several images from P by the arcual distances PP_1 , &c. Now it is evident that

$$\begin{aligned} PP_1 &= 2PA + 2PB - 2AB = 2a, \\ P_1P'_1 &= PP_1 + P'_1P_1 = PB + P_1B + PA + P'_1A \\ &= PB + PA + AB + P_1A + AB + P'_1B \\ &= 4AB = 4a. \end{aligned}$$

$$P_2P_3 = 6a$$

$$P_4P'_4 = 2na.$$

Now, when the last formed image coincide, the arcual distance between them must be a whole circumference. Hence if P_n and P'_n be the last formed coincident images, we have

$$P_nP'_n = 2na = 2\pi.$$

Hence $\alpha = \frac{\pi}{n}$; that is, the mirrors must be inclined to each other at an angle which is an exact submultiple of two right angles, or, which is the same thing, an even submultiple of 360° .

3. Next suppose that, instead of a point, we put a line as an object in the angle between the mirrors; and, first, let us suppose that the mirrors are inclined to each other at an angle which is an odd submultiple of 360° (as one-fifth of 360° in fig. 3). OA, OB are the mirrors, PQ the line placed between them. The image of PQ formed by OA is P_1Q_1 , that formed by OB is P_2Q_2 . The image of P_2Q_2 formed by OA is P_3Q_3 , and the image of P_3Q_3 formed by OB is P_4Q_4 . Now it is readily seen that the points P_4 and Q_4 will not, in general, coincide, and, hence, a symmetrical picture of the line cannot in general be formed when the angle is an odd submultiple of 360° . If, however, the line $OP = OQ$, then the points P_4 and Q_4 will coincide, and a symmetrical picture of five lines be formed. Secondly, let us suppose that the angle AOB is an even submultiple of 360° . By following the course of the images it will be seen that the last-formed images of the line coincide in all positions of PQ, and hence a symmetrical figure can, in all cases, be formed.

Fig. 3.

As the object of the kaleidoscope is to produce symmetrical figures from objects placed in any position between the mirrors, we are necessarily limited to angles which are even submultiples of 360° .

The simple kaleidoscope consists essentially of two plane mirrors EOA and EOB (fig. 4) inclined to each other at an angle which is an even submultiple of 360° . A very common angle in practice is 60° . The mirrors are usually made of two strips of thin flat glass,—the length of each being from 6 to 12 inches, and the greatest breadth from 1 to 3 inches. The mirrors are first fixed, in any convenient manner, at the proper angle, and then inserted into a cylindrical tube of brass or paper. At the one end of the tube is a small eyehole opposite the point E, while the other end is closed by what is called the "object box." This consists of a shallow cylindrical box, which fits on to the end of the tube, and contains the objects from whose reflexion the pattern is produced. These objects may consist of petals of differently coloured flowers, scraps of differently coloured paper, or, still better, pieces of coloured glass. Very often the objects consist of small glass tubes filled with differently coloured liquids and then hermetically sealed. These produce a very fine effect. The objects are placed in the box between two circles of thin glass which fit into the box, the one of which is transparent and the other obscured by grinding. When in position the transparent glass is close to the end of both mirrors and fills up the sector AOB, while the other, the obscured one, is fixed into the outer end of the object box. The distance between the two glasses is made as small as possible,—just room enough being left to allow the objects to fall freely by their own weight into any position between the glasses. Suppose now that the angle AOB is 60° , and that the eye is placed at E, a beautiful symmetrical picture of six equal and similar sectors will be seen round the point O; and, by simply turning the tube round, so as to allow the objects to fall into a new position, an endless variety of pictures can be produced.

Fig. 4.

It is important to notice the proper position of the eye. This should be, as nearly as possible, in the plane

of both mirrors,—first, because in that position only the direct and reflected sectors are all at the same distance from the eye, and, in consequence, no want of symmetry is introduced by the foreshortening of one sector more than another; and, secondly, because in that position the maximum amount of light is reflected to the eye by the mirrors, and, in consequence, the various sectors appear as nearly as possible equally illuminated. Of course a certain amount of light is necessarily lost at each reflexion, and hence there is always a slight difference between the luminosity of the various sectors. However, this is found not to introduce any serious want of symmetry when the instrument is properly constructed.

A modification of the simple kaleidoscope was introduced by Sir David Brewster, whereby the images of large and distant objects can be introduced into the picture. This is effected by removing the object box and replacing it by a tube carrying at its outer end a double convex lens, represented by LL in fig. 5. By a screw adjustment the lens can be so placed as to focus the distant object

Fig. 5.

exactly in the plane of the sector AOB, and so bring its image into the very best position for producing symmetrical patterns. When this instrument is directed towards a tree in full foliage, or towards an arrangement of flowers in full bloom, a very beautiful effect is produced, which can be varied by gradually moving the instrument. This form was called by Brewster the *telescopic kaleidoscope*.

Another form is called the *polyangular kaleidoscope* (fig. 6). The only essential difference in it is that the mirrors are so arranged that the angle between them can be varied at pleasure. This, being very useful for illustrating the theory of the instrument, is the form usually found in collections of philosophical apparatus.

In all the instruments above described only two mirrors have been employed; but obviously we may have more than two. Suppose we wish to employ three mirrors enclosing a triangular opening, and that we also wish to produce perfectly symmetrical pictures. We are here limited in our choice of angles by the following conditions—first, the sum of the three angles which the mirrors make with each other must be equal to 180° , and, secondly, each angle must be an even submultiple of 360° . By trial it is easily found that the only angles which satisfy these conditions are 60° , 60° , 60° ; 90° , 60° , 30° ; and 90° , 45° , 45° . Hence with three mirrors we must choose one or other of these three sets. The first is that usually chosen.

Suppose similarly we wish to use four mirrors; then, we must put them either in the form of a square, when all the mirrors are of equal breadth, or in the form of a rectangle, when the opposite mirrors are of equal breadth. It is obvious that in these two cases only will the angle between each pair of mirrors be an even submultiple of 360° .

With more than four mirrors kaleidoscopes cannot be constructed

so as to give symmetrical forms, since each of the interior angles of a regular polygon of more than four sides must exceed an even submultiple of 360° .

See Harris's *Optics*; Wood's *Optics*; Parkinson's *Optics*; Brewster's *Treatise on the Kaleidoscope*. The last-mentioned contains an account of the application of the instrument to the art of designing. (J. BL.)

KALGAN, or CHANG-KEA-KOW, a large city of China, in the province of Chih-li, with a population estimated at from 70,000 to 100,000. It lies in the line of the Great Wall, 137 miles north-west of Peking, "commanding one of the most important passes between China and Mongolia and the main road of the overland route between China and Russia" (Bushell). Fritzsche gives its position as in $40^\circ 50'$ N. lat. and $114^\circ 54'$ E. long., and its height above the sea as 2810 feet. The valley amid the mountains in which it is situated is under excellent cultivation, and thickly studded with villages. Kalgan consists of a walled town or fortress and suburbs 3 miles long. The streets are wide, and excellent shops are abundant; but the ordinary houses have rather an odd appearance, from the fact that, like those of Erzeroum, they are usually roofed with earth and become covered with green sward. Large quantities of soda are manufactured, and the position of the town renders it the seat of a very extensive transit trade. In early autumn long lines of camels come in from all quarters for the conveyance of the tea-chests from Kalgan to Kiakhta; and each caravan usually makes three journeys in the winter. There is an excellent inn in the town frequented by the Russian merchants, some of whom have permanent residences and warehouses just outside the gate. On the way to Peking the road passes over a beautiful bridge of seven arches, ornamented with marble figures of monkeys, lions, tigers, and other animals. The name Kalgan is Mongolian, and means a barrier or "gate-beam."

KĀLIDĀSA is the most illustrious name among the works of the second epoch of Sanskrit literature, which, as contrasted with the age of the Vedic hymns, may be characterized as the period of artificial poetry. Owing to the utter absence of the historical sense in the Hindu race, it is impossible to fix with chronological exactness the lifetime of either Kālidāsa or any other Sanskrit author. Native tradition places him in the 1st century B.C.; but the evidence on which this belief rests has been shown to be wholly worthless. The works of the poet have been found to contain no allusions by which their date can be directly determined; yet the extremely corrupt form of the Prakrit or popular dialects spoken by the women and the subordinate characters in his plays, as compared with the Prakrit in inscriptions of ascertained age, has led the chief authorities, Weber and Lassen, to agree in fixing on the 3d century of our era as the approximate period to which the writings of Kālidāsa should be referred.

The richness of his creative fancy, his delicacy of sentiment, and his keen appreciation of the beauties of nature, combined with remarkable powers of description, which are conspicuous throughout his works, place Kālidāsa in the first rank of Oriental poets. The effect, however, of his productions as a whole is greatly marred by extreme artificiality of diction, which, though to a less extent than in other Hindu poets, not unfrequently takes the form of puerile conceits, and plays on words, the matter being treated merely as a means for displaying dexterity in the manipulation of the language. In this respect his writings contrast very unfavourably with the more genuine poetry of the Vedas. Though a true poet, he is wanting in that artistic sense of proportion so characteristic of the Greek mind, which exactly adjusts the parts to the whole, and combines form and matter into an inseparable poetic unity. Kālidāsa's fame rests chiefly on his dramas, but he is also distinguished as an epic and a lyric poet.

He wrote three plays, the plots of which all bear a general resemblance to each other, inasmuch as they consist of love intrigues, which, after numerous and seemingly insurmountable impediments of a similar nature, are ultimately brought to a successful conclusion.

Of these, *Calcuttā* is that which has always justly enjoyed the greatest fame and popularity. The unequalled praise bestowed upon it by Goethe sufficiently guarantees its poetic merit. There are two recensions of the text in India, the Bengali and the Devanāgarī, the latter being generally considered older and purer. *Calcuttā* was first translated into English by Sir William Jones (Calcutta, 1789), who used the Bengali recension. It was soon after translated into German by G. Forster (1791), and by Herder in 1803. An edition of the Sanskrit original, with French translation, was published by Chizey at Paris in 1830. This formed the basis of a translation by Hirzel (Zurich, 1830). Another edition of the Bengali recension was published by Premā Chandra (Calcutta, 1880) for the use of European students. The Devanāgarī recension was first edited by Buhdlingk (Bonn, 1842), with a German translation. On this were based the successive German translations of Meyer (Tübingen, 1851) and Lobenz (2d ed., Leipzig, 1881). The same recension has been edited by Dr. G. Burkhard with a Sanskrit-Latin vocabulary and short Prākṛit grammar (Breslau, 1872), and by Professor Monier Williams (Oxford, 2d ed., 1872). Another edition was published at Bombay in 1881.

The *Pitracarocet*, or *Urvasi* story by *Yatour*, abounds with fine lyrical passages, and is of all Indian dramas second only to *Calcuttā* in poetic beauty. It was edited by Leuz (Bonn, 1833) and translated into German by Ilofer (Berlin, 1837), by Hirzel (1838), and by Lobenz (Leipzig, 1881). The best edition is by Bollensen (Vörsburg, 1845). There is also an English edition by Monier Williams, a metrical and prose version by the late Professor H. H. Wilson, and a literal prose translation by Professor E. B. Cowell (1881).

The third play, entitled *Mālavikāgnishatru*, has considerable poetical and dramatic merit, but is confessedly inferior to the other two. It possesses the advantage, however, that its hero Agnimitra and its heroine Mālavikā are more ordinary and human characters than those of the other plays. It was edited by Dr. Trauberg at Bonn, 1840, and more correctly by Shankar P. Pandit, with English notes, in 1899, and ably translated into German by Professor Weber in 1856.

Two epic poems are also attributed to Kālidāsa. The longer of these is entitled *Raghuvamśa*, the subject of which is the same as that of the *Rāmāyana*, viz., the history of Rāma, but beginning with a long account of his ancestors, the ancient rulers of Ayodhya (edited by Stenitzer, Calcutta, 1892). The other epic is the *Kumārasmādhān*, the theme of which is the birth of Kumāra, otherwise called Kṛtārikāya or Skanda, god of war (edited by Stenitzer, London, 1838, and by the Rev. K. M. Banerjee, 3d ed., Calcutta, 1872). Though containing many fine passages, it is tame as a whole.

His lyrical poems are the *Meghadūta* and the *Ritūsamhāra*. The *Meghadūta*, or the Cloud-Messenger, describes the complaint of an exiled lover, and the message he sends to his wife by a cloud. It is full of deep feeling, and abounds with fine descriptions of the beauties of nature. It was edited with fine English translation by H. H. Wilson (Calcutta, 1818), and by Gildemeister (Bonn, 1841); a German adaptation by M. Müller appeared at Königsberg (1847), and one by Schmitz at Bielefeld (1859). It was edited by Johnson, with vocabulary and Wilson's metrical translation (London, 1807). The *Ritūsamhāra*, or Collection of the Seasons, is a short poem, of less importance, on the six seasons of the year. There is an edition by Böhlen, with prose Latin and metrical German translation (Leipzig, 1840).

Another poem, entitled the *Naladāsa*, or Rise of Nala, edited by Bouary (Berlin, 1830) and by Yates (Calcutta, 1844), which is a treatment of the story of Nala and Damayanti, but describes especially the restoration of Nala to prosperity and power, has been ascribed to the celebrated Kālidāsa, but was probably written by another poet of the same name. It is full of most absurd verbal conceits and metrical extravagances.

So many poems, partly of a very different stamp, are attributed to Kālidāsa that it is scarcely possible to avoid the necessity of assuming the existence of more authors than one of that name. It is by no means improbable that there were three poets thus named; indeed modern native astronomers are so convinced of the existence of a triad of authors of this name that they apply the term Kālidāsa to designate the number three. (A. A. M.)

KALINGA, or CALINGA, one of the nine kingdoms of southern India in ancient times. Its exact limits varied, but included the eastern Madras coast, from Palicat to Chioacole, running inland from the Bay of Bengal to the Eastern Ghāts. The name at one time had a wider and vaguer meaning, comprehending Orissa, and possibly extending to the Ganges valley. The Kalinga of Pliny

certainly included Orissa, but latterly it seems to have been confined to the Telugu-speaking country; and in the time of Hwen Tsang (630 A.D.) it was distinguished on the south and west from Andhra, and on the north from Odra or Orissa. The language of the country is Telugu. Taranatha, the Tibetan historian, speaks of Kalinga as one division of the country of Telinga. Hwen Tsang speaks of Kalinga ("Kie-ling-kia") having its capital at what may now be identified with the site either of Rājāmahendri (Rajahmundry) or Coringa. Both these towns, as well as Sinhapur, Kalingsapatam, and Chicacole, share the honour of having been the chief cities of Kalinga at different periods.

KALINGAPATAM, or CALINGAPATAM, a town and port in Ganjam district, Madras, situated at the mouth of the Vamsadhāra river, 18° 20' 20" N. lat., 84° 9' 50" E. long. Population (1871), 4676. It was the capital of the ancient Hindu kingdom of Kalinga, and one of the early seats of the Mahometan power in the Telugu country. Signs of its ancient greatness are still visible in the ruins of many mosques and other large buildings. The place is again rising in importance as a harbour, being the only safe roadstead along 400 miles of coast, and now a regular port of call for steamers. The value of the imports in 1875-76 was £16,400; of the exports, chiefly rice, seeds, and sugar, £32,800. Kalingapatam yields a salt revenue to Government of from £40,000 to £50,000 a year.

KALISH (Polish, *Kalisz*), the chief town of a government of the same name in Russian Poland, is situated in 51° 46' N. lat. and 17° 7' E. long., 135 miles due west of Warsaw on the banks of the Prosna, which there forms the boundary of Prussia. It is one of the oldest and finest cities of Poland, is the seat of a Roman Catholic bishop, and possesses a castle, a gymnasium, a teachers' institute, a theatre, and a large public park. The industrial establishments comprise a brewery, cloth factories, a ribbon factory, and tanneries. In 1871 the population amounted to 18,088, of whom more than 8000 were Jews.

Kalish is identified with the Calisia of Ptolemy, and its antiquity is indicated by the abundance of coins and other objects of ancient art which have been discovered on the site, as well as by the numerous grave mounds existing in the neighbourhood. In modern times it has been the scene of the decisive victory of Augustus the Strong over the Swedish general Marsfield on 26th October 1706, of several minor conflicts in 1813, and of the friendly meeting of the Russian and the Prussian troops in 1815, in memory of which an iron obelisk was erected in the town by Nicholas I. in 1841. The treaty of 1813 between Russia and Prussia is dated from Kalish.

KALITVENSKAYA, a stanitsa or camp-village in the country of the Don Cossacks, on the left bank of the Donetz, 81 miles east of Novotcherkassk. The name is well known in southern Russia through the excellent building material obtained from the sandstone quarries of the neighbourhood. The population increased from about 1800 in 1860 to 12,700 in 1872.

KALNĀ, or CULNĀ, a town in Bardwān district, Bengal, India, situated on the right bank of the Bhāgrāthi river, 23° 13' 20" N. lat., 88° 24' 30" E. long. It is an important river-side market town, with an extensive trade. The population in 1872 amounted to 27,336—22,463 of them Hindus.

KALOCSA, a town of Hungary, and capital of the former county of Solt (now included in the county of Pest-Filis-Solt-Kis-Kun), is situated in a marshy but highly productive district, 3 miles distant from a steam-packet station on the left bank of the Danube, and about 69 miles south of Budapest, 46° 31' N. lat., 18° 58' E. long. Kalocsa is the see of the second of the four Roman Catholic archbishops of Hungary, and has a fine cathedral, a seminary for priests, a Roman Catholic (Jesuit) gymnasium, an observatory, and an archiepiscopal palace (formerly a fortress) containing a library of 80,000 volumes and a botanical

collection. The inhabitants of Kalocsa and its wide-spreading communal lands are for the most part employed in the cultivation of the vine, fruit, flax, hemp, and cereals, in the capture of water-fowl, and in fishing. The population in 1880 amounted to 15,770, chiefly Magyars by nationality and Roman Catholics by creed.

Kalocsa is one of the oldest towns in Hungary. The present archbishopric is a development of a bishopric said to have been founded in the year 1060 by King Stephen the Saint. The town was once well fortified, and of far greater relative importance than at present. It suffered much during the 16th century from the desolating hordes of Ottomans who then ravaged the country. Kalocsa is much resorted to as an ecclesiastical centre.

KÁLPI, or CULPEE, a town in Jalán district, North-Western Provinces, India, situated on the right bank of the Jumna, 28° 7' 30" N. lat., 79° 47' 15" E. long. Population (1872), 15,570, viz., 11,414 Hindus and 4156 Mahometans. It was founded, according to tradition, by Básedeo or Vasudeva, who ruled at Kámbai from 330 to 400 A.D. In 1196 it fell to Kutub-din, the viceroy of Muhammad Ghoor, and during the subsequent Mahometan period it played a large part in the annals of this part of India. About the middle of the last century it fell into the hands of the Marhattas. It was captured by the British in the campaign of 1803, and since 1806 has remained in British possession. In May 1858 Sir Hugh Rose (Lord Strathnairn) defeated there a large force of about 10,000 rebels under the rani of Jhansi. Kálpi was formerly a place of far greater importance than at present. It had a mint for copper coinage in the reign of Akbar; and the East India Company made it one of their principal stations for providing the "commercial investment." A bridge of boats on the Jhansi and Cawnpur road crosses the river during the summer months. Cotton and grain are exported to Cawnpur, Mirzápúr, Calcutta; and paper and sugar candy are manufactured.

KALUGA, a central government of European Russia, surrounded by those of Moscow, Smolensk, Orel (Orloff), and Tula. The area is estimated at 25,594 square miles, or according to the maps of the Kaluga surveying office 27,407. For the most part the surface is flat, and the culminating point of the government is a hill in the northern district of Meduin, 910 feet in height. In the north-west there is a considerable tract of peat-bog. The Oka, a main tributary of the Volga, and its confluent (the Zhizdra, the Ugra, &c.), drain all but a strip of country in the west, which is traversed by the Bolva, an affluent of the Dnieper. Strata of Carboniferous Limestone prevail except in the north, where Jurassic rocks take their place. The coal though common enough is of poor quality, and has been comparatively little worked. Clays from the southern districts are employed in the glass-works of Kaluga and the surrounding governments. Iron-ore is obtained in considerable abundance between the left-hand feeders of the Bolva and the upper course of the Zhizdra. According to the reports of the statistical committee for 1880 (*Pamyatnyaya Knizhka*, 1881) about 1,246,874 acres were covered with forest (pines, firs, birches), large tracts more especially existing in the Zhizdra district; 20,000 acres consisted of marsh land, 903,580 acres were under tillage, and 2,201,208 were devoted to pasturage. The soil in most parts of the government is composed of sand or clay; and it is only in certain portions of the districts of Peremuishl, Kozelsk, and Meshtchovsk that the famous "black earth" is found. Agriculture is in a comparatively low state in Kaluga, requiring a great increase in the outlay of capital, and especially the keeping of more live stock for the fattening of the soil.

Rye and oats are the principal crops, but the production is less than the local demand. Buckwheat, potatoes, flax, and hemp are also grown. Manufacturing industries are on the increase, the

cloth and cotton factories employing upwards of 2000 men, the iron-works more than 6000, the paper-mills about 1300, and the match-works more than 1500. The breeding of canaries, which are sent to all parts of Russia, was a source of livelihood to 350 persons in 1880. Railway lines from Moscow to Orel, from Moscow to Smolensk, and from Smolensk to Orel enclose the government in a triangle, but none of them touch its territory. By means, however, of the navigable streams, a good deal of traffic is carried on. The government is divided into eleven districts (*uyezdy*)—Kaluga, Mosalsk, Meshtchovsk, Likhvin, Kozelsk, Zhizdra, Peremuishl, Meduin, Borovsk, Maloyaroslavets, and Tarusia. The following are the towns of more than 5000 inhabitants, according to the returns for 1870—Kaluga, 38,600; Zhizdra, 11,700; Borovsk, 9500; Meduin, 7800; Kozelsk, 7350; Sukhinitchi, 6050; Meshtchovsk, 5450; Maloyaroslavets, 5150. The government had a population of 1,114,373 in 1880.

KALUGA, the chief town of the above government, is situated 475 feet above the sea-level on the left bank of the Oka, at the confluence of the Yatchenka, 114 miles south-west of Moscow, in 54° 31' N. lat. and 36° 6' E. long. Among the public buildings may be mentioned the cathedral of the Trinity (rebuilt in the present century in room of an older edifice dating from 1687), two monastic establishments, a male and a female gymnasium, an ecclesiastical seminary (with 219 students in 1879), an infant asylum, an orphanage, a public hospital, a lunatic asylum, a hospital for incurables, and a house of correction. The principal articles of production are leather, oil, bast mats, wax candles, starch, and a particular kind of cake known in Russia by the name of the town. This last item alone counts for more than 1,000,000 roubles (£156,000) per annum in the local trade. Situated as it is on a navigable river, and at the junction of important roads, Kaluga is naturally the centre of no small commercial activity. Even in the beginning of the century its merchants and manufacturers were known in Leipzig, Bremen, and Dantzic. Including the suburban villages of Yamskaya and Podsnalynia the town had 36,880 inhabitants in 1870.

The first historical mention of Kaluga occurs in 1389, when Demetrius of the Don assigned it to his son; and its final incorporation with the principality of Moscow belongs to the year 1513. In 1607 it was held by the pretender Bolotnikoff, and vainly besieged for four months by the forces of Shuiski; but in 1619 it fell into the hands of the Zaporogian hetman. Nor was it from war alone that Kaluga suffered. Two thirds of its inhabitants were carried off by a plague; and in 1622 the whole place was laid waste by a conflagration. It recovered, however, and, in spite of several extensive conflagrations (especially in 1743 and 1764) has continued to flourish. The rank of chief town of a province was obtained in 1719. In 1754 the population numbered 13,728, and by 1785 had increased to 17,078. On several occasions Kaluga has been chosen as the residence of political prisoners; among others, the famous Schamyl (see *Russkaya Starina*, 1877) spent his exile there.

KALVARIYA, (i.e., Calvary), a district town in the government of Suwalki in Russian Poland, on the right bank of the Shelupa, 40 miles south-west of Kovno. It carries on a considerable trade, and manufactures needles, linen, flannel, leather, and combs. The inhabitants, of whom more than two-thirds are Jews, amounted to 9400 in 1867, and to 10,200 in 1870.

KALW, or CALW, chief town of a circle in the government district of Schwarzwald, Wurtemberg, is situated on the Nagold, about 34 miles south-west of Stuttgart by rail. It is the seat of local, civil, and criminal courts, and of a chamber of commerce; and it contains a high school, a commercial gymnasium, and a missionary institution. The industries include a large variety of spinning and weaving operations in wool and cotton. Carpets, cigars, and wool-combs are also manufactured. The timber trade, chiefly carried on with the Netherlands, is important. The prevalence of malaria renders the valley of the Nagold unhealthy. The population in 1875 was 4642.

The name of Kalw emerges as early as 1037. In the Middle Ages the town was under the dominion of an ancient and powerful family of counts, whose possessions finally passed to Wurtemberg in 1345. In 1634 the town was taken by the Bavarians, and in 1692 by the French.

KĀMALĀ, a red powder used in medicine as an anthelmintic. It is obtained from *Mallotus Philippinensis*, Mull., a large shrub or small tree from 20 to 45 feet in height, widely distributed in Asia, from southern Arabia in the west to North Australia and the Philippines in the east. The fruit of this species, as of many other Euphorbiaceous plants, is covered with stellate hairs, among which are intermixed ruby-coloured glands. These are found also on other parts of the plant, especially among the down with which the under surface of the leaf is covered. Kāmālā is collected in many parts of India, and forms one of the lesser products of the Government forests in the Madras presidency at Naini Tal, where the *Mallotus* is found growing in immense quantities at the foot of the hills. According to Mr F. E. G. Matthews, numbers of people, chiefly women and children, are engaged in collecting the powder for exportation. A quantity of the berries is thrown into a large basket, and rubbed with the hand until the powder is removed and falls through the basket, as through a sieve, on a cloth spread below it to receive it.

The collection of kāmālā begins in March, and lasts for about a month. The drug thus prepared contains, besides the glands, stellate hairs and fragments of leaves. Some samples, however, are occasionally met with in commerce containing as much as 60 per cent. of earthy matter, which is easily detected by its sinking when the kāmālā is stirred up with water, or by the amount of ash left when the powder is incinerated. In India kāmālā has long been known, since it has several ancient Sanskrit names, one of which, *kapila*, signifies dusky or tawny red. Under the name of wars, kanbil, or qinbil, kāmālā appears to have been known to the Arabian physicians as a remedy for tapeworm and skin diseases as early as the 10th century, and indeed is mentioned by Paulus Ægineta in the 7th, but it did not attract any special attention in Europe as a medicine until experimented with by Mackinnon, a surgeon in the Bengal medical establishment, who tried it in numerous cases of tapeworm. Anderson and others in India, and Leared in London, confirmed the results obtained, and established the fact that kāmālā is an efficient taenifuge. It was soon after introduced into the British pharmacopœia (1864).

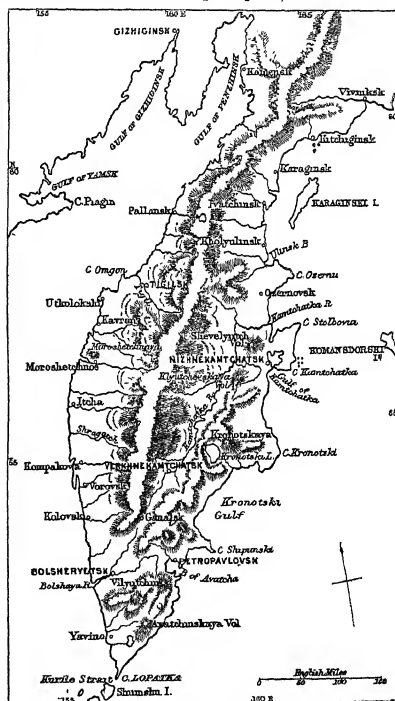

Kāmālā floats on water, which scarcely acts on it even at a boiling heat, but it yields about 80 per cent. of a splendid red resin to alcohol, ether, chloroform, benzol, glacial acetic acid and bisulphide of carbon. When sprinkled over a flame it ignites with a flash like lycopodium, and yields after incineration about 1·7 per cent. of ash. Leube found that the resin consisted of two varieties, one more easily soluble, and fusing at 176° Fahr. (80° C.), and the other dissolving less readily, fusing at 375·8° Fahr. (191° C.). Anderson obtained a substance, named by him rottlerin, $C_{22}H_{30}O_8$, by allowing a strong ethereal solution of kāmālā to stand for a few days. This when purified by recrystallization formed satiny minute tabular yellow crystals soluble in ether, sparingly soluble in cold and more so in hot alcohol, and insoluble in water.

Another kind of kāmālā under the Arabic name of wars is sometimes exported from Aden, where it is shipped from Harar on the east coast of Africa, and is also collected in southern Arabia and exported thence to the Persian Gulf and Bombay. The plant from which this variety is obtained is not known. It differs from true kāmālā in having a deep purple colour, in the greater coarseness of its particles, in yielding 12 per cent. of ash, in having long simple hairs mixed with it, and in becoming quite black when heated to from 199·4° Fahr. (93° C.) to 212° Fahr. (100° C.), at which temperature true kāmālā undergoes no change. The microscopic structure of the

glands is also different, the resin cells being oblong instead of club-shaped, and the grains themselves cylindrical or subconical instead of irregularly spherical. It is to this variety of kāmālā that the name wars alone belongs, while kāmālā, kanbil, and qinbil are restricted to the red powder collected in India. In 1875-76 there were exported from Aden 42,975 lb of wars. Dr Vaughan when residing in Aden in 1852 observed that under the name of wars kāmālā was also used as a dyestuff for silk (*Pharmacographia*, p. 373).

See Hanbury, *Science Papers*, p. 73; *Pharmacographia*, 2d ed., p. 672; Bentley and Trimen, *Med. Plants*, 238; Kuntze, *Flora of Coromandel*, 1798, n., tab. 163; *Pharmaceutical Journal* (2), vol. ix. p. 280; Hunter, *Account of Aden*, 1877, p. 187.

KĀMCHATKA, or KAMTCHATKA, a peninsular portion of eastern Siberia, Russia, stretching south between the Sea of Okhotsk on the west and Behring's Sea on the east, and finding its physical continuation first in the Kurile Islands (of which Shumshu is only 7 miles distant from the terminal Cape Lopatka) and then in the

Map of Kamchatka.

larger islands of the empire of Japan. The area is estimated at 237,266 square miles. The range of mountains which forms the backbone of the peninsula opens up towards the middle into two distinct branches, and gives the whole the general outline of an oval leaf. The western branch is the higher of the two. Southwards from 57° N. lat there are no fewer than twelve active and twenty-six extinct craters,—all, however, except five on

the eastern side of the peninsula. The active volcanoes are as follows:—Klyutchevskaya Sopka (15,040 feet in height), Shevel'yutch (9898 feet), Bolshaya (i.e., the Great) Tolbachka (7800 feet), Kizimen, Uzon, Kishpinitch, the Great and the Little Semetchik, Zhupanova Sopka (8496 feet), Avatchinskaya (8360 feet), Asatcha, and Tehokhtich. The eruptions of Klyutchevskaya are not unworthy of being compared with those of Mount Etna; the most notable chronicled by European observers are those of 1727–1731 (lasting four years), 1737, and 1854. More than twenty hot springs are known. The basis rocks are granite and porphyry, with metamorphic schists, basalts, trachytes, and other volcanic rocks. The sedimentary rocks are mainly of Tertiary and more particularly Eocene origin; those of the Quaternary period have a limited area. Native copper, magnetic iron, lignite, amber, mica, and sulphur are the chief minerals. Of the rivers the largest bears the same name as the peninsula; rising in the highest part of the central range, it flows north for about 310 miles, and falls into the Behring Sea. The valley of the Kamchatka forms the most fertile and most populous portion of the peninsula. For the meteorology of this portion of Asia the materials are of the scantiest; Dr Wild even (*Met. Repertorium*, suppl. vol., St Petersburg, 1881) is obliged to have recourse to observations as far back as 1844. In January the mean temperature appears to be 19°4 Fahr. at the southern point of the peninsula, 17°6 at Petropavlovsk, and –5°6 at the northern extremity. The western coast is very considerably colder in winter than the east, but the snowfall is much heavier in the east than in the west. Towards the south especially snow often lies so thick that the natives cannot keep reindeer. During summer the weather is very uncertain, with frequent rains and fogs; but in the centre of the peninsula especially there is a large amount of warmth. Vegetation, especially on soils of volcanic origin, is remarkably luxuriant, the grass grows nearly 5 feet high, and may be cut three times. In the woods berries, mushrooms, and the Martagon lily abound, the bulbs of the last also furnishing food to the natives. Beyond the forests appear *Rhododendron Kamtschaticum*, *Salix arctica*, and other plants of an alpine type. The Kamchatkan nettle—with richly variegated foliage—is a familiar object in English greenhouses. Besides the Kamchadales proper there are Koryak and Lamut tribes within the limits of the peninsula. By themselves the Kamchadales are called Itelm,—the name by which they are usually known being a corruption of Konchal, their Koryak appellation. There are not in all more than 2000 Kamchadales, and the process of Russification is going on rapidly. They are a strong hardy people, inured to the severities of the climate, capable of any amount of toil in the way of walking. To their women they are affectionate, and even submissive. In winter they live in pits covered with earth and turf, the interior being reached by means of a ladder. In the summer they occupy slight wooden sheds (*bologans*) raised on high props or stilts. The skill they display in the training of their sledge-dogs is not surpassed by any other people who practice the same art. With their sledges (narts)—which measure from 5 to 10 feet in length—they travel 4 to 8 miles an hour. The Kamchadal language cannot be assigned to any known group; its vocabulary is extremely poor. The purity of the tongue is best preserved by the people of the Penzhinsk district on the west coast; many of the inhabitants of the Kamchatka valley speak a broken Russian. Mr Kennan compares the sound of the language to that of water running out of a narrow-mouthed jug. The total population of the peninsula were “331 in 1853, and 5846 in 1870.

The Russians made their first settlements in Kamchatka in the end of the 17th century; in 1696 Vladimir Atlasoff from Anadursh founded Nizhne-Kamchatka, and in 1704 Kobleff founded Bolsheryetsk. About twelve years later the Russians came for the first time by sea from Okhotsk. In 1720 a survey of the peninsula was undertaken; in 1725–30 it was visited by Behring's expedition; and from 1733–45 it was the scene of the labours of the Krasnoarmnikoff and Steller expedition. Disturbance among the natives in 1781 led to the building of a fort at Tiglik. The seat of the government is at Petropavlovsk. In 1855 the country was incorporated with the Maritime Province.

See Krasnoarmnikoff, *Opisanie Kamchatki*, 1786, of which an English translation appeared at Gloucester, 1784, and a German translation at Leipsic, 1774; Lesseps, *Reise durch Kamtschatka*, Berlin, 1791; Primen, *Rasse*, vol. iii.; Langsdorff, *Bemerk. auf einer Reise um die Welt*, 1812; Tronson, *Voyage à Japan*, &c., London, 1859; Petermann's *Mittheilungen*, 1860; *Revue d'Anthropologie*, 1872; Kennan, *Two Life in Siberia*, New York, 1870; and the same author's paper in *Journ. of Amer. Geogr. Soc.*, 1876.

KAMENETS (Polish, *Kamieniec*), usually distinguished as Podolian Kamenets to distinguish it from Lithuanian Kamenets in Grodno, is the chief town of the government of Podolia, Russia. It is situated in 48°40' N. lat. and 26°25' E. long., 983 miles south of St Petersburg, and occupies a high and rocky peninsula formed by the river Smotritsch, a left-hand tributary of the Dniester. Round about the town lie quite a cluster of suburban villages, the Polish Folwark, the Russian Folwark, Zinkovisi, Karvasari, &c.; and on the opposite side of the river, and accessible by a wooden bridge, stands the fine old castle which so long frowned defiance across the Dniester to Khotin. Among the ecclesiastical buildings may be mentioned the Roman Catholic cathedral of St Peter and St Paul, built in 1361, and distinguished by a minaret, which recalls the time when it was used as a mosque by the Turks; the Greek cathedral of John the Baptist, dating from the 16th century, but up to 1798 belonging to the Basilian monastery; the Orthodox monastery of the Trinity; the Catholic Armenian church, founded in 1398, and possessing among its treasures a missal of slightly earlier date and an image of the Virgin Mary that saw the Tartar invasion. The town contains further a Government gymnasium, Orthodox and Roman Catholic seminaries, Jewish colleges, and an infirmary. The population was 20,699 (11,091 males) in 1863, comprising 9965 Jews, 4987 Catholics, 69 Armenians, and 56 Protestants. In 1870 the total was 23,611.

Kamenets appears to be first mentioned in the Russian chronicles in the end of the 12th century, though there is some doubt whether it be the Podolian town that is meant. Laid waste in 1240 by the forces of Baty, the leader of the Golden Horde, it passed out of view for nearly a century. It afterwards appears frequently in the general history of the Podolian region; and in 1431 it was made the chief town of the province of Podolia, installed by Ladislav III., king of Poland. In the course of the 15th and 16th centuries it suffered frequently from the invasions of Tartars, Moldavians, and Turks; and in 1672 the hetman Doroshenko, assisted by Mikolaj IV., made himself master of the place. Restored to Poland by the peace of Cuchovitz (1699), it passed with Podolia to Russia in 1795, and on the constitution of the Podolian government in the following year obtained the rank of government town.

KAMENZ, chief town of a department in the circle of Bautzen, Saxony, is situated on the Black Elster, about 21 miles north-east of Dresden. It is the seat of a local court, and has a handsome new town-house and a library. The hospital is dedicated to the memory of Lessing, who was born here in 1729. A colossal bust of the poet was placed opposite the Wend church in 1863; and a monument was raised to him on a neighbouring hill in 1864. The industries of Kamenz include wool-spinning, and the manufacture of cloth, crockery, and stoneware. In 1875 the inhabitants numbered 6785, including the garrison.

Until the 18th century Kamenz was known by the name Brückentham. In 1818 it passed by purchase to the margrave of Brandenburg; in 1819 it went to the king of Prussia; and in 1836, after suffering much in the Hussite and Thirty Years' wars, it came into

the possession of Saxony. In 1706 and 1848 it was visited by conflagration. About 6 miles south-east is the Cistercian monastery of Marienberg.

KAMES, HENRY HOME, LORD (1696–1782), a philosopher and Scotch judge, was descended from an old Scotch family, and was the son of George Home of Kames, in the county of Berwick, where he was born in 1696. After receiving a somewhat imperfect education from a private tutor, he was in 1712 bound by indenture to a writer to the signet in Edinburgh, but an accidental introduction to the comfortable and dignified leisure of Sir Hew Dalrymple, then president of the court of session, determined him to aspire to the higher position of advocate. He accordingly set himself with great diligence to remedy the defects of his early education, studying in private the various branches of literature and science which constituted the curriculum of arts in the Scottish universities, and with special interest those of metaphysics and moral philosophy. He was called to the bar in 1723, and, as he was unpossessed of those brilliant qualities which sometimes command immediate success, he employed his leisure in the compilation of a volume which he published in 1728 under the title *Remarkable Decisions in the Court of Session from 1716 to 1728*. This work having attracted attention to his abilities, his power of ingenious reasoning and mastery of law gradually gained him a leading position at the bar. His professional duties did not, however, prevent him devoting a large portion of his time to special studies, as well as to philosophy and literature, while his flow of animal spirits, his affectionate disposition, and his conversational gifts rendered him very partial to social intercourse, especially with persons of cultivated tastes. In 1752 he was appointed a judge in the court of session under the title of Lord Kames, and in 1763 he was made one of the lords of justice. Through his wife Agatha Drummond, whom he married in 1741, he in 1761 succeeded to the estate of Blair Drummond, Perthshire, where he put into practice a remarkably bold scheme of agricultural improvement, the removal of a stratum of peat on 1500 acres of land by floating it into the river Forth. He died at Edinburgh, 27th December 1782.

Whatever opinion may be formed of the literary qualities, the originality, or the intrinsic value of the publications of Lord Kames, there can be no question as to the versatility of taste and incessant diligence which they imply. The extent and thoroughness of his legal knowledge is attested by a large number of separate works: *Jus Tertii*, &c., 1732; *Dictionary of Decisions*, 1741; *Essays concerning British Jurisprudence*, 1747; *Principles of the Law of Scotland*, 1754; *Statute Law of Scotland abridged*, 1757; *Historical Law Tracts*, 1758; *Principles of Equity*, 1760; a second volume of *Remarkable Decisions*, 1760; *Elucidations concerning the Commercial and Statute Law of Scotland*, 1770; and *Selected Decisions of the Court of Session*, 1780. Lord Kames also took a special interest in the agricultural and commercial affairs of the country. In 1755 he was appointed a member of the board of trustees for encouragement of the fisheries, arts, and manufactures of Scotland, and about the same time he was named one of the commissioners for the management of the forfeited estates annexed to the crown. One of his favorite amusements was the embellishment of his estate, in connexion with which he carried into execution a novel plan of a winter garden. On the subject of agriculture he wrote *The Gentleman Farmer*, 1776. In 1765 he published a small pamphlet *On the Place Husbandry of Scotland*; and, besetted availing himself of his extensive acquaintance with the proprietors of Scotland to recommend the introduction of manufactures, he took a prominent part in furthering the project of the Forth and Clyde Canal. He was also one of the founders of the Physical and Literary Society, afterwards the Royal Society of Edinburgh. It is, however, as a writer on philosophy that Lord Kames is best known. In 1751 he published his *Essays on the Principles of Morality and Natural Religion*, in which he endeavoured to maintain the doctrine of innate ideas, but succeeded to man an apparent but only apparent freedom of the will. His statement of the latter doctrine so aroused the alarm of certain clergymen of the Church of Scotland that he found it necessary to withdraw what was regarded as a serious error, and to attribute man's delusive sense of freedom, not to an innate conviction implanted by God, but to the influence of the passions. *An Introduction to the*

Art of Thinking, which appeared in 1761, was followed in 1762 by *Elements of Criticism*, an ingenious and in some respects suggestive discussion of the principles of taste, but in many ways imperfect and unsatisfactory. In 1774 he published, in two volumes, *Sketches of the History of Man*, a somewhat heterogeneous medley of opinions and speculations on a great variety of subjects, but containing many shrewd suggestions and much curious observation. The works of Kames as a whole are more remarkable for superficial fertility and varied learning than for real originality, and his reasoning is clever and ingenious rather than subtle and comprehensive. His style is loose, frequently incorrect and awkward in construction, and abounds in expressions which border on slang.

See *Life of Lord Kames*, by A. F. Tytler, Lord Woodhouselee, in 2 vols., 1807.

KAMMIN, or CAMMIN, the chief town of a circle in the government district of Stettin, Prussia, is situated $2\frac{1}{2}$ miles from the Baltic coast, on the Kamminsche Bodden, a lake connected with the sea by the Dierowen. It is the seat of a local court. The venerable cathedral and the church of St Mary are noteworthy. Portland cement and knitted goods are produced in the town, which has also some fishing and shipping industry. There is daily steamer communication with Stettin, about 40 miles south-south-west. Kammin is of Wendish origin. From 1175 till 1628 it was the seat of a bishopric, which at the latter date became a secular principality, afterwards incorporated with Brandenburg. Population in 1875, 5490.

KAMPEN, a town of Holland, in the province of Overijssel, stretches for nearly a mile along the left bank of the Yssel, about $3\frac{1}{2}$ miles above the mouth of the river. It is connected by railway with Zwolle. The town is traversed in its whole length by a canal, and the old walls have been transformed into promenades and drives. Three of the town gates are good examples of the style of such architecture in the 16th and 17th centuries. Of the seven churches the most noteworthy is St Nicholas, which ranks with the cathedral of Utrecht and St John's of Bois-le-Duc as one of the three great mediæval churches in the Netherlands. The town-hall, dating partly from the 16th century and partly from the 18th, is of interest both from its architecture and decorations and for the value of the archives. There are a theological seminary, a gymnasium, an upper burgher school, and a municipal school of design; among the beneficent foundations the most notable is the Great Orphanage. The pasture land of the vicinity fosters a considerable trade in dairy produce; and there are shipyards, rope-walks, a tool factory, cigar factories, paper mills, &c. The inhabitants numbered 7760 in 1840, 11,903 in 1870, and 16,454 in 1876.

Kampen (variously Latinized as *Campm*, *Campi*, and *Campacina* and *Isalam*) appears as early as 1172, and soon acquired municipal rights. In the 14th century it was the seat of a flourishing cloth manufacture, and as a member of the Hanseatic League it developed a large trade with Denmark and various parts of the Low Countries and Germany. The town was nearly besieged by Duke John of Bavaria in 1400 and by Jan van Goy in 1468. During the great wars of the 16th century it was occupied by the forces of the States in August 1572, a little later captured by Don Frederick, recovered for the States by Rennenburg in 1578, and attacked without success by Verulgo in 1584. The Munster party obtained possession of Kampen in 1672, but were expelled by the French in 1673.

Kampen is to the Dutch what Gotham is traditionally to the English, or Schiltach and Schuppenstadt to the Germans. See E. Moelin, *Histor. Kampen Kronyk*; Havard, *Notes of the Zwager Zee*, 1876.

KAMPTULICON. See FROOD CLIFF.

KAMRUP, a district of Assam, India, extending along both banks of the Brahmaputra, between $25^{\circ} 50'$ and $26^{\circ} 53'$ N. lat., and $90^{\circ} 40'$ and $92^{\circ} 2'$ E. long., bounded on the N. by Bhutan state, on the E. by Darrang and Nowgong districts, on the S. by the Khási hills, and on the W. by Goalpara district.

The general physical characteristics of Kamrup are those common to the whole valley of Assam. In the immediate neighbourhood of the Brahmaputra the land is low, and exposed to annual inundation. In this marshy tract reeds

and canes flourish luxuriantly, and the only cultivation is that of rice. At a comparatively short distance from the river banks, the ground begins to rise in undulating knolls towards the mountains of Bhutan on the north, and towards the Khási territory on the south. The hills south of the Brahmaputra in some parts reach the height of 800 feet. It is on the slopes of these hills, amid the primeval jungle, that European planters have set out their trim tea-gardens. The general scenery of Kámrup is thus agreeably diversified; and the villages are described as very picturesque. The Brahmaputra, which divides the district into two nearly equal portions, is navigable by river steamers and large cargo boats throughout the year, and receives several tributaries navigable by large native boats in the rainy season. The chief of these are the Manás, Chául Khoyá, and Barnadi on the north, and the Kulsí and Dibru on the south bank. Forests cover about 130 square miles of the district, of which 49 square miles have been reserved by the forest department. There is also a plantation reserve, where seedlings of teak, *sál*, *siesu*, *sám*, and *nakor* are reared, and experiments are being made with the caoutchouc tree.

The census of 1871 returned a population of 561,781 (292,688 males and 268,993 females), spread over an area of 3631 square miles. Hindus numbered 514,024; Mahometans, 45,823; Buddhists, 182; Christians, 204, of whom 120 are natives; and "others," 448. Kámrup is the headquarters of a sect of Vishnuites, known as Mahápuráshís, who are described as extremely bigoted. The Mahometans are supposed to be the descendants of the early invaders. The native Christian community is under the charge of the American Baptist Mission, which has a station at Gauhati town. The population is entirely rural, the only town with upwards of 5000 inhabitants being Gauhati, with 11,492. The temples of Hajo and Kamakhya attract many pilgrims from all quarters.

The staple crop of the district is rice, of which there are three crops. The estate is the landlord's, and the land settlement is made directly with the cultivators. The condition of the cultivators is high, and it is found difficult to obtain labourers for ordinary work. The indigenous manufactures are confined to the weaving of silk and cotton cloths for home use, and to the making of brass cups and plates. The cultivation and manufacture of tea are conducted almost solely by European capital. In 1874 there were twenty-four plantations, with 5638 acres under tea, the out-turn being 375,634 lb. The chief exports are rice, oilseeds, timber, and cotton; the imports are fine rice, salt, piece goods, sugar, betel nuts, cocoa nuts, and hardware. Education in 1872 was afforded by 146 schools, attended by 3989 pupils, including a high school and college in Gauhati town. The mean temperature is 76°, and the average annual rainfall 70·12 inches.

KAMTHÍ, or KAMPTEE, a large town and cantonment in Nágpur district, Central Provinces, India, 21° 13' 30" N. lat., 79° 14' 30" E. long. Population (1877), 48,831. Considerable trade is carried on here in cattle, country cloth, salt, European piece goods, and timber. The town contains a large market-place, a dispensary, schools, travellers' rest-houses, a Protestant and a Roman Catholic church, five Mahometan mosques, and seventy Hindu temples. An extensive parade ground separates the cantonment from the town, which is built in broad and regular streets.

KAMUSHIN, or KAMYSHIN, a town of Russia, in the Saratoff government, on the right bank of the Volga, 120 miles south-south-west of Saratoff, on the highway to Astrakhan. The inhabitants carry on a good river-trade in wood, tar, grain, fish, tallow, and garden produce,—the Kamushin melons especially being sent to various parts of Russia, and forming the raw material for a kind of syrup (*nardék*) manufactured in the town. The population in 1861 was 8644; the St Petersburg calendar for 1873 gives the number as 15,698.

Kamushin, it is said, was founded in 1668 on the left bank of the Kamushinka, for the suppression of the brigandage carried on in the district. Peter I., intending to make a canal from the stream to the Iovrya, erected a fort on its right bank; and in 1710 the inhabitants of the older settlement removed to the same side,

and the town took the name of Dmitrievsk. The present name dates from 1780, when the place became the chief town of a district.

KANANŪR, or CANNANORE, a town, seaport, and cantonment in Malabar district, Madras, India, 11° 51' 12" N. lat., 75° 24' 44" E. long., with a population in 1871 of 10,265. The sea-borne trade in 1875-76 amounted to £220,244 value of imports, and £115,245 of exports. Anglican, German, and Roman Catholic missions are established in the town. Kananūr belonged to the Kalahasti or Cherakal rājās till the invasion of Malabar by Hyder Ali. In 1498 a Portuguese colony was planted there by Cabral, and seven years later a factory was established by Vasco da Gama. In 1656 the Dutch effected a settlement and built the present fort, which fell into the hands of the Mysore troops in 1766. In 1784 Kananūr was captured by the British, and the reigning princess became tributary to the East India Company. From 1791 it has been the principal British military station on the Malabar coast.

KANARA, or CANARA, NORTH, the most southerly of the coast districts of Bombay, India, lying between 13° 52' and 15° 31' N. lat., and between 74° 10' and 75° 7' E. long., bounded on the N. by Belgaum, E. by Dhārwar and Mysore, S. by South Kanara, W. by the Arabian sea and N.W. by the Portuguese territory of Goa, with an area of 4235 square miles. The chief town is Kārwar. The main feature in the physical geography of the district is the Sahyádrí range of the Western Gháts, which, running from north to south, divides it into two parts, a lowland or coast strip (Payanghát), and an upland plateau (Bálághát). The coast-line is only broken by the Kārwar headland in the north, and by the estuaries of four rivers and the mouths of many smaller streams, through which the salt water finds an entrance into numerous lagoons winding several miles inland. The breadth of the lowlands varies from 5 to 15 miles. From this narrow belt rise a few smooth, flat-backed hills, from 200 to 300 feet high; and at places it is crossed by lofty, rugged, densely wooded spurs, which, starting from the main range of the Sahyádrí hills, maintain almost to the coast a height of not less than 1000 feet. Among these hills lie well-tilled villoys of garden and rice land. The plateau of the Bálághát is irregular, varying from 1500 to 2000 feet in height. In some parts the country rises into well-wooded knolls, in others it is studded by small, isolated, steep hills. Except on the banks of streams and in the more open glades, the whole is one broad waste of woodland and forest. The open spaces are dotted with hamlets or parcelled out into rice clearings.

Of the rivers flowing eastward from the watershed of the Sahyádrí hills the only one of importance is the Wardha, a tributary of the Tungabhadra. Of those that flow westwards, the four principal ones, proceeding from north to south, are the Kálí, Gungawálí, Tatrí, and Sharavati. The last of these, plunging over a cliff 825 feet in height, about 35 miles from Honáwar town, forms the famous Gersoppa falls. The mineral products of the district consist of iron, limestone, and building stone. Extensive forests clothe the Sahyádrí hills, and are conserved under the rules of the forest department. During the ten years 1866-76 they yielded an average annual revenue of £39,307 to the state. Tigers, leopards, bears, deer, and wild hogs are numerous, and small game is plentiful. North Kanara formed part of Madras till 1861, when it was transferred to Bombay presidency.

The census of 1872 returned a population of 398,406 (206,417 males and 191,989 females), 94 to the square mile. The Hindus numbered 364,402; Mahometans, 21,755; Parsís, 25; Christians, 12,180; and Jews, 34. The most noteworthy class among the Hindus are the Havik Bráhmans, who make their livelihood from spice and areca nut gardens. Besides the regular Mahometan population (do-

scendants from Hindu converts to Islam), there are two special classes of foreign Mahometans,—the *Navayátas* or seamen, representatives of early colonies of Arab merchants, and the *Sídis* or descendants of African slaves formerly owned by the Portuguese. The Christians are nearly all Roman Catholics, a few families of whom are of Portuguese extraction, though much mixed by intermarriage with the natives; the remainder consist of local converts or their descendants.

The area under cultivation is returned at 333,175 acres, or about 12 per cent. of the total area. Rice forms the staple crop, but *rdá*, sugar-cane, and sallow are also grown to a considerable extent; and coco-nuts, areca-nuts, cardamoms, and pepper are produced in gardens in large quantities for home consumption and for export. Cochineal is largely exported. Coffee is grown only to a small extent. *Kárwár*, *Kumtipá*, *Aukola*, *Bhatkal*, and *Hosáwar* are the most important seaports. The total value of the trade at these in 1876 was £1,841,173, viz., £1,199,077 exports and £642,096 imports. Carving in sandal wood and ebony forms an important industrial art. Salt is largely manufactured under Government supervision. The total revenue of the district in 1876-77 was £165,597, of which the land tax yielded £82,862, and forests £34,281. There were, in 1875-76, 83 schools, attended by 4425 pupils. Fever of a severe type is the prevalent disease, and occasionally rages in an epidemic form. The average annual rainfall on the coast varies from 100 inches at *Kárwár* to 163 at *Kumtipá*; in the uplands it averages about 72 inches.

KÁNARA, or **CANARA**, **SOUTH**, a district on the western coast of the Madras presidency, India, bounded on the north by North Kánara (Bombay), E. by Mysore and Coorg, S. by Malabar, and W. by the Indian Ocean, with an area of 3902 square miles. The chief town is Mangalore. The district is intersected with rivers, none of which exceed 100 miles in length. They all take their rise in the Western Gháts, and many of them are navigable for boat traffic during the fair weather for from 15 to 25 miles from the coast. The chief of these streams are the *Netravati*, *Gúrpur*, and *Chendragiri*. The general scenery of the district is varied and picturesque. Abundant vegetation, extensive forests, and numerous groves of coco-nut palms extend along the coast, and green rice-fields are seen in every valley. The Western Gháts, rising to a height of from 3000 to 6000 feet, fringe the eastern boundary of the district. Forest land of great extent and value exists, but most of it is private property. Jungle products (besides timber) consist of bamboo, cardamoms, wild arrowroot, gall-nuts, gamboge, catechu, fibrous bark, cinnamon, gums, resin, dyes, honey, and beeswax. The forests formerly abounded in game, which, however, is now rapidly decreasing under incessant shooting.

The census of 1871 returned a population of 919,513 (235 to the square mile), of whom 787,133 were Hindus, 82,803 Mahometans, 49,517 Christians, and 16 "others." The only towns with a population exceeding 2000 are *Mulki*, *Úlpi*, *Kárikál*, *Bantwal*, and *Mangalore*. The staple crop is rice. Coco-nut gardens are numerous along the coast, and areca plantations in the interior. Grain, beans, hemp, *rdá*, sugar-cane, tobacco, and cotton are also grown, but not to any great extent. The chief articles of import consist of piece goods, cotton twist, yarn, oils, and salt. The total value of imports in 1875-76 was £283,266, and the value of the exports £781,072, of which £460,000 represented coffee and £115,000 rice. The total revenue of the district in 1870-71 was £293,776, of which £116,183 was made up by land tax. Education was afforded in 1871 by 103 Government and inspected schools, attended by 4007 pupils.

KANAUJ, an ancient city in Farrukhabad district, North-Western Provinces, India, 27° 2' 30" N. lat., 79° 58' E. long., with a population in 1872 of 17,093, viz., 10,864 Hindus and 6229 Mahometans. Kanauj in early times formed the capital of a great Aryan kingdom, and the Gupta dynasty extended their sway over a large portion of Upper India. The prosperity of the city dates from a prehistoric period, and seems to have culminated about the 6th century. In 1018 it fell before Mahmud of Ghazni, and again in 1194 before Muhammad Ghori. The existing ruins extend over the lands of five villages, and occupy a semicircle fully 4 miles in diameter. Among the antiquities the shrine of *Rájá Jaipál* ranks first in interest. The

great mosque, which bears the name of *Sítá's Kitchen*, also dates back to Hindu times. Hinduism in Lower Bengal dates its legendary origin from a *Bráhmán* migration southwards from this city, about 800 or 900. To this day all *Bráhmáns* in the lower provinces trace their descent from one or other of the five *Bráhmán* emigrants from Kanauj.

KANDAHAR, the largest city in Afghanistan, is situated in 31° 37' N. lat. and 65° 43' E. long., at a height of 3400 feet above the sea. It is 370 miles distant from Herat on the north-west, by *Girishk* and *Farrah*,—*Girishk* being 75 miles, and *Farrah* 225 miles from Kandahar. From *Cabul*, on the north-east, it is distant 315 miles, by *Khelat-i-Ghilzai* and *Ghazni*,—*Khelat-i-Ghilzai* being 85 miles, and *Ghazni* 225 miles from Kandahar. To the *Pishin* valley the distance is about 110 miles, and from *Pishin* to India the three principal routes measure approximately as follows:—by the *Zhób* valley to *Dera Ismail Khan*, 300 miles; by the *Bóri* valley to *Dera Ghazi Khan*, 275 miles; by *Quetta* and the *Bolan* to *Dadur*, 125 miles; and by *Chappar* and *Nari* (the proposed railway route) to *Sibi*, 120 miles. *Sibi* is connected by rail with the rest of India. Immediately round the city is a plain, highly cultivated and well populated to the south and west; but on the north-west this plain is barren, and is bounded by a double line of rough and precipitous hills, rising to about 1000 feet above its general level, and breaking its dull monotony with irregular lines of scarped precipices, crowned with fantastic pinnacles and peaks. To the north-west these hills form the watershed between the valleys of the *Argandab* and the *Tarnak*, until they are lost in the mountain masses of the *Hazarajat*,—a wild region inhabited by tribes of Tartar origin, which effectually shuts off Kandahar from communication with the north. On the south-west they lose themselves in the sandy desert of *Registan*, which wraps itself round the plain of Kandahar, and forms another impassable barrier.

But there is a break in these hills,—a gate, as it were, to the great high road between Herat and India; and it is this gate which the fortress of Kandahar so effectually guards, and to which it owes its strategic importance. Other routes there are, open to trade, between Herat and northern India, either following the banks of the *Hari Rud*, or, more circuitously, through the valley of the *Helmand* to *Cabul*; or the line of hills between the *Argandab* and the *Tarnak* may be crossed close to *Khelat-i-Ghilzai*; but of the two former it may be said that they are not ways open to the passage of Afghan armies owing to the hereditary bitterness of hostility existing between the *Bimák* and *Hazara* tribes and the *Afghans* generally, while the latter is not beyond striking distance from Kandahar. The one great high road from Herat and the Persian frontier to India is that which passes by *Farrah* and crosses the *Helmand* at *Girishk*. Between Kandahar and India new and feasible means of communication are being discovered with every geographical search into the intermediate country. To the north-west, and parallel to the long ridges of the *Tarnak* watershed, stretches the great road to *Cabul*, the same which was traversed by *Nott* in 1842, and by *Stewart* and, more recently, by *Roberts* in 1880. Between this and the direct route to *Pishin* is a road, well known, though never yet traversed by a British force, which leads through *Maruf* to the *Kundar* river and the *Guleri* Pass into the plains of *Hindustan* at *Dera Ismail Khan*. This is the most direct route to northern India, but it involves the passage of some rough country, where lies the great watershed between the basins of the *Helmand* and the *Indus*. But the best known road from Kandahar to India is that which stretches across the series of open stony plains interspersed here and there with rocky hills of irregular formation leading to the foot of the pass across

the Kojak range, on the far side of which from Kandahar lies the valley of Pishin. The passage of the Kojak involves a rise and fall of some 2300 feet, but an excellent road now crosses the pass. The proposed line of railway to Kandahar follows an easier but comparatively waterless route, turning the Kojak at Gwaja (about 25 miles south-west of the Kojak Pass), and involving no serious gradients. Between the Pishin valley and India are several routes, all more or less open to a force equipped for mountain warfare, of which the best known are the Bolan and the Chappar (or Nari) passes from the plateau of Afghanistan to the plains of Sind at Jacobabad; and the Zhob and the Bori valley routes leading through the Sulimani range to Dera Ismail and Dera Ghazi Khan respectively. The Bori valley was the line followed by Sir M. Biddulph in 1879, and it diverges but slightly from that known as the Thal-Chotali route. Thus Kandahar becomes a sort of focus of all the direct routes converging from the wide-stretching western frontier of India towards Herat and Persia, and the fortress of Kandahar gives protection on the one hand to trade between Hindustan and Herat, and on the other it leads to Cabul security from Herat invasion.

Kandahar is approximately a square-built city, surrounded by a wall of about $3\frac{1}{2}$ miles circuit, and from 25 to 30 feet high, with an average breadth of 15 feet. Outside the wall is a ditch 10 feet deep. The city and its defences are entirely mud-built, with no pretensions to architectural beauty. There are four main streets crossing each other nearly at right angles, the central "chouk" being covered with a dome. These streets are wide and bordered with trees, and are flanked by shops with open fronts and verandahs much after the universal fashion of the East. There are no buildings of any great pretension in Kandahar, a few of the more wealthy Hindus occupying the best houses. The tomb of Ahmad Shah is the only attempt at monumental architecture. This, with its rather handsome cupola, and the twelve minor tombs of Ahmad Shah's children grouped around, contains a few good specimens of fretwork and of inlaid inscriptions. The four streets of the city divide it into convenient quarters for the accommodation of its mixed population of Duranis, Ghilzais, Farsiwans, and Kakuris, numbering in all some 30,000 souls. Of these the greater proportion are the Farsiwans (chiefly Kizilbashes).

It is reckoned that there are 1600 shops and 182 mosques in the city. The mullas of these mosques are generally men of considerable power. The walls of the city are pierced by the four principal gates of "Cabul," "Shikarpur," "Herat," and the "Idghah," opposite the four main streets, with two minor gates, called the Top Khana and the Bardurani respectively, in the western half of the city. The Idghah gate passes through the citadel, which is a square built enclosure with sides of about 260 yards in length. The flank defences of the main wall are insufficient; indeed there is no pretence at scientific structure about any part of the defences; but the site of the city is well chosen for defence, and the water supply (drawn by canals from the Argandab or derived from wells) is good.

About 4 miles west of the present city, stretched along the slopes of a rocky ridge, and extending into the plains at its foot, are the ruins of the old city of Kandahar as it existed until it was sacked and plundered by Nadir Shah in 1738. From the top of the ridge a small cincture overlooks the half-buried ruins. On the north-east face of the hill forty steps, cut out of solid limestone, lead upward to a small, dome-roofed recess, which contains some interesting Persian inscriptions cut in relief on the rock, recording particulars of the history of Kandahar, and defining the vast extent of the kingdom of the emperor Baber. Popular belief ascribes the foundation of the old city to Alexander the Great.

Although Kandahar has long ceased to be the seat of government, it is nevertheless by far the most important trade centre in Afghanistan, and the revenues of the Kandahar province assist

largely in supporting the chief power at Cabul. There are no manufactures or industries of any importance peculiar to Kandahar, but the long lines of bazars display goods from England, Russia, Hindustan, Persia, and Turkestan, embracing a trade area as large probably as that of any city in Asia. The customs and town dues together amount to a sum equal to the land revenue of the Kandahar province, which is of considerable extent, stretching to Pul-i-Sangin, 10 miles south of Kabul, and thence to the Cabul side, to the Helmand on the west, and to the Hazara country on the north. Although Farrah has been governed from Kandahar since 1863, its revenues are not reckoned as a part of those of the province. The land revenue proper is assessed in grain, the salaries of Government officials, pay of soldiers, &c., being disbursed by "barats" or orders for grain at rates fixed by Government, usually about 20 per cent. above the city market prices. The land revenue for the year 1877-78 amounted to 640,000 rupees English. English goods imported from Kandahar pay upwards of 12 per cent. on their value at Kandahar. By the time they are exposed for sale at Herat they pay upwards of 28 per cent. *ad valorem*. Nevertheless the greater part of the English goods sold at Herat are imported by Kurrahce and Kandahar—a fact which testifies to the great insecurity of trade between Meshhed and Herat. Some of the items included as town dues are customs. For instance, the tariff on animals exposed for sale includes a charge of 5 per cent. *ad valorem* on slave girls, besides a charge of 10 rupees per head. The kilney fat of all sheep and the skins of all goats slaughtered in the public yard are perquisites of Government, the former being used for the manufacture of soap, which, with snuff, is a Government monopoly. The imports consist chiefly of English goods, indigo, cloth, boots, leather, sugar, salt, iron, and copper, from Hindustan, and of shawls, carpets, "barak" (native woollen cloth), postums (coats made of skins), shoes, silks, opium, and carpets from Meshhed, Herat, and Turkestan. The exports are wool, cotton, madder, cinnamon seed, safflower, fruit, silk, and horses. The system of coinage is also curious: 105 English rupees are melted down, and the alloy extracted, leaving 100 rupees worth of silver; 295 more English rupees are then melted, and the molten metal mixed with the 100 rupees silver; and out of this 305 Kandahari rupees are coined. As the Kandahari rupee is worth about 8 annas (half an English rupee) the Government thus realizes a profit of 1 per cent. Government accounts are kept in "Kham" rupees, the "Kham" being worth about five-azulais of a Kandahari rupee; in other words, it about equals the franc, or the Persian "barani." Interestingly the south and east of Kandahar is traversed by a well-irrigated and highly cultivated country, but it is the valley of the Argandab that possesses the chief local wealth of agriculture, and which, from the luxuriant abundance of its orchards and vineyards, offers the most striking scenes of landscape beauty. The wide extent of the pomegranate fields forms a striking feature in the valley,—the pomegranates of Kandahar, with its "sindar" melons and grapes, being unequalled in quality by any in the East. The vines are grown on artificial banks, probably for want of the necessary wood to trellis them,—the grapes being largely exported in a sun-dried state. Fruit, indeed, besides being largely exported, forms the chief staple of the food supply of the inhabitants throughout Afghanistan. The art of irrigation is so well understood that the water supply is at times exhausted, no river water being allowed to run to waste. The plains about Kandahar are chiefly watered by canals drawn from the Argandab near Baba-wali, and conducted through the same gap in the hills which adorns the Herat road. The amount of irrigation and the number of water channels form a considerable impediment to the movement of troops, and only immediately about Kandahar, but in all districts where the main rivers and streams are bordered by green bands of cultivation. Irrigation by "karez" is also largely resorted to. The karez is a system of underground channelling which usually taps a sub-surface water supply at the foot of some of the many rugged and apparently waterless hills which cover the face of the country. The broad mullas which seam their sides frequently possess a supply of water some distance below the surface which can be tapped by boring. The water is not brought to the surface, but is carried over long distances by an underground channel or drain, which is constructed by sinking shafts at intervals along the required course, and connecting the shafts by tunnelling. The general agricultural products of the country are wheat, barley, pulse, fruit, madder, safflower, lucerne, clover, and tobacco.

Of the mineral resources of the Kandahar district not much is known, but an abandoned gold mine exists about 2 miles north of the town. Some general idea of the resources of the Kandahar district may be gathered from the fact that it supplied the British troops with everything except luxuries during the entire period of occupation in 1878-81; and that, in spite of the great strain thrown on these resources by the presence of the two armies of Ayub Khan and of General Roberts, and after the total failure of the autumn crops and only a partial harvest the previous spring, the army was fed without great difficulty until the final evacuation, at one-third of the prices paid in Quetta for supplies drawn from India.

Kandahar has a stormy history. Sultan Mahmud of Ghazni took it in the 11th century from the Afghans who then held it. In the beginning of the 13th century it was taken by Jenghiz Khan, and in the 14th by Timur. In 1507 it was captured by the emperor Baber, but shortly afterwards it fell again into Afghan hands, to be retaken by Baber in 1521. Baber's son, Humayun, agreed to cede Kandahar to Persia, but failed to keep his word, and the Persians besieged the place unsuccessfully. Thus it remained in the possession of the Moghuls till 1622, when it was taken by Shah Abbas. Aurangzeb tried to take it in 1649 with 6000 men, but failed. Another attempt in 1652 was equally unsuccessful. It remained in Persian possession till 1709, when it was taken by the Afghans, but was retaken after a two years' siege by Nadir Shah. Nadir Shah was assassinated in 1749, and immediately on hearing the news of his death Ahmed Shah (Abdali) seized Nadir Shah's treasure at Kandahar, and proclaimed himself king, with the consent, not only of the Afghans, but, strange to say, of the Hazaras and Baluchis as well. He at once changed the site of the city to its present position, and thus founded the Afghan kingdom, with modern Kandahar as its capital. Ahmed Shah died in 1773, and was succeeded by his son Taimur, who died in 1793, and left the throne to his son Zaman Shah. This prince was deposed by his half brother Mahmud, who was in his turn deposed by Shah Suja, the full brother of Zaman Shah. After a short reign Shah Suja was compelled to abdicate from his inability to repulse the rising power of Fatah Khan, a Barakzai chief, and he took refuge first with Ranjit Singh, who then ruled the Punjab, and finally secured the protection of British power. Afghanistan was now practically dismembered. Mahmud was reinstated by Fatah Khan, whom he appointed his vizier, and whose nephews, Dost Mohammed Khan and Kohn dil Khan, he placed respectively in the governments of Cabul and Kandahar. Fatah Khan was barbarously murdered by Kamran (Mahmud's son) near Ghazni in 1818; and in retaliation Mahmud himself was driven from power, and the Barakzai clan secured the sovereignty of Afghanistan. While Dost Mohammed held Cabul, Kandahar became temporarily a sort of independent chieftainship under two or three of his brothers. In 1839 the cause of Shah Suja was actively supported by the British. Kandahar was occupied, and Shah Suja reinstated on the throne of his ancestors. Dost Mohammed was defeated near Cabul, and after surrender to the British force, was deported into Hindustan. The British army of occupation in northern Afghanistan continued to occupy Kandahar from 1839 till the autumn of 1842, when General Nott marched on Cabul to meet Pollock's advance from Jalalabad. The cantonments near the city, built by Nott's division, were repaired and again occupied by the British army in 1870, when there all was over. It was never by the invasion of Afghanistan, nor were they finally evacuated till the spring of 1881. (T. II. II.)*

KANDI, a town in Murshidabad district, Bengal, India, in 23° 58' N. lat., 88° 5' 1" E. long., with a population in 1872 of 12,016, viz., Hindus, 10,452; Mahometans, 1516; "others," 48. It is the residence of the *râjâs* of Pâikpârâ, a wealthy and devout Hindu family. The founder of this family was Gangâ Govind Sinh, the *baniâ* of Warren Hastings, who was born at Kândi, and retired thither in his old age with an immense fortune. His name has acquired celebrity for the most magnificent *śradddha*, or funeral obsequies, ever performed in Bengal, celebrated in honour of his mother, at a cost, it is said, of £200,000.

KANDY, a town of Ceylon, formerly the capital of a kingdom of the same name, situated towards the heart of the island, at a height of 1713 feet above the sea, 74½ miles by rail from Colombo. It lies round the margin of an artificial lake constructed by the last king of Kandy in 1806, and is beautifully surrounded by hills. The most striking objects of interest are the temples (of which twelve are Buddhist and four Brahman), the tombs of the Kandian kings, and the various buildings of the royal residence, partly allowed to fall into disrepair, partly utilized by the Government. Of the temples the Dalada Malagawa is worthy of particular mention; it claims, as the name indicates, to be in possession of a Buddha tooth. Kandy is the seat of a Government agent and of a district judge, and regular sessions of the criminal court are held in the town. As a municipality (constituted in 1865, and divided into five wards in 1871) it is governed by a body of eight councillors. Among the public buildings and institutions are the Government house or pavilion, erected in 1824, the planters' association, two libraries, an industrial school, and

Trinity College, established in 1857, and reopened in 1871 after being closed for six years. The Church Missionary Society, to which the college owed its existence, began its labours in 1818.

Kandy was occupied by the Portuguese in the 16th century and by the Dutch in 1763; but in both instances the native kings succeeded in shaking off the foreign yoke. The British got possession of the place in 1803, but the garrison afterwards capitulated and were massacred, and it was not till 1814-16 that the king was defeated and dethroned. The British authority was formally established by the convention of March 2, 1815. In 1848, owing to an attempt at rebellion, the town was for a time under martial law.

KANE, Elisha Kent (1820-1887), American traveller, scientist, and arctic explorer, was born in Philadelphia, on February 3, 1820, the eldest of seven children. His father was judge of the eastern district of Philadelphia, and through both parents he inherited a mixture of Irish, English, Scotch, and Dutch blood. In his boyhood, in spite of feebleness of body, he was remarkable for his activity, vivacity, and energy. While still at school he showed a fondness for out-door pastime and enterprise, and a decided leaning towards scientific pursuits. Having chosen civil engineering as a profession, he entered the university of Virginia, where he continued to show his taste for science, especially chemistry, mineralogy, and physical geography. A violent attack of heart disease, however, which stuck to him to the end of his life, induced him to abandon engineering and devote himself to the study of medicine. He obtained his doctor's degree in 1842, having already acquired a reputation in physiological research. In 1843 Kane entered the U.S. navy as surgeon, and was appointed to the "Brandywine," commissioned to carry Mr Webster as U.S. minister to China. While the vessel remained at Rio Janeiro the restless and eager Kane made a journey to the skirts of the Andes and explored their geology. Leaving the ship again at Bombay, he indulged his irrepressible exploring propensities by a journey up country, rejoining his ship at Ceylon. On his arrival at his destination, Macao, he provided a substitute for his post in the embassy, crossed and explored the island of Luzon, visited the mysterious volcano of Taal, and amid many difficulties, descended its steep crater, bringing up with him specimens of its lava. Finally resigning his position on the embassy, he practised for a time at Whampoa, where he was stricken down by rice fever. In August 1844 he left China, and, returning by India (where he visited the Himalayas), Persia, Syria, Egypt, Greece, Austria, Germany, and Switzerland, reached home in 1848. In May of that year he was ordered to the west coast of Africa, where he visited the kingdom of Dahomey, and caught the African fever, which told severely on his constitution. On his return in April 1847, he exchanged the naval for the military service, and was sent to join the U.S. army in Mexico, where he had some extraordinary adventures in endeavouring to reach his destination, and where he was again laid down with fever. In February 1849 he was presented with a sword by the city of Philadelphia, and in the same year made a visit to the Mediterranean and afterwards to the West Indies. On the fitting out of the first Grinnell expedition, in 1850, to search for Sir John Franklin, Kane was appointed surgeon and naturalist under Lieutenant De Haaven, who commanded the two ships, the "Advance" and "Rescue." The expedition left New York on May 22d; and after an absence of sixteen months, during nine of which the ships were ice-bound, they returned without having found any trace of the missing vessels. Kane was in feeble health, but worked on at his narrative of the expedition, which was published in 1854, under the title of *The U.S. Grinnell Expedition in Search of Sir John Franklin*. He also read a paper at the American Geographical Society on an "Open Polar Sea," a chimera

which was to play so important and delusive a rôle in subsequent Arctic explorations. Kane was determined not to give up the search for Franklin, but Government refused all help. In spite of feeble health, he travelled through the States lecturing to obtain funds, and gave up his pay for twenty months. Mr Grinnell again came to the rescue, with the brig "Advance," which was equipped with the help of Mr Peabody and some of the learned societies. It sailed in the end of June 1853, and on August 23d reached 78° 41' in Rensselaer Bay, off the coast of Greenland, where it remained fast during the whole time the expedition was out. During the first winter a sledge party was sent out, and reached 79° 50', though at the expense of terrible sufferings. During the second winter the expedition suffered greatly from want of food and fuel, as well as from scurvy. Still Kane carried on with incessant diligence his scientific observations—magnetic, meteorological, astronomical, and tidal; and the results were afterwards published in the *Smithsonian Contributions to Knowledge*, vols. x.-xiii., 1858. One of the most notable incidents of this expedition was the journey made by Morton, one of the staff, up Kennedy Channel, as far as Cape Independence, in 81° 22' N. lat., whence he saw what he and Kane firmly believed to be an "open polar sea." No doubt a large area of open water was seen, but a permanent open sea in this direction has long ago been proved a myth, though doubtless the constant shiftings of the ice often leave considerable areas of water uncovered at continually shifting points. After the endurance of the greatest hardships, it was finally resolved to abandon the ship, which was done on May 17, 1853, Upernivik being reached after many difficulties on August 5. Kane reached home in October in good health, and set himself at once to write the narrative of his expedition, which was published in 1856. In October of the same year he left Philadelphia for England in search of health. From England he went to Cuba, where he died at Havana on February 16, 1857, at the early age of thirty-seven. Between his first and second arctic voyages, Kane made the acquaintance of the Fox family, the celebrated spiritualists. With one of the daughters, Margaret Fox, he carried on a lengthened correspondence, which was afterwards published by the lady, who declares that they were privately married before Kane left for England. Notwithstanding his weak health, Kane was a man of restless activity and high intelligence, but much of that activity appears to have been wasted. He certainly did a vast amount of work during his short life, but will be remembered mainly for his chivalrous and self-sacrificing but fruitless search for Franklin, during which he appreciably advanced our knowledge of the Arctic area, and made important contributions to physics and biology.

See, besides the works mentioned above, *Biography of E. K. Kane*, by William Elder, 1858; *Life of E. K. Kane and other American Explorers*, by S. M. Snicker; *The Love-Life of Dr Kane, containing the Correspondence and a History of the Engagement and Secret Marriage between E. K. Kane and Margaret Fox*, New York, 1868; "Discoveries of Dr Kane," in *Jour. of the Roy. Geog. Soc.*, vol. xviii., reprinted in *Z. G. S. Arctic Papers* of 1876.

KANEFF, or **KANIEFF**, a town of Russia, in the Kieff government, on the Dnieper, 141 miles south-east of Kieff. The population, which in 1863 was returned as 6838, was about 8000 in 1879; but neither the trade nor the industry of the place is of importance.

Vaselod of Kieff founded a church at Kaneff in 1144, and in the latter part of the same century the place was the annual rendezvous of the forces collected to give protection to the merchant ships returning from Greece. In 1880 Poniatofski, to whom it had passed from Stanislaus Augustus, gave the revenues of the town and the site of the royal court to the prior of the Basilians, who assigned them to the Kaneff schools of the brotherhood. The administration of the Boguslaff district was transferred to Kaneff in 1837, and in 1844 the district took the name of that town.

KANGAROO. When Captain Cook, during his first memorable voyage of discovery, was detained, for the purpose of refitting his ship at Endeavour river, on the north-east coast of Australia, a strange-looking animal, entirely unknown to them, was frequently seen by the ship's company; and it is recorded in the annals of the voyage that, on the 14th of July 1770, "Mr Gore, who went out this day with his gun, had the good fortune to kill one of the animals which had been so much the subject of our speculation, . . . and which is called by the natives kangaroo,"¹ a name which, though it does not appear to be now known to any of the aboriginal tribes of the country, has been adopted for this animal in all European languages, with only slight modifications of spelling. With the exception of a passing glimpse in the beginning of the same century by the Dutch traveller Bruyn of some living examples of an allied species, to be referred to presently, this was the first introduction to the civilized world of any member of a group of animals now so familiar. The affinities of the species, skins of which were brought home by Captain Cook and subsequent voyagers, were recognized by Schreber as nearer to the American opossums (then the only known marsupials) than to any other mammals with which zoologists were acquainted, and consequently it was placed by him, in his great work on the Mammalia, then in the course of publication, in the genus *Didelphis*, with *gigantea* for a specific designation,—the latter having been

FIG. 1.—Kangaroo (*Macropus giganteus*).

bestowed upon it by Zimmerman under the impression that it was a huge species of jerboa. Soon afterwards (1791) Dr Shaw very properly formed a new genus for its reception, which he named *Macropus*, in allusion to the peculiar length of its hind foot. By the name thus formed, *Macropus giganteus*, this kind of kangaroo has ever since been known in zoological literature.

Further explorations in Australia and the neighbouring islands have led to the discovery of a very considerable number of species, which are now included in the family *Macropodidae*, one of the subdivisions of the order *Marsupialia*, for the characters of which see MAMMALIA.

The *Macropodidae*, or kangaroos, taken as a whole, form a very well marked family, easily distinguished from the remaining members of the order by their general conformation, and by peculiarities in the structure of their limbs, teeth, and other organs. They vary in size from that of a sheep down to a small rabbit. The head, especially in the larger species, is small, compared with the rest of the body,

¹ Hawkesworth, *Collection of Voyages*, vol. iii. p. 577 (1778).

and tapers forward to the muzzle. The shoulders and fore limbs are feebly developed, and the hind limbs of disproportionate strength and magnitude, which gives them a peculiarly awkward appearance when moving about on all fours, as they occasionally do when feeding.

Rapid progression is, however, performed only by the powerful hind limbs, the animal covering the ground by a series of immense bounds, during which the fore part of the body is inclined forwards, and balanced by the long, strong, and tapering tail, which is carried horizontally backwards. When not moving they often assume a perfectly upright position, the tail aiding the two hind legs to form a sort of supporting tripod, and the front limbs dangling by the side of the chest. This position gives full scope for the senses of sight, hearing, and smell to warn of the approach of enemies, from which they save themselves by their bounding flight. The fore paws have five distinct digits, each armed with a strong, curved claw. The foot of the hind limb is quite different, and very peculiar in construction, being extremely long and narrow, and (with only one, lately discovered, exception) without any hallux or great toe. It consists mainly of one very large and strong toe, corresponding to the fourth of the human or other typically developed foot, ending in a strong curved and pointed claw. Close to the outer side of this lies a smaller fifth digit, and to the inner side two excessively slender toes (the second and third), bound together almost to the extremity in a common integument. The two little claws of these toes, projecting together from the skin, may be of use in scratching and cleaning the fur of the animal, but the toes must have quite lost all connexion with the functions of support or progression.

The dental formula, when completely developed, is incisors $\frac{3}{3}$, canines $\frac{1}{1}$, premolars $\frac{2}{2}$, molars $\frac{4}{4}$ on each side, giving a total of thirty-four teeth. The three incisors of the upper jaw are arranged in a continuous arched series,

FIG. 2.—Skeleton of hind foot of Kangaroo.

FIG. 3.—Skull and teeth of Bennett's Kangaroo (*Macropus benettii*). δ , δ , δ , first, second, and third upper incisors; pm, second or posterior premolar (the first having been already shed); m, m, m, m, the four true molars. The last, not fully developed, is nearly concealed by the ascending ramus of the jaw.

and have crowns with broad cutting edges; the first or middle incisor is often larger than the others. Corresponding to these in the lower jaw is but one tooth on each side, but it is of great size, procumbent or directed

horizontally forwards, narrow, lanceolate, pointed, and with sharp edges. Owing to the laxity of the union of the two rami of the lower jaw at the symphysis, in many species the two lower incisors can be made to work together like the blades of a pair of scissors, a very remarkable arrangement not known to occur in other mammals. The canines are absent or rudimentary, always so in the lower jaw, and often deciduous at an early age in the upper jaw. The premolars are compressed, with cutting longitudinal edges, the anterior one is always deciduous, being lost about the time the second one replaces the milk molar, so that both premolars are never found in place and use in the same individual. The true molars have quadrate crowns, provided with two strong transverse ridges, or with four obtuse cusps. In *Macropus giganteus* and its immediate allies, both premolars and one or two of the anterior true molars are shed during the lifetime of the animal, so that in old examples only the two posterior molars and the incisors are found in place. The milk dentition, as in other marsupials, is confined to a single molar tooth on each side of each jaw, the other molars and incisors being never changed. The dentition of the kangaroos, functionally considered, thus consists of sharp-edged incisors, most fully developed near the median line of the mouth, for the purpose of cropping the various kinds of herbage on which they feed, and ridged and tuberculated molars for crushing it, there being no tusks or canines for offensive or defensive purposes.

The number of vertebrae is—in the cervical region 7, dorsal 13, lumbar 6, sacral 2, caudal varying according to the length of the tail, but generally from 21 to 25. In the fore limb the clavicle and the radius and ulna are well developed, allowing of considerable freedom of motion of the hand. The pelvis has large epipubic or "marsupial" bones. The femur is short, and the tibia and fibula of great length, as is the foot, the whole of which is applied to the ground when the animal is at rest in the upright position.

The stomach is of large size, and very complex, its walls being puckered up by longitudinal muscular bands into a great number of sacculi, like those of the human colon. The alimentary canal is long, and the caecum well developed. All the species have a marsupium or pouch formed by a fold of the skin of the abdomen, covering the mammary glands with their four nipples. In this pouch the young (which, as in other marsupials, leave the uterus in an extremely small and imperfect condition) are placed as soon as they are born; there their growth and development proceeds; and to it they resort temporarily for the purpose of shelter, concealment, or transport, for some time after they are able to run and jump about the ground and feed upon the same herbage which forms the nourishment of the parent. During the early period of their sojourn in the pouch, the blind, naked, helpless young creatures (which in the great kangaroo scarcely exceed an inch in length) are attached by their mouths to the nipple of the mother, and are fed by milk injected into their stomach by the contraction of the muscle covering the mammary gland. In this stage of their existence the respiratory organs are modified much as they are permanently in the *Cetacea*, the elongated upper part of the larynx projecting into the posterior nares, and so maintaining a free communication between the lungs and the external surface, independently of the mouth and gullet, thus averting all danger of suffocation while the milk is passing down the latter passage.

The kangaroos are all vegetable feeders, browsing on grass and various kinds of herbage, the smaller species also eating roots. They are naturally timid, inoffensive creatures, but the larger ones when hard pressed will turn

and defend themselves, sometimes killing a dog by grasping it in their fore paws, and inflicting terrible wounds with the sharp claws of their powerful hind legs, sustaining themselves meanwhile upon the tail. The great majority are inhabitants of Australia and Tasmania, forming one of the most prominent and characteristic features of the fauna of these lands, and in the scenery of the country, as well as the economy of nature, performing the part of the deer and antelopes of other parts of the world, which are entirely wanting in Australia. They were very important sources of food-supply to the natives, and are hunted by the colonists, both for sport and with a view to their destruction, on account of the damage they naturally do in consuming the grass, now required for feeding cattle and sheep. Notwithstanding this, they have in some districts increased in numbers, owing to the suppression of their former enemies, the aborigines and the dingo or native dog. A few species are found in New Guinea and the adjacent islands, which belong, in the zoological sense, to the Australian province, beyond the bounds of which none have been found either existing or in a fossil state.

The *Macropodidae* are divided into two well-marked sections—(1) the true kangaroos (*Macropodinae*), and (2) a group consisting of smaller animals, commonly called rat-kangaroos, or (improperly) "kangaroo-rats," or sometimes potoroos.

1. In the *Macropodinae* (see fig. 3) the cutting edges of the upper incisors are nearly level, or the first pair but slightly longer than the others. The canines are rudimentary and often wanting. The premolars are usually not longer (from before backwards) than the true molars, and less compressed than in the next section. The crowns of the molars have always two prominent transverse ridges. The fore limbs are small with three claws, armed with strong, moderately long, curved claws. Hind limbs very long and strongly made. Head small, with more or less elongated muzzle. Ears generally rather long and ovate.

Upwards of thirty species of this group have been described, and many attempts have been made to subdivide it into smaller groups or genera for the convenience of arrangement and description, but these have generally been based upon such trivial characters that it is preferable to speak of most of them as sections of the genus *Macropus*, reserving generic rank only to two forms somewhat aberrant both in structure and geographical distribution. According to this arrangement the genera will be as follows:—

1. *Macropus*, Shaw, divided into the following sections or subgenera. A. *Macropus* proper, of which the type is *M. giganteus*, spoken of at the beginning of this article as having been discovered in 1770 by the first English explorers of Australia. It is the common great kangaroo, called "boomer," "forrester," or "old man" by the colonists, and frequents the open grassy plains of the greater part of eastern Australia and Tasmania. Some closely allied species or perhaps local varieties, *M. agyrorhina*, *M. fuliginosus*, and *M. melanopus*, are found in southern and western Australia. B. *Osphranter*, Gould, distinguished from the above by the naked muffle, includes some very large and handsome species, which principally dwell in rocky mountain ranges, as the great red kangaroo, *M. rufus*, *M. antilopinus*, and *M. roosei*. C. *Halmaturus*, F. arv. The kangaroos of this section have also the muffle naked, but they are rather smaller species, frequenters of forests and dense impenetrable brush and scrub, and hence often called brush kangaroos, though a native name "wallaby" is now generally applied to them. There are many species, of which *M. bennettii*, *M. ruficollis*, *M. wallabatus*, *M. dorsalis*, *M. agilis*, *M. derbianus*, *M. theidii*, *M. billardieri* are the best known. *M. brachyurus* is remarkable for its comparatively short and slender tail and small ears. The earliest known species of kangaroo, referred to before, *M. brunsi* (Schubert), may perhaps belong to this section. Several examples were seen by Bryson in 1711 living in captivity in the garden of the Dutch governor of Batavia, and described and figured in the account of his travels (*Reisen over Moskowien*, &c.) under the name of "Flüander." It was quite lost sight of, and its name even transferred by S. Müller to another species (now known as *Doropsis mülleri*, Schlegel) until rediscovered in 1885 by Rosenberg, who sent a series of specimens to the Leyden Museum from the islands of Arru and Ghat Key, thus determining its true habitat. Quite recently three other species of true kangaroo have been discovered out of Australia:—*M. propinquus*, Peters, from the eastern extremity of New Guinea, near Yule Island; *M. crassipes*, Pierson-Ramsay, from near Port Moresby; and *M. browni*, Pierson-Ramsay, from New Ireland. D. *Oryzophala*, Gould, with a hairy muffle and long and slender tail, furnished with a horny nail-like organ at the apex. *M. ungiferus*, *M. francus*, and *M. lunatus*. E. *Lagorchestes*, Gould, hare-kangaroos, a group of small hare-like animals, great leapers

and swift runners, which mostly affect the open grassy ridges, particularly those of a stony character, sleeping in forms or seats like the common hare. Their limbs are comparatively small, their claws sharp and slender, and their muffle clothed with velvet-like hairs. *M. fasciatus*, *M. leporoides*, *M. hirsutus*, *M. conspicillatus*, &c. F. *Petrogale*, Gray. These differ from all the others in having the tail cylindrical and bushy towards the apex instead of tapering. The muffle is naked, the hind feet comparatively short and stout, and densely clothed with coarse hairs, the nails short. These are the "rock kangaroos," making their retreats in caverns and crevices, leaping with surprising agility from one narrow ledge to another, and browsing upon the scanty herbage that the neighbourhood of such situations affords. *M. xanthopus*, *M. penicillatus*, *M. lateralis*, *M. concoloratus*, *M. brachyotus*, *M. inornatus*, &c.

2. *Dendrolagus*, Sal. Müller.—A genus formed for the reception of two species, *D. urvatus* and *D. trusmi*, commonly known as "tree kangaroos," both inhabitants of New Guinea, and which differ greatly from all the foregoing in being chiefly arboreal in their habits, climbing with facility among the branches of large trees, and feeding on the bark, leaves, and fruit. In accordance with this habit their hinder limbs are comparatively shorter than in the true kangaroos, and their fore limbs are longer and more robust, and have very strong curved and pointed claws. These differ from all the preceding, and agree with the next genus, in some details of the structure of the molar teeth, and in the circumstance that the fur of the back of the neck is directed forwards or in a reverse position to that of the remainder of the coat.

3. *Doropsis*, S. Müller.—Of this genus two species are at present known, both from New Guinea, *D. milloti*, and another lately discovered by D'Albertis, *D. lucuosa*. In some respects they resemble the last, but they differ from them and all the other *Macropodinae*, and agree with the next section, in the great size and peculiar form of the premolar teeth.

11. The second section or sub-family, the *Hypsiprymninae* (see fig. 4), have the first upper incisor narrow, curved, and much exceeding the others in length. Upper canines always persistent, flattened, blunt, and slightly curved. Premolars of both jaws always with large, simple, compressed crowns, with a nearly straight or slightly

FIG. 4.—Skull and teeth of Gray's Rat Kangaroo (*Betongia grayii*). c, upper canine tooth. The other letters as in fig. 3.

concave free cutting edge, both outer and inner surfaces usually marked by a series of parallel, vertical grooves or ridges. Molars with quadrate crowns, having a blunt, conical cusp at each corner, the fourth notably smaller than the third, sometimes rudimentary or absent. Fore feet narrow; three middle toes considerably exceeding the first and fifth in length; their claws long, compressed, and but slightly curved. Hind feet as in *Macropus*. Tail long, sometimes partially prehensile, being used for carrying bundles of grass with which they build their nests.

The potoroos or rat-kangaroos are all small animals, none of them exceeding a common rabbit in size. They inhabit Australia and Tasmania, are nocturnal, and feed on the leaves of various kinds of grasses and other plants, as well as roots and bulbs, which they dig up with their fore paws. About ten species are known, presenting a considerable range of diversity in minor characters, and admitting of being grouped in four principal sections, which may perhaps be allowed the rank of genera. These are

1. *Hypsiprymnus*, Illiger.—Head long and slender. Auditory bullae somewhat inflated. Ridges on premaxillae few and perpendicular. Large palatine foramina. Tarsus short. Muffle naked. *H. murinus*, *H. apicalis*, *H. gilberti*, *H. platyops*.

2. *Betongia*, Gray. Head comparatively short and broad. Auditory bullae much inflated. Tarsus long. Large palatine foramina. Ridges on premaxillae numerous and oblique. Muffle naked. *B. penicillatus*, *B. curvicauda*, *B. gaimardii*, *B. opithii*, *B. grayii*, *B. campestris*, &c.

3. *Hypiprymnus*, Garrod.—Head short and broad. Auditory bullae not inflated. No palatine foramina. Tarsus long. Muffle hairy. *H. rufescens*.

4. *Hypospyrmaodon*, Pierson-Ramsay.—Distinguished from all other members of the family by possessing a small prehensile hallux or first toe, without nail. It is, therefore, a form of great interest, as showing a structure of foot connecting that of the kangaroos with that of the phalangers. The single known species, *H. moechatus*, Ramsay, has been lately discovered in north-east Australia. It was described almost simultaneously by Owen under the name of *Pteropus nudicaudatus*.

In seeking among the other marsupials for the nearest allies to the kangaroos, using this word in the comprehensive sense as above, two most striking points in their organization must be borne in mind, the structure of the hind foot and the dentition. Of the former the essential peculiarity is the great predominance of the fourth digit, and the remarkable character of the second and third, which while retaining a considerable length, are of extreme tenuity, and buried up to the claws in a common integument. Such a structure of foot is quite unknown out of the marsupial order, but in that order it is found in the *Phalangistidae* in a very modified form, associated with a large opposable hallux, and a broad sole of the foot, appropriate for climbing trees; and again, in almost the same form as in the kangaroos, in the ground-dwelling *Peramelidae*, which in their dentition and digestive organs are so widely different. The Australian carnivorous marsupials, *Dasyuridae*, and the American opossums or *Didelphidae*, show no trace of this singular conformation. It is therefore only with the former families, the *Phalangistidae* and the *Peramelidae*, that the kangaroos are allied by this character.

The chief peculiarity of the dentition consists in the presence of three pairs of incisors in the upper jaw, the first or middle one of which is generally the largest, opposed to a single pair in the lower jaw, strong, sharp, and prominent. These are followed by an interval, in which may be, in the upper jaw only, a canine, but always so small, as to be of little functional importance. The premolars are compressed and cutting, and the true molars ridged or tuberculated. Such a dentition is found among the *Phalangistidae* alone of existing marsupials. In this respect the *Peramelidae* are completely separated from the kangaroos, their numerous small incisors, large canines, and cuspidated molars resembling those of the *Dasyuridae* and *Didelphidae*. On the whole then, the kangaroos and the phalangers are groups most nearly allied in essential characters, having both dentition and extremities formed upon the same fundamental type, though with modifications of the latter to suit their respective terrestrial and arboreal habits.

Remains of numerous extinct species of true kangaroos, many of them of much larger size than any now existing, are abundant in the Pliocene deposits of Australia, and have been described and figured by Professor Owen in the *Philosophical Transactions*. Hitherto they have been found in no other part of the world. Other animals of gigantic size, the *Diprotodonts*, as large as a rhinoceros, and the *Nototherium*, but little inferior, with dentition of the same general type, but the structure of whose feet is not yet known, lived with these kangaroos in the same land. An extraordinary modification of the *Hypospyrmaodon* type, with the great premolar characteristic of that genus immensely exaggerated in size, and the true molars equally reduced, misnamed *Thylacodon carinifex*, was another contemporary. Beyond these, which all belong to the most recent geological epoch, we have no knowledge of any extinct animals which can be said to be nearly allied to kangaroos, or to connect them with any other forms of mammals. The only marsupials discovered in European Tertiaries resemble the existing opossums of America, and except in their common marsupial characters have no affinities with the kangaroos.

It is, however, a most remarkable fact that in the Par-

'beck beds of the newer Oolitic series, not only in England, but also in deposits of corresponding age in America, lower jaws of small mammals (to which Dr Falconer gave the name of *Plagiandias*), with a type of dentition showing a considerable resemblance to that described above as peculiar to the kangaroos and their existing allies, have been discovered. Unfortunately no part of the skull or upper teeth, or of the limbs of any of these is as yet known; so whether the resemblance was fully carried out, even in the dentition, is uncertain, and it is almost too great a stretch of the imagination to assume that the modern "diprotodont" marsupials have derived their special type of tooth-structure from such remote ancestry. The evidence of the affinity of the still more ancient *Hypospyrmaodon* (Boyd Dawkins), founded upon a single and much worn tooth, having some resemblance to one of the large premolars of *Hypospyrmaodon*, found in the infra-Liasic beds of Watchet in Somersetshire, is based on still slighter foundation; but, if it should eventually turn out to be well-grounded, it would carry back the type to an extraordinary antiquity.

Trans.*, 1867; "On the Affinities and Probable Habits of *Thylacodon*," *Quart. Journ. Geol. Soc.*, August, 1868; A. H. Garrod, "On *Dorcopsis ludlowi* and its Affinities," *Proc. Zool. Soc.*, 1875, p. 48. (W. H. F.)

KÁNGRA, a district in the lieutenant-governorship of the Punjab, India, lying between 31° 20' and 33° N. lat., and between 75° 39' and 78° 55' E. long., bounded on the N.W. by Gurdaspur district and Chamba state, on the N.E. by the Himalaya mountains, on the S.E. by the states of Bashahr, Mandi, and Bilaspur, and on the S.W. by Ilshiarpur district, with an area of 8988 square miles. Kánga district comprises a vast tract, extending eastward from the plain country of the Bari and Jalandhar Doabs, across two distinct Himalayan ranges, far into the heart of Tibet. It naturally falls into three parts—the sub-Himalayan country of Kánga proper, the central valleys of Kullu and Banghal, and the rugged outer region of the Tibetan slope. It consists almost entirely of immense mountain ranges, whose three parallel lines, with a transverse ridge, form four main basins, in each of which a great river takes its rise—the Beas (Bías), Spiti, Chenab, and Rávi. From the great variety of the different tracts included in the district by modern arrangements, it is impossible to assign any general physical peculiarities to the whole beyond their common characteristic as mountainous regions, intersected by snowy chains and scored by deep river valleys. The western portion, abutting on the Punjab plains, admits of cultivation, and supports a comparatively dense population; while the bare and sterile eastern glens are sparsely inhabited by a Tibetan race.

The census of 1868 disclosed a population of 743,882 (398,571 males and 350,311 females),—83 to the square mile. The Hindus numbered 893,506; Mahomedans, 48,618; Sikhs, 1214; Christians, 277; and "others," 178. The six municipal towns with their Subjanyir, Tiru, 3593; Jawla-mukh, 2847; Dharmala, 2024. The famous Hindu temple of Nágarkot at Kánga town is one of the oldest and most wealthy shrines in India, and twice exposed the district to the plunder of the Mahomedans.

The cultivated area of the district is returned at 681 square miles, or less than one-thirteenth of the entire surface. The staple crops include wheat and barley for the spring, and rice and maize for the autumn harvest. Rice is the principal crop of the upper valleys, while maize composes the ordinary food of the upland people for six months of the year. Sugar-cane covers a large area in the neighbourhood of Kánga town. Tea cultivation has taken root as an important industry, both in Kánga proper and in

Kullu. In 1872-73 the district contained twenty-eight plantations, producing a gross out-turn of 438,655 lb of tea, valued at £85,000. Potatoes also constitute a considerable crop. In Ladkhil and Spiti Barley is the agricultural staple; but the former tract does not grow a sufficient quantity of grain for its own consumption, being largely supplied by importations from Kullu.

Agricultural produce forms the staple of the export trade; the imports consist of gram, cotton, tobacco, and European piece goods. The Palampur fair, established by Government with a view to the fostering commerce with Central Asia, draws together a small concourse of Yichakdi merchants. The Ladkhils carry on an enterprising trade with Ladakh and countries beyond the frontier, by means of pack sheep and goats. The total imperial revenue in 1872-73 amounted to £71,434, of which the land-tax contributed £62,443. Crime is rare, but education is still in a very backward state, only 2936 children being under instruction in 1872-73. The endemic diseases of the district include fever and goitre, but scurvy also prevails to a large extent. The widespread cultivation of rice, by which the whole Kangra valley is converted into a swamp, has a very prejudicial effect upon the general health. The average annual rainfall varies from 148 inches at Dharmasala to 76 at Kangra, 52 at Hamirpur, and 108 at Palampur. The mean temperature in the Himalayan station of Dharmasala in 1874-75 was 70°·35 in May, 78°·6 in July, and 53°·85 in December.

KANTZSA, Nagy (i.e., "Great"), a market-town of Hungary, in the trans-Danubian county of Zala, lies 31 miles north-north-east of Kopeinitz, and at the junction of the lines of railway from Sopron (Oedenburg) and Szekesfehérvár (Stuhlweissenburg), 46° 28' N. lat., 17° 0' E. long. Among the public and other buildings are a fine Roman Catholic church, a Franciscan monastery, a Piarist gymnasium, a town-hall, royal and magisterial courts of law, and the usual Government offices. In the neighbourhood are distilleries and brick-making factories. The markets periodically held in the town are much frequented, and the trade in grain, horned cattle, and pigs is generally brisk. The population at the end of 1880 was 18,393.

Nagy-Kanzsa once ranked as the second fortress of Hungary, and consequently played an important part during the wars with the Turks, who, having gained possession of it in 1600, held it until near the close of the 17th century. In 1690, after a siege of two years, it was recovered by the Austrian and Hungarian forces. Its reversion to Hungary was ratified by the treaty of Carlowitz (1699). In 1702 the fortifications were destroyed, and there are now but few traces of their former existence.

KANKAKEE, the chief city and county seat of Kankakee county, Illinois, U.S., is situated on the north bank of the Kankakee river, 66 miles south of Chicago. It is the centre of a very rich and fertile farming district, and has a large trade in agricultural produce. It has fine water-power, and, being within easy reach of extensive coal-fields and deposits of bog-iron ore, does a large manufacturing business. The population of the city and township in 1880 was 5552.

KANO, a town of central Africa, at the head of a province of the kingdom of Sokoto, about 230 miles east of Sokoto and 360 miles west of Kuka. The circuit of the walls is upwards of 15 English miles; but little more than a third of the enclosed area was actually occupied at the time of Barth's visit. The oldest part of the town is that which lies at the foot of the hill Dalá (120 feet), and from this the inhabited portion stretches south for 2½ miles to the walls. To the south of the great market-places lies a deep pond, Jakara, upwards of a mile and a half in length. Two kinds of dwelling-houses are common—square-shaped clay-built structures with flat roofs, and round huts with conical tops. The population, estimated at 30,000, consists of Fellatah, Kanuri (Bornuese), Houssas, and Nupes. Commerce and manufactures go hand in hand, and every family has its share in each. Cotton cloth, woven and dyed in the town, forms a chief article of trade; and to this may be added sandals and shoes, twisted leather straps, and *jetiras* (purses of a peculiar make), kola-nuts, and slaves. About 20,000 loads of natron pass through the town in a year from Bornu to Nupe.

See Clapperton's *Travels*, vol. i.; and Barth, *Travels in North and Central Africa*, vol. ii. The latter gives a sketch plan of Kano.

KANSAS, the central State of the American Union, lies Plate XIII.

between 37° and 40° N. lat. and between 94° 38' and 102° W. long. It is bounded on the N. by Nebraska, on the E. by Missouri, on the S. by Indian territory, and on the W. by Colorado. The State is nearly rectangular in shape, with a breadth of about 210 miles from north to south, and a length of 400 miles from east to west. It contains an area of 81,318 square miles, or 52,043,520 acres.

Kansas is an undulating plain, gently sloping from west to east, at an average of nearly 7 feet per mile. There is also an inclination from north to south, as indicated by the course of the rivers, which flow southerly as well as easterly, but never northerly or westerly, except for short distances from local causes. The mouth of the Kansas river, at the east line of the State, is 750 feet above the sea-level; the average altitude of the western boundary is about 3500 feet. The broad prairie surface is diversified by an endless succession of valleys and woodlands. The great central valley is traversed by the Kansas or Kaw river, which, inclusive of the Smokyhill branch, extends the entire length of the State. Lateral valleys on the north are formed by the Saline, Solomon, Republican, and Blue rivers, and other smaller streams. Another broad valley is formed in the southern half of the State by the Arkansas river, with lateral valleys on the north, traversed by the Walnut, Little Arkansas, Pawnee Fork, and other streams. The south-eastern portion contains the important Neosho valley, and the smaller valleys of the Osage and Verdigris. In the extreme south-west and along the southern boundary are the valley of the Cimarron, and a network of the southern tributaries of the Arkansas. Numerous small affluents of the Missouri enrich and diversify the north-eastern quarter of the State. The streams of Kansas are usually fed by perennial springs, and, as a rule, the eastern and middle portions of the State are well watered. The western part is more elevated, and water is less abundant.

Geology and Minerals.—The surface presents three distinct geological sections. The eastern portion of the State belongs to the Carboniferous system, in which are found inexhaustible beds of valuable bituminous coal, often at shallow depths or cropping out on the surface. The central portion belongs to the Triassic formation, with magnesian limestone, ferruginous sandstone, and gypsum as the representative rocks. Magnesian limestone, known as dolomite, is especially plentiful along the Blue, Republican, and Neosho rivers and their tributaries. This beautiful stone, resembling white, grey, and cream-coloured marble, is exceedingly useful for building purposes. It crops out in the bluffs in endless quantities, and is easily worked. The western portion of the State belongs to the Cretaceous formation, in which chalks and a species of native quicklime are very prominent in the river bluffs. The white and cream-coloured chalks are much used for building purposes, but the blue is usually too soft for exposure to the weather. The quicklime as quarried from the bluffs slakes perfectly, and with sand makes a fairly good mortar, without calcination or other previous preparations. Lead-mines are extensively worked in the south-eastern portion of the State, and prosperous towns and cities are growing up in connexion with these mines. In the central region, salt is produced from wells, and appears in occasional marshes. Salt industries are carried on at Solomon City, near the mouth of the Solomon river, and an excellent brine is obtained at Junction City. The salt of the south-west is found in beds and dry incrustations, varying in thickness from a few inches to 2 feet. The salts of Kansas are remarkably free from lime and other im-

purities. Gypsum is found in beautiful crystalline form in extensive quarries, but it has not been much utilized. The lignite found near the Colorado line makes a valuable domestic fuel.

Climate.—The climate of Kansas is exceptionally salubrious. Extremes of heat and cold occur, as in all open prairie countries, but as a rule the winters are dry and mild, while the summer heats are tempered by the perpetual prairie breezes. The summer nights are invariably cool and refreshing. The mean annual temperature at Fort Riley for twenty-three years ending December 1874 has been 53°. The highest temperature there during the same period was 98° and the lowest 12° below zero. The average annual rainfall at the city of Lawrence for six years (1875-1880) was 32.68 inches, the heaviest rainfalls occurring in May, June, July, and August, the lightest in November, December, January, and February.

Soil.—The soil of the upland prairies is generally a deep rich clay loam, of a dark colour. The bottom lands near the streams are a black sandy loam; and the intermediate lands, or "second bottoms," show a rich and deep black loam, containing very little sand. These soils are all easily cultivated, free from stones, and exceedingly productive. There are exceptional spots on the upland prairies composed of stiff clay, not as easily cultivated, but very productive when properly managed and enriched. In the early history of the country the prairies were covered with the short "buffalo grass," very nutritious for pasturage, on which immense herds of buffalo and other animals subsisted, but utterly unfit for hay. With the disappearance of the buffalo, and as the country is settled and cultivated, the short buffalo grass gives place to the tall blue stem and other bladed grasses valuable alike for pasture and for hay. Timber is abundant along the streams in the eastern section of the State, but is less plentiful in the central portion, and very scarce in some parts of the west. The varieties of timber embrace oak, elm, black walnut, cottonwood, mulberry, box, elder, willow, hickory, sycamore, white ash, and other hard and soft woods.

Agriculture.—The farm products of 1880 were as follows:—Indian corn, 101,420,718 bushels; winter wheat, 23,507,223; spring wheat, 1,772,001; rye, 876,507; oats, 11,468,798; barley, 287,097; buckwheat, 48,465; Irish potatoes, 4,919,287; sweet potatoes, 391,198; clover beans, 558,974; flax seed, 1,245,279; sorghum syrup, 3,787,685 gallons; cotton, 124,517 lb; hemp, 635,874 lb; millet and Hungarian hay, 629,084 tons; Timothy hay, 79,634 tons; hay from wild or native grasses, 798,707 tons; clover pasture, 5927 acres; blue grass pasture, 35,269 acres; native grass pasture, 801,126 acres; produce of market gardens to the value of \$449,787.

The bright climate and pure atmosphere are admirably adapted to the growth of the apple, pear, peach, plum, grape, and cherry. The smaller fruits also, with scarce an exception, flourish finely. Trees never suffer from sudden or water-soaked frosts, and very seldom from the winter's cold, when reasonable judgment and care have been exercised in selecting and managing the grounds. At a national exhibition in Philadelphia in 1880 the great gold medal of the National Pomological Society was awarded to Kansas "for a collection of fruits unsurpassed for size, perfection, and flavor," and similar awards have been made to Kansas fruits at later exhibitions. In November 1872 the American Institute, at its great show, awarded a diploma for 190 varieties of apples grown in Kansas, as the largest and handsomest exhibited. At the International Exhibition at Philadelphia in 1876, Kansas exhibited ninety-six varieties of apples, and received the diploma of the centennial commission. Estimates based on the tables of 1877 indicate that the number of bearing trees now in the State (1881) is about as follows:—2,500,000 apple, 100,000 pear, 8,000,000 peach, 200,000 plum, and 1,000,000 cherry trees. The planting of trees is still on the increase, and the older orchards are very profitable. The same is true of vineyards and plantations of small fruits.

Livestock.—The wide prairies, with their nutritious grasses for hay and grazing, and their never-failing springs of pure water, make the State a very paradise to the herdman and stock-raiser. The following are the statistics for 1880:—horses, 367,589; mules and asses, 58,808; milch cows, 886,640; other horned cattle, 743,672; sheep, 426,492; swine, 1,281,630; value of animals slaughtered

and sold for slaughter, \$12,700,045; value of poultry and eggs sold, \$531,550; wool (clip of 1878), 299,644 lb; wool (1879), 1,184,458 lb; honey (produce of 1879), 376,393 lb; wax (1879), 10,949 lb. The great herds of buffalo which formerly overran the plains have disappeared, the elk is gone, and deer and other game are less plentiful than formerly. There remain, however, the rabbit, hare, turkey, prairie hen, quail, and the usual variety of migratory water-fowl, to gratify the sportsman. The numerous streams are well supplied with stock of choice varieties and of unusually large size.

Manufactures.—There is no part of the country of equal extent better supplied with available water power than Kansas. The streams are fed by living springs, and the inclination of the country insures uniformly rapid currents. Most of the streams maintain a good flow of water in the driest seasons, and in case of heavy rains many of them "underflow" the adjacent bottom lands, saturating the permeable substratum of the country with the surplus water, which in time drains out and feeds the subsiding streams. This feature is particularly true of the Saline, Solomon, and Smokyhill rivers. The Smokyhill river has not risen above the banks of its deep channel at Junction City since 1869, while at the lowest stages it is capable of driving large flouring-mills, having half a dozen sets of burrs. A dam on the Kansas river at Lawrence supplies a water-power capable of developing a great manufacturing centre. In 1870 there were one hundred and ten improvements of water-power in the state. Estimates based on the latest statistics now place the number of utilized mill sites at about three hundred, where flouring-mills, saw-mills, planing-mills, and woolen-mills run the entire year, with very little hindrance from either high or low water. In the eastern section of the State, where coal is plentiful, steam-power is much used, especially in the manufacture of iron. At Leavenworth there are manufactories of iron bridges, engines, boilers, stoves, railroad iron, and miners' tools. There are also manufactories of wagons, carriages, carpets, soaps, paints, and cement, at Leavenworth, Fort Scott, Lawrence, Columbus, Ottawa, and other places. At Topeka, Parsons, Armstrong, and Argentine there are rolling mills and railroad repair shops, while planing-mills, tanneries, cheese factories, and pork-packing establishments are found in various localities.

Transport and Trade.—There are numerous railroads in the State, with an aggregate length of completed track of 3104 miles. The central branch in the north and the Union Pacific (Kansas division) near the centre traverse the northern half of the State from east to west, in nearly parallel lines. The latter, extending by its connection to San Francisco, The Atchison, Topeka, and Santa Fe line passes from the north-east to the south-west, extending through to the Pacific coast; and the Missouri Pacific (Kansas division), by uniting with the Texas Central, connects the richest portion of Kansas with the Gulf of Mexico at Galveston. Other lines in connection with these facilitate the internal commerce of the State. Kansas has an eastern front of 150 miles on the Missouri river, which is navigable for steamboats of all sizes. The internal rivers of the State are not utilized for commercial purposes, though the Kansas was formerly considered navigable to Fort Riley, near the mouth of the Republican river, and steamboats have ascended the Smokyhill to the mouth of the Saline, about 50 miles farther west. By means of these railroads and the Missouri river immense quantities of wheat, corn, cattle, and swine are sent from Kansas to the eastern markets; flour is sent south, south-west, and west, and butter, poultry, and eggs, with large quantities of vegetables, hay, and garden produce, to the western mining regions.

Education.—The public schools are liberally endowed and supported. Two sections of land (280 acres) are set apart in each congressional district for school fund purposes. There are in the State 5242 public school buildings, and the value of public school property is \$4,633,044. The teachers employed number 6707. The pupils of school ages are estimated from statistics of 1875 at 230,000, about half of whom are in actual attendance. The annual expenditures for school purposes, estimated from statistics of 1876, is 1,500,000. The State supports a university at Lawrence, and a normal school at Emporia; and the agricultural college at Manhattan is endowed by the general Government. There are also State institutions for the education of the blind, and the deaf and dumb, and for the care of the insane. A reform school for juvenile offenders is being built at the State capital.

Religion.—All the usual religious denominations are represented, owning church property to the amount of \$2,511,520.

Administration.—In Kansas, as in all the States of the American Union, the government is vested in three departments, legislative, executive, and judicial. The governor is elected for a term of two years. The legislature consists of a senate and house of representatives. The members of the house are elected for two years, and members of the senate for four. The judiciary consists of a State supreme court and subordinate district courts. The judges are all elected by a direct vote of the people.

Population.—The following table gives the population at the last three census enumerations, with the number of inhabitants per square mile on each period:—

	Total.	Males.	Females.	Per Sq. Mile.
1860	107,396	54,173	48,098	1.3
1870	364,399	202,224	162,175	4.5
1880	905,966	538,725	429,241	12.2

The State is divided into 104 counties. The following are the largest towns, with population in 1880—Leavenworth, 16,550; Topeka, 15,451; Atchison, 15,106; Lawrence, 8511; Wyandotte, 6149; Fort Scott, 5372; Wichita, 4911; Emporia, 4632; Parsons, 4195; Ottawa, 4082. Topeka, the State capital, is advantageously situated, and is one of the most flourishing towns in the State.

History.—Kansas belongs to that immense tract of country, purchased by the American Government from France in 1803, known as the Louisiana purchase. Prior to 1854 it was in the hands of various Indian tribes, some native, and others which had been removed from the older States. It was organized and opened for settlement as a territory by Act of Congress in May 1854, in the midst of a heated contest on the slavery question. The slaveholders and the friends of freedom at once began a vigorous contest for the occupancy and control of the new territory, and thus it was that Kansas became the vanguard in the great struggle which resulted in the overthrow of slavery in the United States. Before the formal beginning of the war, societies were organized by the rival settlers and their friends in the States on both sides of the slavery question, and even rival legislatures were elected and convened. The discussions frequently resulted in personal violence, and the greatest excitement prevailed till the breaking out of the civil war. Kansas was admitted into the Union as a State in January 1861, and took an active part in furnishing troops for the suppression of the rebellion. The State was frequently invaded, and the city of Lawrence was sacked and burned in August 1863. Since the overthrow of slavery, Kansas has shared fully in the general progress of the country. (J. D. F.)

KANSAS CITY, in Jackson county, Missouri, U.S., the second city in size and importance in the State, is situated on the right bank of the Missouri immediately below the mouth of the Kansas river, 235 miles west by north of St. Louis. It is a large railroad centre, several important lines meeting there, and giving the city large facilities for commanding the trade of western Missouri, Kansas, northern Texas, and part of Colorado and New Mexico. The Missouri at this point is crossed by a bridge 1387 feet long, resting on seven piers. The business in agricultural products is very large, and is constantly increasing, that of packing beef and pork being especially great, and growing with remarkable rapidity. The city was laid out in 1830, but its growth may be said to date from 1830, when its population numbered 4418. In 1870 the population had increased to 32,290, and in 1880 it was 55,787.

KANT, IMMANUEL (1724-1804). So far as changes of external fortune are concerned, the life of the greatest philosopher of the 18th century presents little or nothing of interest. Born in humble circumstances, he passed a quiet and almost undisturbed existence within the narrow limits of his native place. Education, both of school and university, he obtained at Königsberg, and during a prolonged academic activity in that retired Prussian town he gave forth the works which have exercised such influence on European thought that, in the estimation of the best historical judges, they may be placed on a level with the great events of the French Revolution as the most important factors in determining the characteristic features of 19th century culture. A biography of Kant can be little more than a record of the successive phases of his literary activity.

The family of Kant was of Scotch extraction, the grandfather of the philosopher having been an emigrant from Scotland who had settled, first at Memel, and afterwards at Tilsit. The name Kant, as it was originally spelled, is not uncommon in the north of Scotland, whence the family is said to have come, and it is not perhaps mere fancy to trace in some of the ethical doctrines of the critical philosophy and in the personal character of its author some of the prominent features of Scottish nationality. The father of the philosopher carried on the business of a saddler in Königsberg, and in that town, on the 22d April

1724, was born Immanuel, the fourth of a large family, most of whom died at an early age. Königsberg was then somewhat noted as a stronghold of what is known as Pietism, a phase of religious thought and life which had in Germany, as elsewhere, too much that was unpleasant, but which nevertheless was capable of exercising a powerful influence for good on the development of a really strong and ample character. "Say what you will of Pietism," writes Kant to his friend Rink, "no one can deny the real worth of the characters which it formed; they possessed the highest that man can possess—a peace, a cheerfulness, an inner harmony with self, which was disturbed by no passion." To influences of this kind Kant was subjected in his early years, partly from his mother, for whose memory he ever cherished the warmest affection and regard, partly from his excellent friend and patron, Schulz, the director of the Collegium Fredericianum in Königsberg, and afterwards professor of theology in the university. At the Collegium Fredericianum Kant was entered in his tenth year, with the definite view of proceeding to the theological courses of the university. His inclination at this time, determined probably by the high character of his teachers, was towards classics, and he was recognized, with his schoolfellow, the afterwards celebrated David Ruhnken, as among the most competent and promising classical scholars of the college. His taste for the greater Latin authors, particularly Lucretius, was never lost, and he acquired through his school training an unusual facility in Latin composition. With Greek authors he does not appear to have been equally familiar.

During his university course, which began in 1740, Kant was principally attracted towards mathematics and physics, doubtless through the influence of Knutzen, who then, as extraordinary professor, lectured on most branches of mathematics and also on philosophy. The lectures on classics do not seem to have satisfied Kant, and, though he attended Schulz's courses on theology, and even preached on one or two occasions, he appears finally to have given up the intention of entering the church. The last years of his university studies were much disturbed by the straitened means of his family, and he was compelled to have recourse to private teaching of the humblest kind. The death of his father, in 1746, destroyed his hopes of remaining at the university until he should have obtained some subordinate academic post. Much against his inclination he undertook the office of private tutor, and for nine years acted in this capacity in various families in the immediate neighbourhood of Königsberg. Although the life was not one which Kant would have chosen, and one for which he was not specially qualified—as he used to say regarding the excellent precepts of his *Ladagogics*, he was never able to apply them—yet it gave him an extended knowledge of the world, and added to his other accomplishments the grace and polish of refined society, which he displayed ever afterwards to a degree somewhat unusual in a philosopher by profession.

In 1755 Kant returned to Königsberg as tutor in the family of Count Kayserling. By the kindness of a friend named Richter, he was enabled again to take up his university career, and in autumn of that year he graduated as doctor and qualified as "Privatdozent." Two of the theses publicly defended on the occasion are printed in his works; an address, on the easier and harder styles of philosophical exposition, has not been published. For fifteen years he continued to labour in this subordinate position, his fame as writer and lecturer steadily increasing. On two occasions he was disappointed in the hope of obtaining a professorship in his own university, but during this time, as in later years, he refused all offers that would have withdrawn him

from Königsberg. The only academic preferment received by him during the lengthy probation was the post of under-librarian, to which he was appointed in 1766. His lectures, at first mainly upon physics, gradually expanded until nearly all descriptions of philosophy were included under them. A most interesting programme of his courses on metaphysics, logic, ethics, and physical geography for the session 1765-66 has been printed in his works (i. 289-299). The history of his literary activity during this period will be given in connexion with the notice of his writings.

In 1770 he obtained the chair of logic and metaphysics at Königsberg, and delivered as his inaugural address the dissertation *De Mundi Sensibilis et Intelligibilis Forma et Principiis*. Eleven years later appeared the *Kritik of Pure Reason*, the work towards which he had been steadily advancing, and of which all his later writings are developments.

In 1783 he published the *Prolegomena*, intended as an introduction to the *Kritik*, which had been found to stand in need of some explanatory comment. A second edition of the *Kritik*, with some modifications, appeared in 1787, after which it remained unaltered.

In spite of its frequent obscurity, its novel terminology, and its declared opposition to prevailing systems, the Kantian philosophy made rapid progress in Germany. In the course of ten or twelve years from the publication of the *Kritik of Pure Reason*, it was expounded in all the leading universities, and it even penetrated into the schools of the Church of Rome. Such men as Schulze in Königsberg, Kieseewetter in Berlin, Jakob in Halle, Born and Heydenreich in Leipzig, Reinhold and Schmid in Jena, Buhle in Göttingen, Tennemann in Marburg, and Saell in Giessen, with many others, made it the basis of their philosophical teaching, while theologians like Tiefftrunk, Stüdtlin, and Ammon eagerly applied it to Christian doctrine and morality. Young men flocked to Königsberg as to a shrine of philosophy. The Prussian Government even undertook the expense of their support. Kant was hailed by some as a second Messiah. He was consulted as an oracle on all questions of casuistry;—as, for example, on the lawfulness of inoculation for the small-pox. This universal homage for a long time left Kant unaffected; it was only in his later years that he spoke of his system as the limit of philosophy, and resented all further progress. He still pursued his quiet round of lecturing and authorship, and contributed from time to time papers to the literary journals. Of these, among the most remarkable was his review of Herder's *Philosophy of History*, which greatly exasperated that author, and led to a violent act of retaliation some years after in his *Metakritik of Pure Reason*. Schiller at this period in vain sought to engage Kant upon his *Horen*. He remained true to the *Berlin Journal*, in which most of his criticisms appeared.

In 1792 Kant, in the full height of his reputation, was involved in a painful collision with the Government on the question of his religious doctrines. Wöllner had replaced Von Zedlitz as minister of spiritual affairs, and, in an age peculiarly lax and heterodox, an unwise attempt was made to apply a rigid censorship to works of philosophical theology. It was not wonderful that the philosophy of Kant had excited the declared opposition of all adherents of historical Christianity, since its plain tendency was towards a moral rationalism, and it could not by any process of interpretation be reconciled to the literal doctrines of the Lutheran Church. It would have been much better to permit his exposition of the philosophy of religion to enjoy the same literary rights as his earlier works, since Kant could not be interdicted without first silencing a multitude of theologians who were at least equally separated from positive Christianity. The Government, however, judged

otherwise; and after the first part of his book, *On Religion within the Limits of Reason alone*, had appeared in the *Berlin Journal*, the publication of the remainder, which treats in a more rationalizing style of the peculiarities of Christianity, was forbidden. Kant, thus shut out from Berlin, availed himself of his local privilege, and, with the sanction of the theological faculty of his own university, published the full work in Königsberg. The Government, who were probably as much influenced by hatred and fear of the French Revolution, of which Kant was supposed to be a partisan, as by love of orthodoxy, resented the act; and a secret cabinet order was received by him intimating the displeasure of the king, Frederick William II., and exacting from him a pledge not to lecture or write at all on religious subjects in future. With this mandate Kant, after a struggle, complied, and kept his engagement till 1797, when the death of the king, according to his construction of his promise, set him free. This incident, however, produced a very unfavourable effect on his spirits. He withdrew in 1794 from society; next year he gave up all his classes but one public lecture on logic or metaphysics; and in 1797, before the removal of the interdict on his theological teaching, he ceased altogether his public labours, after an academic course of forty-two years. He previously, in the same year, finished his treatises on the *Metaphysics of Ethics*, which, with his *Anthropology*, completed in 1798, were the last considerable works that he revised with his own hand. His *Lectures on Logic*, on *Physical Geography*, on *Pedagogics*, were edited during his lifetime by his friends and pupils. By way of asserting his right to resume theological disquisition, he also issued in 1798 his *Strife of the Faculties*, in which all the strongest points of his work on religion were urged afresh, and the correspondence that had passed between himself and his censors was given to the world.

From the date of his retirement from the chair Kant declined in strength, and gave tokens of intellectual decay. His memory began to fail, and a large work at which he wrought night and day, on the connexion between physics and metaphysics, was found to be only a repetition of his already published doctrines. After 1802, finding himself attacked with a weakness in the limbs, attended with frequent fits of falling, he mitigated a little the Spartan severity of his life, and also consented to receive medical advice. A constant restlessness oppressed him; his sight gave way; his conversation became an extraordinary mixture of metaphors; and it was only at intervals that gleams of his former power broke out, especially when some old chord of association was struck in natural science or physical geography. A few days before his decease, with a great effort he thanked his medical attendant for his visits in the words, "I have not yet lost my feeling for humanity." On the 12th of February 1804, he breathed his last, having almost completed the eightieth year of his age.

It is superfluous to characterize the genius of Kant; but a few words may be added as to his personal appearance and habits of life, study, and teaching. His stature was small, and his appearance feeble. He was little more than 5 feet high; his breast was almost concave, and, like Schleiermacher, he was deformed in the right shoulder. His hair was light, his complexion fresh, his forehead high and square, while his eyes of light blue showed an expression of unusual depth and power. His senses were quick and delicate; and, though of weak constitution, he escaped, by strict regimen, all serious illness till the close of life.

His life was arranged with mechanical regularity; and, as he never married, he kept the habits of his studious youth to old age. His man-servant awoke him summer

and winter at five o'clock; and, on being appealed to on one occasion, testified that Kant had not once failed in thirty years to respond to the call. After rising he studied for two hours, then lectured other two, and spent the rest of the forenoon, till one, at his desk. He then dined at a restaurant, which he frequently changed, to avoid the influx of strangers, who crowded to see and hear him—till in later years his growing means enabled him to invite a friend or two daily to his own home. This was his only regular meal; and, as he loved the *duceur cœnam* of the Romans, he often prolonged the conversation till late in the afternoon. He then walked out for at least an hour in all weather, and spent the evening in lighter reading, except an hour or two devoted to the preparation of his next day's lectures, after which he retired between nine and ten to rest. The furniture of his house was of the simplest character; and, though he left a considerable sum, the produce of his writings, to his relatives, he indulged in no luxury, and was a pattern of that superiority to fashion and appearance so often met with in the literary life of Germany. In his earlier years he often spent his evenings in general society, where his overflowing knowledge and conversational talents made him the life of every party. He was especially intimate with the families of two English merchants of the name of Green and Motherby, where he found many opportunities of meetings—captains, and other travelled persons, and thus gratifying his passion for physical geography. This social circle included also the celebrated Hamann—the Magus or Wizard of the North—the friend of Herder and Jacobi, who was thus a mediator between Kant and these philosophical adversaries.

Kant's reading was of the most extensive and miscellaneous kind. He cared comparatively little for the history of speculation, being in this department more a discoverer than a scholar. But his acquaintance with books of science, general history, travels, and belles lettres was boundless. He was well versed in English literature, chiefly of the age of Queen Anne, and had read English philosophy from Locke to Hume, and the Scottish school. He was at home in Voltaire and Rousseau, but had little or no acquaintance with the French sensational philosophy. He was familiar with all German literature up to the date of his *Kritik*, but ceased to follow it in its great development by Goethe and Schiller. It was his habit to obtain books in sheets from his publishers Kanter and Nicolovius; and he read over for many years all the new works in their catalogue, in order to keep abreast of universal knowledge. He was excessively fond of newspapers and works on politics; and this was the only kind of reading that could interrupt his studies in philosophy.

As a lecturer, Kant avoided altogether that rigid style in which his books were written, and which was only meant for thinkers by profession. He sat behind a low desk, with a few jottings on slips of paper, or text-books marked on the margin, before him, and delivered an extemporaneous address, opening up the subject by partial glimpses, and with many digressions and interspersed anecdotes or familiar illustrations, till a complete idea of it was presented. His voice was extremely weak, but sometimes rose into eloquence, and always commanded perfect silence. Like Adam Smith, he fixed his eye on one student, and marked by his countenance whether the lecture was understood. The least irregularity in the appearance or dress of this selected hearer disconcerted him; and the story is well known of the missing button, which defeated a lecture. Though kind to his students, he refused on principle to remit their fees, as this, he thought, would discourage independence. It was another principle that his chief exertions should be bestowed on the intermediate class of talent, as the geniuses would help themselves, and the

dundees were beyond remedy. Hence he never delivered his deeper doctrines, such as are found in his *Kritik*, from the chair. His other avocations allowed him little personal intercourse with his numerous hearers, and he often complained of the want of lively sympathy and ascertained progress inseparable from such a system.

Simple, honourable, truthful, kind-hearted, and high-minded as Kant was in all moral respects, he was somewhat deficient in the region of sentiment. He had little enthusiasm for the beauties of nature, and indeed never sailed out into the Baltic, or travelled more than 40 miles from Königsberg. Music he disregarded, and all poetry that was more than sententious prose. His ethics have been reproached with some justice as setting up too low an ideal for the female sex. Though faithful in a high degree to the duties of friendship, he could not bear to visit his friends in sickness, and after their death he repressed all allusion to their memory. His engrossing intellectual labours no doubt tended somewhat to harden his character; and in his zeal for rectitude of purpose he forgot the part which affection and sentiment must ever play in the human constitution. Those who count these defects most grave will yet find much to admire in the lofty tone of his character, and in the benevolence which could thus express itself: "Whoever will suggest to me a good action left undone, him will I thank, though he suggest it even in my last hour!"

This brief notice of his life may appropriately close with Herder's beautiful sketch of Kant's character, all the more interesting that it was written in 1795, after their quarrel:—"I have had the good fortune to know a philosopher who was my teacher. In the vigour of life he had the same youthful gaiety of heart that now follows him I believe into old age. His open forehead, built for thought, was the seat of imperturbable cheerfulness and joy; the most pregnant discourse flowed from his lips; wit, humour, and railery came to him at will, and his instructions had all the charm of an entertainment. With the same easy mastery with which he tested the doctrines of Leibnitz, Wolf, Baumgarten, Crusius, and Hume, or pursued the discoveries of Newton, Kepler, and other lights of science, he also took up the current writings of Rousseau, such as the *Émile* or *Héloïse*, or any new phenomenon of the natural world, and from the criticism of each came back to the impartial study of nature, and to the enforcement of the dignity of man. History in all its branches, natural science, physics, mathematics, and experience were the materials that gave interest to his lectures and his conversation; nothing worthy of study was to him indifferent; no faction or sect, no selfishness or vanity, had for him the least attraction, compared with the extension and elucidation of truth. He excited and pleasantly impelled us to mental independence; despotism was foreign to his nature. This man, whom I name with the deepest gratitude and respect, is Immanuel Kant; his image rises before me surrounded with pleasing recollections!"

The Writings of Kant.

From the preceding sketch of Kant's academic activity it must be evident that he combined in a quite unusual degree knowledge of physical science with speculative acuteness and devotion to the special work of philosophy. No other thinker of modern times has been throughout his work so penetrated with the fundamental conceptions of physical science; no other has been able to hold with such firmness the balance between empirical and speculative ideas. Beyond all question much of the influence which the critical philosophy has exercised and continues to exercise must be ascribed to this characteristic feature in the training of its great author.

The early writings of Kant are almost without exception on questions of physical science. It was only by degrees that philosophical problems began to engage his attention, and that the main portion of his literary activity was turned towards them. It will be convenient, therefore, in enumerating the varied writings of Kant, to place in a separate group those which bear directly on physical science. The following are the most important in this group:—

1. *Thoughts on the True Estimate of *Vita Viva*, 1747*: an essay dealing with the famous dispute between the Cartesian and Leibnizians regarding the expression for the amount of a force. According to the Cartesians, this quantity was directly proportional to velocity; according to their opponents, it varied with the square of the velocity. The dispute has now lost its interest, for physicists have learned to distinguish accurately the two quantities which are vaguely included under the expression amount of force, and consequently have been able to show in what each party was correct and in what it was in error. Kant's essay, with some fallacious explanations and divisions, criticizes acutely the arguments of the Leibnizians, and concludes with an attempt to show that both modes of expression are correct when correctly limited and interpreted.

2. *Whether the Earth in its Revolution has experienced some Change since the Earliest Times*, 1756. In this brief essay Kant throws out a notion which has since been carried out, in ignorance of Kant's priority, by Delaunay (1805) and Adams. He points out that the action of the moon in raising the waters of the earth must have a secondary effect in the slight retardation of the earth's motion, and refers to a similar cause the fact that the moon turns always the same face to the earth.

3. *General History and Theory of the Heavens* ("Allgemeine Naturgeschichte und Theorie des Himmels"), published anonymously in 1756. In this remarkable work Kant, proceeding from the Newtonian conception of the solar system, extends his consideration to the entire sidereal system, points out how the whole may be mechanically regarded, and throws out the important speculation which has since received the title of the nebular hypothesis. In some details, such, e.g., as the regarding of the motion of the entire solar system as portion of the general mechanical mechanism, he had predecessors, among others J. Wright of Durham, but the work as a whole contains a revolutionary and anticipatory conception of much that was afterwards current with Herschel and Laplace. The hypothesis of the original nebular condition of the system, with the consequent explanation of the great phenomena of planetary formations and movements of the satellites and rings, is unquestionably to be assigned to Kant.

4. *Brief Account of some Thoughts on Fire* ("Meditationum quarundam de igne enchiridion didacticon"), 1756: an inaugural dissertation, maintaining little beyond the notion that bodies operate on one another through the medium of a uniformly diffused, elastic, and subtle matter (ether) which is the underlying substance of heat and light. Both heat and light are regarded as vibrations of this diffused ether.

5. *On the Causes of Earthquakes*, 1755; *Description of the Earthquake of 1755, 1756*; *Consideration of some Recently Experienced Earthquakes*, 1756.

6. *Replendishing Remarks on the Theory of the Winds*, 1756. In this brief tract, Kant apparently in entire ignorance of the explanation given in 1755 by Halley, points out that the varying velocity of rotation of the successive zones of the earth's surface furnishes a key to the phenomena of periodic winds. His theory is in almost entire agreement with that now received. See the parallel statements from Kant's tract and Dove's essay on the influence of the rotation of the earth on the flow of its atmosphere, 1835, given in Zollner's work, *Ueber die Natur der Cometen*, pp. 477-482.

7. *On the Different Races of Men*, 1775; *Determination of the Nature of a Human Race*, 1785; *Conjectural Beginning of Human History*, 1786: these tracts containing some points of interest as regards the empirical grounds for Kant's doctrine of teleology. References will be made to them in the notice of the *Kritik of Judgment*.

8. *On the Permanence in the Moon*, 1785; *On the Influence of the Moon on the Weather*, 1794. The second of these contains a remarkable discussion of the relation between the centre of the moon's figure and its centre of gravity. From the difference between these Kant is led to conjecture that the climatic conditions of the side of the moon turned from us must be altogether unlike those of the face presented to us. His views have been revisited by Hansen.

9. *Lectures on Physical Geography*, 1822: published from notes of Kant's lectures, with the approval of the author.

Consideration of these works is sufficient to show that Kant's mastery of the science of his time was complete and thorough, and that his philosophy is to be dealt with as having throughout a reference to general scientific conceptions. For more detailed treatment of his importance in science, reference may be made to

Zollner's essay on "Kant and his Merits on Natural Science" contained in the work on the *Nature of Comets* (pp. 426-484); to Dietrich, *Kant und Newton*; to Schütze, *Kant und Darwin*; and to Reuschle's careful analysis of the scientific works in the *Deutsche Vierteljahrsschrift*, 1893.

The notice of the philosophical writings of Kant need not be more than bibliographical, as in the account of his philosophy it will be necessary to consider at some length the successive stages in the development of his thought. Arranged chronologically these works are as follows:—

1755. *Principiorum Primorum cognitionis Metaphysicæ nova Dilucidatio*.

1756. *Metaphysicæ cum geometria junctæ usus in philosophiâ naturalî, cujus Specimen I. continet Moraliologiam Physicam*.

1763. *Die falsche Spitzfindigkeit der vier syllogistischen Figuren, "The False Subtlety of the Four Syllogistic Figures"*.

1763. *Versuch den Begriff der negativen Gröszen in die Weltweisheit einzuführen*, "Attempt to introduce the Notion of Negative Quantities into Philosophy."

The Kantian Philosophy.

Historians are accustomed to divide the general current of speculation into epochs or periods marked by the dominance of some single philosophical conception with its systematic evolution. Perhaps in no case is the character of an epoch more clearly apparent than in that of the critical philosophy. The great work of Kant absolutely closed the lines of speculation along which the philosophical literature of the 18th century had proceeded, and substituted for them a new and more comprehensive method of regarding the essential problems of thought, a method which has prescribed the course of philosophic speculation in the present age. The critical system has thus a twofold aspect. It takes up into itself what had characterized the previous efforts of modern thought, shows the imperfect nature of the fundamental notions therein employed, and offers a new solution of the problems to which these notions had been applied. It opens up a new series of questions upon which subsequent philosophic reflection has been directed, and gives to them the form, under which it is possible that they should be

faithfully regarded. A work of this kind is essentially epoch-making.

In any complete account of the Kantian system it is therefore necessary that there should be constant reference, on the one hand, to the peculiar character of the preaching 18th century philosophy, and, on the other hand, to the problems left for renewed treatment to move modern thought. Fortunately the development of the Kantian system itself furnishes such treatment as is necessary of the former reference. For the critical philosophy was a work of slow growth. In the early writings of Kant we are able to trace with great definiteness the successive stages through which he passed from the notions of the preceding philosophy to the new and comprehensive method which gives its special character to the critical work. Scarcely any great mind, it has been said with justice, ever matured so slowly. In the early essays we find the principles of the current philosophies, those of Leibnitz and English empiricism, applied in various directions to those problems which serve as tests of their truth and completeness, we note the appearance of the difficulties or contradictions which manifest the one-sidedness or imperfection of the principle applied; and we can trace the gradual growth of the new conceptions which were destined, in the completed system, to take the place of the earlier method. To understand the Kantian work it is indispensable to trace the history of its growth in the mind of its author.

Of the two preceding stages of modern philosophy, only the second, that of Locke and Leibnitz, seems to have influenced practically the course of Kant's speculation. With the Cartesian movement as a whole he shows little acquaintance and no sympathy, and his own philosophic conception is never brought into relation with the systematic treatment of metaphysical problems characteristic of the Cartesian method! The fundamental question for philosophic reflection presented itself to him in the form which it had assumed in the hands of Locke and his successors in England, of Leibnitz and the Leibnitzian school in Germany. The transition from the Cartesian movement to this second stage of modern thought had doubtless been natural and indeed necessary. Nevertheless the full bearings of the philosophic question were somewhat obscured by the comparatively limited fashion in which it was then regarded. The tendency towards what may be technically called subjectivism, a tendency which differentiates the modern from the ancient method of speculation, is expressed in Locke and Leibnitz in a definite and peculiar fashion. However widely the two systems differ in details, they are at one in a certain fundamental conception which determines the whole course of their philosophic construction. They are throughout individualist, i.e. they accept as given fact the existence of the concrete, thinking subject, and endeavour to show how this subject, as an individual conscious being, is related to the wider universe of which he forms part. In dealing with such a problem, there are evidently two lines along which investigation may proceed. It may be asked how the individual mind comes to know himself and the system of things with which he is connected, how the varied contents of his experience are to be accounted for, and what certainty attaches to his subjective consciousness of things. Regarded from the individualist point of view, this line of inquiry becomes purely psychological, and the answer may be presented, as it was presented by Locke, in the fashion of a natural history of the growth of conscious experience in the mind of the subject. Or, it may be further asked, how is the individual really connected with the system of things apparently disclosed to him in conscious experience? What is the precise significance of the existence which he ascribes both to himself and to the objects of his experience? What is the nature of the relation between himself as one part of the system, and the system as a whole? This second inquiry is specifically metaphysical in bearing, and the kind of answer furnished to it by Leibnitz on the one hand, by Berkeley on the other, is in fact prescribed or determined beforehand by the fundamental conception of the individualist method with which both begin their investigations. So soon as we make clear to ourselves the essential nature of this method, we are able to discern the specific difficulties or perplexities arising in the attempt to carry it out systematically, and thus to note with precision the special problems presented to Kant at the outset of his philosophic reflections.

Consider, first, the application of the method on its psychological side, as it appears in Locke. Starting with the assumption of conscious experience as the content or filling-in of the individual mind, Locke proceeds to explain its genesis and nature by reference to the real universe of things and its mechanical operation upon the mind. The result of the interaction of mind, i.e., the individual mind, and the system of things, is conscious experience, consisting of ideas, which may be variously compounded, divided, compared, or dealt with by the subjective faculties or powers with which the entity, Mind, is supposed to be endowed. Matter of fact and matter of knowledge are thus at a stroke disovered. The very notion of relation between mind and things leads at once to the counter notion of the absolute restriction of mind to its own subjective nature. That Locke was unable to reconcile these opposed notions is not surprising; that the difficulties and obscurities of the *Essay* arise from

the impossibility of reconciling them is evident on the slightest consideration of the main positions of that work. Of these difficulties the philosophies of Berkeley and Hume are systematic treatments. In Berkeley we find the resolute determination to accept only the one notion, that of mind as restricted to its own conscious experience, and to attempt by this means to explain the nature of the external reality to which obscure reference is made. Any success in the attempt is due only to the fact that Berkeley introduces alongside of his individualist notion a totally new conception, that of mind itself as not in the same way one of the matters of conscious experience, but as capable of reflexion upon the whole of experience and of reference to the supreme mind as the ground of all reality. It is only in Hume that we have definitely and completely the evolution of the individualist notion as groundwork of theory of knowledge; and it is in his writings, therefore, that we may expect to find the fundamental difficulty of that notion clearly apparent. It is not a little remarkable that we should find in Hume, not only the sceptical dissolution of all fixity of cognition, which is the inevitable result of the individualist method, but also the clearest consciousness of the very root of the difficulty. The systematic application of the doctrine that conscious experience consists only of isolated objects of knowledge, impressions or ideas, leads Hume to distinguish between truths reached by analysis and truths which involve real connexion of the objects of knowledge. The first he is willing to accept without further inquiry, though it is an error to suppose, as Kant seems to have supposed, that he regarded mathematical propositions as coming under this head (see *HUME*), with respect to the second, he finds himself, and confesses that he finds himself, hopelessly at fault. No real connexion between isolated objects of experience are perceived by us. No single matter of fact necessarily implies the existence of any other. In short, if a difficulty be put in its ultimate form, no existence thought as a distinct individual can be truly said to exist, or imply relation to any other existence. If the parts of conscious experience are regarded as so many distinct things, there is no possibility of connecting them other than contingently, if at all. If the individual mind be really thought as individual, it is impossible to explain how it should have knowledge or consciousness at all. "In short," says Hume, "there are two principles which I cannot render consistent, nor is it in my power to renounce either of them, viz, that all our distinct perceptions are distinct existences, and that the mind never perceives any real connexion among distinct existences." But our perceptions either inhere in something simple or individual, or did the mind perceive some real connexion among them, there would be no difficulty in the case" (*Appt. to Treatise of Human Nature*).

Thus, on the one hand, the individualist conception, when carried out to its full extent, leads to the total negation of all real cognition. If the real system of things, to which conscious experience has reference, be regarded as standing in causal relation to this experience, there is no conceivable ground for the connection to reality of the notions which sometimes are involved in thought! The same result is apparent on the other hand, when we consider the theory of knowledge implied in the Leibnitzian individualism. The metaphysical conception of the monads, each of which is the universe *in nuce*, presents insuperable difficulties when the connexion or interdependence of the monads is in question, and these difficulties obtrude themselves when the attempt is made to work out a consistent doctrine of cognition. For the whole mass of cognizable fact, the *mundus intelligibilis*, is contained *in pte* in each monad, and the several modes of apprehension can only refer to the many stages in the developing consciousness of the monad. Sense and understanding, real connexion of facts and analysis of notions, are not, therefore, distinct in kind, but differ only in degree. The same fundamental axioms, the logical principles of identity and sufficient reason, are applicable in explanation of all given propositions. It is true that Leibnitz himself did not work out any complete doctrine of knowledge, but in the hands of his successors the theory took definite shape in the principle that the whole work of cognition is in essence analytical. The process of analysis might be complete or incomplete. For finite intelligences there was an inevitable incompleteness so far as knowledge of matters of fact was concerned. In respect to them, the final result, was found in a series of irreducible notions or categories, the *primitia possibilis*, the analysis and elucidation of which was specifically the business of philosophy or metaphysics.

It will be observed that, in the Leibnitzian as in the empiricist individualism, the fundamental notion is still that of the abstract separation of the thinking subject from the materials of conscious experience. From this separation arise all the difficulties in the effort to develop the notion systematically, and in tracing the history of Kant's philosophical progress we are able to discern the gradual perception on his part that there was to be found the ultimate cause of the perplexities which became apparent in considering the subordinate doctrines of the system. The successive essays which have already been enumerated as composing Kant's precritical work are not to be regarded as so many imperfect sketches of the doctrines of the *Kritik*, nor are we to look in them for anticipations of the

critical view. They are essentially tentative, and exhibit with unusual clearness the manner in which the difficulties of a received theory force on a wider and more comprehensive view. There can be no doubt that some of the special features of the *Kritik* are to be found in these precritical essays, e.g., the doctrine of the *Aesthetik* is certainly foreshadowed in the *Dissertation* of 1770; the *Kritik*, however, is no patchwork, and what appears in the *Dissertation* takes an altogether new form when it is wrought into the more comprehensive conception of the later treatise.

The particular problem which gave the occasion to the first of the precritical writings is, in an imperfect or particular fashion, the fundamental question to which the *Kritik* is an answer. What is the nature of the distinction between knowledge gained by analysis of notions and knowledge of matters of fact? Kant seems never to have been satisfied with the Wolffian identification of logical axioms and of the principle of sufficient reason. The tract on the *Stae Subdity of the Four Syllogistic Figures*, in which the view of thought or reason as analytic is clearly expressed, closes with the significant division of judgments into those which rest upon the logical axioms of identity and contradiction and those for which no logical ground can be shown. Such immediate or indemonstrable judgments, it is said, abound in our experience. They are, in fact, as Kant presently perceived, the foundations for all judgments regarding real existence. It was impossible that the question regarding their nature and legitimacy and their distinction from analytic judgments should not present itself to him. The three tracts belonging to the years 1765-66 bring forward in the sharpest fashion the essential opposition between the two classes of judgments. In the *Essay on Negative Quantities*, the fundamental thought is the total distinction in kind between logical opposition (the contradictoryness of notions, which Kant always viewed as formal, definite products of thought) and real opposition. For the one the adequate explanation is found in the logical axiom of analytical thinking; for the other no such explanation is to be had. Logical ground and real ground are totally distinct. "I can understand perfectly well," says Kant, "how a consequence follows from its reason according to the law of identity, since it is discoverable by mere analysis of the notion contained in it. . . . But how something follows from another thing and not according to the law of identity, this I should gladly have made clear to me. . . . How shall I comprehend that, since something is something, it should be?" But things, in short, are distinct existences, and as distinct, not necessarily or logically connected in thought. "I have," he proceeds, "reflected on the nature of our knowledge in relation to our judgments of reason and consequent, and I intend to expound fully the result of my reflections. It follows from them that the relation of a real ground to that which is thereby posited or denied cannot be expressed by a judgment but only by means of a notion, which by analysis may certainly be reduced to yet simpler notions of real grounds, but yet in such a way that the final resort of all our cognition in this regard must be found in simple and irreducible notions of real grounds, the relation of which to their consequents cannot be made clear."

The striking similarity between Kant's expressions in this *Essay* and the remarks with which Hume introduces his analysis of the notion of cause has led to the supposition that at this period of his philosophical career Kant was definitely under the influence of the earlier empirical thinker. Consideration of the whole passage is quite sufficient to show the groundlessness of this supposition. The difficulty with which Kant is presented was one arising inevitably from reflection upon the Leibnizian theory of knowledge, and the solution does not in any way go beyond that theory. It is a solution, in fact, which must have been impossible had the purport of Hume's empirical doctrine been present to Kant's mind. He is here at the point at which he remained for many years, accepting without any criticism certain fundamental notions as a ground for real cognition. His ideal of metaphysics is still that of complete analysis of given notions. No glimmering of the further question, Whence come these notions and with what right do we apply them in cognition? is yet apparent. Any direct influence from Hume must be referred to a later period in his career.

The prize essay *On the Principles of Natural Theology and Morals* brings forward the same fundamental opposition,—though in a special form. Here, for the first time, appears definitely the distinction between synthesis and analysis, and in the distinction is found the reason for the superior certainty and clearness of mathematics as opposed to philosophy. Mathematics, Kant thinks, proceeds synthetically, for in it the notions are constructed. Metaphysics, on the other hand, is analytical in method; in it the notions are given, and by analysis they are cleared up. It is to be observed that the description of mathematics as synthetic is not an anticipation of the critical doctrine on the same subject. Kant does not, in this place, raise the question as to the reason for assuming that the arbitrary syntheses of mathematical construction have any reference to reality. The deeper significance of synthesis has not yet become apparent.

In the *Only Possible Ground of Proof for the Existence of God*, the

argument, though largely Leibnizian, advances one step further towards the ultimate inquiry. For there Kant states as probably as in the critique of speculative theology his fundamental doctrine that real existence is not a predicate to be added in thought to the conception of a possible subject. So far as subjective thought is concerned, possibility, not real existence, is contained in any judgment.

The year 1765 was marked by the publication of Leibnitz's posthumous *Nouveaux Essais*, in which his theory of knowledge is more fully stated than in any of his previous tracts. In it is probably Kant gave some attention to this work, though no special reference to it occurs in his writings, and it may have assisted to give additional precision to his doctrine. In the curious essay, *Dreams of a Clairvoyant*, published 1766, he emphasizes his previously reached conclusion that connexions of real fact are mediated in our thought by ultimate notions, but adds that the significance and warrant for such notions can be furnished only by experience. He is inclined, therefore, to regard as the function of metaphysics the complete statement of these ultimate, indemonstrable notions, and therefore the determination of the limits to knowledge by their means. Even at this point, where he approximates more closely to Hume than to any other thinker, the difficulty raised by Hume does not seem to occur to him. He still appears to think that experience does warrant the employment of such notions, and when there is taken into account his correspondence with Lambert during the next few years, one would be inclined to say that the *Architectonik* of the latter represents most completely Kant's idea of philosophy.

On another side Kant had been shaking himself free from the principles of the Leibnizian philosophy. According to Leibnitz, space, the order of coexisting things, resulted from the relations of monads to one another. But Kant began to see that such a conception did not accord with the manner in which we determine directions or positions in space. In the curious little essay, *On the Ground of distinguishing Particular Divisions in Space*, he pointed out that the idea of space as a whole is not deducible from the experience of particular spaces, or particular relations of objects in space, that we only cognize relations in space by reference to space as a whole, and finally that definite positions involve reference to space as a given whole.

The development of Kant's thought up to this point is intelligible when regarded from the Leibnizian point of view, with which he started. There appears no reason to conclude that Hume at this time exercised any direct influence. One may go still further, and add that even in the *Dissertation* of 1770, generally regarded as more than foreshadowing the *Kritik*, the really critical question is not involved. A brief notice of the contents of this tract will suffice to show how far removed Kant yet was from the methods and principles of the critical or transcendental philosophy. Sense and understanding, according to the *Dissertation*, are the two sources of knowledge. The objects of the one are things of sense or *phenomena*; the objects of the other are *noumena*. These are absolutely distinct, and are not to be regarded as differing only in degree. In *phenomena* we distinguish matter, which is given by sense, and form, which is the law of the order of sensations. Such form is twofold—the order of space and time. Sensations formed by space and time compose the world of appearance, and this when treated by the understanding, according to logical rules, is *experience*. But the logical use of the understanding is not its only use. Much more important is the *real* use, by which as produced the pure notions whereby we think things as they are. These pure notions are the laws of the operation of the intellect; they are *leges intellectus*.

Apart, then, from the expanded treatment of space and time as subjective forms, we find in the *Dissertation* little more than the very precise and definite formulation of the slowly growing opposition to the Leibnizian doctrines. That the more intellectual notions should be defended as springing from the nature of intellect is not out of harmony with the statement of the *Träume eines Geistesuchers*, for there the pure notions were allowed to exist, but were not held to have validity for actual things except on grounds of experience. Here they are supposed to exist, discerned from experience, and are allowed validity as determinations of things in themselves.

The stage which Kant had now reached in his philosophical development was one of great significance. The doctrine of knowledge expressed in the *Dissertation* was the final form which the Wolffian rationalism could assume for him, and though many of the elements of the *Kritik* are contained therein, it was not really in advance of the Wolffian theory. The doctrine of space and time as forms of sense-perception, the reference of both space and time and the pure intellectual notions to the laws of the activity of mind itself, the distinction between sense and understanding as one of kind, not of degree, with the correlative distinction between phenomena and noumena,—all of these reappear, though changed and modified, in the *Kritik*. But, despite this resemblance, it seems clear that, so far as the *Dissertation* is concerned, the way

had only been prepared for the true critical inquiry, and that the real import of Hume's sceptical problem had not yet dawned upon Kant. From the manner, however, in which the doctrine of knowledge had been stated in the *Dissertation*, the further inquiry had been rendered inevitable. It had become quite impossible for Kant to remain longer satisfied with the ambiguous position assigned to a fundamental element of his doctrine of knowledge, the so-called pure intellectual notions. These notions, according to the *Dissertation*, had no function save in the connection of things-in-themselves, i. e., to objects which are not directly or immediately brought into relation to our faculty of cognition. They did not serve as the connecting links of formed experience; on the contrary, they were supposed to be absolutely dis severed from all experience which was possible for intelligence like ours. In his previous essays, Kant, while likewise maintaining that such pure, irreducible notions existed, had asserted in general terms that they applied to experience, and that their applicability or justification rested on experience itself, but had not raised the question as to the ground of such justification. Now, from another side, the supreme difficulty was presented—how could such notions have application to any objects whatsoever? For some time the correlative difficulty, how objects of sense-perception were possible, does not seem to have suggested itself to Kant. In the *Dissertation* sense-perception had been taken as reciprocity of representations of objects, and experience as the prolegmatic treatment of such representations by the logical or analytical processes of understanding. Some traces of this confused fashion of regarding sense-perceptions are left even in the *Kritik*, specially perhaps in the *Aesthetics*, and they give rise to much of the ambiguity which unfortunately attaches to the more developed theory of cognition. So soon, however, as the critical question was put, on what rests the reference of representations in us to the object or thing? in other words, how do we come to have knowledge of objects at all? it became apparent that the problem was one of the pure notions, but to sense-perceptions likewise. It is in the statement of this general problem that we find the new and characteristic feature of Kant's work.

There is thus no reason to doubt the substantial accuracy of Kant's reference to the particular occasion or cause of the critical inquiry. Up to the stage indicated by the *Dissertation*, he had been attempting, in various ways, to unite two radically divergent modes of explaining cognition—that which would account for the content of experience by reference to things-in-themselves, and that which viewed the intellect itself as somehow furnished with the means of pure, rational cognition. He now discovered that Hume's sceptical analysis of the notion of cause was really the treatment of one typical or crucial instance of the much more general problem. If experience, says Hume, consists solely of states of mind somehow given to us, each of which exists as an effect, and therefore as distinct from others, with what right do we make the common assumption that parts of experience are necessarily connected? The only possible answer, drawn from the premises laid down, must be that there is no warrant for such an assumption. Necessity for thought, as Kant had been willing to admit and as Hume also held, involves or implies something more than is given in experience—for that which is given is contingent—and rests upon an *a priori* or pure notion. But *a priori* notions, did they exist, could have no claim to regulate experience. Hume, therefore, for his part, rejected entirely the notion of cause as being a fiction and delusive, and professed to account for the habit of regarding experience as necessarily connected by reference to arbitrarily formed custom of thinking. Experience, as given, contingent material, had a certain uniformity, and recurring uniformities generated in us the habit of regarding things as necessarily connected. That such a resort to experience for explanation could lead to no valid conclusion has been already noted as evident to Hume himself.

The dogmatic or individualist conception of experience had thus proved itself inadequate to the solution of Hume's difficulty regarding the notion of cause—a difficulty which Kant, unconsciously, had thought to be the only one contemplated by his predecessors. The perception of its inadequacy in this respect, and the consequent generalization of Hume's problem, are the essential features of the new critical method. For Kant was now prepared to formulate his general inquiry in a definite fashion. His long-continued reflexion on the Wolfian doctrine of knowledge had made clear to him that synthetic connexion, the essence of real cognition, was not contained in the products of thinking as a formal activity of mind operating on material, or otherwise supplied. On the other hand, Hume's analysis enabled him to see that synthetic connexion was not contained in experience regarded as given material. Thus neither the formal nor the material aspect of conscious experience, when regarded from the individualist point of view, supplied any foundation for real knowledge, whether *a priori* or empirical. An absolutely new conception of experience was necessary, if the fact of cognition was to be explained at all, and the various modes in which Kant expresses the business of his critical philosophy were merely different fashions of stating the one ultimate problem, differ-

ing according to the particular aspect of knowledge which he happened to have in view. To inquire how synthetic *a priori* judgments are possible, or how far cognition extends, or what worth attaches to metaphysical propositions, is simply to ask, in a specific form, what elements are necessarily involved in the existence of which the subject is conscious. How is it possible for the individual thinking subject to connect together the parts of his experience in the mode we call cognition?

The problem of the critical philosophy is, therefore, the complete analysis of experience from the point of view of the conditions under which such experience is possible for the conscious subject. The central ideas are thus self-consciousness, as the supreme condition under which experience is subjectively possible, and the manifold details of experience as a varied and complex whole. The solution of the problem demanded the utmost care in keeping the balance between these ideas; and it can hardly be said that Kant was perfectly successful. He is frequently untrue to the more comprehensive conception which dominates his work as a whole. The influence of his previous philosophical training, may, even the unconscious influence of terminology, frequently induces in his statements a certain laxity and want of clearness. He selects definitely for his starting point neither the idea of self-consciousness nor the details of experience, but in his actual procedure passes from one to the other, rarely, if ever, taking into full consideration the weighty question of their relation to one another. About all he is consciously under the influence of the individualist notion which he had done so much to explode. The conception of conscious experience, which is the not result of the *Kritik*, is undeniably profounder and richer than that which had ruled the 18th century philosophizing, but for Kant such experience still appears as somehow the arbitrary product of the relation between the individual conscious subject and the realm of real facts. When he is actually analysing the conditions of knowledge, the influence of the individualist conception is not prominent; the conditions are stated as quite general, as conditions of knowledge. But so soon as the deeper, metaphysical problems present themselves, the shadow of the old doctrine reappears. Knowledge is regarded as a mechanical product, part furnished by the subject, part given to the subject, and is thus viewed as mechanically divisible into *a priori* and *a posteriori*, *im-pure* and *empirical*, necessary and contingent. The individual as an agent, conscious of universal moral law, is yet regarded as in a manner opposed to experience, and the Kantian ethical system is thus a *factum* for thought. The ultimate relation between intelligence and natural fact, expressed in the notion of *end*, is thought as problematic or contingent. The difficulties or obscurities of the Kantian system, of which the above are merely the more prominent, may all be traced to the one source, the false or at least inadequate idea of the individual. The more thorough explanation of the relation between experience as critically conceived and the individual subject was the problem left by Kant for his successors.

In any detailed exposition of the critical system it would be requisite in the first place to state with some fulness the preliminary of the problems immediately before Kant, and in the second place to follow with some clearness the successive stages of the system as presented in the three main works, the *Kritik of Pure Reason*, the *Kritik of Practical Reason*, and the *Kritik of Judgment*, with the more important of the minor works, the *Metaphysics of Nature* and the *Metaphysics of Ethics*. It would be necessary, also, in any such expanded treatment, to bring out clearly the Kantian resistance to the philosophical sciences, and to indicate the relation between the critical or transcendental investigation of the several faculties and the more developed sciences to which that investigation serves as introduction. As any detailed statement of the critical system, however compressed, would be beyond the limits of the present article, it is proposed here to select only the more salient doctrines, and to point out in connexion with them what advances had been effected by Kant, and what remained for subsequent efforts at complete solution of the problems raised by him. Much that is of interest and value must necessarily be omitted. It is a sketch of a laborious system, and for all points of special interpretation reference must needs be made to the many elaborate dissertations on or about the Kantian philosophy.

The doctrine from which Kant starts in his critical or transcendental investigation of knowledge is that to which the slow development of his thought had led him. The essence of cognition or knowledge was a synthetic act, an act of combining in thought the detached elements of experience. Now synthesis was explicative, neither by reference to pure thought, the logical or elaborative faculty, which in Kant's view remained analytic in function, nor by reference to the effects of external real things upon our faculties of cognition. For, on the one hand, analysis or logical treatment applied only to objects of knowledge already given in synthetic forms, and, on the other hand, real things could yield only isolated effects and not the combination of these effects in the forms of cognitive experience. If experience is to be matter of knowledge for the conscious subject, it must be regarded as the conjoint product of given material and synthetic combination. Form and matter

may indeed be regarded separately and dealt with in isolation for purposes of critical inquiry, but in experience they are necessarily and inseparably united. The problem of the *Kritik* thus becomes for Kant the complete statement of the elements necessarily involved in synthesis, and of the subjective processes by which these elements are realized in our intuitions. He is not asking, with Locke, whence the details of experience arise; he is not attempting a natural history of the growth of experience in the individual mind; but he is endeavouring to state exhaustively what conditions are necessarily involved in any fact of knowledge, *i. e.*, in any synthetic combination of parts of experience by the conscious subject.

So far as the elements necessarily involved in conscious experience are concerned, these may be enumerated briefly thus—given data of sense, inner or outer; the forms of perception, *i. e.*, space and time; the forms of thought, *i. e.*, the categories; the althetical condition of knowledge, the identity of the pure ego or self. The ego or self is the central unity in reference to which alone is any part of experience cognizable. But the consciousness of self is the foundation of knowledge only when related to given material. The ego has not in itself the element of difference, and the essence of knowledge is the consciousness of unity in difference. For knowledge, therefore, it is necessary that difference should be *given* to the ego. The modes under which it is possible for such given difference to become portion of the conscious experience of the ego, the modes under which the isolated data can be synthetically combined so as to form a cognizable whole, make up the form of cognition, and upon this form rests the possibility of any *experiential* or rational knowledge.

The notion of the ego as a purely logical unity, enmeshing in itself no element of difference, and having only analytic identity, is fundamental in the critical system, and lies at the root of all its difficulties and perplexities. To say that the ego as an individual does not *produce* the world of experience is by no means the same as to say that the ego is pure unity without element of difference. In the one case we are treating the ego as one of the objects of experience and denying of it productive efficacy; in the second case we are dealing with the unity of the ego as a condition of knowledge, of any experience whatsoever. In this second sense, it is wholly wrong to assert that the ego is pure identity, pure unity. The unity and identity of the ego, so regarded, are taken in abstraction, *i. e.*, as discovered from the more complex whole of which they are necessary elements. When the ego is taken as a condition of knowledge, its unity is not more important than the difference necessarily correlated with it. That the ego as a thing should not produce difference is quite beside the mark. The consequences of the abstract separation which Kant so draws between the ego and the world of experience are apparent throughout the whole system. Assuming at the outset an opposition between the law and matter of knowledge, he is driven by the exigencies of the problem of reconciliation to insert term after term as means of bringing them together, but never succeeds in attaining a junction which is more than mechanical. To the end, the ego remains, purely the pure logical ego, purely the concrete individual spirit, and no explanation is afforded of the relation between them. It is for this reason that the system of forms of perception and categories appears so contingent and haphazard. No attempt is made to show how or why the difference supplied for the pure logical ego should present itself necessarily under these forms. They are regarded rather as portions of the subjective mechanism of the individual consciousness. The mind or self appears as though it were endowed with a complex machinery by which alone it could act upon the material supplied to it. Such a crude conception is far, indeed, from doing justice to Kant's view, but it undoubtedly represents the underlying assumption of many of his central deductions. The philosophy of Fichte is historically interesting as that in which the deficiencies of Kant's fundamental position were first discerned and the attempt made to remedy them.

Unfortunately for the consistency of the *Kritik*, Kant does not attempt to work out systematically the elements involved in knowledge before considering the subjective processes by which knowledge is realized in consciousness. He mixes up the two inquiries, and in the general division of his work depends rather upon the results of previous psychology than upon the lines prescribed by his own new conception of experience. He treats the elements of cognition separately in connexion with the several subjective processes involved in knowledge, *viz.*, sense and understanding. Great ambiguity is the natural result of this procedure. For it was not possible for Kant to avoid the misleading connotation of the terms employed by him. In strictness sense, understanding, imagination, and reason ought to have had their functions defined in close relation to the elements of knowledge with which they are severally connected, and as these elements have no existence as separate facts, but only as factors in the complex organic whole, it might have been possible to avoid the error of supposing that each subjective process furnished a distinct, separately cognizable portion of a mechanical whole. But the use of separate terms, such as sense and understanding, almost unavoidably led to philosophy only interpretable as signifying that each furnished a specific kind of

knowledge, and all Kant's previous training contributed to strengthen this erroneous view. Especially noteworthy is this in the case of the categories. Kant insists upon treating these as *Begriffe*, notions, and assigns to them certain characteristics of notions. But it is readily seen, and in the *Logic* Kant shows himself fully aware of the fact, that these pure connective links of experience, general aspects of objects of intelligible experience, do not resemble concepts formed by the so-called logical or elaborative processes from representations of completed objects. Nothing but harm can follow from any attempt to identify two products which differ so entirely. So, again, the *Aesthetik* is rendered extremely obscure and difficult by the prevalence of the view, already noted as obtaining in the *Dissertation*, that sense is a faculty receiving representations of objects. Kant was anxious to avoid the error of Leibnitz, who had taken sense and understanding to differ in degree only, not in kind; but in avoiding the one error he fell into another of no less importance.

The consideration of the several elements which in combination make up the fact of cognition, or perception, as it may be called, contains little or nothing bearing on the origin and nature of the given data of sense, inner or outer. The manifold of sense, which plays so important a part in the critical theory of knowledge, is left in an obscure and perplexed position. So much is clear, however, that according to Kant sense can be regarded as an *aspective* or representations of objects. The data of sense are more *statisch*, not partial or contrasted representations. The sense-manifold is not to be conceived as having, *per se*, any of the qualities of objects as actually cognized; its parts are not cognizable *per se*, nor can it with propriety be said to be received successively or simultaneously. When we apply predicates to the sense-manifold regarded in isolation, we make that which is only a factor in the experience of objects into a separate independent object, and use our predicates transcendently. Kant is not always in his language faithful to his view of the sense-manifold, but the theory as a whole, together with his own express definitions, is unimpeachable. On the origin of the data of sense, Kant's remarks are few and little satisfactory. He very commonly employs the term *affection* of the faculty of sense as expressing the mode of origin, but offers no further explanation of a term which has significance only when interpreted after a somewhat mechanical fashion. Unquestionably certain of his remarks indicate the view that the origin is to be sought in things-in-themselves, but against hasty misinterpretations of such remarks there are certain cautions to be borne in mind. The relation between phenomena and noumena in the Kantian system does not in the least resemble that which plays so important a part in modern psychology between the subjective results of sense-affection and the phenomena of the external conditions of such affection. Kant has positively declared that it would be a gross absurdity to suppose that in his view separate, distinct things-in-themselves existed corresponding to the several objects of perception. And, finally, it is not at all difficult to understand why Kant should say that the affection of sense originated in the action of things-in-themselves, when we consider what was the thing-in-itself to which he was referring. The thing-in-itself to which the empirical order and relations of sense-experience are referred is the divine order, which is not matter of knowledge, but involved in our practical or moral beliefs. Critics who limit their view to the *Kritik* of *Pure Reason*, and there, in all probability, to the first or constructive portion of the work, must necessarily fail to interpret the doctrines of the Kantian system, which do not become clear or definite till the system has been developed. Reason, for Kant, is an organic whole; the speculative and moral aspects are never severed; and the solution of problems which appear at first sight to belong solely to the region of speculative thought may be found ultimately to depend upon certain characteristics of our nature as practical.

Data of sense-affection do not contain in themselves synthetic combination. The first conditions of such combination are found by Kant in the universal forms under which alone sense-phenomena manifest themselves in experience. These universal forms are space, time, and the categories, *a priori*, and in characteristic features resembling intuitions, not notions. They occupy, therefore, a peculiar position, and one section of the *Kritik*, the *Aesthetik*, is entirely devoted to the consideration of them. It is important to observe that it is only through the *a priori* character of these perceptive forms that rational science of nature is at all possible. Kant is here able to resume, with fresh insight, his previous position. In his early essays he had rightly drawn the distinction between mathematical demonstration and philosophic proof, referring the certainty of the first to the fact that the constructions were synthetic in character and entirely determined by the action of constructive imagination. It had not then occurred to him to ask, With what right do we assume that the conclusions arrived at from arbitrary constructions in mathematical matter have applicability to objects of experience? Might not mathematics be a purely imaginary science? To this question he is now enabled to return an

answer. Space and time, the two essential conditions of sense-perception, are not data given by things, but universal forms of intellect into which all data of sense must be received. Hence, whatever is true of space and time regarded by imagination as objects, *i.e.*, quantitative constructions, must be true of the objects making up our sense-experience. The same forms and the same constructive activity of imagination are involved in mathematical synthesis and in the construction of objects of sense-experience. The foundation for pure or rational mathematics, then, being included under the pure science of movement, is thus laid in the critical doctrine of space and time.

The *Aesthetic* isolates sense perception, and considers its forms as though it were an independent, complete faculty. A certain confusion, arising from this, is noticeable in the *Analytic* when the necessity for justifying the position of the categories is under discussion, but the real difficulty in which Kant was involved by his doctrine of space and time has its roots even deeper than the erroneous isolation of sensibility. He has not in any way "deduced" space and time, but, proceeding from the ordinary current view of sense-experience, has found these remaining as residuum after analysis. The relation in which they stand to the categories or pure notions is ambiguous; and, when Kant has to consider the fashion in which category and data of sense are to be brought together, he merely places side by side as *a priori* elements the pure connective notions and the pure forms of perception, and finds it, apparently, only a matter of contingent convenience that they should harmonize with one another and so render cognition possible. To this point also Fichte was the first to call attention.

Affection of sense, even when received into the pure forms of perception, is not matter of knowledge. For cognition there is requisite synthetic combination, and the intellectual function through which such combination takes place. The forms of intellectual function Kant proceeds to enumerate with the aid of the commonly received logical doctrines. For this reference to logic he has been severely blamed, but the precise nature of the debt due to the commonly accepted logical classification is very generally misconceived. Synthetic combination, Kant points out, is formally expressed in a judgment, which is the act of uniting representations. At the foundation of the judgments which express the types of synthetic combination, through which knowledge is possible, lie the pure general notions, the abstract aspect of the conditions under which objects are cognizable in experience. General logic has also to deal with the union of representations, though its unity is analytic merely, not synthetic. But the same intellectual function which serves to give unity in the analytic judgments of formal logic serves to give unity to the synthetic combinations of real perception. It appeared evident, then, to Kant that in the forms of judgment, as they are stated in the common logic, there must be found the analogues of the types of judgment which are involved in transcendental logic, or in the theory of real cognition. His view of the ordinary logic was wide and comprehensive, though in his restriction of the science to pure form one can trace the influence of his earlier training, and it is no small part of the value of the critical philosophy that it has revived the study of logic and prepared the way for a more thorough consideration of logical doctrines. The position assigned to logic by Kant is not, in all probability, one which can be defended; indeed, it is hard to see how Kant himself, in consistency with the critical doctrine of knowledge, could have retained many of the older logical theorems, but the precision with which the position was stated, and the sharpness with which logic was marked off from cognate philosophical disciplines, prepared the way for the more thoughtful treatment of the whole question.

Formal logic thus yields to Kant the list of the general notions, pure intellectual predicates, or categories, through which alone experience is possible for a conscious subject. It has already been noted how serious was the error involved in the description of these as notions, without further attempt to clear up their precise significance. Kant, indeed, was mainly influenced by his strong opposition to the Leibnizian rationalism, and therefore assigns the categories to understanding, the logical faculty, without consideration of the question,—which might have been suggested by the previous statements of the *Dissertation*,—what relation these categories held to the empirical notions formed by comparison, abstraction, and generalization when directed upon representations of objects. But when the categories are described as notions, *i.e.*, as formal products of thought, the very *idea* of necessity the problem which had presented itself to Kant at every stage of his pre-critical thinking,—with what right can we assume that these notions apply to objects of experience? The answer which he proceeds to give altogether explodes the definition of the categories as formal products of thought, and enables us to see more clearly the nature of the new conception of experience which lies in the background of all the critical work.

The unity of the ego, which has been already noted as an element entering into the synthesis of cognition, is a unity of a quite distinct and peculiar kind. That the ego to which different

parts of experience are presented must be the same ego, if there is to be cognition at all, is analytically evident; but the peculiarity is that the ego must be conscious of its own unity and identity, and this unity of self-consciousness is only possible in relation to difference not contained in the ego but given to it. The unity of synthetic unity of experience itself, and the forms of this synthetic unity, the categories, are, therefore, on the one hand, necessary as forms in which self-consciousness is realized, and, on the other hand, restricted in their application and validity to the data of given sense, or the particular element of experience. Thus experience presents itself as the organic combination of the particular of sense with the individual unity of the ego through the universal forms of the categories. Reference of representations to the unity of the object, synthetic unity of apperception, and subsumption of data of sense under the categories, are thus three sides or aspects of the one fundamental fact.

In this deduction of the categories, as Kant calls it, there appears for the first time an endeavour to connect together into one organic whole the several elements entering into experience. It is evident, however, that much was wanting before this essential task could be regarded as complete. Kant has certainly brought together self-consciousness, the system of the categories and data of sense. He has shown that the conditions of self-consciousness are the conditions of possible experience. But he has not shown, nor did he attempt to show, how it was that the conditions of self-consciousness are the very categories arrived at by consideration of the system of logical judgments. He does endeavour to show, but with small success, how the junction of category and data of sense is brought about, for according to his scheme these stood, to a certain extent at least, apart from and independent of one another. The failure to effect an organic combination of the several elements was the natural consequence of the false start which had been made.

The mode in which Kant endeavours to show how the several portions of cognition are subjectively realized brings into the clearest light the inconsistencies and imperfections of his doctrine. Sense had been assumed as furnishing the particular of knowledge, understanding as furnishing the universal; and it had been expressly declared that the particular was cognizable only in and through the universal. Still, each was conceived as somehow in itself complete and finished. Sense and understanding, distinct functions, and there was wanting some common form, some intermediary which should bring them into conjunction. Data of sense as purely particular could have nothing in common with the categories as purely universal. But data of sense had at least one universal aspect,—their aspect as the particular of the general forms, space and time. Categories were in themselves abstract and valueless, serviceable only when restricted to possible objects of experience. There was thus a common ground on which category and intuition were united in one, and an intermediate ground whereby the universal of the category might be so far individualized as to comprehend the particular of sense. This intermediate process—which is really the junction of understanding and sense—Kant calls productive imagination, and it is only through productive imagination that knowledge or experience is actually realized in our subjective consciousness. The specific forms of productive imagination he calls *schemata*, and upon the nature of the *schemata* Kant gives much that has proved of extreme value for subsequent thought.

Productive imagination is thus the concrete element of knowledge, and its general modes are the abstract expression of the *a priori* laws of all possible experience. The categories are restricted in their applicability to the *schemata*, *i.e.*, to the pure forms of conjunction of the manifold in time, and in the modes of combination of *schemata* and categories we have the foundation for the rational sciences of mathematics and physics. Perception or real cognition is thus conceived as a complex fact, involving data of sense and pure perceptive forms, determined by the category and realized through productive imagination in the *schemata*. The system of principles which may be deduced from the consideration of the mode in which understanding and sense are united by productive imagination is the positive result of the critical theory of knowledge, and some of its features are remarkable enough to deserve attention. According to his usual plan, Kant arranges these principles in conformity with the table of the categories, dividing the four classes, however, into two main groups, the mathematical and the dynamical. The mathematical principles are the abstract expression of the necessary mode in which data of sense are determined by the category in the form of intuitions or representations of objects; the dynamical are the abstract expression of the modes in which the existence of objects of intuition is determined. The mathematical principles are constitutive, *i.e.*, express determinations of the objects themselves, the dynamical are regulative, *i.e.*, express the conditions under which objects can form parts of real experience. Under the mathematical principles come the general rules which furnish the ground for the application of quantitative reasoning to real facts of experience. For as data of sense are only possible

objects when received in the forms of space and time, and as space and time are only cognized when determined in definite fashion by the understanding through the schema of number (quantity) or degree (quality), all intuitions are extensive quantities and contain a real element, that of sense, which has degree. Under the dynamical principle, the general modes in which the existence of objects are determined, fall the analogies of experience, or general rules according to which the existence of objects in relation to one another can be determined, and the postulates of experience, the general rules according to which the existence of objects for us or our own subjective existence can be determined. The analogies of experience rest upon the order of perceptions in time, *i.e.*, their permanence, succession, or coexistence, and the principles are respectively those of substance, causality, and reciprocity. It is to be observed that Kant in the expression of these analogies reaches the final solution of the difficulty which had so long pressed upon him, the difficulty as to the relation of the pure connective notions to experience. These notions are not directly applicable to experience, nor do we find in experience anything corresponding to the pure intellectual notions of substance, cause, and reciprocity. But experience is for us the combination of data of sense in the forms of productive imagination, forms determined by the pure intellectual notions, and accordingly experience is possible for us only as in modes corresponding to the conditions. The permanent in time is substance in any possible experience, and no experience is possible save through the determination of all changes as in relation to a permanent in time. Determined sequence is the causal relation in any possible experience, and no experience is possible save through the determination of perceived changes as in relation to a determined order in time. So with coexistence and reciprocity.

The postulates of experience are general expressions of the significance of existence in the experience of a conscious subject. The element of reality in such experience must always be given by intuition, and, so far as determination of existence is assumed, external intuition is a necessary condition of inner intuition. The existence of external things is as certain as the existence of the concrete subject, and the subject cannot cognize himself as existing save in relation to the world of facts of external perception. Inner and outer reality are strictly correlative elements in the experience of the conscious subject.

Throughout the positive portion of his theory of cognition, Kant has been led by his doctrine that the three determining complete notions, having an impact or significance revealing the bounds of possible experience. Moreover, the manner in which space and time had been treated made it possible for him to regard them as contingent forms, necessary for intelligences like ours, but not to be viewed as absolutely necessary. The real meaning of these peculiarities is hardly ever expressed by him, though it is clear that the solution of the matter is to be found in the inadequacy of the positive theory to meet the demands of reason for completed explanation. But the conclusion which was led was one of the greatest importance for the after development of his system. Cognition is necessarily limited. The categories are restricted in their application to elements of possible experience to that which is presented in intuition, and all intuition is for the ego contingent. But to assert that cognition is limited and its matter contingent is to form the idea of an intelligence for whom cognition would not be limited and for whom the data of intuition would not be given, contingent facts, but necessarily produced along with the pure categories. This idea of an intuitive understanding is the definite expression for the completed explanation which reason demands, and it involves the conception of a realm of objects for such an understanding, a realm of objects which, in opposition to the phenomena of our relative and limited experience, may be called noumena or things-in-themselves. The noumena, therefore, is in one way the object of a non-sensuous intuition, but more correctly is the expression of the limited and partial character of our knowledge. The idea of a noumenon is thus a limiting notion.

Assuredly, the difficult section of the *Kritik*, or the ground of the distinction between phenomena and noumena, would not have led to so much misinterpretation as it has done, had Kant then brought forward what lies at the root of the distinction, his doctrine of reason and its functions. Understanding, as has been seen, is the faculty of cognition strictly so called; and within its realm, that of space, time, and matter, positive knowledge is attainable. But the ultimate conception of understanding, that of the world of objects, quantitatively determined, and standing in relation of mutual reciprocity to one another, is not a final ground of explanation. We are still able and necessitated to reflect upon the whole world of phenomena as thus cognized, and driven to inquire after its significance. In our reflection we necessarily treat the objects, not as phenomena, as matters of positive, scientific knowledge, but as things-in-themselves, as noumena. The distinction between phenomena and noumena is, therefore, nothing but the expression of the distinction between understanding and reason, a distinction which, according to Kant, is merely subjective.

The specific function of reason is the effort after completed ex-

planation of the experience presented in cognition. But in such effort there are no notions to be employed other than the categories, and these, as has already been seen, have validity only in reference to objects of possible experience. We may expect, then, to find the transcendent employment of the categories leading into various difficulties and inconsistencies. The criticism of reason in its specific aspect throws fresh light on the limits to human knowledge and the significance of experience.

Experience has presented itself as the complex result of relation between the ego or subject and the world of phenomena. Reason may therefore attempt a completed explanation either of the ego or of the world of phenomena or of the total relation between them. The three inquiries correspond to the subjects of the three ancient metaphysical sciences, natural psychology, rational cosmology, rational theology. It is readily seen, in regard to the first of them, that all attempts to determine the nature of the ego as a simple, permanent, immaterial substance rest upon a confusion between the ego as pure logical unity and the ego as object of intuition, and involve a transcendent use of the categories of experience. It profits not to apply such categories to the soul, for no intuition corresponding to them is or can be given. The idea of the soul must be regarded as transcendent. So too when we endeavour, with the help of the categories of quantity, quality, relation, and modality, to determine the nature and relation of parts of the world, we find that reason is landed in a peculiar difficulty. Any solution that can be given is too narrow for the demands of reason and too wide for the restrictions of understanding. The transcendent employment of the categories leads to infinity, or equally balanced statements of apparently contradictory results. Due attention to the relation between understanding and reason enables us to solve the antinomies and to discover their precise origin and significance. Finally, the endeavour to find in the conception of God, as the supreme reality, the explanation of experience, is seen to lead to no valid conclusion. There is not any intuition given whereby we might show the reality of our idea of a Supreme Being. So far as knowledge is concerned, God remains a transcendental ideal.

The criticism of the transcendental ideas, which is also the examination of the claims of metaphysics to rank as a science, yields a definite and intelligible result. These ideas, the expression of the various modes in which unity of reason may be sought, have no objects corresponding to them in the sphere of cognition. They have not, therefore, like the categories, any *constitutive* value, and all attempts at metaphysical construction upon the nucleus of an idea of science must be resigned as of necessity hopeless. But the ideas are not, on that account, destitute of all value. They are immensely significant, as indicating the very essence of the function of reason. The limits of scientific cognition become intelligible, only when the sphere of understanding is subjected to critical reflection and compared with the possible sphere of reason, that is, the sphere of rationally complete cognition. The ideas, therefore, in relation to knowledge strictly so called, have *regulative* value, for they furnish the general precepts for extension and completion of knowledge, and, at the same time, since they spring from reason itself, they have a real value in relation to reason as the very utmost nature of intelligences. Self-consciousness cannot be regarded as merely a mechanically determined result. Free reflection upon the whole system of knowledge is sufficient to indicate that the sphere of intuition, with its rational principles, does not exhaust conscious experience. There still remains, over and above the realm of nature, the realm of free, self-conscious spirit; and, within this sphere, it may be anticipated that the ideas will have a significance far richer and deeper than the merely regulative import which they possess in reference to cognition.

Where, then, are we to look for this realm of free self-consciousness? Not in the sphere of cognition, where objects are mechanically determined, but in that of will or of reason as practical. That reason is practical or prescribes ends for itself is sufficiently manifest from the mere fact of the existence of the conception of morality or duty, a conception which can have no corresponding object within the sphere of intuition, and which is theoretically, or in accordance with the categories of understanding, irreconcilable. The presence of this conception is the datum upon which may be founded a special investigation of the conditions of reason as practical, a *Kritik* of pure practical reason, and the analysis of it yields the statement of the formal precepts of morality.

The realization of duty is impossible for any being which is not thought as free, *i.e.*, capable of self-determination. Freedom, it is true, is theoretically not an object of cognition, but its impossibility is not thereby demonstrated. The theoretical proof rather serves as useful aid towards the more exact determination of the nature and province of self-determination, and of its relation to the whole concrete nature of humanity. For in man self-determination and mechanical determination by empirical motives coexist, and only in so far as he belongs and is conscious of belonging both to the sphere of sense and to the sphere of reason does moral obligation become possible for him. The supreme end prescribed by reason in its practical aspect, namely, the complete subordination of the empirical

side of nature to the precepts of morality, demands, as conditions of its possible realization, the permanence of ethical progress in the moral agent, the certainty of freedom in self-determination, and the necessary harmonizing of the spheres of sense and reason through the intelligent author or ground of both. These conditions, the postulates of practical reason, are the concrete expressions of the three transcendental ideas, and in them we have the full significance of the ideas for reason. Immortality of the soul, positive freedom of will, and the existence of an intelligent ground of things are speculative ideas practically warranted, though theoretically neither demonstrable nor comprehensible.

Thus reason as self-determining supplies notions of freedom; reason as determined supplies categories of understanding. Union between the two spheres, which seem at first sight disparate, is found in the necessary postulate that reason shall be realized, for its realization is only possible in the sphere of sense. But such a union, when regarded *in abstracto*, rests upon, or involves, a notion of quite a new order, that of the adaptation of nature to reason, or, as it may be expressed, that of end in nature. Understanding and reason thus coalesce in the faculty of *judgment*, which mediates between, or brings together, the universal and particular elements in conscious experience. Judgment is here merely *reflective*, that is to say, the particular element is given, so determined as to be possible material of knowledge, while the universal, not necessary for cognition, is supplied by reason itself. The empirical details of nature, which are not determined by the categories of understanding, are judged as being arranged or ordered by intelligence, for in no other fashion could nature, in its particular, contingent aspect, be thought as forming a complete, consistent, intelligible whole.

The investigation of the conditions under which adaptation of nature to intelligence is conceivable and possible makes up the subject of the third great *Kritik*, the *Kritik of Judgment*, a work presenting unusual difficulties to the interpreter of the Kantian system. The general principle of the adaptation of nature to our faculties of cognition has two specific applications, with the second of which it is more closely connected than with the first. In the first place, the adaptation may be merely *subjective*, when the empirical condition for the exercise of judgment is furnished by the feeling of pleasure or pain; such adaptation is aesthetic. In the second place, the adaptation may be objective or logical, when empirical facts are given of such a kind that their possibility can be conceived only through the notion of the end realized in them; such adaptation is teleological, and the empirical facts in question are organisms.

Aesthetics, or the scientific consideration of the judgments resting on the feelings of pleasure and pain arising from the harmony or want of harmony between the particular of experience and the laws of understanding, is the special subject of the *Kritik of Judgment*, but the doctrine of teleology there unfolded is the more important for the complete view of the critical system. For the analysis of the teleological judgment and of the consequences flowing from it leads to the final statement of the nature of experience as conceived by Kant. The phenomena of organic production furnish data for a special kind of judgment, which, however, involves or rests upon a quite general principle, that of the contingency of the particular element in nature and its subjectively necessary adaptation to our faculty of cognition. The notion of contingency arises, according to Kant, from the fact that understanding and sense are distinct, that understanding does not determine the particular of sense, and, consequently, that the principle of the adaptation of the particular

to our understanding is merely supplied by reason on account of the peculiarity or limited character of understanding. End in nature, therefore, is a subjective or problematic conception, implying the limits of understanding, and consequently resting upon the idea of an understanding constituted unlike ours,—of an intuitive understanding in which particular and universal should be given together. The idea of such an understanding is, for cognition, transcendental, for no corresponding fact of intuition is furnished, but it is realized with practical certainty in relation to reason as practical. For we are, from practical grounds, compelled with at least practical necessity to ascribe a certain aim or end to this supreme understanding. The moral law, or reason as practical, prescribes the realization of the highest good, and such realization implies a higher order than that of nature. We must, therefore, regard the supreme cause as a moral cause, and nature as so ordered that realization of the moral end is in it possible. The final conception of the Kantian philosophy is, therefore, that of ethical teleology. As Kant expresses it in a remarkable passage of the *Kritik*, "The systematic unity of ends in this world of intelligences, which, although as mere nature it is to be called only the world of sense, can yet as a system of freedom be called an intelligible, *i.e.*, moral world (*regnum gratiæ*)," leads inevitably to the teleological unity of all things which constitute this great whole according to universal natural laws, just as the unity of the former is according to universal and necessary moral laws, and unites the practical with the speculative reason. The world must be represented as having originated from an idea, if it is to harmonize with that use of reason without which we should hold ourselves unworthy of reason—*viz.*, the moral use, which rests entirely on the idea of the supreme good. Hence all natural research tends towards the form of a system of ends, and in its highest development would be a physics-teleology. But this, since it arises from the moral order as a unity grounded in the very essence of freedom and not accidentally instituted by external commands, establishes the teleology of nature on grounds which *a priori* must be inseparably connected with the inner possibility of things. The teleology of nature is thus made to rest on a transcendental teleology, which takes the ideal of supreme ontological perfection as a principle of systematic unity, a principle which connects all things according to universal and necessary natural laws, since they all have their origin in the absolute necessity of a single primal being" (p. 538).

Editions of Kant's Works.—The standard collective editions are (1) that by Rosenkranz and Schubert, 12 vols., 1838-42, containing in vol. i. the *Life* by Schubert, and in vol. xii. a *History of the Kantian Philosophy* by Rosenkranz; (2) that by Hartenstein, in 10 vols., 1838-39; (3) a second edition by Hartenstein, in 8 vols., 1867-69, in which the arrangement is strictly chronological; (4) that by Kirchmann, in 8 vols., 1868. Convenient editions of the three *Kritiks* have been published by Kelsch, and critical editions of the *Prolegomena* and *Kritik d. r. Vernunft* by B. Erdmann, whose treatise *Kants Kritikismus in d. ersten und zweiten Aufhabe d. Kr. d. r. Vernunft*, 1878, and pamphlet, *Nachlese zu K. Kr. d. r. Vernunft*, 1881, contain much interesting matter.

Of works upon the Kantian philosophy the number is very great. A brief notice of them is given in the bibliographical references in Ueberweg's *Gesch. d. Philosophie*, 1st. ed., §§ 18-20. A very comprehensive survey is contained in the recent work by H. Vaihinger, *Commentar zu Kants Kritik d. r. reinen Vernunft*, 1884, where the older and more recent literature is elaborately classified and briefly characterized. (H. A. L.)
